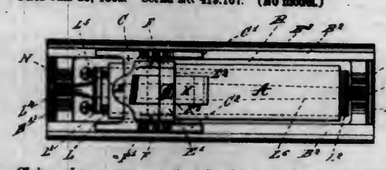
2. A picture-hanger comprising an approximately U-shaped frame adapted to be attached to the bottom of a picture and having sides and a transverse portion, a bail connected to the top of the frame and adapted to be fastened to the top of the picture, and an adjustable bail adapted to be suspended from a hook and having sides provided with eyes to receive the sides of the frame and to slide thereon and provided with a series of hooks adapted to engage the transverse portion of the frame, substantially as described.

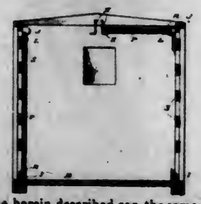
3. A picture-hanger comprising an approximately U-shaped

frame having a transverse portion and adapted to have its lower end attached to the bottom of a picture, a V-shaped bail hinged to the transverse portion and provided at its apex with a U-shaped bend to be fastened to the top of a picture, an adjustable bail having the upper ends of the sides converging and having its sides bent to form a series of hooks and provided with eyes to receive the sides of the frame and to slide thereon, and a transverse brace connecting the sides of the adjustable bail, substantially as described.



480,633. HAME-FASTENER. JOHN H. SNYDER, Fruitport, Mich. Filed Nov. 18, 1891. Serial No. 412,342. (No model.)

Claim.—1. The combination, with the chain A and hooks *a* and B, of the elongated link-shaped supports C, having one end bent at an angle to provide the fulcrum D, the lever E, having eye *e'* and slot *e*, and the tongue F, having handle F' and bent end F^2, which enters slot *e*, substantially as described.



2. In a hame-fastener, the strap A, having hook *a*, the hook B, the link D, having the right-angled end D engaged by one of the links of strap A, said supporting-links C being engaged with the hook B, the lever E, having eye *e'* and slot *e* and mounted on fulcrum-support D, and the tongue F, carried in eye *e'*, and having its end bent to embrace the fulcrum D, substantially as described.

480,634. APPARATUS FOR WHETTING AND SHARPENING THE EDGES OF EDGED TOOLS. CHARLES SPRUCK, Paterson, N. J. Filed Jan. 25, 1892. Serial No. 419,167. (No model.)

Claim.—In an apparatus for whetting and sharpening the edges of edged tools, a tool-holder mounted in bearings formed in a sliding carriage, and a sliding carriage for tool-holder provided with runners, in combination with a frame or box provided with slides, in which said runners reciprocate or are moved longitudinally, an adjustable rocking frame or cradle within and near the bottom of said box, and an oil or whetstone secured in said rocking frame or cradle, adapted to rock laterally and permit the stone to accommodate itself to the transverse angle of cutting-face of the tool to be operated upon, constructed substantially as shown and described, and for the purposes specified.

480,635. COMBINED FREIGHT AND STOCK CAR. EDWARD R. STEINHILBER, Galesburg, Ill. Filed Mar. 23, 1891. Serial No. 386,089. (No model.)

Claim.—1. The herein described car, the same comprising a body having slatted sides, hooks depending from the roof, solid side walls, each comprising members connected by hinges, and sliding hinges at the upper ends of said side walls, said hooks holding the side pieces in folded and raised position, as and for the purpose set forth

2. The herein-described car, the same comprising a body having slatted sides with outwardly-inclined sills, vertical strips secured to the uprights of the car-body and projecting inwardly past the slats, solid side members mounted in sliding hinges inside and at the top of the car, said members comprising two strips, the inner with horizontal grains and the outer with vertical, and the lower edge of the side members being beveled and engaging said sills, and vertical grooves in the outer faces of said members engaging said metallic strips, all substantially as and for the purpose hereinbefore set forth.

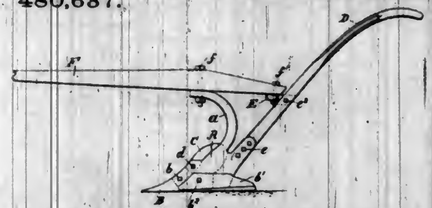
3. The herein-described car, the same comprising a body having

480,635.

slatted sides with outwardly-inclined sills, vertical strips secured to the uprights of the car-body and projecting inwardly past the slats, solid side walls mounted in sliding hinges inside and at the top of the car, and the lower edge of the side walls being beveled and engaging said sills, and vertical grooves in the outer faces of said walls engaging said metallic strips, all substantially as and for the purpose set forth.

480,636. CONVERTIBLE CHAIR. ASHER B. STEVENS, Brooklyn, N. Y.; Moses N. Baker, administrator of said Asher B. Stevens, deceased, assignor to Gilman Waite, Baldwinville, Mass. Filed Sept. 6, 1888. Renewed Apr. 1, 1892. Serial No. 427,393. (No model.)

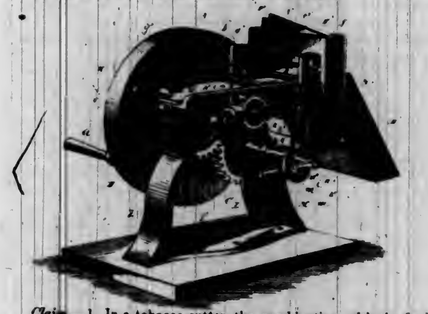
Claim.—1. A chair comprising a seat, one pair of rigid legs and one pair of hinged legs, jointed rockers pivoted to said pairs of legs, and a rocker-operating device consisting, essentially, of segmental pieces pivoted to the jointed rockers at their points of juncture, provided with a connecting cross-bar and adapted to engage fixed portions of the chair for converting the chair into a sewing-chair or a rolling chair or rocking-chair at pleasure, substantially as described.



2. A chair comprising a seat, one pair of rigid legs and one pair of hinged legs, jointed rockers pivoted to said pairs of legs, and a rocker-operating device consisting, essentially, of segmental pieces pivoted to the jointed rockers at their points of juncture, provided with a connecting cross-bar and adapted to engage fixed portions of the chair, and pairs of rollers or wheels journaled to the legs to admit of the conversion of the chair into a sewing-chair, a rocking-chair, or a rolling or invalid chair, substantially as set forth.

3. A convertible chair comprising a seat provided with pins on its side edges, a pair of legs rigidly secured to the seat, and a pair of legs hinged to the seat, jointed rockers pivoted to the legs, and a rocker-operating device pivoted to the rockers at their junction and extending rearwardly of the chair and notched to engage the said pins on the seat and provided with a cross-bar for connecting their ends in the rear of the chair, substantially as described.

480,637. PLOW. GEORGE W. SWINSON, Magnolia, N. C. Filed Dec. 17, 1891. Serial No. 415,401. (No model.)



Claim.—1. The herein-described improvement in plows, comprising the standard having the beam pivoted to the upper end of its forward arm, the handles connected to a short arm of said standard and the plate having a rear dovetail portion received between the handles and having a transverse hole therethrough to receive the securing-bolt from the handles, said plate also having a slot in its front portion, the upper edges of which are provided with series of grooves or cut-outs adapted to engage an adjusting-bolt passing through the rear end of the beam and said slot, substantially as set forth.

480,637.

2. The herein-described improved plow, consisting of the standard having a forwardly-curved arm and a rear short arm, the handles having their lower converged ends secured to said short arm, the plate held between said handles having a slot and grooves or cut-outs in its upper face, the beam pivoted on said forward curved arm, the nutted bolt passed through the rear end of said beam and also through said slotted plate, the plow-point, the landside, and the mold-board, each secured by a single nutted bolt passed through holes or apertures in said plow-standard, substantially as set forth.

480,638. TOBACCO-SHAVER. JOHN B. TABB, New Bedford, Mass. Filed Dec. 23, 1890. Serial No. 375,614. (No model.)

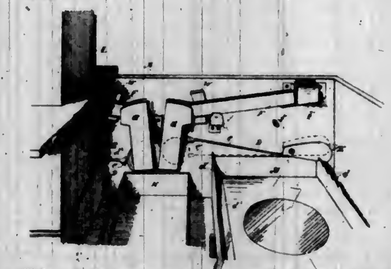
Claim.—1. In a tobacco-cutter, the combination, with the feed-gear, of the cutter-operating mechanism having a projection intermittently engaging and operating said feed-gear when the cutter is operated, said projection being so arranged that the feed-gear will be operated when the cutter is at its highest point, and means for automatically returning the feed-plate of the feed-gear, substantially as specified.

2. In a tobacco-cutter, the combination, with the disk having a cam projection thereon and means for operating said disk, of the double concave arm engaged intermittently by said cam, a sleeve operated by said arm, a second arm connected to said sleeve, a collar adjustably held on said latter arm, a feed-plate, a rack connected to said feed-plate, and a connection between said adjustable collar and the rack whereby the feed-plate is operated, substantially as specified.

3. The combination, with the feed-plate and means for its forward intermittent movement, of the lever having a projection engaged by said feed-plate when the latter is at the limit of its forward movement, a fork carried by said lever, a movable clutch engaged by said fork and mounted on the actuating pinion-shaft, means carried by said clutch for throwing the feed-plate mechanism out of gear, an automatic catch for retaining it in such position, means for returning said feed-plate, and means for releasing said catch and returning said parts to their normal position as said feed-plate is returned, substantially as specified.

4. The combination, with the feed-trough and the feed-plate arranged to reciprocate therein, of the mechanism for actuating said feed plate, comprising the rack-and-pinion and the cam-and-lever devices, the clutch-and-lever mechanism operated by said plate to release it when it has reached the limit of its feed, and means for returning said feed-plate to its normal position when so released, substantially as specified.

5. In a tobacco-cutter, the combination, with the feed-trough and the feed-plate working therein, of the vertically-slotted parallel arms secured to said trough, a horizontal frictional guard-plate working between said arms, and a rod held in the slots of said arms and provided with clamps for securing said plate at the desired adjustment, substantially as specified.



6. In a tobacco-cutting machine, the disk E, the cutter-reciprocating pitman connected thereto, the vertically-reciprocating cutter, and the cam projection located on said disk and intermittently engaging and actuating the feed mechanism when the cutter is operated, and means for operating said disk, in combination with the feed mechanism and means for automatically releasing and returning the feed-plate of said feed mechanism when it has reached the limit of its forward movement, substantially as specified.

7. The tobacco-cutter having the horizontal feed-trough, the feed-plate working in said trough at right angles to the plane of the path of the cutter, its rack-bar, the pinion and ratchet, and the cam-and-lever mechanism actuated by the cutter-actuating gear for operating said ratchet, rack, and pinion, in combination with the lever, clutch-and-stop mechanism for releasing said feed-plate when it has reached the limit of its feed and throwing it out of gear with its actuating mechanism, and means for returning said plate when so released, substantially as specified.

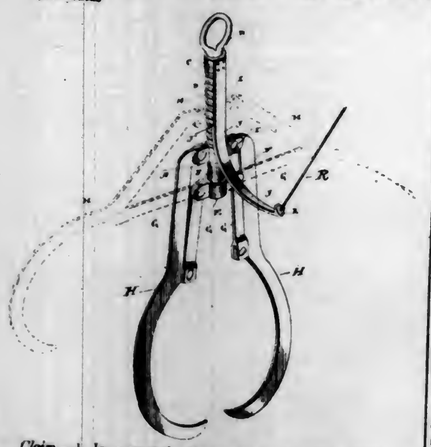
8. In a tobacco-cutting machine, the combination, with the disk E, having the cutter-reciprocating pitman connected therewith, and the cam projection thereon, arranged to engage the feed mechanism when the cutter is at its highest point, of the double-concave cam-lever operated by said projection, the feed mechanism operated by said lever, and the clutch-and-lever mechanism operated by the feed-slide plate to release it when it has reached the limit of its movement, and means for returning said plate to its normal position, substantially as specified.

9. A crank-driven tobacco-cutting machine having an intermittent and automatically-reversing adjustable feed, a disk carrying a cam arranged to operate said feed, said disk also having a wrist-and-pitman connection with a reciprocating-cutter carrier, substantially as specified.

480,639. COIN-ACTUATED VENDING-MACHINE. WILLIAM S. VAN SANT, Auburn, Cal. Filed May 2, 1892. Serial No. 431,544. (No model.)

Claim.—1. In a coin-actuated vending-machine having a coin-passage, a sliding drawer having a ratchet-surface at one side, a pawl normally engaging the ratchet-surface of the drawer and released from contact therewith by the passage of the coin, and an inclined plane on the drawer, upon which the stem of the pawl is held by the weight of the coin to hold the pawl out of contact with the ratchet-surface while the drawer is being pulled out, substantially as herein described.

2. In a coin-actuated vending-machine having a coin-passage, a drawer having a ratchet-surface at one side and an inclined plane at the opposite side, and a pivotally-secured pawl normally engaging said ratchet-surface and having its stem in the path of the coin, said stem adapted to be held against the inclined plane on the drawer by the weight of the coin to hold the pawl elevated and to ride down said inclined plane as the drawer is pulled out, whereby the coin is released from the stem, substantially as herein described.



3. In a coin-actuated vending-machine, the combination of the sliding drawer having on one side a ratchet and on its other side an inclined plane, the gravity-pawl engaging the ratchet of said drawer for locking it, the stem or shank of said pawl passing over the other side of the drawer and controlled by its inclined plane, the contact-plate of said stem or shank, and a suitable coin-passage to direct the coin to said contact-plate, substantially as herein described.

4. In a coin-actuated vending-machine, the combination of the sliding drawer having the ratchet-teeth on one side and the inclined plane on the other, the gravity-pawl engaging the ratchet-teeth for locking the drawer, the stem or shank of said pawl passing over the inclined plane side of the drawer, the contact-plate of said stem or shank, the opposing vertical passage for the coin, and a suitable runway to direct the coin to said vertical passage, substantially as herein described.

5. In a coin-actuated vending-machine, the combination of the sliding drawer having the ratchet-teeth on one side and the inclined plane on the other, the gravity-pawl engaging the ratchet-teeth for locking the drawer, the stem or shank of said pawl passing over the inclined plane side of the drawer, the contact-plate of said stem or shank, the opposing vertical passage for the coin, and the weighted tilting runway communicating with the vertical passage, substantially as herein described.

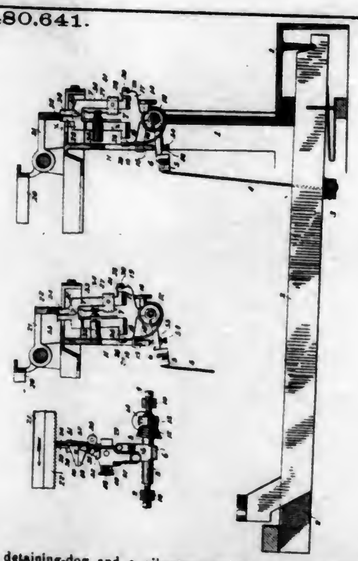
6. In a coin-actuated vending-machine, the combination of the vertical chamber containing the articles to be vended, a drawer underlying said chamber, the drop-plate containing the inscription of the articles to be vended and adapted to cover and expose another inscription, and the arm of said drop-plate passing down in the chamber and held in place by the contents thereof, substantially as herein described.

480,640. SUBMARINE GRAPPLE. WILLIAM D. WALSH and JOHN A. DOWLING, Duluth, Minn. Filed Apr. 11, 1892. Serial No. 428,703. (No model.)

Claim.—1. In a grapple, the combination, with a stem and a spring-actuated head moving thereon, of grapples pivoted at their upper ends to the said head and arms pivotally secured at their inner ends to the stem and at their outer ends to the said grapples between their ends, substantially as shown and described.

2. In a grapple, the combination, with a stem, a collar secured thereto, a spring secured at its upper end to said collar and depending around said stem, a vertically-moving head, grapples pivoted at their upper ends thereto, and arms pivotally connected at their inner ends to the stem and at their outer ends to the said grapples, of a depending plate-spring secured at its upper end to the collar and provided with a notch between its ends where it engages said head, substantially as shown and described.

3. In a grapple, the combination, with a stem, a head adapted to move vertically thereon, grapples pivotally connected to said head, and means for spreading or opening said grapples, of a spring which depends from the upper end of the stem for the purpose of holding the said head in a raised position, substantially as shown and described.



4. In a grapple, the combination, with a stem, a vertically-moving head thereon, grapple-arms pivotally secured thereto, and a means for spreading the said arms, of a spring depending from the upper end of the stem, which spring is notched, so as to engage the said head when in a raised position, the lower end of the said spring being curved outward, and an operating-line secured thereto, substantially as shown and described.

480,641. TYPE-WRITING MACHINE. GEORGE B. WEBB, New York, N. Y., assignor to the Remington Standard Type Writer Manufacturing Company, same place. Filed Sept. 28, 1891. Serial No. 406,997. (No model.)

Claim.—1. In a type-writing machine, the combination, with a paper-carriage and a rack, of an independently-movable detaining-dog and an independently-movable spacing-dog, the detaining-dog being arranged to travel and stop in line with the spacing-dog during and at the cessation of the letter-space movement of the carriage, substantially as described.

2. In a type-writing machine, the combination, with a paper carriage, a rack, and a vibratory dog-holder, of a vibratory spring-actuated detaining-dog and a vibratory spring-actuated spacing-dog, substantially as described.

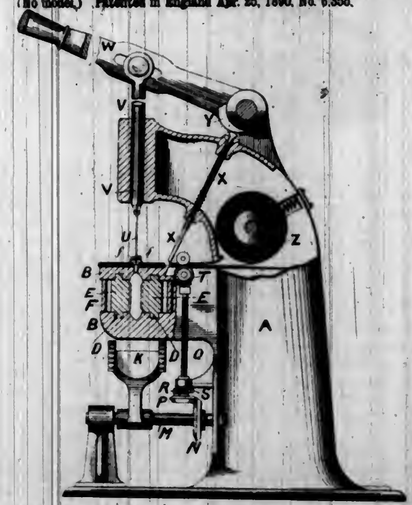
480,641.

3. In a type-writing machine, the combination, with a paper-carriage, a rack, and a vibratory dog-holder, of a vibratory spring-actuated detaining-dog and a vibratory spring-actuated spacing-dog overlapping the detaining dog on the right-hand side, so as to carry the same in the feeding operation of the carriage, substantially as described.

4. In a type-writing machine, the combination, with a paper-carriage, a rack, and a vibratory dog-holder, of a vibratory spring-actuated detaining-dog, a stop in front thereof, an overlapping vibratory spring-actuated spacing-dog, and a stop arranged in rear thereof, substantially as described.

5. In a type-writing machine, the combination, with a paper-carriage, a rack, and a vibratory dog-holder, of a vibratory spring-actuated detaining-dog, a stop in front and a stop in rear thereof, an overlapping vibratory spring actuated spacing-dog, and a stop arranged in rear thereof, substantially as described.

6. In a type-writing machine, the combination, with a paper-carriage a rack, and a vibratory dog-holder, of a vibratory spring actuated spacing dog connected to move the detaining dog toward the left and means for limiting the vibration in both directions of both said dogs, substantially as described.



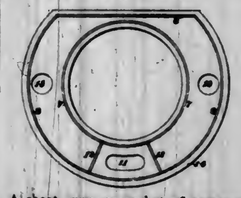
7. In a type-writing machine, the combination, with a paper carriage, a rack, and a vibratory dog-holder, of a detaining-dog pivoted on one side of said dog-holder, a spacing-dog pivoted on the other side of said dog-holder and overlapping the detaining-dog, a stop back of the spacing-dog, a stop in front of both said dogs, and a spring for each dog, having a tension toward the right, substantially as described.

8. In a type-writing machine, the combination, with a paper-carriage, a rack, and a vibratory dog-holder, of a pivoted spring-actuated detaining-dog having a pivotal joint and spring intermediate its ends and a pivoted spring-actuated overlapping spacing-dog, substantially as described.

9. In a type-writing machine, the combination, with a paper-carriage, a rack, and a vibratory dog-holder, of a vibratory spring-actuated detaining-dog normally in engagement with the rack and against a front stop and a vibratory spring-actuated spacing-dog normally out of the rack and out of line with the detaining-dog and against a back stop, the construction and arrangement being such that when the detaining-dog is rocked out of the rack the spacing-dog is rocked in, then the detaining-dog moves at first toward the right, then the carriage feeds, the spacing-dog and the detaining-dog traveling together in line toward the left with the feed of the carriage, and finally both dogs stop in line and with the spacing-dog in engagement with the rack, so that when the finger-key is released the spacing-dog shall rock out of the rack and the detaining-dog in and into the space just occupied by the spacing-dog, substantially as described.

10. In a type-writing machine, the combination, with the framework, of a vibratory dog-holder and an adjustable stop carried by the dog-holder to limit the forward movement of the dog-holder, substantially as described.

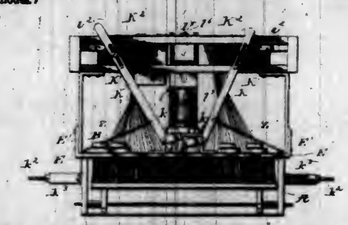
480,642. MACHINE FOR INSERTING LABELS IN SOAP CAKES. ALFRED E. WEBB, London, England, assignor to the Economic Advertising Company, Limited, same place. Filed July 5, 1890. Serial No. 357,843. (No model.) Patented in England Apr. 25, 1890, No. 6,355.



Claim.—1. The combination of a reservoir or holder for soap cakes or tablets, a paper-carrier, a table having a pair of laterally-movable dies between which the soap cake or tablet is received, means for moving the half dies toward and from each other, and a reciprocating pressing-blade for forcing the paper into the body of the soap cake or tablet while the latter is confined between the dies, substantially as described.

2. The combination of a reservoir or holder for soap cakes or tablets, a paper-carrier, a table having a pair of laterally-movable half-dies between which a soap tablet is received, mechanism for reciprocating the table, means for moving the half-dies toward and from each other as the table reciprocates, and a vertically-movable pressing-blade for forcing the paper into the body of a soap cake or tablet while the latter is confined between the half-dies, substantially as described.

2. The combination of a reservoir for holding soap cakes or tablets, a paper-carrying reel, a table having a pair of laterally-movable half-dies between which a soap cake or tablet is received, mechanism for reciprocating the table, means for moving the half-dies toward and from each other, a cutter for severing the paper to form a label, a reciprocating pressing-blade for forcing the label into the body of a soap cake or tablet while the latter is confined between the half-dies, and devices for operating the cutter and the pressing-blade, substantially as described.



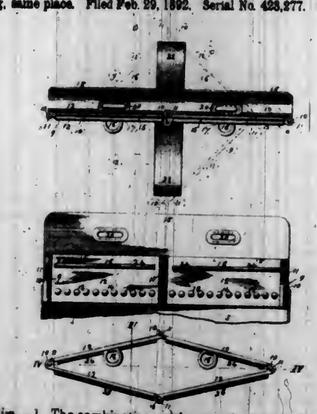
480,643. PACKING. THOMAS W. WELSH, Wilmerding, Pa. Filed June 16, 1892. Serial No. 436,948. (No model.)

Claim.—1. A sheet, ring, or gasket of compressible or elastic packing material, having inner and outer ridges formed on its surface near the edges, a flat surface between the ridges, an opening or port through said flat part of the gasket, and inclosing ridges between the inner and outer ridges, which, with portions of the inner and outer ridges, form a complete inclosure for the port and prevent leakage from it to the space between the inner and outer ridges or to the atmosphere, substantially as set forth.

2. A ring, sheet, or gasket of compressible or elastic packing material for packing a compound joint consisting of at least two joints which open one into the other, said packing being adapted to be placed in the main joint or between the surfaces which form the main joint and having a ridge formed on it near its outer edge and two ridges formed on it adjacent to its inner edge, which inclose between them the other joint or joints, substantially as set forth.

480,644. TELEGRAPH-TRANSMITTER. CHARLES WILLOUGHBY, San Francisco, Cal. Filed June 30, 1891. Serial No. 398,056. (No model.)

Claim.—1. The combination, with a transmitter of the character described, of the spring-stops *p* and *p'* and means for connecting said stops, respectively, to the respective letter-bars, substantially as and for the purpose specified.



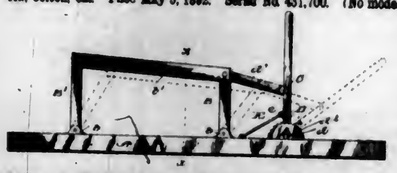
2. In a transmitter, substantially as herein described, the combination, with character-plates adapted to move horizontally and levers pivoted to said plates, of spring-stops *p* and *p'*, said levers and spring-stops adapted to be operated by the finger-bars B, substantially as and for the purposes specified.

3. In a transmitter, substantially as herein described, having horizontally-sliding character-plates, an adjustable reciprocating block or carriage, and a contact-spring located in said block, said spring adapted to engage the character-plates, substantially as and for the purpose specified.

4. In a transmitter, substantially as herein described, the combination, with an adjustable reciprocating block or carriage having a contact-spring and pointa³ and *n*⁴ and a roller loosely mounted thereon, of a cylinder and piston and means for reciprocating said carriage, said piston being connected with the block or carriage, substantially as and for the purposes specified.

5. In a transmitter, substantially as herein described, the combination, with an adjustable block or carriage having a contact-spring and loosely-mounted roller and a piston connected with said block or carriage, of a lever pivoted to the frame of the transmitter and provided with a slip-catch and connected with a lever immediately below and operated by the letter or finger bars B, substantially as and for the purposes specified

480,645. EXPANSIBLE HINGED-MOUTH MAIL-POUCH. GEORGE F. WINDFELDER, St. Louis, Mo., assignor of one-half to Hugo R. Riebeling, same place. Filed Feb. 29, 1892. Serial No. 423,277. (No model.)

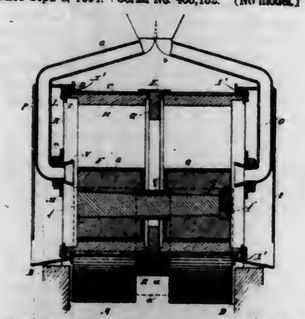


Claim.—1. The combination, with a pouch, of an endless hinge 9, consisting of two sections 12 having loops 10 and staples 16, two sections 12 having loops 10 and staple-eyes 17, and the pivot-pins 11, by which the loops are hinged together, means by which the hinge is secured to the pouch, and a folding flap, 18, secured to the outside of

the staple-sections, having staple-eyes 20, substantially as described.

2. The combination, with a pouch, of an endless hinge 9, consisting of two sections 12 having loops 10 and internal ridges 24, formed with staples 16, two sections 12 having loops 10 and internal grooves 25, providing projections 26 and formed with staple-eyes 17, and the pivot-pins 11, by which the loops are hinged together, and means by which the hinge is secured to the pouch, substantially as described.

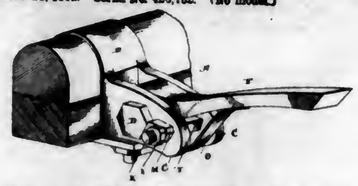
3. The combination, with a pouch, of an endless hinge 9, consisting of two sections 12 having loops 10 and internal ridges 24, formed with staples 16, two sections 12 having loops 10 and internal grooves 25, providing projections 26 and formed with staple-eyes 17, and the pivot-pins 11, by which the loops are hinged together, means by which the hinge is secured to the pouch, and a folding flap 18, secured to the outside of the staple-sections, having staple-eyes 20, substantially as described.



480,646. LIFTING-JACK. HENRY YORK and FREDRICK W. AUSTIN, Colton, Cal. Filed May 3, 1892. Serial No. 431,700. (No model.)

Claim.—1. The herein-described improved lifting-jack, comprising the base-board, the posts pivotally secured thereto at their lower ends and having upper parallel connecting cross-bars, the pitman, the lever for raising and lowering said posts, and having a pawl, a ratchet-plate engaged by said pawl, and means for holding said lever stationary, as set forth.

2. The herein-described improved lifting-jack, comprising the base-board, the posts pivotally secured thereto, the inclined cross-bars connected to said posts, the operating-lever connected to said posts, a pawl, and an eye or staple, the ratchet-plate engaged by said pawl, and the pivoted hook designed to engage said eye or staple, substantially as set forth.

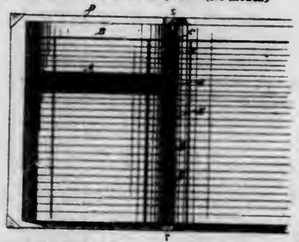


480,647. QUARTZ-CRUSHER. ANDREAS P. ANDERSON, Oriental, Nev. Filed Sept. 8, 1891. Serial No. 405,132. (No model.)

Claim.—1. A hollow rotary drum mounted upon horizontally-journaled supporting-rollers and having a belt by which it is rotated, a centrally located interior ring or flange by which the drum is divided into two parts, dies fitted around the periphery of the drum having the inner ends abutting against this ring and the outer ends against a corresponding outer ring, against which discharge-screens are fixed, crushing-rollers fitting each of the compartments of the drum and secured to a common shaft which extends through the rollers from end to end, hollow cylindrical shoes fitting upon said rollers, having their inner ends formed with closed heads through which the shaft passes, and a sleeve fitting the shaft between said heads, whereby the latter are kept in place upon the rollers, substantially as herein described.

2. The horizontal hollow rotating drum supported upon rollers having an interior ring or flange dividing it into two compartments, rollers fitting the compartments upon each side of the ring, having a common shaft extending through them, whereby the ring serves as a guide to keep the rollers in place, screen fitting the ends of the drum having rings around the periphery by which they are clamped or secured to corresponding rings or flanges upon the ends of the drum, a bar extending transversely across each end of the drum, feed-funnels fitted in the centers of said bars extending through the screens with the larger ends on the inside, and nuts by which they are secured in place, and a double feed-chute by which material to be crushed is delivered through the funnels in each end of the drum, substantially as herein described.

480,648. THILL-COUPLING. JOHN C. BAILEY, Ford City, Pa. Filed Mar. 28, 1892. Serial No. 426,782. (No model.)



Claim.—1. A thill-coupling comprising a clip having ears provided with screw-threaded apertures, a thill-iron having cavities in opposite sides thereof, screw-threaded pivotal bolts which pass through the said screw-threaded apertures and have their inner ends engage the said thill-cavities, the outer ends of the said bolts being made angular, and a locking-bolt which passes through the said ears and engages the said angular heads of the pivotal bolts and locks them against unscrewing, substantially as set forth.

2. A thill-coupling comprising a clip having ears, screw-threaded pivotal bolts, which pass through said ears from opposite sides, a thill-iron having cavities in opposite sides thereof, which the inner ends of the said pivotal bolts enter, the said ears having transverse angular openings outside of the pivotal bolts, an angular locking-bolt passing therethrough, the said locking-bolt having angular portions which engage the said headed ends of the pivotal bolts, substantially as described.

3. A thill-coupling comprising a clip, ears extending therefrom, carrying a pivotal bolt, a thill-iron pivoted thereby, a transverse bolt in front of the said pivotal bolt, and a loop having opposite ends secured to the said thill and passing around the said transverse bolt, substantially as and for the purpose specified.

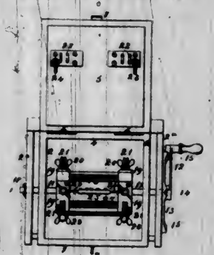
480,649. BOOK-INDICATOR. MAHLON G. BAILEY and HENRY T. WELCH, San José, assignors to James G. Spaulding, San Francisco, Cal. Filed Apr. 6, 1892. Serial No. 428,053. (No model.)

Claim.—1. A book-indicator consisting of a cord or support to be secured to and lie in the back of a book and an indicating-strip of non-absorbent material having a bearing at its inner end of equal width with the strip and adapted to have a close sliding connection with the cord or support, whereby the strip may be truly aligned with the lines of the book, substantially as herein described.

2. A book-indicator consisting of a cord or support to be secured to the ends of the book and to lie in the back or bend thereof, an indicating-strip to extend transversely over the surface of the book-page, a sleeve mounted and adapted to slide on the cord or support, and a bearing secured to the inner end of the indicating-strip and mounted and adapted to slide on the sleeve, substantially as herein described.

3. A book-indicator consisting of a cord or support to be secured to the ends of the book and to lie in the back or bend thereof, a sleeve mounted and adapted to slide upon said cord or support and having end stops, an indicating-strip to extend transversely over the surface of the book-page, and a bearing connected with the inner end of said strip and mounted and sliding upon the sleeve between its stops, whereby by contact therewith said bearing and sleeve move together, substantially as herein described.

4. A book-indicator consisting of a cord or support to lie in the back or bend of the book and provided with end fastenings for securing it to the ends of the book, a sleeve having end stops and mounted and sliding upon said cord or support, an indicating-strip to extend transversely over the surface of the book-page and made of a flexible or pliant sheet of celluloid, and a bearing secured to the inner end of the indicating-strip and having a length equal to the full width of said strip, said bearing being mounted and adapted to slide on the sleeve between its stops and to carry it with it, substantially as herein described.



5. In a shifting line-indicator for books, having an elastic guide-cord provided with a slidable sleeve or cover and means for attaching said cord to a book, a pliable sheet of non-absorbent material having a clasp slidable on said sleeve and limited in its movement by the latter, substantially as herein described.

480,650. SUSPENDER-BUCKLE. BYRON J. BALLIETT, Mansfield, Ohio. Filed Feb. 23, 1892. Serial No. 422,453. (No model.)

Claim.—A buckle consisting of the lower part comprising a rectangular portion with teeth and loop, and an upper part pivotally connected with the lower part and having hook below its pivot, and a toothed portion above the pivot, substantially as specified.

480,651. ELECTRIC-FUSE BOX. GEORGE W. BAUMHOFF, St. Louis, Mo., assignor of one-half to George D. Capen, same place. Filed Dec. 16, 1891. Serial No. 415,269. (No model.)

Claim.—1. A fuse-box having inner perforate sides, as 2, protected by outer imperforate sides, as 2*, set a distance asunder, allowing the escape of heat and smoke through the inner sides and between the inner and outer sides, as shown and described.

2. The combination, in a fuse-box, of a revoluble drum or block with attachments for two or more fuses, tongues in electric connection with the ends of the fuses, and a door to the box, having contact-clips brought in contact with the tongues by the closing of the door, substantially as and for the purpose set forth.

3. The combination, in a fuse-box, of a longitudinally-recessed revoluble block having a shaft journaled in the sides of the box, whereby it may be turned, contacts at the ends of the block, and conducting-wires connected with the contacts and running along the recesses and provided with fuses, substantially as shown and described.

4. The combination, in a fuse-box, of a revoluble drum or block carrying two or more fuses, with connections insulated from each other and each adapted to be brought into the electric current singly by turning the block, the block-shaft 11, a handle 12, and a ring or plate 13, having notches 14 to arrest the motion of the block, for the purpose set forth.

5. The described combination, in a fuse-box, of a hinged lid, the contact-clips 22, attached to the lid, the wires 23 24, connected to the clips, the revoluble fuse block or drum carrying fuses connected to brackets 19, carrying contact-tongues, the shaft carrying the fuse-block, a handle 12 on the shaft, and the ring or plate 13, having notches engaging the handle, for the purpose set forth.

480,652. THILL-SUPPORT. JOSEPH A. BEAN, Suffern, N. Y., assignor of one-half to Robert Barioch, same place. Filed Apr. 7, 1892. Serial No. 428,167. (No model.)

Claim.—1. In a shaft-holder, the combination of a pivoted arm carried by a rigid support, the free end of said arm being bifurcated and provided with inwardly-projecting pawls formed integral with the arm, said pawls being adapted to engage with a fixture attached to the thills having a ratchet-plate, substantially as shown, and for the purpose set forth.

2. In a shaft support or holder, the combination of a rearwardly-extending bracket attached to the axle, an arm pivoted to said bracket and provided at its free end with a bifurcated portion having pawls on the inner sides, a fixture D, carried by the thills and provided with a web, side flanges, and ratchet-teeth, with which the pawl of the arm C engages, substantially as shown, and for the purpose set forth.

3. In a shaft-holder, the combination of a fixture carried by the shafts, consisting of a plate *c*, from which extends a web *f*, having laterally-extending flanges provided with ratchet-teeth, an arm C, pivotally connected to a rearwardly-projecting bracket carried by the axle, the upper end of said arm being provided with pawls and recessed or cut away beyond said pawls, and a spring *d*, adapted to contact with the arm C and bracket B, adjacent to the pivotal connection of the parts, substantially as shown, and for the purpose set forth.

480,653. FLUE-CLEANER. ENOS T. BELL, Dublin, Ind. Filed Nov. 30, 1891. Serial No. 413,590. (No model.)

Claim.—1. In a flue-cleaner, a brush-wheel comprising the parallel flanges having a plurality of sections secured therein, said sections having obliquely disposed wings or vanes thereon, and means whereby said sections are thrown outwardly or expanded when the wheels are in operation, substantially as specified.

2. In a flue-cleaner, a brush-wheel comprising the parallel flanges having a plurality of brush-carrying sections pivotally and loosely held therein, said sections having obliquely-disposed wings or flanges thereon, substantially as specified.

3. In a flue-cleaner, a brush-wheel formed in a plurality of sections arranged to be thrown outwardly by the revolution of said wheel, said sections having obliquely-disposed wings or vanes thereon provided with cutting or scraping edges, substantially as specified.

4. In a flue-cleaner, a brush-wheel formed in a plurality of sections

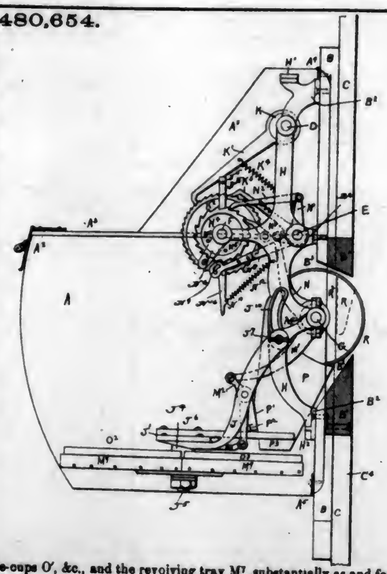
arranged to be expanded or thrown outwardly by the revolution of said wheel, said sections carrying obliquely-disposed wings or vanes having cutting or scraping edges, and also brushes, substantially as specified.

5. In a flue-cleaner, the combination, with the rod having the rotary brush-wheels thereon adapted to be driven in opposite directions and formed in expansible sections, of the piston-disk on said rod having the perforations therein adapted to direct jets of steam against said wheels and provided with a wiping-ring, substantially as specified.

6. In a flue-cleaner, the combination, with the steam-actuated rod carrying the perforated piston-disk and the oppositely-driven brush-wheels, of the pipe or tube, the reel connected thereto, but outside thereof, and independent of the steam-supply, the ribbon carried by said reel and passing through said tube, and the slack connection between said ribbon and rod, substantially as specified.

7. In a flue-cleaner, the combination, with the pipe or tube having the gasketed nozzle adapted to form a steam-tight joint with the mouth of the flue, of the coupling to which said pipe is connected, said coupling having the steam-inlet, and the stuffing-box comprising the case or shell held in the end of said coupling and having a saturated filling, and a flexible disk held between the end of said shell and an interior wall of the coupling, substantially as specified.

8. In a steam-actuated flue-cleaner, the combination, with the pipe or tube having the nozzle adapted to form a steam-tight joint with the mouth of a flue, the coupling connected to said pipe and provided with the steam-inlet and the stuffing-box, of the reel or spool connected to said coupling, the flexible ribbon or cable carried thereby and passing through said stuffing-box, coupling, and pipe, the rod having a slack connection with said ribbon, and the rotary cleaners carried by said rod and operated by jets of steam from said pipe, substantially as specified.



9. In a steam-operated cleaner, the combination, with the pipe or tube having the nozzle thereon, the coupling connected to said pipe and having the steam-inlet, and the stuffing-box, of the reel connected to said coupling, the crank therefor, the guard for the ribbon, the pawl-and-ratchet devices for normally holding said reel, and the spring-stop adapted to automatically engage said reel when the ribbon has been unwound, substantially as specified.

10. In a flue-cleaner, the combination, with the ribbon or cable and the cleaning device connected thereto, of the reel carrying said ribbon and having the guard, the crank, the pawl, and the spring-actuated stop adapted to come into engagement with a notch or shoulder on the periphery of the reel when the ribbon is unwound therefrom substantially as specified.

11. The combination, with the pipe or tube having the gasketed nozzle at one end and connected at the opposite end to a coupling provided with a steam-inlet, of the stuffing-box in said coupling, said box comprising the case or shell having a saturated filling, substantially as specified.

12. A flue-cleaner comprising the pipe or tube having the gasketed nozzle at one end and adapted to form a steam-tight joint with a flue-mouth, the coupling connected to said pipe and provided with a steam-inlet and with a stuffing-box, a reel or spool carried by said coupling, a ribbon or cable carried by said spool or reel and passing through said stuffing-box, coupling, and pipe, the rod connected to said ribbon or cable, the perforated piston-disk on said rod and provided with a wiping-ring, and the rotary brush-wheels adapted to be driven in opposite directions by steam admitted into said pipe, substantially as specified.

480,654. GRAIN-SAMPLING MACHINE. JOHN BIGELOW, Minneapolis, Minn. Filed Apr. 13, 1891. Serial No. 388,747. (No model.)

Claim.—1. An organized machine in which are combined the following elements, viz: the spout through which the stream flows, and a cup or like article adapted to be moved in and filled by said stream, and a receptacle to receive the contents of said cup, whereby the machine can take periodically a sample from a stream flowing in a spout and place it in a receptacle by itself, substantially as described.

2. An organized machine in which are combined the following elements, viz: a conveying-spout and a receptacle or cup adapted to be moved in the stream flowing in said spout, and a series of other movable receptacles to receive in order the contents of the first cup or receptacle, and suitable stop mechanism whereby automatically the machine is stopped when any desired number of the last-named receptacles have been filled.

3. The combination of a conveying-spout with an organized machine for taking samples from the stream flowing in said spout, having a sampling-cup R projecting within the interior of said spout and set segmentally with the arc of its own (cup R) revolution, substantially as and for the purpose set forth.

4. The combination of the sampling-cup R, means to impart a jog or shake to the same when it is being emptied, the conductor P, and receptacle-cups O', &c., substantially as and for the purpose described.

5. The combination of the sampling-cup R, conductor P, receptacle-cups O', &c., and the revolving tray M', substantially as and for the purpose described.

6. A sample-taking mechanism attachable to the bottom of a spout, set at an angle, combined with a tray having automatic adjustable connection with the operating mechanism and capable of an adjustment to compensate for the angle of the spout, so that it may hold its receptacle-cups approximately horizontal, substantially as shown and described.

7. In a sampling-machine, substantially as described, a stationary vertical shaft carrying a horizontal receptacle-cup-bearing tray and a ratchet-wheel with a holding-pawl and an operating-pawl to give a periodical revolving movement to said tray around said shaft, substantially as and for the purpose described.

8. In a sampling-machine, substantially as described, a stationary vertical shaft carrying a horizontal revolving cup-bearing tray and removable receptacle-cups constructed so as to be set around said shaft and to be carried in suitable divisions by said tray, substantially as and for the purpose described.

9. In a sampling-machine, the combination, with a chute or passage for the material to be sampled, of a movable support or carrier, a number of receptacles removably secured to said carrier, each receptacle having a distinguishing character, and means for intermittingly removing a portion of the material from the chute and depositing it in one of the receptacles, substantially as set forth.

10. In a sampling-machine, the combination, with a chute or passage for the material to be sampled, of a movable support or carrier adjacent to the chute, a number of receptacles arranged in series in the carrier, each series being removable from the carrier and provided with distinguishing characters, and means for intermittingly removing a portion of the material from the chute and depositing it in one of the receptacles, substantially as set forth.

11. A sampling-machine for the purpose set forth, having an automatic stopping device arranged to act after any desired number of its receptacle-cups within the maximum number shall have been presented to the mouth of its conductor-spout and filled, whereby whatever may be the motive power applied to the machine, and notwithstanding inattention on the part of the person having the machine in charge, only such cups as may be desired will be filled and the contents of the receptacle-cups will not be duplicated, substantially as shown and described.

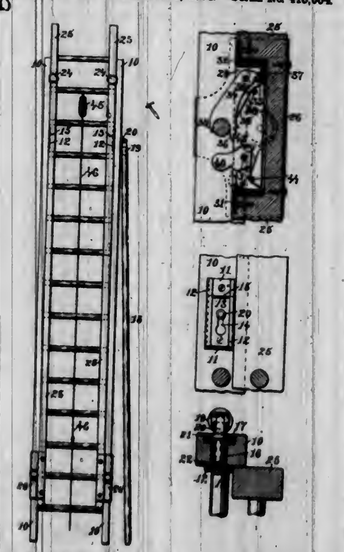
12. The combination of the ratchet-wheel N^4, the swinging piece N^6, and its pin N^7 with the ratchet-pawl K', stripper-lever N^{16}, and the holding-piece N^5, having an inclined plane N^5, the rotating pin N^7 engaging piece N^5, all as and for the purposes set forth.

13. The combination of the driving-shaft D, eccentric K, eccentric-rod pawl K', ratchet-wheel K^2, shaft F, eccentric L, eccentric-rod pawl L', ratchet-wheel L^2, and shaft G, and the segmentally-arranged cup, constructed and adapted to operate substantially as and for the purpose set forth.

14. The combination of the shaft G, sleeve R^4, disk R^3, cover R', and segmentally-arranged cup R, substantially as and for the purpose set forth.

15. The combination of the shaft G, the spring R^5, arranged to exert pressure, as shown, cup R, and disk R^3, having a slot-and-pin connection R^7 with said shaft, and a toothed connection with the stationary tooth-piece S, substantially as and for the purpose described.

16. In a sampling-machine, the combination, with a chute, of a shaft G, journaled adjacent thereto, swinging arms J, secured at their upper ends to said shaft, a movable carrier secured to the lower end of said arms and provided with receptacles, a cupped sleeve secured to the shaft G and adapted to be rotated within the chute and to intermittingly remove a portion of the material therefrom and deposit it in one of the receptacles of the carrier, a sleeve S, encircling the shaft and provided with an arm S', said sleeve S engaging with said cupped sleeve and adapted to give it a jog, and a bolt or screw J^9 for engaging with the arm of the sleeve and varying the time that the cupped sleeve is jogged by the sleeve S, substantially as set forth.



17. The combination of the shaft G, eccentric M, eccentric-rod M', lever M^3, pawl-carrying piece M^2, spring-pawl M^4, and ratchet-wheel M^5, substantially as and for the purpose set forth.

18. In a sampling-machine, the combination, with a shaft F, two ratchet-wheels K^2 and N^4, mounted thereon, the wheel N^4 being provided with pins N^8, an armed sleeve N^6, loosely mounted on the shaft and provided with a pin N^7, a piece N^5, having a slot and also an inclined portion against which the pin N^7 engages, a lever N^{16}, having a pin N^{10} in the slot of the piece N^5, a pin N^{15} at the opposite end of said lever, and an arm K', engaging with the ratchet-wheel K^2, the pin N^{15} being adapted to engage with the arm K' and disengage it from the wheel K^2, and thereby stop the rotation of the wheel N^4 and arrest the movement of the receptacle-carrier, substantially as set forth.

19. The combination of the shaft F, ratchet-wheel N^4 and pins N^8, piece N^6 and pin N^7, shaft E and piece N^5, with inclined plane N^5 and slot N^{11}, and the shipper-lever N^{16}, with pins N^{10} and N^{15}, substantially as and for the purpose set forth.

20. In a sampling-machine for the purpose described, the combination of an inclosing case, a periodically-acting sampling-cup, a horizontal cup-bearing tray, and mechanism for actuating said sampling-cup and said tray, substantially as described.

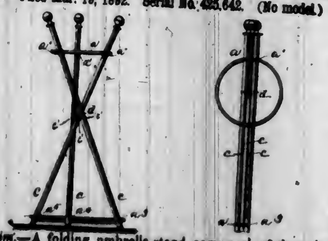
480,655. COMBINATION EXTENSION-LADDER. CYRUS P. BUSHNELL, Providence, R. I. Filed Dec. 1, 1891. Serial No. 413,634. (No model.)

Claim.—1. The combination, with a ladder provided with metal sockets extending through the side frames and having an outer enlarged portion, of studs or shanks pivotally secured to side poles adapted to extend through said sockets and furnished with enlargements adapted to rotate in the enlarged portions thereof, and means for pivotally securing said studs in the sockets, as described.

2. The combination, with the ladder 10, provided with the perforated or slotted plates 11 and the latch-plates 13, having the slots 14 movable therein, the sockets 16, extending through the side frames of said ladder opposite said plates 11, and having the enlarged portions 17 of the studs 20 pivotally secured to the side poles, and having the enlarged shoulders 21, adapted to rotate in the enlargements 17 of said sockets, and the contracted necks 22, to be engaged by the slots 14 of the latch-plates to pivotally secure said studs in place, as and for the purpose described.

3. The combination, with the ladder 10, provided at the upper portion with the roller-bearings 23, journaled on a shaft secured to the side frames, and the clamping-irons 24, also secured thereto, of the ladder 25, provided with the casings 26, having the clamping-arms 27 and the roller-bearings 28, journaled on shafts secured in said casings, and means for automatically locking said ladders together, as described.

4. An automatic locking device for extension-ladders, consisting of a spring-operated locking-arm journaled in a casing adapted to be secured to one section of the ladder, and having a jaw formed between two downwardly-extending lips, and a spring-operated key also journaled in said casing and adapted to enter the jaw of the locking-arm to depress said arm, as described.

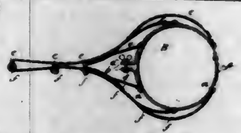


5. In a locking device for extension-ladders, the combination, with the casing 29, having the stop 33 formed on one end thereof, of the locking-arm 34, journaled on a shaft secured in said casing and having the stop 37, and lips 35 and 36, and operated by the spring 38, secured as described, and the key 40, journaled on the shaft 41, secured in said casing, and having the cam-shoulder 42, and a spring 43 bearing against said shoulder, as and for the purpose described.

480,656. TELEPHONE. JAMES A. CHRISTY, San Francisco, Cal., assignor, by direct and mesne assignments, to Thomas W. Cosgrove, Bernard Shraft, Frona Eunice Wait, and E. J. Baldwin, same place. Filed Dec. 1, 1890. Renewed Oct. 5, 1891. Serial No. 407,674. (No model.)

Claim.—In a transmitter, a case having a wire-gauze screen over the mouth, an insulating-washer resting on the screen, a diaphragm resting on the washer, a metal washer set upon the diaphragm having electrical connections to the exterior of the case and insulating-washer set upon the metal washer, an insulating-ring surrounding the metal and insulating-washers, and an electrode having a disk in close proximity to the diaphragm, a perforated dome on which the disk is supported, and a washer in contact with the walls of the case, as set forth.

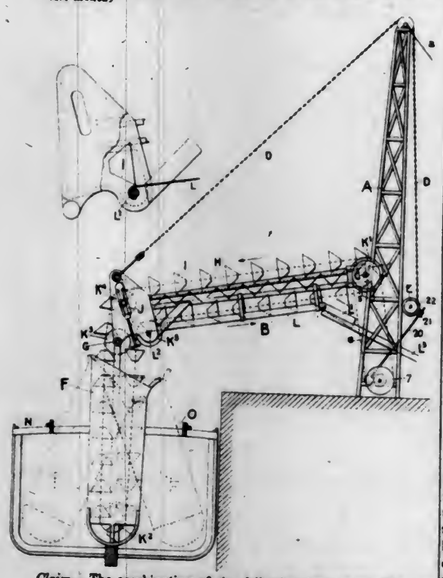
480,657. UMBRELLA-STAND. GEORGE R. DAVIS, St. John, Canada. Filed Mar. 19, 1892. Serial No. 425,642. (No model.)



Claim.—A folding umbrella-stand composed of three legs *a a a*, united at about their center by a ball-joint *d*, each of the legs having a notch on its inner edge near the lower end and a notch on its outer edge above the ball-joint, a drip-pan provided with a flange to engage the lower notches of the legs, and a ring to spring into engagement with the upper notches to hold the stand together and to form a support for the upper ends of umbrellas placed in the stand, substantially as described.

480,658. STOVEPIPE DRYING-RACK. LESSIE M. DOWLER, Tyler, Tex., assignor of one-third to Charlie M. Dowler. Filed Apr. 25, 1892. Serial No. 430,552. (No model.)

Claim.—1. The combination of band A, having the sockets *a* and lips *b*, bolt *d*, passing through said lips and secured by the thumb-screw *d'*, and bent arms *e* and *f*, working in said sockets and adapted to be gathered in a bundle, the hooks *e'* interlocking with the eyes *f'* in the arms *f*, as shown and described.



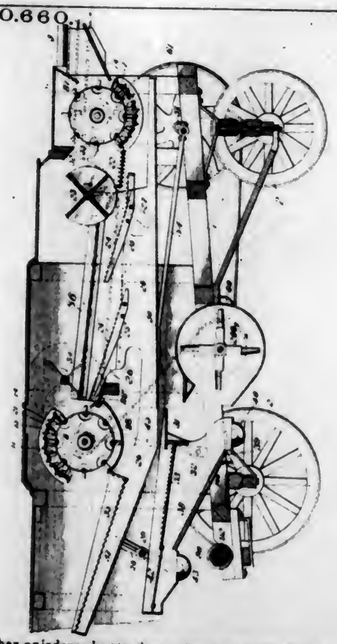
480,658

2. The combination of the band A, having the sockets *a*, lips *b*, and spring *c*, said lips adapted to be secured by proper bolt, bent arms *e* and *f*, arms *e*, having the hooks *e'*, and arms *f*, having the eyes *f'*, said arms adapted to be gathered in a bundle, the hooks *e'* interlocking with the eyes *f'* in the arms *f*, as shown and described.

3. The combination, with a stove or steam pipe B, of a band A, having the sockets *a*, lips *b*, and springs *c*, said lips adapted to be secured by proper bolt, bent arms *e* and *f*, arms *e*, having the hooks *e'*, and arms *f*, having the eyes *f'*, said arms adapted to fit around the said band and be gathered in a bundle, the hooks *e'* interlocking with the eyes *f'* of the arms *f*, as shown and described.

480,659. ELEVATOR. WILLIAM D. EWART, Chicago, Ill., and JAMES M. DODGE, Philadelphia, Pa., assignors to the Link-Belt Engineering Company, Philadelphia, Pa. Filed Nov. 24, 1890. Serial No. 372,419. (No model.)

Claim.—The combination of the following instrumentalities arranged and operating together in substantially the manner hereinbefore described, viz: a framework serving as a boom, provided with a conveyer-trough bottom, an elevator-leg pivotally suspended from said boom, and a continuous double-strand bucket-carrier running over suitable wheels mounted in the framework of said boom and elevator-leg, the buckets of which carrier lift the material bodily in the elevator-leg and then push or scrape it along the trough-bottom of the boom to a suitable place of discharge.



480,660. MACHINE FOR THRASHING AND SEPARATING GRAIN. ARTHUR B. FARQUHAR, HENRY W. EISENHART, and SAMUEL S. MORTON, York, Pa. Filed Nov. 14, 1891. Serial No. 411,873. (No model.)

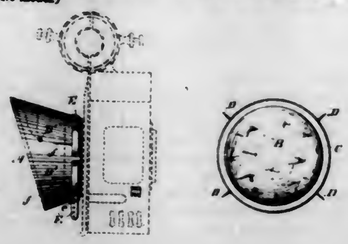
Claim.—1. The combination of the cylinder having its head provided with a projecting annular flange, and the bearing in which the cylinder-shaft turns having a reduced portion, over which the said flange projects, and thereby constitutes a sand-band or dust-guard for the bearing, substantially as described.

2. In combination with a cylinder, a concave having a section carrying a transversely-arranged set of teeth mounted on pivotal supports in the side pieces of the concave, a breakable support which holds the said section in working position, and a stop which limits the movement of the said section after the said breakable support is broken, substantially as described.

3. In a thrashing-machine, the combination, with a cylinder, of a

480,660.

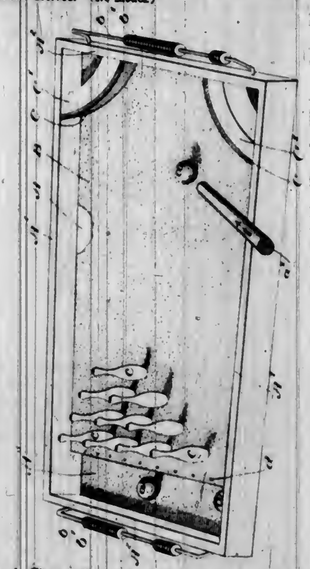
concave having independent teeth-carrying sections, each having pivotal supports and breakable supporting-pins, the said pivotal supports being arranged in front of the said pins, substantially as described.



4. In a thrashing-machine, the combination, with a cylinder, of a concave arranged above the cylinder and having a series of teeth-carrying sections, the rods 21, upon which the sections are pivotally supported, the breakable pins 14, and the stops 19, which limit the movement of the teeth-sections toward the cylinder in the event of a pin 14 breaking, substantially as described.

5. In a separating-machine, the combination, with the screen having a journal projecting therefrom, of a rock-arm provided with a bearing 48 for the journal and with an oil-chamber 46, which is separated from the bearing by a perforated partition, substantially as described.

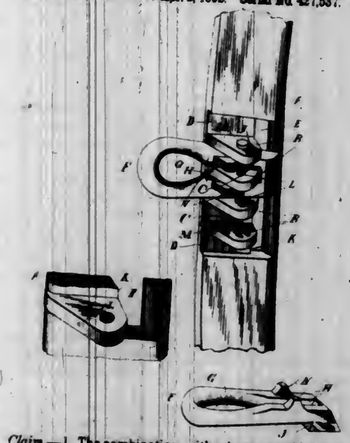
6. In a grain thrashing and separating machine, the combination of the first cylinder and concave, the rear cylinder and concave, the upper screen situated between the said two cylinders, the screen 35 in rear of the rear cylinder, and the bottom boards 30 and 37 under these said screens, respectively, and inclining toward each other, the lower screen-carrying frame arranged to receive the materials delivered upon the bottom boards 30 and 37, the blast-fan 260, which directs a blast of air to the material upon the lower frame and against the material as it falls from the boards 30 and 37, and means for vibrating the said screens, substantially as described.



7. In a thrashing-machine, the combination, with a cylinder and concave, of a blast-fan and a deflecting board which directs and concentrates the blast caused by the fan to the operative portion of the cylinder, substantially as described.

480,661. SUPPLEMENTARY LENS FOR BICYCLE AND CARRIAGE LAMPS. ALBERT L. FRANCE, Milldale, assignor to the Kenton Can Company, Covington, Ky. Filed May 26, 1891. Serial No. 394,187. (No model.)

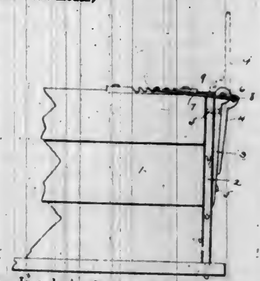
Claim.—The combination of the following elements: the detachable leather lens-holding bonnet A, having the pin holes *D'* and slits *f*, the strap E, with its buckle *e*, the lens B, having the circumscribing band C, and pins D, clinched to the bonnet, substantially as shown and described.



480,662. GAME APPARATUS. MARTIN H. GLEASON, Fitchburg, Mass., assignor to John K. Gleason, same place. Filed Apr. 12, 1892. Serial No. 428,788. (No model.)

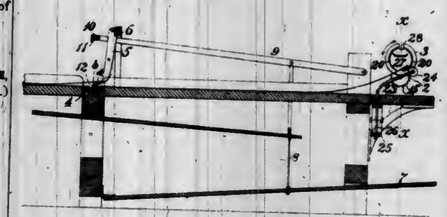
Claim.—1. The combination, with the board having straight side and end guards, of a convexed cushion in one corner of the board and adapted to be struck by a ball, substantially as described.

2. A board having straight side and end guards and a convexed corner cushion at one end, of a transverse pocket at the other end of the board, substantially as described.



480,663. HAME. WILLIAM H. JOHNSON and ORSON J. SMITH, Farmer City, Ill. Filed Apr. 2, 1892. Serial No. 427,537. (No model.)

Claim.—1. The combination, with a hame provided upon its outer surface with a series of laterally-projecting perforated ears and having a vertical slot in front of said ears, of a tug-clip adapted to be removably secured upon any one of said ears, said clip being provided with an opening at the rear end for the reception of the tug, and the front end being provided with a slot for engaging with the ears of the hame, and also provided with a hook upon its under surface for engaging with the rear wall of the slot in the hame, and means for preventing the forward movement of the clip, and a cotter through the perforations of the ears outside of the clip, substantially as set forth.

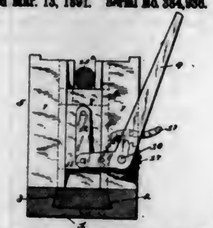


2. The combination, with a hame provided upon its outer surface with a series of laterally-projecting perforated ears and having a vertical slot in front of the ears, a tug-clip adapted to be removably secured upon any one of said ears, said clip being provided at its front end with a slot for engaging with the ears, and with a hook upon its under surface for engaging with the rear wall of the slot in the hame, and having an upwardly projecting lug upon each side of the slot upon the front end of the clip, and the rear portion of the clip being provided with an opening for the reception of the tug, and a cotter through the perforations in the ears in front of the outwardly-projecting lugs of the clip, substantially as set forth.

480,664. END-GATE TIGHTENER FOR CARS AND WAGONS. ANDREW E. S. LINDSEY, Imperial, Pa. Filed Feb. 19, 1892. Serial No. 422,112. (No model.)

Claim.—In a device for the purpose described, the combination consisting of the hinge-pieces 3, secured to the end-gate 1, the rack-bars attached to the cars, the levers 4, pivoted to the said hinge-pieces 3, and the clevises 7, pivoted to the levers 4, all arranged and combined for service substantially as and for the purpose described.

480,665. MACHINE FOR JOINING AND ROLLING SHEETS FOR ROOFING. WILLIAM A. LEET, Wheeling, West Va. Filed Aug. 31, 1891. Serial No. 404,223. (No model.)



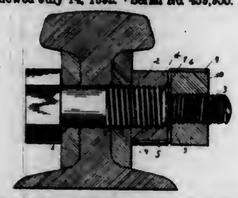
Claim.—1. In a machine for rolling metal sheets for roofing, the combination of independent disks provided with hooks for engaging the end of a strip of metal, means for moving one of said disks toward and from the other, and mechanism for transmitting a rotary movement from one disk to the other, substantially as set forth.

2. In a machine for rolling metal sheets for roofing, the combination of two independent disks revoluble in unison and one movable toward and from the other, a supporting-flange, and a hook for engaging the sheets formed on the inner face of each disk, substantially as set forth.

3. In a machine for rolling metal sheets for roofing, the combination of two independent disks revoluble in unison and one movable toward and from the other, and a spring actuated roller for holding the coils of the sheet-metal strip during the winding operation, substantially as set forth.

4. In a machine for rolling metal sheets, two independent disks revoluble in unison and one movable toward and from the other, and provided with supporting-flanges, and a hook formed on the inner faces of the disks, in combination with ledges for supporting the ends of a bundle of trimmings, the edges of the disks being notched for the reception of the projecting ends of the tie strip or trimming, substantially as set forth.

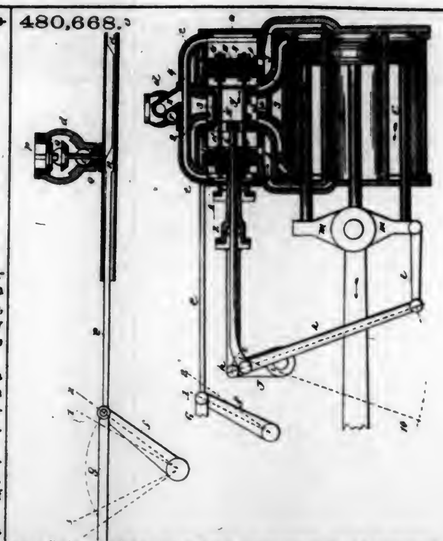
480,666. ADJUSTABLE BIT-HOLDER. GEORGE W. LOUDEN, Pittsburg, Pa. Filed Mar. 13, 1891. Serial No. 384,936. (No model.)



Claim.—1. In a device of the character set forth, a frame having an opening, a vertically-adjustable plate fitted in suitable ways in said frame, a lever connected with the plate for adjusting the same, a pawl-and-ratchet mechanism for holding the lever and consequently the plate in adjusted position, and a liner or liners for reducing the width of the opening in said frame.

2. In a device of the character set forth, the combination of a base, a frame adjustable longitudinally in said base and having an opening, a plate in said frame, means for adjusting said plate vertically, and liners for reducing the width of the opening in said frame, substantially as shown and described.

3. In a device of the character set forth, a frame having an opening, a vertically-adjustable plate fitted in suitable ways in said frame, means for adjusting said plate, and liners for reducing the width of the opening in said frame, substantially as shown and described.



4. In a device of the character set forth, the combination of a frame, a vertically-adjustable plate fitted in suitable ways in said frame, a bell-crank lever, a link connecting the inner end of said lever to said plate, a shaft borne by said frame and forming the fulcrum for said lever, a ratchet on said shaft, and a pawl pivoted to said frame, adapted to engage said ratchet and serving to hold it and consequently the plate in adjusted position, substantially as shown and described.

480,667. NUT-LOCK. GEORGE A. MILLER, Butler, Pa. Filed Oct. 3, 1891. Renewed July 14, 1892. Serial No. 439,955. (No model.)

Claim.—The combination, with the bolt having the right-hand thread formed thereon for a portion of its length and at its extremity a reduced end provided with a left-hand thread, of the securing-nut threaded with right-hand thread and having one of its faces provided with a dovetailed recess, the locking device consisting of the annular plate perforated to fit over the bolt and having radially opposite ears inwardly and outwardly bent at a right angle to the said plate, the former ear having its opposite edges beveled or dovetailed and fitted within the dovetailed recess of the securing-nut, and the jam-nut threaded on the left-hand threaded outer end of the bolt and embraced by the outer angular portion of the locking device, substantially as specified.

480,668. COMPOUND LOCOMOTIVE STEAM-ENGINE. HENRY MOSE, Keokuk, Ill. Filed Oct. 30, 1890. Serial No. 369,864. (No model.)

Claim.—1. In a compound locomotive and other compound engines having the single steam or valve chest, the valves comprising two independent valve-sections, one of said sections controlling the admission and exhaust of steam to and from a high-pressure cylinder and the other section controlling the admission of steam from the high-pressure cylinder to a low-pressure cylinder, and the exhaust from the low-pressure cylinder, in combination with any means for operating the said valves independently of each other, substantially for the purpose as shown and described.

2. In a compound locomotive steam-engine having the single steam-chest and a valve composed of two independent valve-sections, the valve for the low-pressure cylinder having a reduced degree of external lap in comparison to the high-pressure valve, in combination with means for obtaining a simultaneous lead, substantially as set forth.

3. In a compound locomotive having the single valve-chest and a valve composed of two independent valve-sections, the outer section for the high-pressure cylinder and the inner section for the low-pressure cylinder, the inner low-pressure valve-section having connection to an independent valve stem or spindle, in combination with any means for operating said valves independently of each other, substantially for the purpose set forth.

4. In a compound engine having the two independent valve-sections, the fulcrum or compensating rod *k* and the hollow valve-rod *h*, in combination with the said valves and cross-head *m*, substantially for the purpose set forth.

5. In a compound locomotive-engine having the single steam or valve chest, the steam and relief port *x* in valve E and the passage *v*, in combination with the auxiliary steam and relief valves *q* and *p*, substantially for the purpose as set forth.

6. In a compound locomotive having the single valve-chest, the combination of the auxiliary steam-valve *q* and the atmospheric relief-valve *p*, in combination with means for operating valve *q*, substantially for the purpose as set forth and described.

7. In a compound locomotive having the auxiliary steam or starting valve *q*, the rod *c* or wedge-rod *n n*, having connection to the reversing-gear or shaft-arm for the purpose of operating auxiliary steam-valve *q*, substantially for the purpose as set forth.

8. In a compound locomotive having the wedge-rod *n n*, the tube or guard *o*, in combination with the auxiliary steam-valve *q*, substantially for the purpose as set forth.

9. In a compound locomotive having the single steam or valve chest, the combination of the relief-valve *p*, and the auxiliary valve *q*, placed in one valve case or box and acting in combination with each other, substantially for the purpose as shown and described.

10. In a compound locomotive having the single steam or valve chest, the combination of the high-pressure cylinder placed within the low-pressure cylinder, steam-passages leading from opposite ends of each of said cylinders to a valve-seat face, an exhaust-passage leading from said valve-seat face, and a distribution-valve composed of two independent valve-sections and controlling the valve-seat ports, said valve providing a passage for steam between the sections from the high to the low pressure cylinder, the low-pressure-valve section having a less degree of lap and a shorter range of traverse than the high pressure valve, and the fulcrum or compensating rod *k*, acting in combination with the cross-head and other valve-motion to retard and accelerate the action of the low-pressure-valve section, substantially as set forth.

480,669. PERFUMED STARCH AND PROCESS OF MAKING THE SAME. FREDERICK C. NORFOLK, Des Moines, assignor to the Norfolk Manufacturing Company, Ottumwa, Iowa. Filed Oct. 24, 1891. Serial No. 409,715. (No specimens.)

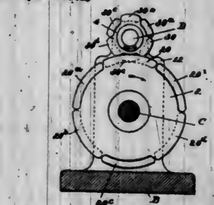
Claim.—1. As a new article of manufacture, perfumed starch consisting of ordinary dry powdered starch mixed with paraffine saturated with a perfume, said paraffine and perfume being intimately ground into and combined with the starch, substantially as and for the purpose described.

2. A perfumed starch comprising ordinary dry powdered starch, borax, and paraffine saturated with perfume and ground into the starch and borax, substantially as described.

3. The method of producing perfumed starch, which consists in mixing paraffine and a perfume with powdered starch and then heating the mass and reducing the same to a very fine powder by grinding the whole until its temperature rises to a point where the perfume is dried and caused to thoroughly permeate the mass, for the purpose described, substantially as set forth.

4. The method of producing perfumed starch, which consists in reducing solidified paraffine to a fine comminuted state, as by grating, moistening the same with a liquid perfume, mixing the moistened paraffine with powdered starch, and finally grinding the whole mass to reduce it to very fine particles and thereby raise the temperature of the mass to a point where the perfume becomes dry and thoroughly permeates the whole mass, substantially as described.

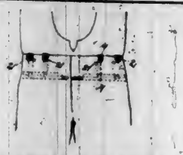
480,670. HAND-CART. WILLIAM RADLEY and THOMAS W. BEAL, Sandwich, Ill., assignors to the Sandwich Enterprise Company, same place. Filed Nov. 30, 1891. Serial No. 413,506. (No model.)



Claim.—1. The combination, with a suitable frame and body, of a pivotal and also a sliding means of connection between the two, arranged one above the other and detachable by movement in the same direction, substantially as described.

2. The combination, with a suitable frame, of a body pivoted thereon and suitable means of engagement arranged at a distance vertically from the pivotal connection and adapted to permit of movement upon the pivot, but not otherwise, such engagement, as well as the engagement at the pivot, being in the proper direction to sustain the body, but not in a direction to prevent the body from being lifted from the frame, substantially as described.

3. The combination, with a suitable frame and body, of castings C upon the frame, having the open bearings *c* and hooks *c'*, and castings G upon the body, having the trunnions *g* and the feet *g'*, substantially as described.



480,671. GEARING. FRANCIS H. RICHARDS, Hartford, Conn., assignor to Walter Wood, Philadelphia, Pa. Filed Mar. 24, 1892. Serial No. 426,211. (No model.)

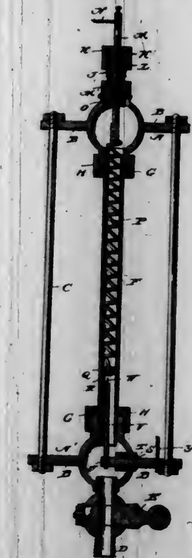
Claim.—1. The improved gearing herein described, consisting in the combination, with the driving-wheel having two series of alternating cogs and spaces set with the cogs of one series opposite the spaces of the other series, of a driven wheel having corresponding cogs and spaces and meshing with the driving-wheel, substantially as set forth.

2. The improved bevel-gearing herein described, consisting in the combination, with a bevel driving-wheel having two series of alternating cogs and spaces, the cogs of one series being set opposite the spaces of the other series, of the bevel driven wheel having two corresponding series of cogs and spaces, the cogs of one series being set opposite the spaces of the other series and meshing with the bevel driving-wheel, substantially as set forth.

480,672. SUPPORTER FOR TROUSERS AND SIMILAR GARMENTS. CHARLES S. ROGERS, San Antonio, Tex., assignor of one-half to Luther J. Overcash, New York, N. Y. Filed Nov. 16, 1891. Serial No. 412,070. (No model.)

Claim.—1. A supporter for trousers and similar garments, comprising an extensible belt formed solely of two semicircular half-sections and upwardly-extending rigid supports connected directly to said belt and designed to be attached to the trousers or similar garment substantially as set forth.

2. A supporter for trousers and similar garments, comprising an extensible belt formed of two semicircular half-sections and upwardly-extending rigid and extensible supports connected to said belt and designed to be attached to the trousers or similar garment, substantially as set forth.



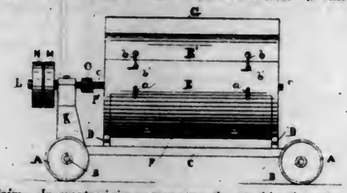
3. A supporter for trousers and similar garments, comprising an extensible belt, a band surrounding said belt, and rigid upwardly-extending supports connected to said belt and designed to be attached to the trousers or similar garment, substantially as set forth.

4. A supporter for trousers and similar garments formed in two semicircular half-sections, an elastic or extensible section connecting two of the adjacent ends of said sections, a hook and a ring carried each by one of the opposite ends of said sections, and upwardly-extending supports connected to the belt and designed to be attached to the trousers or similar garment, substantially as set forth.

5. A supporter for trousers and similar garments, comprising a belt, a number of upwardly-extending rigid supporting-standards connected to said belt and each provided with a pivoted clamping-lever, and a number of rigid upwardly-extending extension-supports working telescopically in said standards and held in position by said clamping-levers, said extension-supports being designed for attachment to the trousers or similar garment, substantially as set forth.

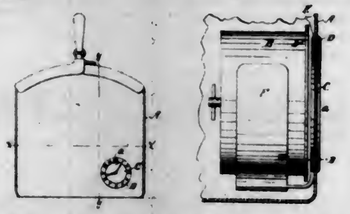
6. A supporter for trousers and similar garments, comprising a belt composed of two sections, an elastic or extensible section connecting the two belt-sections, an eye carried by the opposite end of one of the belt-sections, a hook carried by the corresponding end of the opposite belt-section, a band having its margin embracing the belt-sections, a number of guide-standards surrounding the belt-sections at their lower ends and having longitudinal guide-flanges upon their body portions, pivoted clamping-levers carried by said standards and having clamping-tongues, and extensible supports provided with button-loops and working in said guide-standards and also engaged by the clamping-tongues, substantially as set forth.

480,673. ELECTRIC LOW-WATER ALARM. ERNESTE ROTHLISBERGER, Lima, Ohio. Filed Apr. 18, 1892. Serial No. 429,587. (No model.)



Claim.—1. An electric low-water alarm consisting of an upper and lower case, rods or posts connecting said cases, a pipe leading from

the boiler to the lower case and having a cock, a sight-tube communicating with the cases, a spiral electric conductor arranged in the tube and having a contact-point, and a stationary conductor having a contact-point, the action of the steam or heat expanding the spiral conductor and bringing the points in contact, for the purpose described.



2. An electric low-water alarm consisting of an upper and lower case, a sight-tube communicating with said cases, an adjustable electric conductor, a spiral conductor connected thereto and having a contact-point, a guide for said spiral conductor, and a stationary electric conductor having an adjustable contact-point, all arranged and adapted to operate for the purpose described.

480,674. MEAT-MIXING APPARATUS. JOHN H. SCHAEFER, Baltimore, Md., assignor to John H. Schaefer, Jr., and George N. Schaefer, same place. Filed Mar. 5, 1892. Serial No. 423,938. (No model.)

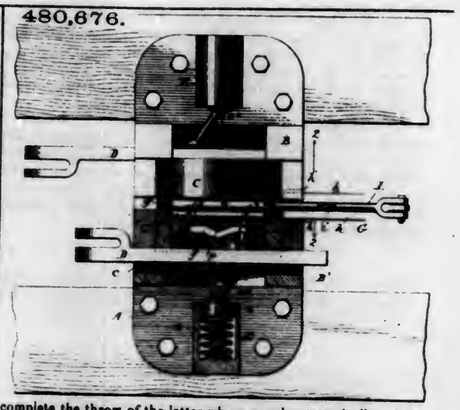
Claim.—In meat-mixing apparatus, the combination of a truck, a box or casing mounted on said truck, a shaft in open bearings on the ends of said casing and having shoulders to prevent endwise movement in said bearings, and a squared end projecting from the casing, a movable lid for the casing, comprising coverings for the shaft-bearings and driving mechanism having a rotary head which is provided with a squared socket in one side face to removably receive the squared end of the shaft, substantially as and for the purpose described.

480,675. SATCHEL OR OTHER RECEPTACLE. CHARLES H. SHAW, Brooklyn, assignor to Robert H. Thompson, New York, and Henry D. Norris, Brooklyn, N. Y. Filed Jan. 5, 1892. Serial No. 417,065. (No model.)

Claim.—1. A satchel or similar receptacle having an opening and a holder arranged adjacent said opening for supporting a timepiece, substantially as specified.

2. The combination, with a satchel or similar device having an opening, of a holder for a timepiece, arranged within the satchel adjacent the opening, and a ring-shaped dial surrounding said opening on the outer side, substantially as specified.

3. The combination, with a satchel or similar receptacle having an opening, of a support for a timepiece, arranged adjacent said opening and consisting of arc-shaped strips of metal, substantially as specified.



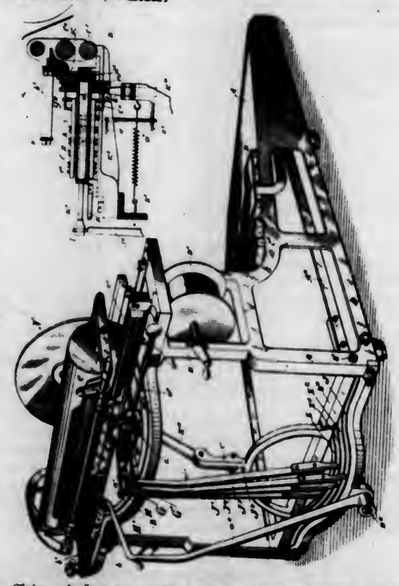
4. The combination, with a satchel or similar receptacle having an opening, of a timepiece having its hands disclosed through said opening, the said satchel or similar receptacle having a space in the rear of and surrounding said timepiece, adapted for the reception of wearing-apparel, substantially as specified.

480,676. SWITCH-STAND. FRED. W. SNOW, Hilburn, assignor to the Standard Equipment Company, New York, N. Y. Filed Dec. 17, 1891. Serial No. 415,413. (No model.)

Claim.—1. In a switch-stand comprising a switch-operating rod and an engaging device normally out of engagement therewith, a projection on the engaging device in the path of the switch-operating rod, arranged to complete the throw of said rod, substantially in the manner and for the purposes hereinbefore set forth.

2. In a switch-stand comprising a switch-operating rod and an engaging device for the rod normally out of engagement therewith, a switch-operating lever arranged to move the engaging device, and the switch-rod to operate the same by hand, and a projection on said engaging device in the path of the switch-operating rod, arranged to

480,676.



complete the throw of the latter when moved automatically, substantially as described.

3. The combination of the engaging device having a slot in its side, with the switch-rod having a projecting pin co-operating with said engaging device and a projection arranged in the slot in the path of the pin, substantially as described.

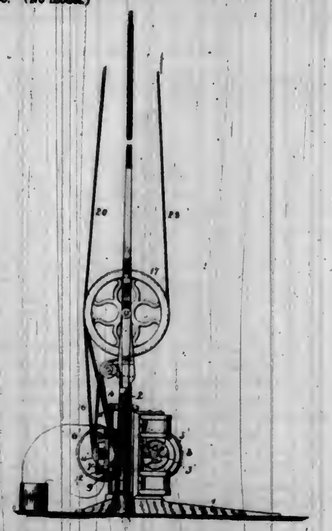
4. In a switch-stand, the combination, with the switch-operating rod provided with a pin having a rounded end, of an engaging device normally out of engagement with said rod and having a slot in its side and a projection arranged in said slot to co-operate with the rounded end of the pin to complete the movement of the switch-operating rod, substantially as described.

5. The combination, with the switch-operating rod having a pin projecting therefrom, of an engaging device normally out of engagement with said rod and having a slot in its side, a projection arranged in a central position in said slot, and ribs projecting from said slot, substantially as described.

480,677. TYPE-WRITING MACHINE. WILLOUGHBY W. STREET, Springfield, Mass. Filed Oct. 8, 1890. Renewed July 5, 1892. Serial No. 439,051. (No model.)

Claim.—1. In a type-writing machine, the combination, with the key-levers and a movable carriage under tension provided with a rack, of a shaft and pinion engaging with said rack, two ratchet-wheels, one fixed and the other loose on said shaft, a spring connecting said wheels, a pawl adapted to engage with the two wheels alternately, a lever carrying said pawl and worked or moved by the depression and

elevation of any one of the key-levers, bars or stops arranged to slide through the loose ratchet-wheel and to enter slots of different lengths in the other, and levers for moving said stops and causing them to engage with the slots, each of said levers being adapted to be moved or operated by certain key-levers only, according to the space required by the characters to which said levers correspond, as set forth.

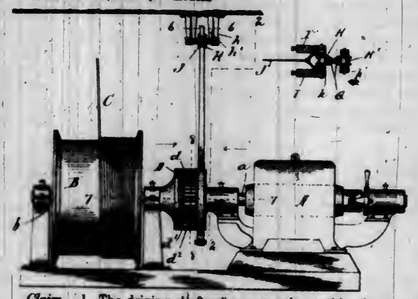


2. In a type-writing machine, the combination, with the key-lever, a carriage under tension, and feed-controlling levers or frames adapted to be depressed or moved by said key-levers, one by all of said key-levers and the others by groups of the same classified according to the spaces required by the characters to which they correspond, of a shaft and pinion engaging with the carriage or a rack therein, two ratchet-wheels, one fast and the other loose thereon, a spring connection between the two wheels, a series of bars or stops adapted to slide through the loose wheel and to enter slots of different lengths in the other, a pawl or detent adapted to engage with the ratchet-wheels alternately, connections between said pawl and feed-controlling lever or frame common to all the other keys, and independent connections between the sliding rods or pins and the other feed-controlling levers, respectively, substantially as and for the purpose set forth.

3. In a type-writing machine of the kind described, the feed-controlling mechanism for the movable carriage, consisting in the combination of a pinion-shaft engaging with the rack-bar of the carriage, a ratchet-wheel containing slots of unequal lengths and fixed to the pinion-shaft, a sleeve turning loosely on the same, a plurality of grooved disks mounted loosely on the sleeve, a ratchet-wheel fixed thereto, a spring connection between the two ratchet-wheels, a series of sliding rods or stops, each fast to one of the grooved disks and passing freely through the others, a series of sliding bars in fixed bearings and connected with the spacing-levers, and pins projecting from the said bars and engaging with the grooved disks, respectively, whereby the movement of any one of the sliding bars carries the corresponding stop through an opening in the ratchet-wheel on the sleeve into one of the slots in the ratchet-wheel on the pinion-shaft and determines the extent of the movement of one ratchet relatively to the other.

4. In the type-writing machine herein described, the combination, with the carriage and rack under tension, and the feed-escapement for such carriage, comprising the pinion-shaft and the fixed and loose ratchet-wheels thereon and a spring connecting the same, of a pawl R' in position to engage with a notch or step in the said loose ratchet-wheel when the carriage has been moved to its starting-point, as set forth.

5. The combination, with the loose ratchet-wheel F', of the feed-escapement and the carriage the feed of which is controlled by said escapement, and the pawl R', having a spring R" connected therewith, the said arm being adapted to enter a recess in the carriage when the same is in its starting position and turn the pawl into engagement with a notch or step in the ratchet-wheel F', as and for the purpose set forth.



480,678. DENTAL ENGINE. CHARLES W. THOMAS, Jersey City, N. J., assignor of five-sixths to Philip Van Volkenburgh, New York, and John H. Pendleton, Brooklyn, N. Y. Filed Oct. 21, 1890. Serial No. 368,885. (No model.)

Claim.—1. In a dental engine, the combination of a drill and its supporting-holder, an electric motor for driving the same, connections between the motor and the drill, two independent friction-gears, and independent connections between said friction-gear and a common driving-sheave, whereby the direction of the drill can be altered, substantially as shown and described.

2. In a dental engine, the combination of a drill and its supporting-holder, the normally-open contact-springs arranged in said holder, an electric motor for operating the drill, a tilting frame and friction-gear 5 6 5' 6' and connections between said friction-gear and the drill, a supplementary battery, and means, substantially as shown and described, under the control of the contact-springs for tilting the gear-carrying frame and stopping, starting, or reversing the direction of the drill, as set forth.

480,679. REDUCTION-GEAR. WILLIAM M. THOMAS, Detroit, Mich., assignor to Louis Warfield, same place. Filed Mar. 31, 1892. Serial No. 427,144. (No model.)

Claim.—1. The driving-shaft of a motor, in combination with a driven shaft in line therewith, an internal gear mounted on the latter, an eccentric fixed on the end of the motor-shaft, a gear-wheel mounted loosely on said eccentric and of less diameter than the said internal gear within which it is arranged, and a stop device adapted at will to stop the said gear-wheel from rotary movement about the eccentric while at the same time permitting lateral movement thereof, substantially as described.

2. In a reduction-gear device, a driving-shaft *a*, in combination with a driven shaft *b*, arranged in line therewith, an internal gear-wheel D, mounted on the driven shaft, an eccentric E on the driving-shaft and arranged within the circumference of said internal gear, a spur-gear F, mounted loosely on said eccentric and of less diameter than the internal gear, and a brake D, adapted to be applied to the wheel F to hold it from rotation, but free to move with said wheel in its lateral movement caused by the rotation of the eccentric, substantially as described.

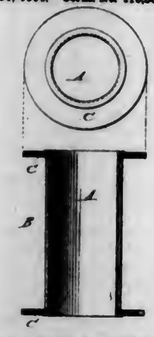
3. A motor-driving shaft *a*, in combination with a driven shaft *b*, arranged in line therewith, the internal gear D, mounted on the latter, the eccentric E, fixed on the end of the former shaft, the spur-gear F, mounted loosely on the eccentric, arranged within the internal gear and provided with a hub F', the brake-arms *g*, hinged together at one end and adapted to clasp the hub F', and guide-rollers H H', arranged to hold the outer or free ends of said arms in proper position to clamp the wheel F, while at the same time they are free to move lengthwise between said rollers, substantially as described.

4. The guide-rollers H H', the former mounted in adjustable bearings, in combination with springs I, arranged behind said bearings, the gear-wheel F, mounted loosely on a rotating eccentric E, a brake G, consisting of hinged arms *g*, adapted to embrace and clamp the said gear-wheel, and with their free ends arranged to slide between said rollers, an internal gear D, surrounding the gear F and of greater diameter, and a cord or other device attached to the movable roller, whereby the brake may be released at will, substantially as described.

480,680. SUSPENDER-BUCKLE. JOSIUS A. TRAUT, New Britain, Conn. Filed Apr. 4, 1892. Serial No. 427,599. (No model.)

Claim.—1. In a buckle of the class specified, the combination, with the box and its catch, of a strap-carrying slide consisting of two

parts pivotally connected and having a spring constructed to engage the slide-box catch, substantially as set forth.



2. In a buckle of the class specified, the combination, with the box and its catch, of a strap-carrying slide consisting of two parts pivotally connected, one of said parts having a spring constructed to engage the slide-box catch and the other part having a catch engaging the box for detaching the slide on the closing of the spring, substantially as set forth.

3. In a buckle of the class specified, the combination, with a slide-box substantially as described, of the buckle-slide consisting of the part *e*, having a box-engaging spring, and the part *f*, swiveled upon the part *e* and having a strap-carrying loop, substantially as set forth.

4. In a buckle of the class specified, the combination, with the slide-box, of the buckle-slide consisting of the two parts *e* and *f*, the one folded upon the other, the part *e* having the buckle-spring fixed thereto and constructed to engage a catch on the slide-box and the other part having a strap-carrying loop supported in the folded lower end thereof and having the projecting lip for engaging the back plate of the slide-box, substantially as set forth.

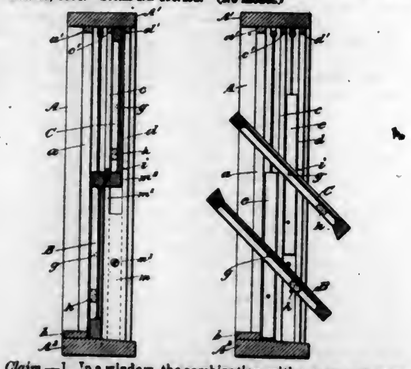
5. The combination, with the box and with the catch on the front plate of the box, of the strap-carrying slide having a spring adapted to engage said catch and having on the strap-carrying end thereof the upturned lip constructed to engage the back plate of the box, whereby to withdraw the front plate from the catch on the closing of the spring, substantially as described.

480,681. ELECTRICAL SPOOL. SCHUYLER S. WHEELER, New York, N. Y., assignor to the Crocker-Wheeler Electric Company, same place. Filed Dec. 30, 1891. Serial No. 416,531. (No model.)

Claim.—1. A sleeve or spool for an electro-magnet, consisting of a tube of insulating material having its ends dressed or trimmed to absolute parallelism, a pair of insulating-washers resting thereon, and an interior tube the outer ends of which are secured to the washers, whereby said parts are held firmly together, substantially as described.

2. A sleeve or spool for an electro-magnet, consisting of a metallic cylinder or tube surrounded by a non-conducting cylinder or tube held in place by a pair of non-conducting washers, the ends of the inner tube being turned down against the outer faces of the washers, substantially as described.

3. A sleeve or spool for an electro-magnet, consisting of a metallic cylinder or tube, a surrounding non-conducting cylinder or tube having its opposite ends cut or trimmed to absolute parallelism, and a pair of non-conducting washers resting one on each end of said non-conducting sleeve and held in place by the turned-down ends or edges of the inner sleeve, substantially as described.



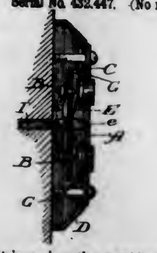
4. A spool for an electro-magnet, consisting of a pair of concentric sleeves or tubes, the inner tube being of metal and the outer of non-conducting material, but of less length, a pair of insulating washers or heads resting on opposite ends of the outer sleeve and held in place by the turned-down ends of the inner sleeve, substantially as described.

5. A spool for an electro-magnet, consisting of a non-conducting cylinder or tube having its opposite ends cut or trimmed to absolute parallelism, a pair of non-conducting washers or heads resting one on each end of said tube and held firmly in place by an internal metallic tube having its opposite ends turned down or riveted, substantially as described.

6. A spool for an electro-magnet, consisting of two or more non-conducting tubes having their ends cut or trimmed to absolute parallelism, in combination with three or more heads or washers of insulating material and an internal metallic tube having its opposite ends riveted or turned down against the outer faces of the end washers, so as to hold all of the parts together, substantially as described.

7. A spool for an electro-magnet, consisting of two concentric tubes, the inner tube being of metal and the outer of non-conducting material, but slightly shorter, in combination with a pair of non-conducting heads or washers resting on the ends of the non-conducting tube and held in place by the end flanged or outwardly-curved edges of the inner tube, substantially as described.

480,682. WINDOW. ROBERT H. WHITE, Madison, Ind. Filed Dec. 29, 1891. Serial No. 416,432. (No model.)



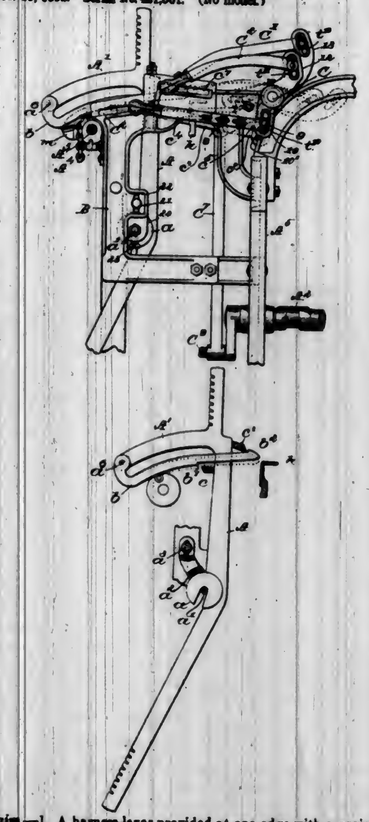
Claim.—1. In a window, the combination, with a casement, an upper and lower sash, and guiding strips on the casement, of slide-blocks pivoted on the side edges of the sashes, closing-strips slotted to embrace the upper sash, and means for removably securing the closing-strips against the guiding-strips, substantially as described.

2. In a window, the combination, with a casement, guiding-strips on each side of the inner walls of the casement, and sliding blocks for each side of the casement and lying within the spaces between the guiding-strips and flush with their outer edges, of a spring-pressed locking-bolt on each side rail of the sashes, adapted to lock the sashes to the slide-blocks and the slide-blocks to the casement, closing-strips slotted to embrace the upper sash, and means for securing the closing-strips on the guiding-strips and to the casement, substantially as described.

3. In a window having an upper and a lower sash adapted to slide vertically and rock in the casement by a pivoted engagement with slide-blocks traversing channels between guiding-strips on the sides of the casement, and closing-strips embracing the upper sash and having slotted upper portions and removably secured to the sides of the casement on the guiding-strips, substantially as described.

4. In a window having an upper and lower sash held to slide and adapted to rock on slide-blocks movable between guiding-strips on the casement, and closing-strips secured to the casement imposed on the guiding-strips and slotted to embrace the upper sash and adapted to permit said sash to be lowered to a limited degree, substantially as described.

480,683. ELECTRIC PUSH. JOHN F. WOLLENSAK, Chicago, Ill. Filed May 10, 1892. Serial No. 432,447. (No model.)



Claim.—1. In electric pushes, the combination of a plate of insulating material, binding-screws for holding the ends of the circuit-wires, arranged on the plate and extending through to the inside, a face-plate having push-buttons, and flat springs loosely and removably arranged in the framework for holding the buttons in place and adapted to be pressed into position by the buttons to complete the circuit, substantially as described.

2. In electric pushes, the combination of a plate of insulating material, binding-screws for holding the ends of the circuit-wires, arranged on the plate and extending through to the inside, a face-plate having push-buttons, and flat springs crimped or bent at their middles to rest against the face-plate and adapted to be pressed into position by the buttons to complete the circuit, substantially as described.

3. In electric pushes, the combination of a plate of insulating material, binding-screws for holding the ends of the circuit-wires, arranged on the plate and extending through to the inside, a face-plate having push-buttons, flat springs crimped or bent at their middles to rest against the face-plate and adapted to be pressed into position by the buttons to complete the circuit, and a rod lying in the crimp or bend of the spring and transverse thereto, substantially as described.

480,684. LOOM. HORACE WYMAN and JOHN A. CLARK, Worcester, Mass., assignors to the Crompton Loom Works, same place. Filed Feb. 13, 1892. Serial No. 421,331. (No model.)

Claim.—1. A harness-lever provided at one edge with a projecting arm, a jack pivotally mounted on said arm and provided at its under side nearest its pivot with a notch and at its upper side yet farther from its pivot with a second notch, combined with actuating-bars acting as a lifter and a depressor, respectively, and a pattern-surface to affect positively the raising of the jack to place its notch farthest from the pivotal point in position to be engaged by the actuating-bar acting as a depressor, substantially as described.

2. A harness-lever provided at one edge with a projecting arm, a jack pivotally mounted on said arm and provided at its under side nearest its pivot with a notch and at its upper side yet farther from its pivot with a second notch, combined with actuating-bars acting as a lifter and a depressor, and a pattern-surface, the raising of the jack to place its notch farthest from the pivotal point in position to be engaged by the actuating-bar acting as a depressor, being effected positively by the pattern-surface, and a jack safety-bar to insure the continuous engagement of the jacks with the depressor during the opening and closing of the shed, substantially as described.

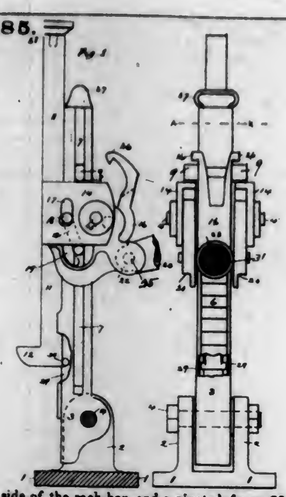
3. In a loom, a harness-lever provided at one edge with a projecting side arm, a jack pivoted upon one end of said projection and extended toward and across the said lever and provided at its under side at one side of said lever with a lifting-notch and at its upper side at the opposite side of said lever with a depressing-notch, a pattern-surface, a lifter located below the said notched jack and at the side of the lever having the pivot of the jack, and a depressor located above said notched jack at that side of the said lever beyond which the free end of the said jack is extended, whereby the jack may be removed without detaching the lifter, substantially as described.

4. In a loom, a harness-lever provided at one edge with a projecting side arm, a jack pivoted upon one end of said projection and extended toward and across the said lever and provided at its under side at one side of said lever with a lifting-notch near the pivot of the jack and its upper side at the opposite side of said lever with a depressing-notch farther from the pivot of the jack, a pattern-surface, a lifter located below the said notched jack and a depressor located above said notched jack at that side of the said lever beyond which the free end of the said jack is extended, a rock-shaft having upwardly and downwardly extended arms, connections between said arms and the lifter and depressor, and guides for said lifter and depressor, substantially as described.

5. In a loom, a harness-lever provided at one edge with a projecting side arm, a jack pivoted upon one end of said projection and extended toward and across the said lever and provided at its under side at one side of said lever with a lifting-notch near the pivot of the jack and at its upper side at the opposite side of said lever with a depressing-notch farther from the pivot of the jack, a pattern-surface, a lifter located below the said notched jack and projecting side arm, and a depressor located above said notched jack at that side of the said lever beyond which the free end of the said jack is extended, a rock-shaft having upwardly and downwardly extended arms, connections between said arms and the lifter and depressor, guides for the lifter and depressor, and devices to impart to the said rock-shaft a movement to carry the arms from a substantially vertical into a substantially horizontal position, substantially as described.

6. In a loom, a harness-lever provided at one edge with a projecting side arm, a jack pivoted upon one end of said projection and extended toward and across the said lever and provided at its under side at one side of said lever with a lifting-notch near the pivot of the jack and at its upper side at the opposite side of said lever with a depressing-notch farther from the pivot of the jack, a pattern-surface to positively raise the jack to place its depressing-notch in engagement with the depressor, a lifter located below the said notched jack and projecting side arm, and a depressor located above said notched jack at that side of the said lever beyond which the free end of the said jack is extended, a rock-shaft having upwardly and downwardly extended arms, connections between said arms and the lifter and depressor, guides for said lifter and depressor, the connections between the lifter and the arms of the rock-shaft being adjustable in the direction of their length, substantially as described.

7. In a loom, a harness-lever provided at one edge with a projecting arm, a jack pivoted upon one end of said arm and extended toward and across the said lever and provided at its under side at one side of said lever with a lifting-notch near the pivot of the jack and at its upper side at the opposite side of said lever with a depressing-notch farther from the pivot of the jack, a pattern-surface to positively raise the jack to place its depressing-notch in engagement with the depressor, a lifter located below the said notched jack and projecting side arm, a depressor located above said notched jack at that side of the said lever beyond which the free end of the said jack is extended, and a rock-shaft having upwardly and downwardly extended arms, the said arms at opposite sides of the longitudinal center of the rock-shaft being of different lengths, substantially as described.



8. The harness-levers having slotted hubs, the loom-frame, the stands to support the fulcrum-rod for the said levers, the fulcrum-rod, and adjusting-screws 23, combined with set-screws 21, to operate substantially as described.

480,685. LIFTING-JACK. ALMON P. AIKEN, Port Perry, Pa. Filed June 11, 1891. Serial No. 396,926. (No model.)

Claim.—1. In a lifting-jack, the combination, with a double-faced rack-bar having grooves formed on two of its sides, slidable bars fitted in said grooves and having angular projections, and a lifting-bar arranged at one side of said rack-bar and having teeth adapted to engage those on the adjacent side thereof, of pawls or levers 19, adapted to engage the angular projections of said slidable bars, and operating-pawl 16 for engaging the teeth on one side of the rack-bar, and a means for operating said pawls 16 and 19, substantially as described, and for the purposes specified.

2. In a lifting-jack, the combination, with a double-faced rack-bar having grooves formed on two of its sides, slidable bars fitted in said grooves and provided with angular projections at points intermediate of their lengths, and a lifting-bar arranged at one side of said rack-bar and having teeth adapted to engage those of the adjacent side thereof, of pawls or levers 19, adapted to engage the angular projections of said slidable bars, an operating-pawl 16 for engaging the

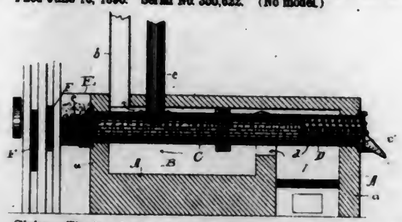
480,685.

teeth on one side of the rack-bar, and a pivoted frame 22, having a lever attached thereto and formed with recessed curved arms 20, adapted to engage said pawls 19, substantially as described, and for the purposes specified.

3. In a lifting-jack, the combination, with a pivoted double-faced rack-bar having grooves formed on two of its sides, slidable bars fitted in said grooves and provided with outwardly-extending projections at their upper ends, and a lifting-bar arranged at one side of said rack-bar and having teeth adapted to engage those on the adjacent side thereof, of pawls 16, adapted to engage the teeth on the opposite side of said rack-bar and provided with hooks for engaging the projections of the slidable bars, all substantially as shown and described.

4. In a lifting-jack, the combination, with a double-faced rack-bar pivoted at its lower end and having grooves formed in the other sides of said rack-bar, slidable bars fitted in said grooves and provided with outwardly-extending lugs at their upper ends and angular projections at intermediate points of their lengths, of a lifting-bar arranged at one side of the rack-bar, flanges carried by said lifting-bar and inclosing the rack-bar, and an operating-pawl pivoted to said flanges, and provided with hooks adapted to be engaged with the lugs on the upper ends of the sliding bars on the rack-bar, substantially as shown and described, for the purpose specified.

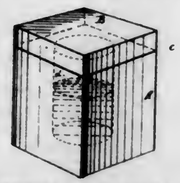
5. The combination, with a double faced rack-bar, and a lifting-bar provided with a series of teeth which engage with one set of teeth on the rack-bar, of slidable bars fitted in grooves in the sides of the rack-bar and provided with intermediate angular portions and outwardly-extending projections at their upper ends, flanges attached to the lifting-bar and surrounding the rack-bar, the pawls fulcrumed between said flanges and lying in rear of the angular projections on the slidable bars, a pawl also fulcrumed between said flanges and engaging with the rack-bar, hooks carried by said latter pawl and adapted to take over the projection at the upper ends of the slidable bars, and curved hooks 20, arranged below the main pawl, substantially as shown and described, for the purpose specified.



6. In a lifting-jack, the combination, with the double-faced rack-bar having grooves on two of its sides, a lifting-bar arranged at one side of said rack-bar and having teeth adapted to engage the teeth on the adjacent side thereof, flanges projecting from said lifting-bar and inclosing the rack-bar, slidable bars fitted in the grooves in the rack-bar, and having angular projections and pawls or levers adjacent to said angular projections, of a frame 22, pivoted to said casting and having curved recessed arms adapted to engage said pawls or levers, said frame also being adapted to have an operating-lever secured to it, and a pawl pivoted to said frame and adapted to engage the teeth on the adjacent side of the rack-bar.

7. The combination, in a lifting-jack, of the base-piece, a rack-bar pivoted thereto at its lower end and having guide-strips, a lifting-bar having at its lower end a pin engaging said guide-strips, so as to hold the lower end of the lifting-bar to the rock-bar while permitting said lifting-bar to be raised or lowered, said lifting-bar also having intermediate of its length teeth engaging those of the rack-bar, and means for separating the teeth of the rack-bar and lifting-bar and for raising and lowering the latter, substantially as described.

8. The combination, in a lifting-jack, of a base-piece, a rack-bar pivoted at its lower end thereto, a lifting-bar loosely connected at its lower end to said rack-bar, so as to be held in engagement therewith, but permitted to move up and down thereon, said lifting-bar also having intermediate of its length teeth engaging those of the rack-bar, and means for separating the teeth of the rack-bar and lifting-bar and for raising and lowering the latter, substantially as described.



9. The combination, in a lifting-jack, of a base-piece, a double-faced rack-bar pivoted at its lower end thereto, a lifting-bar loosely connected at its lower end to said rack-bar, so as to be held in engagement therewith, but permitted to move up and down thereon, said lifting-bar also having intermediate of its length teeth engaging those on one side of the rack-bar, a pawl engaging the teeth on the adjacent side of the rack-bar, and a means for forcing the teeth of the lifting-bar out of engagement with those of the rack-bar, so as to permit said lifting-bar to be raised or lowered.

480,686. PROCESS OF REFINING FUME. FRANK L. BARTLETT, Portland, Me., assignor to the American Zinc Lead Company, same place. Filed June 16, 1890. Serial No. 355,622. (No model.)

Claim.—The herein-described process of refining fume, which consists in passing it through an externally-heated tube or chamber in the presence of an atmosphere of sulphurous gas, stirring said fume and scraping it from the walls of said tube or chamber during its passage through the same, the air being excluded from said tube, substantially as described.

480,687. GELATINOUS FOOD PRODUCT. RICHARD B. BEAUMONT, Rutherford, N. J. Filed Apr. 11, 1892. Serial No. 428,723. (No specimens.)

Claim.—As an improved article of manufacture, a gelatinous food product and its flavoring material, made substantially as herein shown and described, consisting of a prepared gelatinous food compound or mass carrying its flavoring materials wholly or in part within a sealed cavity or chamber formed within the food mass and the whole adapted to be made ready for eating by dissolving and cooling, all as set forth.

480,688. FASTENER FOR THE MEETING-RAILS OF SASHES. EDWIN S. BENNETT, Boston, Mass. Filed Dec. 7, 1891. Serial No. 414,835. (No model.)

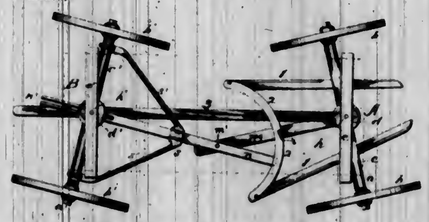
Claim.—1. In a sash-fast, the combination of a base-piece A A', having notches *a a'*, the latch C, having a bolt adapted to engage with the notches *a a'*, and the catch member B, having a spring B', adapted to engage with the latch C and to form with it a drawing contact-lock, substantially as and for the purpose set forth.

2. In a sash-fast, the combination of the latch C, having a forked end provided with projections H H', adapted to engage with the recesses L L', formed in the base-piece A A', as described, the recessed base-piece A A', sliding bolt D D', and a catch member B, substantially as and for the purpose set forth.

480,689. AUTOMATIC CIRCUIT-CLOSER FOR TELEGRAPH-KEYS. CHARLES W. BRADFORD, Clinton, Me., assignor of one-half to Forest J. Martin, same place. Filed May 31, 1892. Serial No. 434,994. (No model.)

480,689.

Claim.—1. In a telegraph-key, the combination, with the lower contact and the key-lever, of a pivoted lever carried by the key-lever, a spring for maintaining the pivoted lever in contact with the lower contact of the key to normally close the circuit, a set-screw passing through the key-lever and bearing on said spring, whereby to regulate its tension, and means for moving the pivoted lever out of contact with the lower contact of the key, substantially as and for the purpose set forth.



2. In a telegraph-key, the combination, with the lower contact and the key-lever, of a pivoted lever carried by the key-lever, a spring bearing on the pivoted lever to force it into contact with the lower contact of the key to normally close the circuit through the key, a set-screw passing through the key-lever and bearing on the spring for regulating the tension thereof, a button carried by the key-lever and having a perforation and a recess therein, a pin passing through said perforation and bearing on said pivoted lever, and a disk carried by said pin and adapted to enter the recess in the button when the key is operated, substantially as set forth.

480,690. VEHICLE-HUB. ABSA G. BURROWS, Dunmore, W. Va., assignor of one-half to Levi Gay, same place. Filed Nov. 5, 1891. Serial No. 410,996. (No model.)

Claim.—The combination, with a hub provided at its outer end with a recess and having at its inner end oppositely-disposed sockets, an axle-box arranged within the hub and having its outer end threaded and provided at its inner end with an annular enlargement 7, forming a shoulder 8, and spring-actuated pins arranged within the sockets, of a spindle adapted to fit into the axle-box and provided with a cylindrical enlargement or flange closing the inner end of the axle-box and having an annular groove arranged to be engaged by said pins, and a cap closing the outer end of the axle-box, substantially as described.

480,691. VEHICLE-GEAR. THOMAS R. CAPWELL and WILLIAM C. FULLER, Dunkirk, N. Y. Filed Jan. 15, 1892. Serial No. 418,179. (No model.)

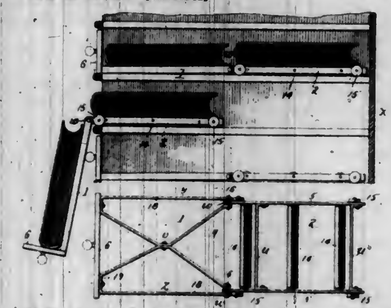
Claim.—1. In a vehicle-gear, the combination, with the axles and hounds, the reach connecting them, one of said reaches consisting of sections pivotally connected together, the forward section being secured to the axle and to the rear bars of the hounds, and the other section being provided with a slot, through which the king-bolt passes and having its front end extended forward and engaging with said hound-bars.

2. In a vehicle-gear, the combination, with the axles and hounds, the reach connecting them, one of said reaches consisting of sections pivotally connected together, the forward section being secured to the forward axle and the rear bar of the hound, said hound-bar having a groove in its rear edge, and the other section being provided with a slot, through which the rear king-bolt passes and having its front end extended forward and engage with the groove in said hound-bar.

480,692. WASTE AND OVERFLOW CONNECTION FOR CEMENT LAUNDRY-TUBS. JOHN CLIFFORD and JOHN H. GAVIN, Chicago, Ill., assignors to the L. Wolff Manufacturing Company, same place. Filed Sept. 5, 1891. Serial No. 404,897. (No model.)

Claim.—1. The combination, with a common waste connection B,

480,692.



of a set of tubs or vessels A, cast upon or about said waste connection, said waste connection being a straight pipe secured on the outside of said tubs at the bottom thereof, having outlets connecting with each of said tubs and a single outlet connecting with the waste or drain pipe, and being provided at each end with a removable screw-threaded plug or trap, so that said waste connection may be rodded from end to end, substantially as specified.

2. The combination, with a set of tubs or vessels A, of a common waste connection B, secured exteriorly thereto along the bottom of the same and provided with integral tubular outlets *b*, one for each tub, having collars or flanges b^3, said tubs being molded or cast around said tubular projections or bushings *b* to secure said waste connection in place, substantially as specified.

3. The combination, with a set of cement tubs A, of a common exterior waste connection B, having tubular outlets *b*, one for each tub, on its upper side and a single waste-pipe connection outlet *b'* on its under side, said waste connection B being also provided with hollow arms b^4, cast integral therewith, to receive the overflow-pipes D, said tubular outlets *b* having collars b^3 and said waste connection B having trap-screws b^4, one at each end, substantially as specified.

4. The combination, with a set of cement or composition washtubs or vessels A, of a common waste connection B, secured to the bottom or under side of the tubs upon the outside thereof and provided with a flat upper side fitting directly against the bottom or under side of the tubs, said tubs being molded or cast to or about said waste connection and the waste connection being furnished with tubular projections or bushings, one connecting with and constituting the outlet for each of said tubs, substantially as specified.

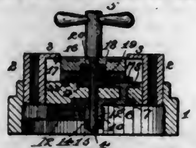
480,693. CASE FOR BOOKS. CHARLES E. FOSTER, Washington, D. C., and JAMES W. HINE, Jamestown, N. Y., assignors to the Fenton Metallic Manufacturing Company, Jamestown, N. Y. Filed Feb. 24, 1891. Serial No. 382,466. (No model.)

Claim.—1. A book-case provided with a horizontal book-supporting shelf divided between its ends into two sections which are hinged together to permit the forward section to swing at an angle to the inner one in order to expose the book upon the inner section when it is drawn out from the case, each section being adapted to receive and support a book, substantially as described.

2. A book-case provided with horizontal sliding shelves, each in two sections hinged together end to end to permit the forward section to swing down when withdrawn and with a support 6 for a book when the section is in its outer position upon the forward section, substantially as set forth.

3. A book-case provided with horizontal sliding shelves, each in two sections hinged together end to end, the rear section provided with roller-supports for a book, substantially as set forth.

4. A book-case provided with horizontal shelves, each in two sections hinged end to end, the rear sections having anti-friction rollers resting upon horizontal guides, substantially as described.



5. A shelf for a book-case, in two sections hinged together end to end to afford independent supports for two books, one in front of the other, substantially as set forth.

6. A shelf for a book-case, consisting of two sections hinged together end to end, the rear section provided with roller-bearings, substantially as described.

7. A shelf for books, consisting of two sections hinged together, the front section consisting of a front plate 6, and two parts *y z*, formed by bending the bars to form side pieces 18, front bearings 19, and to

receive between their ends the bars of the rear section, substantially as described.

480,694. ELECTRIC SWITCH. JACOB S. GIBBS, Hartford, Conn., assignor to the Perkins Electric Switch and Manufacturing Company, same place. Filed Feb. 27, 1892. Serial No. 423,005. (No model.)

Claim.—1. A switch consisting of a base, fixed and movable poles supported thereon, a handle connected with the movable poles, and a train of multiplying-gears interposed between the handle and movable poles, substantially as specified.

2. A switch consisting of a base, fixed and movable poles supported thereon, a handle connected with the movable poles, a train of multiplying-gears interposed between the handle and movable poles, and a spring actuated by the movement of the handle, substantially as specified.

3. A switch consisting of a base, fixed and movable poles supported thereon, a handle, multiple gearing, one of which is loosely attached to said handle, and a spring between the arms of which a projection on the handle is arranged to move, as and for the purposes specified.

4. A switch consisting of a base, fixed and movable poles supported thereon, a handle, and multiple gearing, one of which is loosely connected with said handle and another of which is loosely connected with the movable poles, substantially as specified.

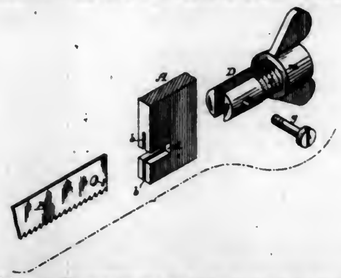
5. A switch consisting of a base, fixed and movable poles supported thereon, a movable bed formed of two movable spring-pressed pieces tenoned together bearing poles, and a handle connected with the bed by gearing, substantially as specified.

6. A switch consisting of a base, fixed and movable poles supported thereon, a movable bed bearing poles, and a handle and gears, said handle connected by means of a pin that projects into an enlarged socket in a spring-controlled hub on one of the gears, another of said gears being connected with the bed by means of a hub projecting into an enlarged socket in the bed, substantially as specified.

480,695. CAR-VESTIBULE. GEORGE HANCOCK, Providence, R. I., assignor to himself and Sheffield Smith, same place. Filed Mar. 24, 1892. Serial No. 426,267. (No model.)

Claim.—The combination, with the platform B, provided with the slot *e*, and the top plate D, provided with the slot *i*, the bar C, provided with the pivot-stud *b*, having the head *f* and adapted to move back and forth in the slot *e*, and the bar G, provided with the pivot-stud *h*, having the head *j* and adapted to move back and forth in the slot *i*, of the frame A, pivoted to the bars C and G by means of the pins *g* and *h*, the springs *m m* at the side of the bars C and G, the springs *n* at the rear of the said bars, and the flexible connection H, substantially as described.

480,696. PEDAL-FOOT FOR PIANOS. ASARIAH H. HASTINGS, New York, N. Y. Filed Mar. 24, 1892. Serial No. 426,173. (No model.)

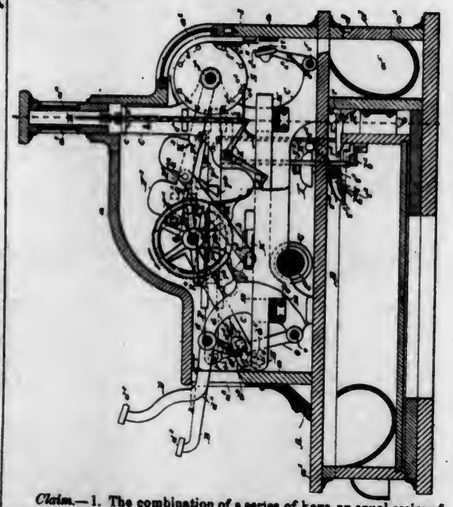


Claim.—1. In a piano or similar instrument, the pedal-foot A, in combination with the latch-lever C, applied under the pedal-foot A and arranged to lock by direct spring-pressure, substantially as set forth.

2. The pedal-foot A, in combination with the latch-lever C, applied under the pedal-foot A, having its front end I projecting upward through an opening in the front end of the pedal-foot A and adapted to be operated by the toe of the performer, substantially as set forth.

3. The pedal-foot A, in combination with the latch-lever C, applied under the pedal-foot A, having the rear end passing upward through the pedal-foot, pivotally attached thereto, and adapted to lock by direct spring-pressure upon the bottom rail of the case or its equivalent, substantially as set forth.

480,697. BUTCHER'S OR BOW SAW. HENRY HOEFER, Philadelphia, Pa. Filed Oct. 6, 1891. Serial No. 407,870. (No model.)



Claim.—1. The combination of the frame and blade of a butcher's or bow saw, with a slotted screw-bolt embracing said frame and connected to the blade, and a nut adapted to said bolt and bearing upon the outer face of the frame, substantially as specified.

2. The combination of the frame of a butcher's or bow saw, having vertical and transverse slots at its lower end, with the blade guided in said vertical slot, a slotted screw-bolt embracing the frame and having a transverse pin adapted to the transverse slot of the frame and engaging with the blade, and a nut adapted to said bolt and bearing upon the outer face of the frame, substantially as specified.

3. The combination of the frame of the saw, the blade, a slotted screw-bolt embracing the frame, a screw-pin passing through said bolt and through an opening in the blade of the saw, and a nut adapted to the bolt and bearing against the outer face of the frame, substantially as specified.

480,698. CASH INDICATOR, REGISTER, AND CHECK-PRINTER. JAMES JACQUES, Chelmsford, Mass. Filed Jan. 9, 1891. Serial No. 377,244. (No model.)

Claim.—1. The combination of a series of keys, an equal series of sliding horizontal stop-rods, each moved backward by the depression of one of said keys and each provided with a downward projection, a series of movable stops arranged below said stop-rods and adapted to be pushed aside by said projections when said rods are pushed backward, fixed stops arranged one at each end of said series of movable stops, the distance between said fixed stops being greater than the length of said series of movable stops by the width of one of said projections, to prevent the simultaneous backward movement of two or more stop-rods and thereby to prevent the simultaneous depression of two or more keys, as and for the purpose specified.

2. The combination of a series of keys, an equal series of sliding horizontal rods, each operated by one of said keys, an equal series of bell-crank levers, each operated by one of said rods, and an equal series of signals, each mounted upon a vertically-sliding signal-rod and each raised by one of said levers, as and for the purpose specified.

3. The combination of a series of numbered keys, an equal series of sliding horizontal rods, each operated by the depression of one of said keys, and an equal series of type-levers, each arranged to be moved by the movement of one of said rods and each provided with a type corresponding to the number on the key by which such type-bar is actuated, as and for the purpose specified.

4. The combination of a series of numbered keys, an equal series of sliding horizontal rods, each operated by the depression of one of said keys, an equal series of type-levers, each arranged to be moved by the movement of one of said rods and each provided with a type corresponding to the number on the key by which such type-lever is operated to print a number corresponding to the number of the key depressed upon a strip of paper, and a knife secured to said type-lever to cut a ticket so printed from said strip, as and for the purpose specified.

5. The combination of a series of numbered keys, an equal series of sliding horizontal rods, each operated by the depression of one of said keys, an equal series of type-levers, each arranged to be moved by the movement of one of said rods and each provided with a type corresponding to the number on the key by which such type-lever is actuated, and an equal series of paper-reels, each adapted to be partially rotated at each return movement of one of said rods, to unwind a strip of paper carried on such reel and to bring the end portion of such strip into a position to be printed by the type of the corresponding type-lever, as and for the purpose specified.

6. The combination of a series of numbered keys, an equal series of sliding horizontal rods, each operated by the depression of one of said keys, an equal series of type-levers, each arranged to be moved by the movement of one of said rods and each provided with a type corresponding to the number on the key by which said type-lever is actuated, an equal series of paper-reels, each provided with a ratchet concentric therewith, an equal series of pawls, each secured to one of said rods and adapted to engage one of said ratchets and to give a partial rotation to the corresponding reel at each return movement of the rod to which said pawl is secured, to unwind a strip of paper carried by such reel and to bring the end portion of such strip into a position to be printed by the type of the corresponding type-lever, as and for the purpose specified.

7. The combination of a series of numbered keys, an equal series of sliding horizontal rods, each operated by the depression of one of said keys, an equal series of type-levers, each arranged to be moved by the movement of one of said rods and each provided with a type corresponding to the number on the key by which such type-lever is actuated, an equal series of paper-reels, each provided with a ratchet concentric therewith, an equal series of pawls, each secured to one of said rods and adapted to engage one of said ratchets and to give a partial rotation to the corresponding reel at each return movement of the rod to which such pawl is secured, to unwind a strip of paper carried by such reel and to bring the end portion of such strip into a position to be printed by the type of the corresponding type-lever, and retaining-pawls adapted to engage said ratchets and to prevent a reverse movement of said paper-reels, as and for the purpose specified.

8. The combination of a series of numbered keys, an equal series of sliding horizontal rods, each operated by the depression of one of said keys, an equal series of type-levers, each arranged to be moved by the movement of one of said rods and each provided with a type corresponding to the number on the key by which such type-lever is actuated, an equal series of paper-reels, each adapted to be partially rotated at each return movement of one of said rods, to unwind a strip of paper carried on such reel and to bring the end portion of such strip into a position to be printed by the type of the corresponding type-lever, and a knife secured to said type-lever to cut a ticket so printed from said strip, as and for the purpose specified.

9. The combination of a case, a drawer sliding therein, a series of keys, an equal series of signals and signal-rods, each carrying one of said signals and adapted to be raised by the depression of a corresponding key, a locking-piece adapted to hold up any raised signal-rod, and a lever operating said locking-piece and actuated by the opening of said drawer to release a raised signal-rod and to allow said signal-rod and its signal to fall, as and for the purpose specified.

10. The combination of a case, a drawer sliding therein, a series of keys, an equal series of signals and signal-rods, each carrying one of said signals, a locking-piece adapted to engage and hold up any raised signal-rod, a lever, one end of which engages said locking-piece, and an incline or cam secured on said drawer and adapted to strike and turn said lever when said drawer is opened and to disengage said locking-piece from such raised signal-rod and to allow said rod to fall, as and for the purpose specified.

11. The combination of a key, a horizontal rod having a rack and adapted to be moved longitudinally in one direction by the depression of said key and in the other direction by the return of said key to its normal position, two pawls each adapted to engage said rack-rod and to prevent, each in the opposite direction from the other, the longitudinal movement of said rack-rod, said rack-rod having two projections, each adapted to strike one of said pawls and to throw the same out of engagement with said rack-rod at the completion of the movement of said rack-rod in one direction, and a lever arranged to be struck by either of said pawls when said pawl is thrown out of such engagement and simultaneously to strike the other of said pawls and to throw said last-named pawl into such engagement, as and for the purpose specified.

12. The combination of a key, a horizontal rod having a rack and adapted to be moved longitudinally in one direction by the depression of said key and in the other direction by the return of said key to its normal position, two pawls, each adapted to engage said rack-rod and to prevent each in the opposite direction from the other, the longitudinal movement of said rack-rod, said rack-rod having two projections, each adapted to strike one of said pawls and to throw the same out of engagement with said rack-rod at the completion of the movement of said rack-rod in one direction, a lever arranged to be struck by either of said pawls when said pawl is thrown out of such engagement and simultaneously to strike the other of said pawls and to throw said last-named pawl into such engagement, and spring-pressers, each adapted to hold one of said pawls out of engagement with said rack-rod, as and for the purpose specified.

13. The combination of a series of keys, an equal series of hooks, each pivoted on one of said keys, a lever, a horizontal bar rigidly secured to said lever and adapted to be moved in one direction by the depression of any key and to be engaged by any hook upon the depression of the corresponding key and to prevent a return movement of said key until the return movement of said bar and lever, a rack-rod connected to said lever and moved thereby, two pawls, each adapted to prevent, each in the opposite direction from the other, the longitudinal movement of said rack-rod, said rack-rod having two projections, each adapted to strike one of said pawls and to throw the same out of engagement with said rack-rod at the completion of the movement of said rack-rod in one direction, and a lever arranged to be struck by either of said pawls when said pawl is thrown out of engagement and simultaneously to strike the other of said pawls and to throw said last-named pawl into such engagement, as and for the purpose specified.

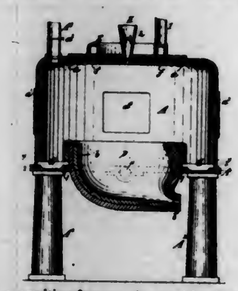
14. The combination of a series of keys, an equal series of hooks, each pivoted to one of said keys, a lever, a horizontal bar rigidly secured to said lever and adapted to be moved in one direction by the depression of any key and to be engaged by any hook upon the depression of the corresponding key and to prevent a return movement of said key until the return movement of said bar and lever, a rack-rod connected to said lever and moved thereby, two pawls, each adapted to prevent, each in the opposite direction from the other, the longitudinal movement of said rack-rod, said rack-rod having two projections each adapted to strike one of said pawls and to throw the same out of engagement with said rack-rod at the completion of the movement of said rack-rod in one direction, a lever arranged to be struck by either of said pawls when said pawl is thrown out of engagement and simultaneously to strike the other of said pawls and to throw said last-named pawl into such engagement, and an incline adapted to be struck upon the return to position of any depressed key by a forwardly-extending arm with which each hook is provided to disengage the hook on such key from said horizontal bar and to allow each key to be operated independently of the others, as and for the purpose specified.

15. The combination of a key and weighted toggle-levers adapted to be bent by the depression of said key and by their extension to restore said key to its normal position, as and for the purpose specified.

16. The combination of a series of keys and weighted toggle-levers adapted to be bent by the depression of any of said keys and by their extension to restore any depressed key to position, as and for the purpose specified.

17. The combination of a series of keys, a registering-lever actuated by any of said keys, registering devices actuated by the movement of said registering-lever, and toggle-levers adapted to be bent by the movement of said registering-lever upon the depression of any key and by their extension to restore said registering-lever to position when such key is released, as and for the purpose specified.

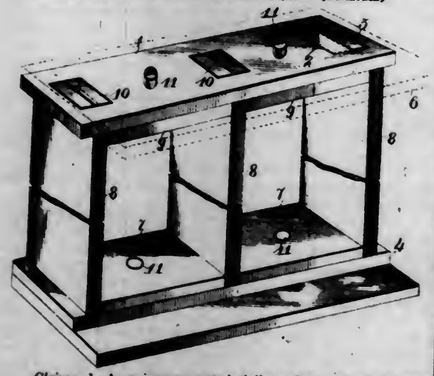
18. The combination of the case, a drawer sliding therein, a series of keys, a sliding rod having a backward longitudinal movement upon the depression of any of said keys, a finger supported upon said rod, an unlatching-rod adapted to be raised by said finger upon the backward movement of the same, and a latch to engage said drawer and retain the same in said case and adapted to be disengaged from said drawer by the raising of said unlatching-rod, as and for the purpose specified.



19. The combination of the case, a drawer sliding therein, a series

of keys, a sliding rod having a backward longitudinal movement upon the depression of any of said keys, a finger supported upon said rod, an unlatching-rod adapted to be raised by said finger upon the backward movement of the same, and a latch-shaft having a latch to engage said drawer and retain the same in said case and adapted to be rocked by the raising of said unlatching-rod to release said drawer, as and for the purpose specified.

20. The combination of the case, a drawer sliding therein, a series of keys, a sliding rod having a backward longitudinal movement upon the depression of any of said keys, a finger pivoted upon said rod and having an offset, an unlatching-rod bent laterally at its upper end and adapted to be raised by said finger running under said bent upper end and to fall when said offset passes said bent upper end, and a latch-shaft having a latch to engage said drawer and retain the same in said case and adapted to be rocked by the raising of said unlatching-rod to release said drawer, as and for the purpose specified.

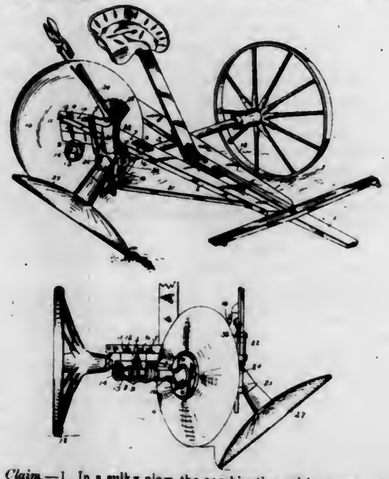


21. The combination of the case, the drawer sliding therein, a bell supported on said case, and a pivoted bell-lever having at its lower end a lateral projection, a spring secured to said drawer and arranged to pass over said projection when said drawer is being closed and to run under said lateral projection when said drawer is opened to turn said bell-lever away from said bell, and another spring arranged to throw said bell-lever toward said bell when said first-named spring passes said projection and releases said bell-lever, as and for the purpose specified.

480,699. SMELTING-FURNACE JOHN S. OLIVER, Brooklyn, N. Y., assignor to John Brooks, Boston, Mass., and the Oliver Aluminum Company, of West Virginia. Filed June 15, 1891. Serial No. 396,363. (No model.)

Claim.—In a smelting-furnace, the combination of a chamber, grate-bars in the lower part of the chamber, a pot at the lower part of the chamber and having its bottom below the grate-bars provided with a discharge-outlet, and apertures or tuyeres for admitting gas through the top of the chamber to the pot, substantially as specified.

480,700. JAIL-GRATING. PETER J. PAULY, Sr., of St. Louis, Mo., assignor to the Pauly Jail Building and Manufacturing Company, same place. Filed Mar. 15, 1892. Serial No. 425,059. (No model.)



Claim.—1. As an improvement in jail or other gratings, the combination, with the horizontal grate-bars provided with holes divided into rectangular and dovetailed portions, said rectangular portions being of a length equal to the greatest length of said dovetailed portions, of vertical grate-bars provided at their ends with dovetailed tenons corresponding to the dovetailed portions of the holes, and rectangular blocks corresponding to and adapted to be disposed in said rectangular portion of the holes, substantially as and for the purpose set forth.

2. The combination of horizontal grate-bars 1 and 4, holes formed therein composed of rectangular portions 2 and dovetailed portions 3, vertical grate-bars 8, provided with dovetailed tenons 12, adapted to fit in said dovetailed portions, blocks 10, adapted to fit in said rectangular portions, a ceiling-plate 6, a floor-plate 5, plates 7 and 9, adapted to be interposed between said vertical grate-bars, and means for securing said plates 7 and 9 to the floor-plate 5 and ceiling-plate 6, respectively, substantially as set forth.

3. The combination of horizontal grate-bars 1 and 4, holes formed therein composed of rectangular portions 2 and dovetailed portions 3, vertical grate-bars 8, provided with dovetailed tenons 12, adapted to fit in said dovetailed portions, blocks 10, adapted to fit in said rectangular portions, a ceiling-plate 6, a floor-plate 5, plates 7 and 9, adapted to be interposed between said vertical grate-bars and countersunk bolts or rivets 11, for securing said plates 7 and 9 to the floor-plate 5 and ceiling-plate 6, respectively, substantially as set forth.

REISSUES.

11,257. ROTARY PLOW. MILTON T. HANCOCK, Shreveport, La. Filed July 6, 1892. Serial No. 439,181. Original No. 463,047, dated Nov. 10, 1891.

Claim.—1. In a sulky-plow, the combination, with a rotary plow or cutting-wheel and its supporting-frame, of an axle having a land-wheel at one end and a staggered dished guide-wheel mounted at the other end of said axle and having a solid and unbroken convex surface in proximity to said plow to receive the soil thrown onto it by the plow and discharge it at the rear, substantially as described.

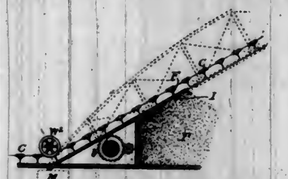
2. The combination, with a diagonally-arranged rotary plow or cutting-wheel and its supporting-frame, of an axle on which said frame is laterally adjustable, a land-wheel at one end of said axle, and a staggered and dished guide-wheel mounted at the other end of the axle in proximity to the rotary plow and having a solid and unbroken convex surface presented toward said plow, substantially as described.

3. The combination, with an adjustable diagonally-arranged rotary plow or cutting-wheel and an adjustable frame on which said plow is mounted, of a solid and dished guide-wheel mounted in a staggered position adjacent to and outside the plow slightly in advance thereof and having a solid convex surface presented toward the plow to receive the soil and discharge it at the rear, substantially as described.

4. The combination of an axle having a land-wheel at one end and a staggered solid and dished guide-wheel at its other end, a frame laterally and longitudinally adjustable on said axle, and an adjustable and diagonally-arranged rotary plow mounted on said frame in rear of the axle, substantially as described.

5. The combination of an axle having a land-wheel at one end, a vertical bracket or plate secured to the other end of said axle and provided with a segmental rack, a plate or casting having guides engaged with said bracket and provided with a downward-inclined spindle, a solid dished and staggered guide-wheel mounted on said spindle, a lifting-lever and its pawl pivoted to the bracket and connected by a link to the guide-wheel plate, a frame mounted on the axle, and a diagonally-arranged rotary plow mounted at the rear end of said frame, substantially as described.

6. The combination of an axle having a land-wheel at one end, a vertically-adjustable bracket secured to the other end of said axle, a guide-plate in which said bracket is supported and provided with a downward-inclined spindle, a solid dished and staggered guide-wheel mounted on said spindle, a frame laterally adjustable on the machine-axle, and a diagonally-arranged rotary plow adjustably mounted at the rear end of said frame, substantially as described.



7. The combination of an axle having at one end a land-wheel and at the other end a solid dished and staggered guide-wheel, means for raising and lowering the last-named end of the axle with relation to the said guide-wheel, a frame adjustably mounted on the machine-axle, and a diagonally-arranged rotary plow mounted in adjustable obliquely-arranged boxes at the rear end of said frame, substantially as described.

8. In a rotary plow, the combination of the axle having an ordinary carrying-wheel on one end and a staggered wheel at the other end, a framework secured to said axle, and a plowing-disk mounted on said framework in the rear of said axle and faced toward said staggered wheel, whereby the sidewise pressure occasioned by the operation of said plowing-disk is counteracted by the substantially direct resistance of said staggered wheel.

9. In a rotary plow, the combination of an axle having an ordinary carrying-wheel upon one end and a smooth convex-surfaced and staggered guide-wheel at the other end, a framework supported by said axle, and a plowing-disk supported by said framework and arranged, as shown, to throw its furrow onto the convex surface of said staggered guide-wheel, said plowing-disk and said guide-wheel being positioned as shown and the sidewise pressure occasioned by the plowing thus effectually counteracted, while the earth of the furrow is discharged to the rear from the adjacent surfaces of said disk and wheel.

10. In a rotary plow, the combination of the axle having an ordinary carrying-wheel at one end and a staggered guide-wheel at the other end having an approximately sharp edge which rests in the bottom of the last preceding furrow which has been plowed, a framework secured to the axle, and the plowing-disk mounted on the framework in the rear of the axle diagonally to the line of draft, with its axis substantially coincident to a line extending therefrom across the bearing of said staggered wheel, substantially as and for the purposes set forth.

11,258. MACHINERY FOR HANDLING COAL. JAMES M. DODGE, Philadelphia, Pa., assignor to the Dodge Coal Storage Company, Nangatuck, Conn. Filed Feb. 2, 1892. Serial No. 420,125. Original No. 446,814, dated Feb. 17, 1891.

Claim.—1. In an apparatus for piling coal or analogous material, a sheer structure composed of legs arranged in respect to each other at or about the angle of repose of the material to be piled, and also arranged to span the pile to be formed, with a continuous forward-feed conveyer carried by said sheer structure and adapted to form the pile under the sheers, substantially as described.

2. In an apparatus for piling coal or analogous material, a stationary sheer structure composed of legs fixed in respect to each other at or about the angle of repose of the material to be piled, and also arranged to span the pile to be formed, masonry supports upon which the lower ends of the legs are fixed, and a continuous forward-feed conveyer carried by said sheer structure and adapted to form the pile under the sheers, substantially as described.

3. The combination of a sheer structure composed of members upwardly inclined toward each other and connected at the top, so as to form a mutual support and leave a free and unencumbered space between said members, and a continuous forward-feed conveyer supported throughout the length of its elevating portion by one of said members, the latter being open at the bottom to allow of the discharge of material from the elevating portion of the conveyer at advancing points beneath said supporting members, substantially as described.

4. The combination of the sheers composed of legs inclined at or about the natural angle of repose of the material to be piled and joined at their upper ends with a conveyer arranged to carry the material to be piled up one of said legs and means for connecting the lower parts of the legs together, substantially as set forth.

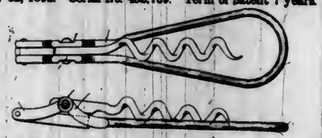
5. The combination of the sheers having legs inclined at or about the natural angle of repose of the material to be piled and joined at their upper ends, an inclined plane on one of said legs, and a continuous forward-feed conveyer for carrying the material on this inclined plane to a point of discharge, substantially as set forth.

DESIGNS.

21,758. BADGE. EDGAR GANS, Macomb, Ill. Filed June 13, 1892. Serial No. 436,583. Term of patent 7 years.

Claim.—The design for a badge, as herein described and shown.

21,759. BROOCH-PIN. THOMAS TOOBY, Niagara Falls, N. Y. Filed June 21, 1892. Serial No. 437,525. Term of patent 7 years.

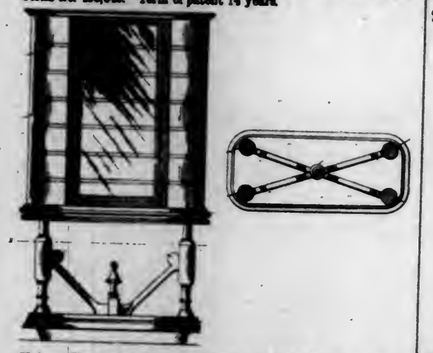


Claim.—The design for a brooch-pin, herein shown and described.

21,760. CONFECTION. DILLON E. MAPOTHER, Louisville, Ky. Filed Mar. 7, 1892. Serial No. 424,091. Term of patent 14 years.

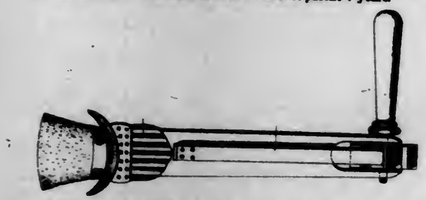
Claim.—The design for a confection, herein described and shown.

21,761. CORKSCREW. CHARLES PUDDEFOOT, Detroit, Mich. Filed May 12, 1892. Serial No. 432,789. Term of patent 7 years.



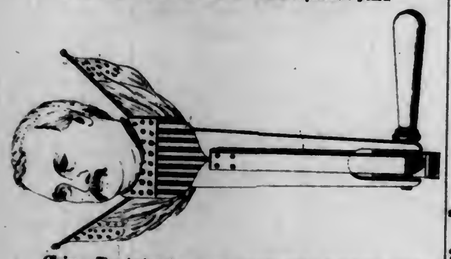
Claim.—The design for a corkscrew, as herein shown and described.

21,762. BOX. WEBSTER C. BEERS, Flatbush, N. Y. Filed June 27, 1892. Serial No. 438,212. Term of patent 7 years.



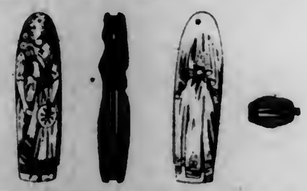
Claim.—The design for a box, substantially as described and represented.

21,763. SHOW-CASE. FRED R. BALDWIN, Muskegon, Mich., assignor of one-half to Henry L. Young, Chicago, Ill. Filed June 25, 1892. Serial No. 438,049. Term of patent 14 years.



Claim.—The design for a show-case, substantially as herein described and shown.

21,764. TOY RATTLE. JESSE A. CRANDALL, Brooklyn, N. Y. Filed June 28, 1892. Serial No. 438,328. Term of patent 7 years.

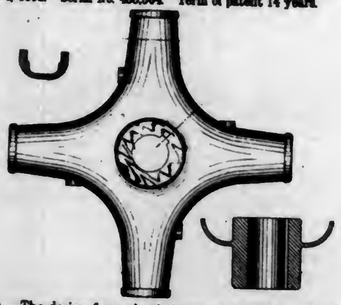


Claim.—The design for a rattle, substantially as herein shown and described.

21,765. TOY RATTLE. JESSE A. CRANDALL, Brooklyn, N. Y. Filed June 28, 1892. Serial No. 438,329. Term of patent 7 years.

Claim.—The design for a rattle, substantially as herein described.

21,766. KNIFE-HANDLE. GEORGE W. KOBB, Chicago, Ill. Filed Feb. 26, 1891. Serial No. 383,013. Term of patent 7 years. Patented in Germany Apr. 14, 1890, No. 848.



Claim.—1. The design for a knife-handle, consisting of the sides A and B, ornamented as herein shown and described.

2. In a design for a knife-handle, the side A, ornamented substantially as herein shown and described.

3. In a design for a knife-handle, the side B, ornamented substantially as herein shown and described.

21,767. CLUTCH-FRAME. HARRY W. HILL, Cleveland, Ohio. Filed June 4, 1892. Serial No. 435,564. Term of patent 14 years.

Claim.—The design for a clutch-frame, as herein shown and described.

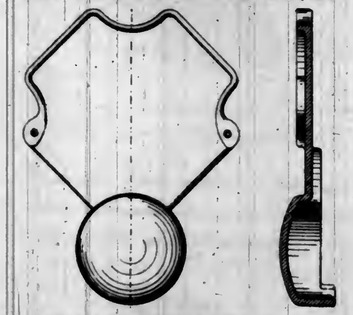
21,768. MATCH-BOX. CHARLES OSBORNE, New York, N. Y., assignor to the Whiting Manufacturing Company, same place. Filed May 27, 1892. Serial No. 434,676. Term of patent 3½ years.

Claim.—The design for a match-box, substantially as herein shown and described.

21,769. DOOR-KNOB. RUDOLPH W. R. CHRISTMEN, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company, same place. Filed May 31, 1892. Serial No. 435,060. Term of patent 14 years.

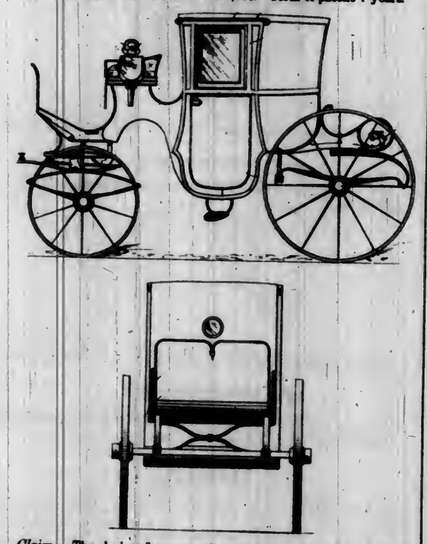
Claim.—The design for a door-knob, as herein shown and described.

21,770. LAMP-BURNER. FRANK REIND, Meriden, Conn. Filed June 11, 1892. Serial No. 436,391. Term of patent 14 years.



Claim.—The design for a lamp-burner, as herein shown and described.

21,771. DENTAL PUNCH. CHARLES R. BLAKE, Sr., San Francisco, Cal. Filed June 27, 1892. Serial No. 438,309. Term of patent 14 years.



Claim.—The design for a dental punch, substantially as herein shown and described.

21,772. ROOFING-TILE. GEORGE H. BABCOCK, Plainfield, N. J. Filed Apr. 21, 1892. Serial No. 430,120. Term of patent 14 years.

Claim.—The design for a sheathing or roofing tile, as herein shown and described.

21,773. CARRIAGE-BODY. AARON T. DEHARBE, New York, N. Y. Filed June 23, 1892. Serial No. 437,773. Term of patent 7 years.

Claim.—The design for a carriage-body, herein shown and described.

21,774. COFFIN-PLATE. OLIVER MCCARTHY, Meriden, Conn., assignor to the Meriden Britannia Company, same place. Filed July 11, 1892. Serial No. 439,706. Term of patent 7 years.

Claim.—The design for coffin-plates, as herein described, and shown in the accompanying illustration.

21,775. COFFIN-HANDLE. OLIVER MCCARTHY, Meriden, Conn., assignor to the Meriden Britannia Company, same place. Filed July 11, 1892. Serial No. 439,707. Term of patent 7 years.

Claim.—The design for a coffin-handle, as described, and shown in the accompanying illustration.

21,776. SINK-TRAP. HARRY C. MONTGOMERY, Cleveland, Ohio. Filed June 30, 1892. Serial No. 438,622. Term of patent 7 years.

Claim.—The design for a sink-trap, as herein shown and described.

TRADE-MARKS

REGISTERED AUGUST 9, 1892.

21,569. LINEN SHIRTS. NORMAN HANNAGH, Pittsburg, Pa. Filed July 5, 1892.

Industry

Essential feature.—The word "INDUSTRY." Used since 1886.

21,570. MISSES' AND CHILDREN'S OUTER AND UNDER GARMENTS. IDA D. JAYNES, Milwaukee, Wis. Filed July 5, 1892.

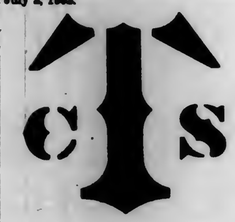
Liliputian Parlors.

Essential feature.—The words "LILIPUTIAN PARLORS." Used since September, 1888.

21,571. ALL SPIRITUOUS AND FERMENTED LIQUORS EXCEPT BRANDY. J. W. NICHOLSON & Co., London, England. Filed July 11, 1892.

Essential feature.—The representation of a lion's head supported by or resting on a crown. Used since July 1, 1850.

21,572. PHOTOGRAPHIC PAPER, PLATES, AND CHEMICALS. ARTHUR SCHWARZ, New York, N. Y. Filed July 2, 1892.



Essential feature.—The representation of a star. Used since April 1, 1892.

21,573. WATERPROOF COLLARS AND CUFFS. THE CELLULOID COMPANY, Newark, N. J. Filed July 12, 1892.

VICTOR

Essential feature.—The word "VICTOR." Used since May 1, 1892.

21,574. AMMONIA-ALUM. NATHANIEL WATERBURY, New York, N. Y. Filed July 2, 1892.

Essential feature.—The letters "CTS." Used since February 1, 1891.

21,575. BICARBONATE OF SODA. NATHANIEL WATERBURY, New York, N. Y. Filed July 2, 1892.

Essential feature.—The letters "BCS." Used since February 1, 1891.

21,576. BAKING-POWDER. CLEMENS AHAUS, Sidney, Ohio. Filed July 14, 1892.

Essential feature.—The words "POND LILY." Used since February 26, 1891.

21,577. ABSORBENT PADS. ISAAC D. ALLEN & Co., Boston, Mass. Filed July 15, 1892.

FLORETTA

Essential feature.—The word "FLORETTA." Used since July 1, 1892.

21,578. SMOKING-PIPES. HIRSCHL & BENDHEIM, St. Louis, Mo. Filed July 5, 1892.

COLUMBUS.

Essential feature.—The word "COLUMBUS." Used since June 10, 1892.

21,579. ARTIFICIAL STONE AND ITS COMPOSITIONS. PYROLITH COMPANY, Jersey City, N. J., and New York, N. Y. Filed July 16, 1892.

PYROLITH

Essential feature.—The word "PYROLITH." Used since June 1, 1892.

21,580. BAKING-POWDER. THE POTTER PARLIN COMPANY, Cincinnati, Ohio, and New York, N. Y. Filed July 16, 1892.

Essential feature.—The representation of a peacock. Used since October 15, 1888.

21,581. GLOVES. DUNHAM, BUCKLEY & Co., New York, N. Y. Filed Apr. 13, 1892.

Trévoux

Essential feature.—The word "TRÉVOUX." Used since January 15, 1892.

21,582. WHEAT-FLOUR. I. A. GRAVES & Co., Watertown, N. Y. Filed Apr. 6, 1892.

Essential feature.—The representation of a white eagle on a black disk. Used since September 15, 1891.

21,583. REMEDY FOR NERVOUS DISORDERS. WILLIAM H. GARDNER, Augusta, Me. Filed June 20, 1892.

Essential feature.—A symbolical figure representing a giant having the head of an ox and wielding a club. Used since January 10, 1888.

21,584. VARNISHES, PAINTS, JAPANS, AND ANALOGOUS MATERIALS OR COMPOUNDS. H. Z. GRAVES & COMPANY, Philadelphia, Pa. Filed July 8, 1892.

MIRROR-STONE

Essential feature.—The compound word "MIRROR-STONE." Used since July 1, 1889.

21,585. LIQUID PREPARATION FOR CLEANING GLOVES. GLOVINE MANUFACTURING Co., Ashley, Pa. Filed July 6, 1892.

GLOVINE.

Essential feature.—The word "GLOVINE." Used since May 18, 1892.

21,586. VETERINARY MEDICINES AND PREPARATIONS. STEPHEN PFEIFFER & SON, Cricklewell, near Malmesbury, England. Filed May 23, 1892.

Essential feature.—The representation of a Roman shepherd carrying a lamb on his shoulders, with ewes following. Used since February 14, 1892.

21,587. HOOKS AND EYES. REMARDSON & DE LONG BROS., Philadelphia, Pa. Filed May 4, 1892.

21,587.

Essential feature.—The pictorial representation of an eclipse in connection with the representation of a book. Used since February 9, 1892.

21,588. PICTURE-VARNISH. GEORGE H. STORY, New York, N. Y. Filed June 9, 1892.

Essential feature.—The words "THE BRILLIANT" and the figure of a crescent. Used since March 1, 1892.

21,589. CATARRH REMEDIES. ORRIN P. SMITH, Auburn, Nebr. Filed June 23, 1892.

Essential feature.—The representation of a pond-lily in full bloom and a cupid sitting upon a lily-pad beside it. Used since June 1, 1890.

21,590. WRINGERS. THE AMERICAN WRINGER COMPANY, Providence, R. I., and New York and Auburn, N. Y. Filed July 15, 1892.

MASCOTTE

Essential feature.—The word "MASCOTTE." Used since July 1, 1887.

21,591. WRINGERS. THE AMERICAN WRINGER COMPANY, Providence, R. I., and New York and Auburn, N. Y. Filed July 15, 1892.

RELIEF

Essential feature.—The word "RELIEF." Used since January 1, 1887.

21,592. WRINGERS. THE AMERICAN WRINGER COMPANY, Providence, R. I., and New York and Auburn, N. Y. Filed July 15, 1892.

IDEAL

Essential feature.—The word "IDEAL." Used since January 1, 1887.

21,593. WRINGERS. THE AMERICAN WRINGER COMPANY, Providence, R. I., and New York and Auburn, N. Y. Filed July 5, 1892.

BANNER

Essential feature.—The word "BANNER." Used since January 1, 1887.

21,594. WHISKY. THE WM. BERGENTHAL COMPANY, Milwaukee, Wis. Filed June 12, 1891.

Essential feature.—The words "OLD LEXINGTON." Used since January, 1884.

21,595. A COMPLEXION CREAM. MARTIN VAN BUREN, Philadelphia, Pa. Filed Sept. 7, 1891.

Essential feature.—The words "MADAM MAURICE'S CREAM" and the representation of a woman's head. Used since August 14, 1891.

21,596. PHOTOGRAPHIC DRY-PLATES. LEO H. BAEKELAND, New York, N. Y. Filed July 15, 1892.

Luxotype.

Essential feature.—The word "LUXOTYPE." Used since April 15, 1892.

21,597. REMEDY FOR DOG DISTEMPER. TAYLOR & SEVERANCE, Middleville, Mich. Filed June 16, 1892.

Essential feature.—The representation of an English pointer dog, the capital letters "A. K. C. S. B.," the number "24,000," and the word "VANQUISH." Used since May 1, 1892.

21,598. A NATURAL AND ARTIFICIAL FERTILIZER. DURHAM FERTILIZER COMPANY, Durham, N. C., and Richmond, Va. Filed June 30, 1892.

Essential feature.—The representation of a sulky-cultivator hitched to a team of horses and having a rider in its seat. Used since December, 1889.

21,599. MEAT CHOPPERS AND PRESSES. ENTERPRISE MANUFACTURING COMPANY OF PENNSYLVANIA, Philadelphia, Pa. Filed June 11, 1892.

TINNED

Essential feature.—The representation of two hands pointing toward the word "TINNED." Used since May 1, 1891.

21,600. CHLORIDE OF SODIUM OR COMMON SALT. THOMAS HIGGIN & Co., Liverpool, England. Filed Apr. 18, 1892.

WINNINGTON

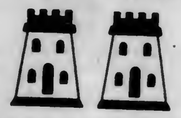
Essential feature.—The word "WINNINGTON." Used since 1887.

21,601. PAPER, ENVELOPES, CARDS, BLANK BOOKS, AND PAPER BADGES. BOLIVE A. JOHNSON, Chicago, Ill. Filed July 7, 1892.

HOO-HOO.

Essential feature.—The representation of a cat and the word "Hoo-Hoo." Used since January 21, 1892.

21,602. METALLIC WHEELBARROWS. THE J. C. MCNEIL COMPANY, Akron, Ohio. Filed May 7, 1892.



McNeil Steel

Essential feature.—The representation of a wheelbarrow and the words "MCNEIL STEEL." Used since March 19, 1892.

21,603. LARD AND ITS SUBSTITUTES. THE W. J. WILCOX LARD AND REFINING COMPANY, Guttenberg, N. J., and New York, N. Y. Filed July 18, 1892.

LOS TRES CASTILLOS

Essential feature.—The words "LOS TRES CASTILLOS" and the representation of three castles. Used since July 1, 1892.

THE NORRIS PETERS CO., PHOTO-LITHO., WASHINGTON, D. C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

GARFORD *v.* EDWARDS.

Decided July 29, 1892.

PRACTICE—INTERFERENCE—ISSUE.

In an interference where the senior party claimed "a curved-spring seat-support" and his application disclosed a spring-support curved at both ends, *Held* that the junior party, showing a spring-support curved at one end only, was properly within the issue and satisfied its requirements.

APPEAL from Examiners-in-Chief.

BICYCLE-SADDLE.

Application of Arthur L. Garford filed January 2, 1891, No. 376,461. Application of William J. Edwards filed December 14, 1889; renewed July 13, 1891, No. 399,278.

Mr. E. L. Thurston for Garford.

Mr. Charles G. Page and *Messrs. Pennie & Goldsborough* for Edwards.

SIMONDS, *Commissioner:*

This is an appeal from the decision of the Examiners-in-Chief awarding priority to Garford upon the following interference issue:

The combination, in a velocipede, with a U shaped spring and a clip for adjustably securing the lower leg thereof to the saddle-support, of a curved-spring seat-support and a clip for adjustably securing the seat-support to the upper leg of the U-shaped spring, whereby the U-shaped spring may be adjusted back and forth with reference to both the saddle-support and the spring-seat support and whereby the seat-spring and saddle support may each be independently adjusted on the U-shaped spring.

Edwards shows "a curved-spring seat-support," in one figure of his drawings curved only at one end and in the other figure curved at both ends. If Garford is to prevail, it must be held that the issue covers the case where the spring-support is curved at one end only, and Edwards contends that such is not the meaning of the issue. The issue specifies in this regard simply "a curved-spring seat-support," and the curve at one end satisfies the requirement of the language used on the face of things. Edwards contends that, although this may be so, yet the real purpose of the curved-spring seat-support is to attain a certain tilting of the seat, and that no tilting of the seat was within Garford's original idea as disclosed by his specification. In this contention Edwards is mistaken, for the Garford specification does describe the tilting of the seat when the support is curved at one end only, and although curving that support at both ends may give added advantages it still must be held that the support curved at one end comes within the fair meaning of the words "a curved-spring seat-support" as those words are used in the issue.

Garford reduced the invention to practice in public some months before Edwards had his conception thereof, and he did not subsequently lose his rights by abandonment or two years' public use. Therefore priority of invention must be awarded to Garford, and the decision of the Examiners-in-Chief is affirmed.

EX PARTE NATIONAL UNITED STATES STAMP DELIVERY COMPANY.

Decided July 29, 1892

PRACTICE—TRADE-MARK AND LABEL.

"The arrangement of two panels, one in red and one in blue, each bearing a shield," etc., is proper subject-matter for a trade-mark rather than a Label.

APPEAL from Examiner of Trade-Marks.

LABEL.

Application filed May 7, 1892.

Mr. A. W. Harrison for the applicant.

SIMONDS, *Commissioner:*

This is an appeal from the decision of the Examiner of Trade-Marks refusing to register a Label on the ground that it presents trade-mark matter, the Examiner saying:

The arrangement of two panels, one in red and one in blue, each bearing a shield and other symbolical figures, is certainly not descriptive either of applicants's merchandise or of any other. It is as fanciful and arbitrary as any trade-mark and its attachment to the merchandise will serve, as it appears designed to serve, the purposes of a trade-mark, and for this reason its registration as a Label must be denied.

Without passing upon all of the objections urged, it is enough to say that the figures of the shields are just such figures as are well recognized trade-mark subject-matter, and the decision of the Examiner is affirmed.

EX PARTE VAN SLYKE.

Decided June 6, 1892.

DESIGNS—WORDS AND FIGURES (NUMERALS) APPEARING THEREON.

Where certain words and figures (numerals) appeared on the illustration of a Design, *Held* that they should be erased if they form no part of the Design. *Held*, further, that the Examiner should reject if such words, etc., are a part of the Design, provided he is of the opinion that words and figures (numerals) may not form part of the subject-matter of a Design patent.

ON petition,

DESIGN.

Application of James M. Van Slyke filed April 2, 1892, No. 427,546.

Messrs. Munn & Co. for the applicant.

FROTHINGHAM, *Assistant Commissioner:*

This is a petition taken from the action of the Examiner refusing to allow the above-entitled applica-

tion until certain alleged matter should be erased from the drawing and specification, as hereinafter set forth.

The application relates to a Design for the handle of a spoon.

The applicant states as follows:

The Design embraces features commemorative of the eagle "Old Abe," which accompanied a Wisconsin regiment through the War of the Rebellion.

The Design consists in the ornamentation of the handle of a spoon, the essential feature of which is the figure of an eagle. * * * On one side of the handle, near the top, appears a second trunk or growth c', and on one limb thereof appears the name "Old Abe," and on the block on which the eagle is perched appear the figures "1861-65." On the handle below the said name appears the word "Wisconsin."

I claim—

The Design for a spoon, herein shown and described.

The Examiner required that the words "Old Abe," "Wisconsin," and the figures "1861-65" should be removed from the face of the drawing and the statement of the specification be modified in accordance with such removal. It is from this action that the present petition is taken.

The Examiner states in his answer that the applicant—

makes a case which can be allowed, the objectionable and redundant words and figures being removed; but with these words and figures retained it cannot be allowed.

If it is a fact that the words, etc., objected to are not a part of applicant's Design, (and the bringing of this petition to the Commissioner would indicate that applicant does not consider them as a part thereof,) it follows that the action of the Examiner should be affirmed, without prejudice, however, to the right of applicant to make said words, etc., a part of his Design. If, on the other hand, the said words, etc., are a part of his Design, or the applicant should hereafter make them a part thereof, it is clear that the objection in the present case should take the form of a rejection provided the Examiner is still of the opinion that words and figures may never form a part of a Design. It is stated incidentally, however, that I am at present inclined to the view that it would not be advisable to lay down as a general proposition of law that words and figures (numerals) may never form part of the subject-matter of a Design patent.

The petition is denied, but without prejudice to the applicant to revise his specification, if desired.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—Southern District of New York.

CAMPBELL PRINTING-PRESS & MANUFACTURING COMPANY *v.* MANHATTAN RAILWAY COMPANY.

Decided March 9, 1892.

1. PATENTS FOR INVENTIONS—INFRINGEMENT—ACCOUNTING.
Where infringement is admitted, damage is presumed, and the owner of the patent is entitled to a reference for accounting without giving specific evidence of damage.

2. SAME—INJUNCTION.
Where in a suit against a railroad company for infringement the answer admits the validity of the patent, complainant's title thereto, and the infringement, the company cannot avoid an absolute injunction by averring that the invention is of trifling value and offering to submit to a decree for nominal past damages and to an injunction against the adoption of any more of the patented articles on condition of the undisturbed use of those already upon its trains.

3. SAME.
On the question as to whether an injunction should issue it is immaterial that the owner of the patent has never made, used, or sold any of the patented articles or licensed any one to do so, especially when it appears that he has not done so because defendant and other railroad companies, being unwilling to pay the price asked by him, adopted his invention without leave, expecting to pay a less sum by way of damages for infringement.

4. SAME—HARDSHIP.
Defendant cannot escape the injunction on the ground of hardship to itself or to the public, since the decree may provide for a gradual removal from its cars of the patented article, so as not to cause the withdrawal from service of a large amount of rolling-stock at any one time, and for that purpose the amount of rolling-stock required and available for its business may be proved by affidavits or the oral examination of its superintendent or master mechanic.

SUIT by the Campbell Printing-Press & Manufacturing Company against the Manhattan Railway Company for infringement of a patent. Decree for injunction and an accounting.

Mr. Charles De Hart Brower for the complainant.
Messrs. Davies, Short & Townsend for the defendant.

LACOMBE, *J.:*

The complainant is the owner of Letters Patent No. 401,680, granted April 16, 1889, to Edward S. Boynton for a new and useful improvement in valves for pneumatic pipes or tubes.

The second claim of the patent is:

2. In combination with an external pivoted valve, a self-closing device consisting of a compressive helical spring held within a tubular guide formed upon or attached to said valve between one end of said guide and a stop at the pivotal point of the valve, substantially as and for the purposes set forth.

This claim was sustained by Judge Coxe in *Campbell Printing-Press & Manufg. Co.* v. *Eames Vacuum Co.*, (44 Fed. Rep., 64,) and disclaimer as to the first claim was duly entered in the Patent Office prior to the bringing of this suit. The bill charges infringement of this second claim, prays injunction and accounting, and expressly waives answer under oath. A preliminary injunction was refused. (*Campbell Printing-Press & Manufg. Co.* v. *Manhattan Ry. Co.*, 47 Fed. Rep., 663.) The case now comes up for final hearing upon bill, answer, and replication. The answer (unverified) admits the grant of the Letters Patent and complainant's title thereto and that they are good and valid as to the second claim thereof. It further admits that since April 16, 1889, (the date of the issue of the patent,) defendant has used couplings embodying the invention covered by the second claim, and that the number so used is 2,678, on 1,017 cars and 322 locomotives, some of said couplings having been applied before April 16, 1889, and others from time to time since. It further avers that the invention is of trifling, if any, pecuniary value; that complainant has never made, used, or sold the patented invention and has never licensed any one to make, use, or sell the same; that the defendant uses it upon cars constantly employed by it in the transportation of passengers, and that an injunction would be a hardship to defendant, would seriously inconvenience it in its passenger-carrying service, and would be of no benefit to complainant. It offers to submit to a final decree for injunction against the use of any additional infringing couplings. For the past and future undisturbed use of those which it has it placed upon

its cars without leave or license of the owner of the patent, and in admitted violation of the rights secured to such owner thereby, it also offers to submit to a judgment for nominal damages.

To the complainant's application for an accounting before a master it is objected that it has not given specific evidence of damages sustained; but under the pleadings it is not necessary for the complainant to give such proof. Infringement is admitted, and from infringement damage and deprivation of profits are presumed. (*Wooster* v. *Muser*, 20 Fed. Rep., 162.) To what extent and whether nominal or substantial is a matter to be settled on the accounting. Complainant has shown all that is necessary to entitle it to a decree sending the case to a master when it has shown infringement of a valid patent owned by itself. (*Brickill* v. *Mayor*, 7 Fed. Rep., 479.) The decision of Judge Brown in the case at bar (48 Fed. Rep., 314) did not pass upon this point. It only settled a question of practice, holding that a motion at chambers was not proper procedure.

The contention of the defendant that, because it is willing to pay nominal damages for past infringement, an injunction to restrain future infringement should not issue is unsound.

In *Birdsell* v. *Shaliol* (112 U. S., 487; 5 Sup. Ct. Rep., 244) the Supreme Court held that—

an infringer does not, by paying damages for making and using a machine in infringement of a patent, acquire any right himself to the future use of the machine. On the contrary, he may, in addition to the payment of damages for past infringement, be restrained by injunction from further use, [citing authorities.]

(See, also, *Matthews* v. *Spangenberg*, 15 Fed. Rep., 813; *Bragg* v. *City of Stockton*, 27 Fed. Rep., 509.)

The proposition advanced by the defendant is practically this: If an inventor, whose patented improvement in locomotive machinery, although valid, is of but trifling value to a common carrier, himself thinks it valuable, and therefore demands a license-fee for its use higher than such common carriers as would like to use it are willing to pay, they may, nevertheless, appropriate his invention to their use, may place it on their cars and locomotives without his permission, and may continue to use it till it wears out, without interference, on the ground that to remove it would inconvenience the public, and that for such enforced license they should be made to pay not the fee the inventor asks, but such sum as a master of the court may think the invention is worth. Baldly stated, the contention is that when a patentee asks a price for the use of his patent higher than users wish to pay and refuses to license its use except at such price it may be confiscated and sold to whoever wants it at a price to be fixed by a United States circuit court. Whether or not such a qualification of the monopoly secured by Letters Patent would be desirable legislation is immaterial. It is not now on the statute book, nor is there found controlling authority in its support among the cases cited by the defendant's counsel.

In *Barnard* v. *Gibson* (7 How., 657) the parties claimed conflicting interests as assignees of a patent, and there was thus an issue raised in the case which the circuit court had determined adversely to the defendant; but his right to review that decision by appeal from final decree, whenever it might be entered, still remained. The Supreme Court declared that it was a "hardship" sufficient to have deterred the circuit court from granting an injunction that the case was not ended in that court, so that there might be a final decree for the defendant to appeal from and perhaps secure a reversal of the finding that complainant's title was good. Here no such issue is raised. Title, validity of the patent, and infringement are established not by the decision of this court, but by defendant's own admissions on the record, and no appeal could possibly result in a different conclusion. In *Pullman* v. *Railroad Co.* (5 Fed. Rep., 72) defendants were strenuously asserting prior use and non-infringement. In *Hoe* v. *Advertiser Co.* (14 Fed. Rep., 914) it was apparent that to make a change in the printing-press on which the daily newspaper of the defendant was printed would greatly embarrass the usual course of its business. Moreover, the defendant was contesting the validity of the patent, and, though the circuit court sustained it, there was a possibility of reversal. In *Howe* v. *Morton* (1 Fish. Pat. Cas., 601) the validity of the patent was vigorously assailed. In *Stainthorp* v. *Humiston* (2 Fish. Pat. Cas., 311) the fact of infringement was contested. In *Morris* v. *Manufacturing Co.* (3 Fish. Pat. Cas., 67) the court did not—

think that complainant's title was entirely clear.

The patent had only six months to run, and injunction would close defendant's mill for that whole period, throwing many hands out of employment. In *Wells* v. *Gill* (6 Fish. Pat. Cas., 89) the decree (in another case) which sustained the validity of the patent was before the Supreme Court on appeal. Judge Strong, though refusing an injunction, expressly stated that had that decree been acquiesced in or affirmed by the Supreme Court he would have awarded one. All of these cases (except *Barnard* v. *Gibson*, *supra*) were applications for preliminary injunctions, as were also *Colgate* v. *Telegraph Co.* (4 Ban. & A., 415) and *New York Grape Sugar Co.* v. *American Grape Sugar Co.*, (10 Fed. Rep., 837.) *Lowell Manufg. Co.* v. *Hartford Carpet Co.* (2 Fish. Pat. Cas., 475) is plainly an authority only under the facts of that particular case, which are stated too briefly in the report to afford much information as to what the court did decide. In *Forbush* v. *Bradford* (1 Fish. Pat. Cas., 318) Judge Curtis refused a temporary injunction where the same issues had been tried at law between the same parties, such trial resulting in a verdict for the plaintiff; but he did so on the express ground that a bill of exceptions had been taken upon points which involved the validity of the patent, and that, as the bill of exceptions was not frivolous, the litigation as to complainant's title was not, in fact, terminated, and it was necessary, in weighing the relative hardship of granting or refusing an injunction, to contemplate a decision adverse to complainant's title as a possible result; but the learned judge expressly added that, even though the effect of an injunction would be to stop all the defendant's looms till the patented improvement could be removed, that would not prevent the court from granting an injunction if the right had been finally established at law. In the case at bar, where neither validity, title, nor

infringement is questioned, the complainant's right to its monopoly is finally established. In *McCrary* v. *Canal Co.* (5 Fed. Rep., 367) injunction was refused where defendants were using complainant's improvement in coupling and steering canal-boats on the ground that the—

allowance of an injunction would cause much greater injury to the respondent than benefit to the complainant.

Defendants were contending that the patent was an invalid reissue. Although the circuit court did not sustain that or the other defenses, the defendants still had their appeal, and it could not be held that all questions of validity, title, and infringement had been finally determined. As no facts are stated in the report of the case, it does not appear what was the respective injury or benefit. In the case at bar the only injury to the defendant is the cost of substituting some other coupling. It expressly repudiated (on the former motion) any benefit from the improvement, insisting that other couplings which it was free to use were better than complainant's. By refusing an injunction the court practically informs the complainant and all who may wish to use its couplings that because it asks more for the improvement than they are willing to pay it must, nevertheless, be content to see them appropriate it at a price to be fixed hereafter by this court. On which side the balance of hardship in this case inclines seems not difficult to determine.

The remarks of Judge Grier in *Sanders* v. *Logan* (2 Fish. Pat. Cas., 167) are purely *obiter*, the bill in that case being dismissed on the ground that prior use was shown. Besides, the learned judge evidently assumed that the license-fee, payment of which would be full compensation to the complainant for future as well as past trespasses, was a "fixed sum." Undoubtedly, where there is a given license-fee which is paid by others for the use of an improvement in some mill, manufactory, locomotive, or steam-engine, equity will not lend its aid to enable a patentee, by an injunction practically against the whole apparatus, to extort a larger sum from some particular infringer who is prepared to pay the "given sum" for the privilege of using the improvement; but that is not this case. There is no fixed sum, for there have as yet been no actual sales of licenses, other railroads (as was stated on the argument) having followed defendant's example and appropriated the new coupling without payment or permission, expecting, apparently, by that means to be able to compel the complainant to accept much less than he would sell his license for, except under some such constraint, perhaps a merely nominal sum, for although it seems to have kept putting his couplings on its cars even after it had tested it by use defendant yet insists that it is a wholly valueless improvement.

The decision of Judge Blodgett in *Hoe* v. *Knap* (27 Fed. Rep., 204) fully sustains the defendant's contention. In that case the owner of the patent was a large manufacturer of printing-presses, which he did not keep in stock, but made to order. The patented device was a small part of the entire machine. As matter of fact, complainant had not up to that time sold any press embodying the improvement, because none had been ordered. Apparently he thought it for his best business interest to hold the patent and use it exclusively in presses of his own make, and hence had no regular license-fee for its use. Judge Blodgett, however, at final hearing, refused an injunction against an infringer, holding that—

under a patent which gives a patentee a monopoly he is bound either to use the patent himself or allow others to use it on reasonable terms.

No authorities for this proposition, however, are cited in the opinion, nor is such a construction of the statute which provides that a patentee shall receive a grant of the exclusive right to make, use, and vend his invention supported by argument. Although great weight is always to be given to decisions of the circuit courts, they are not controlling authority when the same question is presented in another circuit. I do not therefore feel constrained by this decision to refuse the complainant its injunction because it asks more for a license than defendant cares to pay.

Defendant also insists that injunction should not issue because the infringing couplings now in use by it are used in the service of the public, and to enjoin would be to work great hardship to the public. In *Bliss* v. *Brooklyn* (4 Fish. Pat. Cas., 596) injunction was refused because the hose-couplings complained of were necessary for the daily use of the city in the prevention of fires, and there is a long line of authorities to the same effect. There is, however, nothing in the case at bar, beyond the bare assertion of the defendant, to show that an injunction properly regulated as to time may not be obeyed without in any way interfering with the service which defendant renders to the public as a common carrier of passengers. It seems to have experienced no difficulty at all in temporarily withdrawing its locomotives and cars from such service at suitable seasons for a sufficient length of time to affix the complainant's couplings. Why it may not in like manner remove them does not appear. Complainant may take decree for account and injunction. The terms of the injunction, providing from how many cars and locomotives the infringing couplings shall be removed each week, may be settled on notice, and if defendant will at that time present affidavits showing the character of the work required, the amount of its rolling-stock in use and reserve, and its shop facilities there need be no difficulty about arranging the terms of the decree; or, if it be preferred, defendant, instead of affidavits, may present its superintendent or master mechanic for examination to aid the court in settling the terms.

U. S. Circuit Court—District of Massachusetts.

INDURATED FIBRE INDUSTRIES COMPANY *et al.* *v.* GRACE *et al.*

Decided July 28, 1892.

1. PATENTS—INFRINGEMENT—PLEADING.
   Where there are joint defendants to a bill for infringement, it is sufficient if the bill contains a general allegation of infringement, and it need not in terms allege a joint infringement.
2. DEMURRERS TO THE VALIDITY OF PATENTS.
   The practice of permitting demurrers on the merits of the invention involved discussed and discouraged.

ON demurrer.

PUTNAM, *J.*:

One ground of demurrer assigned is that the bill is defective because it does not in terms allege a joint infringement, or at least set out sufficient facts from which a joint infringement can be gathered.

Neither party has furnished me any decision of any court, or any observation of any text-writer, or referred me to any approved forms directly touching this proposition, unless *Robinson on Patents* (sec. 1104) and *Shickle* v. *South St. Louis Foundry Co.*. (22 Fed. Rep., 105.) What is said in *Robinson on Patents* rests entirely on *Shickle* v. *South St. Louis Foundry Co.*, and this case was an oral ruling, made apparently conversationally, without any citation of authorities or expression of well-considered reasons, and under such circumstances that the court may very likely have gathered from other parts of the bill that, *prima facie*, the defendants were, in fact, several infringers. This case is not sufficient to satisfy me that for this matter there is any special rule applicable to bills for infringement of patents not found elsewhere.

The cases and text-books are full of expressions that in bills of this nature a general allegation of infringement is sufficient, thus conforming to the common practice in other suits, and giving the impression that there is no special rule to be observed by patentees in framing pleadings at law or in equity.

In actions at common law, whether on torts or in contract, in bills in equity for waste or nuisance, and even in pleadings of so high a character as indictments for murder and piracy, a general allegation charging those named as defendants or those indicted, without the interpolation of the word "jointly" or its equivalent, is sufficient; and I can see no reason why it is not sufficient in bills like this, in which the act charged does not in law necessarily involve a conspiracy, but, as with ordinary torts, is proven by showing common wrong doing without alleging or especially proving a common intent.

The rules of the Supreme Court have stricken from bills in equity the common confederacy clause; but for all ordinary bills this was long since recognized as of no intrinsic value, and its omission can hardly require the interposition of new allegations.

I know of no more approved forms than those given in *Curtis's Equity Precedents*, where I find the frame of a bill in behalf of the owners of a patent against two defendants. This nowhere alleges that defendants jointly infringed; nor does it contain an equivalent therefor. It is true that the form uses the common confederacy clause in the following words, namely:

that the said defendants have confederated to use the said improvement;

but the portions which properly constitute the statement of the infringement conform literally to the bill in the case at bar.

In the absence of any sufficient authority shown me to the contrary, I shall therefore apply the rule of pleading usual everywhere else, and hold that the bill sufficiently alleges a common infringement.

The principal ground of the defendants' demurrer is that the patent sued on appears on its face void for want of invention. This proposition was stated at the oral argument to have reference to the state of the art, but it was not claimed that, independently of what is set out in the specifications, the court could take judicial knowledge thereof. Reference was made especially to those portions which state that, prior to the alleged invention sought to be covered by the patent, the insulating properties of paper were known, and also that in some positions for small spaces or for temporary uses sheet-paper had been wrapped about the conductor, and that it had been suggested that paper-pulp be coated upon the latter. It may be that other portions of the specifications, more or less relevant, were referred to on this point.

It was also claimed that by making profert of the Letters Patent these specifications were made a part of the bill. This is undoubtedly correct. Nevertheless, they were not thus made a part of it more effectually or for any different purpose than if set out in the bill at length.

A bill in equity does not necessarily make all the statements of fact contained in a contract or Letters Patent or other instrument proper parts of its pleadings, either by referring to them, or by annexing as an exhibit, or by making profert, or by reciting the tenor at length. With reference to Letters Patent, the claim or claims become, of course, a fundamental portion of the allegations of the bill, so far as any of them—in case there are more than one—are relied on by the complainant. So everything in the specifications which must be resorted to by the court in construing the claims might be considered as part of the complainants' pleadings. But all portions which merely set out the state of the art are like recitals of facts in contracts or other instruments, more or less conclusive on the party who sets them up, yet in the eyes of the law explainable, and not absolutely presumed to have been so alleged as to become the subject of demurrer. Especially must this be so with specifications in patents, in which many statements are necessarily complex, relate to unfamiliar topics, and are not easily understood without extrinsic evidence.

It is true that, so far as the specifications contain any representations which, if erroneous, may be presumed to have misled the Patent Office to the detriment of the public, the patentee may be estopped. On the other hand, I do not understand the law has gone so far as to forfeit a valuable patent because the patentee has inaptly or somewhat inaccurately described the state of the art, or that it conclusively prohibits him from showing such inaptitude or inaccuracy if it also appears that the public has not been prejudiced thereby, and in the case at bar, where the state of the art has been set out, not so positively or categorically as the respondents seem to assume, but somewhat confusedly and with qualifications, I should be unwilling to hold on a demurrer that there was no possibility that the complainants might introduce evidence placing their alleged invention in a more favorable position than the respondents assign for it.

I am not aware that in this circuit the practice of demurring on the ground of the want of invention has obtained a footing. The mischief of permitting it unnecessarily is well pointed out by the reference of

Judge Blodgett to the crop of demurrers which one of his decisions occasioned in the Northern District of Illinois. (*Eclipse Manufg. Co.* v. *Adkins*, 36 Fed. Rep., 554.)

I am not able to ascertain that the practice of this character which exists in some of the districts has ever had the direct approval of the Supreme Court. The expressions in *Brown* v. *Piper*, (91 U. S., 37,) frequently referred to, do not seem to go to that extent, as in that case there was a bill, answer, and proofs, so that the complainant had had full opportunity, and all possible facts were before the court. On such a record the court might with safety say that there was nothing on the face of the patent itself which could require its attention.

In *New York Belting Co.* v. *New Jersey Rubber Co.*, (137 U. S., 445,) where the subject-matter was that of a design, the court overruled the demurrer on the merits, without either expressly condemning or approving the practice on this point.

It is true, nevertheless, that in several districts this practice is sustained, and it is also approved by *Robinson on Patents* (sec. 1110) and by Mr. Gould's notes to *Story's Equity Pleadings*, (10th edition, sec. 452.)

In *Blessing* v. *John Tregerser Steam Copper Works* (34 Fed. Rep., 753) Judge Shipman uses the following language:

> To decide, in advance of an opportunity to give evidence, that no evidence can possibly be given upon the question of invention which would permit the case to be submitted to the jury, seems to me to be ill-advised except in an unusual case.

This would seem especially so if the questions, not only of value and usefulness, but of novelty, are to be in any degree determined by what transpires subsequent to the issue of the patent, as was suggested in *Magowan* v. *New York Belting Co.* (141 U. S., 332-343) and *Barbed Wire Patent*, (143 U. S., 275,) even with such qualifications as appear in *McClain* v. *Ortmayer* (141 U. S., 419) and *Adams* v. *Bellaire Stamping Co.*, (141 U. S., 539.)

However, without undertaking to settle whether in any case a demurrer can be allowed for want of invention appearing on the face of the patent, or whether in this particular case the state of the art would be, with the aid of the recitals in the specifications, a matter of judicial knowledge, I hold that the recitals relied on by the respondents are not made by the profert a part of the complainants' allegations in any technical or proper sense, so that they can be considered on demurrer, and that, aside from such recitals, the court cannot take cognizance of the state of the art to which this particular patent relates.

I am aware that in *Fougeres* v. *Murbarger* (44 Fed. Rep., 292) and in *Studebaker Bros. Manufg. Co.* v. *Illinois Iron & Bolt Co.*, (42 Fed. Rep., 52,) in each of which cases the demurrer was sustained, the court read into the bill statements of facts found in the specifications; but I do not perceive that the propriety of doing so was considered, and the practice seems so clearly violative of fundamental principles of correct pleading that I am compelled to follow my own conclusions.

I believe that of all the cases properly in point which have been cited in the briefs or otherwise found the demurrer was sustained in only three.

Demurrer overruled, with costs for complainants to the time of filing respondents' answer, respondents to answer on or before rule day in October next

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., August 10, 1892.

SIR: The Secretary of the Interior has ordered that Wilbur C. Benton, Sr., and Wilbur C. Benton, Jr., composing firm of Wilbur C. Benton & Co., of Cincinnati, Ohio, be not recognized after this date as agents or attorneys in the prosecution of any claim or other matter before this Department or any Bureau thereof.

Very respectfully, WM. H. DE LACY,
Acting Chief Clerk.

The Commissioner of Patents.

World's Columbian Exposition—Protection of Foreign Exhibitors.

DEPARTMENT OF STATE,
Washington, D. C., July 30, 1892.

To the Diplomatic and Consular Officers of the United States:

GENTLEMEN: I subjoin a transcript of the act of Congress approved April 6, 1892, Public No. 29, entitled "An act to protect foreign exhibitors from prosecution for exhibiting wares protected by American patents and trade-marks," which reads as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That no citizen of any other country shall be held liable for the infringement of any patent granted by the United States, or of any trade-mark or label registered in the United States, where the act complained of is or shall be performed in connection with the exhibition of any article or thing at the World's Columbian Exposition at Chicago.

You will transmit copies of this circular to the government of the country to which you are accredited, and ask that it be given the widest possible circulation for the information of those directly concerned.

I am, gentlemen, your obedient servant,

JOHN W. FOSTER,
Secretary of State.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., August 4, 1892.

Official copy to the Commissioner of Patents for his information and guidance.

E. M. DAWSON,
Chief Clerk.

Changes in Classification.

(ORDER NO. 772.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., August 11, 1892.

Sub-class Coiling and Bending Pipe, of Class 134, Metal-Tubing and Wire, is hereby transferred from Division III to Division XIV to become a part of Class 153, Metal-Bending.

The title of Class 134, Metal-Tubing and Wire, is hereby changed to Metal-Tube Manufacture, the present sub-classes of said class are abolished, and the following new sub-classes are established:

1. Straight weld.
2. Spiral weld.
3. Cross weld.
4. Seamless—
5. Rolling, longitudinal,
6. spiral,
7. cross.
8. Bent seam.
9. Lining.
10. Mandrels.
11. Tubes.

Sub-class 8, Wire, Covering, is hereby established in Class 205, Metal-drawing.

N. L. FROTHINGHAM,
Acting Commissioner.

Indexes to Patents on Electricity.

Indexes to patents relating to electricity, covering the period of time from July 1, 1882, to June 30, 1890, have been issued, and are for sale. These indexes, arranged alphabetically, numerically, and by classes, comprise the following volumes, the prices of which are given below:

Vol. 1. Index to patents relating to electricity granted by the United States prior to June 30, 1881, with an appendix, July 1, 1881, to June 30, 1882. One volume, 250 pages. In paper covers, $3; bound, $5.

Vol. 2. Appendix No. 2, July 1, 1882, to June 30, 1883. One volume, 50 pages In paper covers, $1.50.

Vol. 3. Appendix No. 3, July 1, 1883, to June 30, 1884. One volume, 60 pages. In paper covers, $1.50.

Vol. 4. Appendix No. 4, July 1, 1884, to June 30, 1885 One volume, 60 pages. In paper covers, $1.50.

Vol. 5. Appendix No. 5, July 1, 1885, to June 30, 1886. One volume, 54 pages In paper covers, $1.50.

Vol. 6. Appendix No. 6, July 1, 1886, to June 30, 1887. One volume, 52 pages. In paper covers, $1.50.

Vol. 7. Appendix No. 7, July 1, 1887, to June 30, 1888. One volume, 68 pages. In paper covers, $1.50.

Vol. 8. Appendix No. 8, July 1, 1888, to June 30, 1889. One volume, 72 pages. In paper covers, $1.50.

Vol. 9. Appendix No. 9, July 1, 1889, to June 30, 1890. One volume, 84 pages. In paper covers, $1.50.

Vol. 10. Appendix No. 10, July 1, 1890, to June 30, 1891. One volume, 98 pages. In paper covers, $1.50.

Notice.

All solicitors, agents, or attorneys who, in circulars or advertisements or otherwise, refer to the Commissioner of Patents, or to any other official of the Patent Office, for evidence of their professional standing, do so without authority.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Issue of August 16, 1892.

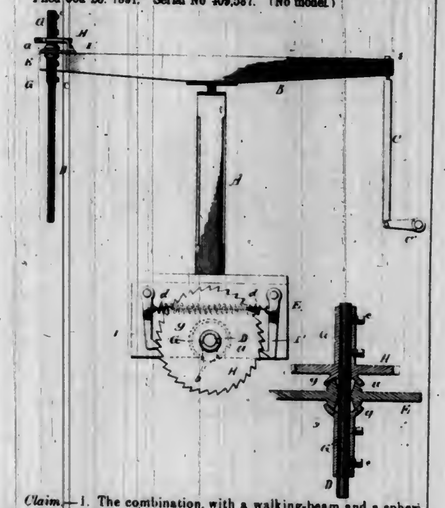
APPLICATIONS UNDER EXAMINATION.



Condition at Close of Business August 9, 1892.

Division No.	Subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. New.	Amended	No. of applications awaiting action.
	Between one and two months in arrears.			
14	Metal-Bending, Wire-Working, Coin-Controlled Apparatus, Farriery, etc.	June 18	Aug. 5	99
31	Gas, Painting, Leather, Tanning, Alcohol, Oils, Fats, and Glue, etc.	June 13	Aug. 2	78
8	Furniture, Toilet, Umbrellas and Canes, etc.	June 11	July 26	250
	Between two and three months in arrears.			
16	Telegraphy, Telephony, Electric Lighting and Signaling.	June 3	Aug. 3	189
11	Boots and Shoes, Clasps, Buckles and Buttons, Harness, Hose and Belting.	June 1	July 30	264
25	Artesian and Oil Wells, Butchering, Mills and Thrashing, Stone-Working, etc.	May 19	July 30	253
21	Textiles, etc.	May 16	July 28	170
2	Farm Stock, Products, etc	May 17	July 25	275
23	Instruments of Precision, Acoustics, Optics, etc.	May 17	July 25	277
30	Lamps, Gas-Fittings, Type-Writers, Matrix-Making Machines.	June 8	July 19	177
24	Sewing-Machines and Apparel	May 11	July 15	128
6	Chemistry, Medicines, Fertilizers, Preserving, Photography, Sugar and Salt, etc.	May 10	July 14	221
22	Fire-Arms, Navigation, Signals, etc.	May 13	July 12	220
12	Mechanical Engineering, Store-Service, etc.	May 17	July 12	222
9	Hydraulics, Fire-Extinguishers, etc.	May 13	July 8	299
18	Steam-Engineering, etc	May 10	July 5	251
17	Paper-Manufactures and Printing.	May 11	July 2	187
5	Fine Arts, Stationery, Book-Binding, Music, etc.	May 28	July 1	202
20	Builders' Hardware, Cutlery, Safes, Dentistry, Surgery, Undertaking, Artificial Limbs, etc.	May 31	June 25	259
3	Metallurgy, Metal Founding, Forging, Rolling, Coating, Annealing and Tempering, etc.	June 1	June 28	210
27	Brushing and Scrubbing, Grinding and Polishing, Laundry, etc.	May 28	June 11	254
	Between three and four months in arrears.			
32	Advertising, Baggage, Packing and Storing Vessels, etc.	Apr. 29	July 13	352
10	Carriages and Wagons and Railway-Cars.	May 3	July 12	584
1	Tillage and Fences	May 2	June 11	360
15	Plastics, Paper-Making, Paving, Glass, Fuel, Bread-Making, etc.	Apr. 13	May 31	363
	Between four and five months in arrears.			
7	Harvesters, Games and Toys	Apr. 4	July 27	402
29	Wood-Working Machines, Carpentry, Coopering and Roofing, etc.	Apr. 5	July 18	441
4	Civil Engineering, etc.	Apr. 8	June 23	424
28	Pneumatics, Refrigeration, Air and Gas Engines, etc.	Mar. 31	June 6	502
19	Stoves and Furnaces	Mar. 31	May 20	474
	Between five and six months in arrears.			
13	Metal-Working, Arms and Projectiles, etc.	Mar. 1	July 5	418
26	Electricity, Generation, Distribution, etc.	Mar. 2	June 27	442

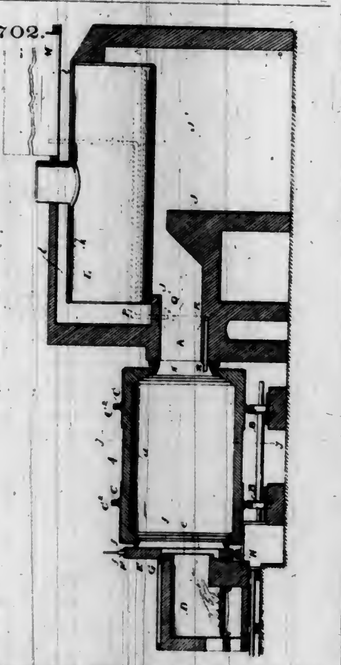
PATENTS

GRANTED AUGUST 16, 1892.

480,701. PUMP FOR OIL-WELLS. GEORGE ALLEN, Franklin, Pa. Filed Oct. 23, 1891. Serial No. 409,587. (No model.)

Claim.—1. The combination, with a walking-beam and a spherical bearing thereon having a double conical opening formed therein, of a polish-rod and sleeves secured on the rod above and below the spherical bearing, said sleeves provided with concave bearings adapted to receive and form sockets for the spherical bearing, substantially as set forth.



2. The combination, with a walking-beam, a polish rod, and a spherical bearing on the beam, of concaved sockets on the rod on each side of the spherical bearing, adapted to receive the latter, a ratchet-toothed wheel integral with one of the sockets, and a pawl or pawls on the beam in position to engage the toothed wheel, substantially as set forth.

3. The combination, with a walking-beam, a plate thereon, a rod, and sleeves secured to the rod and engaging the plate, of a toothed wheel secured to the rod and a pawl carried by the beam and engaging the wheel.

4. The combination, with a walking-beam, a plate thereon having a slotted spherical bearing, a rod passing through the slot, and sleeves secured to the rod, each having a curved or saucer-shaped end for engaging said spherical bearing, one of said sleeves having a toothed wheel rigid thereon, of pawls carried by the walking-beam and engaging said wheel, substantially as set forth.

480,702. APPARATUS FOR RECLAIMING SODA-ASH. LEWIS D. ARMSTRONG, Lock Haven, Pa.; Meylert M. Armstrong, administrator of Lewis D. Armstrong, deceased, assignor to the New York and Pennsylvania Company, of Pennsylvania. Filed June 20, 1891. Serial No. 396,886. (No model.)

480,702.

Claim.—1. A rotary incinerator having one or more driving-rings about its outer surface, provided with a separate rim fastened thereto with slight freedom of circular movement upon the body of said ring.

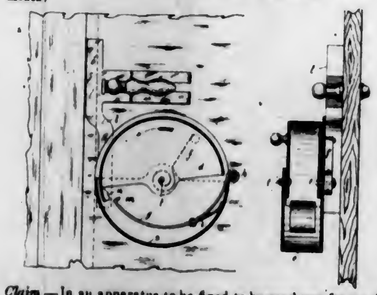
2. A rotary incinerator having a metal driving-rim C, consisting of the body portion C', fastened to the outer surface of the incinerator and provided with slots *b* in its upper surface and the lateral slots *c'* in its sides, the rim C², the bolts *c*, passing through the rim C² into the slots *b*, and the pins *d*, passing through the lateral slots *c'* into the bolt *c*.

3. In apparatus for reclaiming soda-ash, the combination, with a rotary incinerating-furnace, of a stationary outwardly-flaring mouthpiece projecting into the rotary incinerator and having its diameter within the incinerator larger than the diameter of the opening thereof through which it projects.

4. The combination, with a rotary incinerator, of a stationary flue adjacent to the neck thereof and an outwardly-flaring bell-mouthpiece about said stationary flue, projecting into said incinerator and formed in segments.

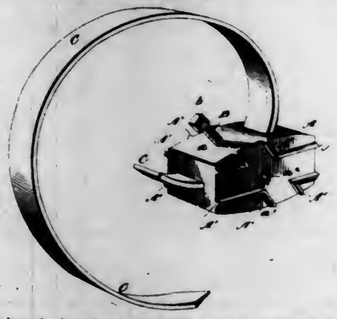
5. The combination of a rotary incinerator, of a bell-shaped mouthpiece N, consisting of the segmental outwardly flaring pieces N' and the segmental plate O, to which said segmental pieces N' are detachably connected.

6. In an apparatus for reclaiming soda-ash, the combination of the fire-box D, rotary cylinder A, having the mouthpiece I projecting beyond the end of the cylinder, and the shield E, having a central opening *e*, arranged between the fire-box and mouthpiece I.



7. In an apparatus for reclaiming soda-ash, the combination of a stationary part having an outlet-flue, a rotary incinerator, a mouthpiece carried by said stationary part about the flue and projecting into the rotary incinerator, an outwardly-projecting mouthpiece carried by the opposite end of the rotary incinerator, a fire-box, and a shield having a central opening and arranged between the fire-box incinerator.

480,703. DRESS-FORM. HERMINE BAER, San Francisco, Cal. Filed Feb. 18, 1892. Serial No. 421,968. (No model.)



Claim.—A nest or series of sectional dress-forms of different sizes contained one within the other, each of said forms being composed of two sections hinged together, substantially as described.

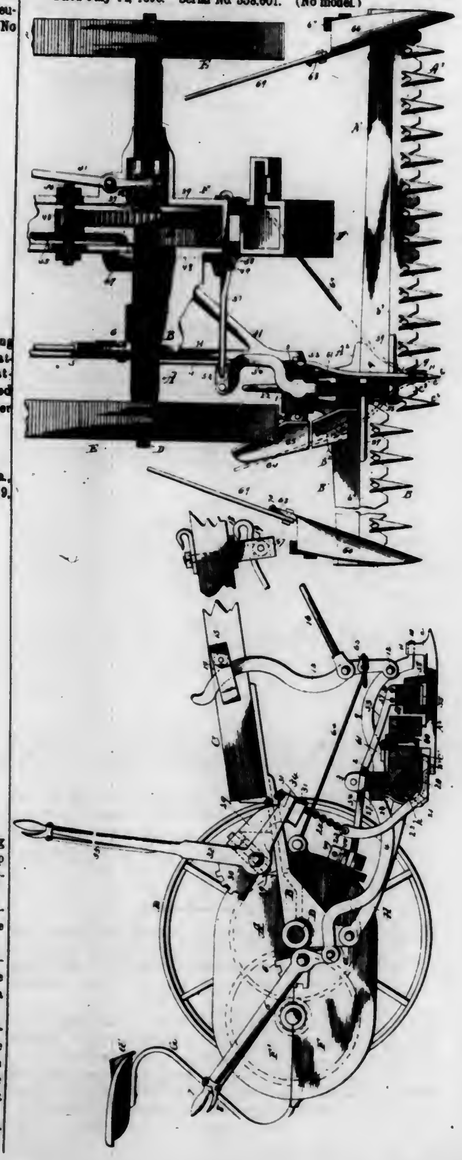
480,704. HOUSE-DOOR PARCEL-BOX. GEORGE BENICKE, Neuminster, Germany. Filed Feb. 19, 1892. Serial No. 422,165. (No model.)

Claim.—In an apparatus to be fixed to house-doors for receiving and retaining goods, the combination of the semi-cylindrical box *c*, attached by the bracket *l* to the door-handle, with the cover *d* oscillating round the pivots *l' l'*, the spring *f*, and the false bottom *g*, pressed upward by spring *i* and having a projection *m* catching the shoulder *n*, as and for the purpose set forth.

480,705. SPRING-TOOTH HARROW. JOHN W. BRANT, York, Pa., assignor of one-third to Charles W. Brant, same place. Filed Apr. 19, 1892. Serial No. 429,708. (No model.)

Claim.—1. A spring-tooth holder consisting of a block having longitudinal side lugs, a transverse bolt-hole, and openings in its top and rear walls on the arc of a circle, substantially as shown and described.

2. A spring-tooth holder consisting of a hollow block having transverse bolt-openings and in its upper and rear walls openings on the arc of a circle for the reception of the tooth, as set forth.



3. A spring-harrow-tooth holder consisting of a hollow rectangular block with convex upper and lower walls, side ribs, a transverse bolt-opening, and openings in its top and rear walls upon the arc of a circle, as set forth.

4. A spring-harrow-tooth holder consisting of a hollow rectangular block with convex upper and lower walls, side ribs, a transverse bolt-opening, and openings in its top and rear walls upon the arc of a circle, and an interior enlargement on the upper wall to the rear of the opening therein and provided with a screw-threaded opening, as set forth.

5. The combination, with a hollow block having convex upper and lower walls, a transverse bolt opening, openings in the upper and rear walls at substantially right angles to each other upon the arc of a circle, and an interior enlargement of the upper wall to the rear of said opening therein and provided with inclined screw-threaded openings, of a spring harrow-tooth having its rear end passed through said openings in the upper and rear walls, and a set-screw passed through said inclined screw-threaded opening and adapted to bear upon said tooth, as set forth.

6. A spring-tooth holder consisting of the block having openings for the reception of a tooth and upon its sides frame-embracing ribs arranged to receive the frame in either of two positions, each of which is at right angles to the other, whereby additional adjustment is provided for the purpose of increasing the life of the tooth, substantially as specified.

480,706. MOWING-MACHINE. CHARLES M. BROWN, Chicago, Ill. Filed July 14, 1890. Serial No. 358,601. (No model.)

Claim.—1. In a mowing-machine, the combination, with a push-bar which terminates in advance of one of the drive-wheels, of two cutting mechanisms connected to said push-bar, a fender secured to one of said cutting mechanisms and a fender secured to the push-bar, whereby a track will be cleared for said drive-wheels, substantially as set forth.

2. In a mowing-machine, the combination, with a push-bar having a pintle which terminates at a point in advance of one of the drive-wheels, of two cutting mechanisms hinged to said pintle, a fender secured to one of the cutting mechanisms in close proximity to the hinged connection thereof, and a fender secured to said pintle, substantially as set forth.

3. In a mowing-machine, the combination, with the cutting mechanism and the tongue, of an arm pivotally connected with the cutting mechanism and having loose sliding connection with the tongue and a draw-bar pivotally connected to said arm and having loose sliding connection with the tongue, substantially as set forth.

4. In a mowing-machine, the combination, with the cutting mechanism and the tongue, of a substantially S-shaped arm pivotally connected with the cutting mechanism and passing through a guide on the tongue and a draw-bar pivotally connected to the S-shaped arm, substantially as set forth.

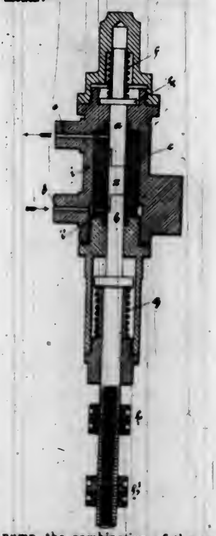
5. In a mowing-machine, the combination, with the cutting mechanism and the tongue, of a substantially S-shaped arm pivotally connected with the cutting mechanism, a guide on the tongue through which said lever passes, a roller in said guide, and a draw-bar connected to said S-shaped arm, substantially as set forth.

6. The combination, with a push-bar and connected cutting mechanism, of a lever fulcrumed on the cutting mechanism approximately over the point of connection between the cutting mechanism and the push-bar and rearward of the cutter-bar, said lever connected at one end with the cutter-bar, a pitman, and a link connecting one end of the lever with the pitman, substantially as set forth.

7. The combination, with the main frame, a push-bar, and cutting mechanism, of an arm pivotally connected with the push-bar, a bail extending from said arm to the forward end of the cutting mechanism, a link pivotally connected with the arm, an operating-lever connected with the link, and a draft attachment extending forward from the bail, substantially as set forth.

8. In a mowing-machine, the combination, with a main frame, push-bar, and cutting mechanism, of an arm pivotally connected with the push-bar, a link connected pivotally with the arm and extending rearwardly therefrom, an operating-lever connected to the rear end of the said rearwardly-extending link, a bail connecting the pivoted arm with the cutting mechanism, and a draw-bar connected with the cutting mechanism, substantially as set forth.

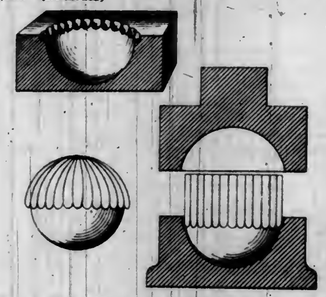
9. In a mowing-machine, the combination, with a main frame, a push-bar, and cutting mechanism, of an arm pivotally connected with the push-bar, a rearwardly-extending link connected at its forward end to the pivoted arm, an operating-lever connected to the rear end of said rearwardly-extending link, a bail connected at one end to the pivoted arm and at its forward end to the cutting mechanism, an arm pivotally connected to this bail and extending through a guide on the tongue, and a draw-bar pivotally connected to the last-mentioned arm, substantially as set forth.



10. In a mowing-machine, the combination, with a main frame, a push-bar, and a sleeve loosely mounted on the push-bar, of shoes hinged to the sleeve, finger-bars and knife-bars supported by said shoes, a collar loosely mounted on the forward end of the push-bar, a gag-lever pivotally connected to said collar and adapted to enter between the inner edges of the shoes, means for operating said gag-lever, and a spring connected with the loose sleeve and terminating in the space between the shoes and bearing at its respective ends against said shoes, substantially as set forth.

11. In a mowing-machine, the combination, with a main frame, a push-bar, cutting mechanism hinged to the push-bar, and a gag-lever, of a toothed segment hinged to the main frame, a perforated arm projecting from said segment, an operating-lever pivoted to one face of the quadrant, and a flexible connection between the short arm of the operating-lever and the gag-lever, said connection passing through the perforated arm on the quadrant, substantially as set forth.

12. In a mowing-machine, the combination, with a main frame, a push-bar, cutting mechanism hinged to the push-bar, and a pivoted gag-lever, of a quadrant hinged to main frame, the axis of said hinged connection being disposed obliquely to the line of draft, a perforated arm projecting from said quadrant, an operating-lever pivotally connected to one face of the quadrant, a finger-bar connected with the lever and adapted to engage the quadrant, and a flexible connection between the short arm of the operating-lever and the rear end of the gag-lever, said flexible connection passing through the arm on the quadrant, substantially as set forth.

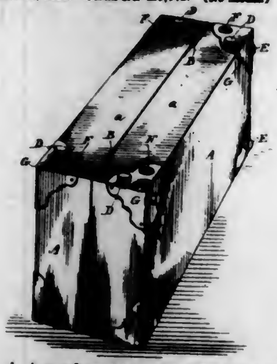


13. In a mowing-machine, the combination, with the main frame, driving mechanism, a push-bar, two finger-bars hinged to the push-bar, and a knife-bar on each finger-bar, of an arm pivotally connected with the push-bar, a gag-lever, a horizontally-vibrating lever pivotally connected at its center to said arm and connected at its forward end to the knife-bars by a swivel connection, the rear end of said lever being carried around the gag-lever and having a link pivotally connected to its rear end, and a pitman connecting said link with the driving mechanism, substantially as set forth.

480,707. PUMP. OSCAR BRÜHLER, Rhenburg, assignor to I. M. Grob & Co., Rutritzsch-Leipsic, Germany. Filed May 10, 1892. Serial No. 432,696. (No model.)

Claim.—In a pump, the combination of the operated piston *b*, having a notch *b'*, with the piston *a* provided with a notch *i* and being under the action of the spring *f*, and with the chamber *c*, having an inlet-channel *d* and an outlet-channel *e*, as and for the purpose set forth.

480,708. METHOD OF FORMING HOLLOW BALLS, &c., FROM SHEET METAL. JOHN BURKHARDT, New York, N. Y., assignor to William H. Jackson & Co., same place. Filed Apr. 21, 1892. Serial No. 430,142. (No model.)

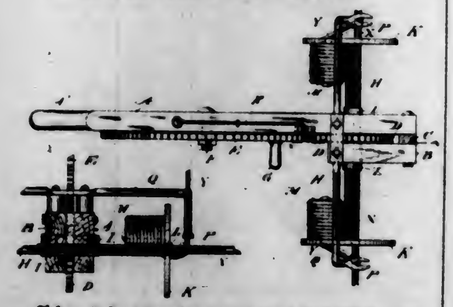


Claim.—1. The process herein set forth of forming hollow ornamental bodies of sheet metal by successive compressions of the metal between series of dies of different configuration corresponding with the shapes described and in the regular order specified—namely, first forming the metal into cup shape, then enlarging the upper or cylindrical half of the cup and contracting the lower or closed half of the cup, reducing it to hemispherical shape, forming a central girdle of beads around its perimeter, then forming ribs or flutings upon the upper or cylindrical part of the cup corresponding with and terminating in the circle of beads, and then reducing the cup to a spheroidal shape, being ribbed upon one half, as described.

2. The process herein described of forming ornamental hollow bodies of sheet metal, consisting in forming the metal into a cup by compressing the same between dies, then compressing the cup between dies which will enlarge the diameter of a part of the cup, then compressing the cup between dies which will form a row of beads around

its middle part, then compressing the beaded cup between dies which form ribs upon part of the cup terminating in the beads at the middle of the cup, then compressing the cup between dies which will form ornamental figures upon the closed hemispherical portion of the cup, then revolving the cup on a mandrel and impressing ornamental figures thereon around its perimeter by the action of a rotary engraved tool, and then compressing the article or cup between plain dies which will reduce it to an oval or spheroidal shape.

480,709. MEDICINE-CASE. HENRY D. CAPITAIN, Chicago, Ill. Filed Feb. 20, 1892. Serial No. 422,172. (No model.)



Claim.—1. A case formed in sections hinged together and having feet, each section having, also, sockets for receiving the feet of the other section, substantially as set forth.

2. A case having its bottom formed in two similar sections *a*, hinged together, each of said sections being provided with feet D and sockets F, the sockets of one section being situated so as to be directly opposite and receive the feet of the other section, substantially as set forth.

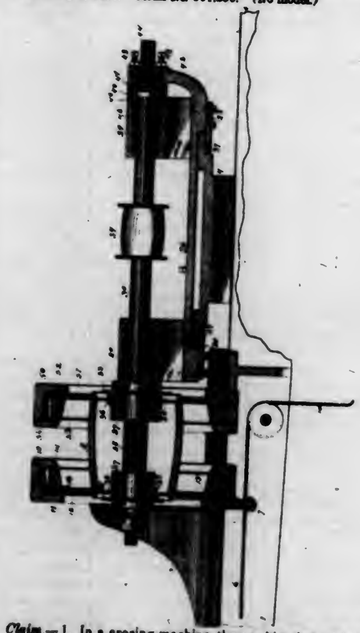
3. As a new article of manufacture, a corner-piece for cases having a foot D and a socket F, substantially as set forth.

4. As a new article of manufacture, a corner-piece having a foot formed by forcing outward a portion of the metal of which it is formed and a socket formed by forcing inward a portion of said metal, substantially as set forth.

480,710. MACHINE FOR ATTACHING VERTICAL WIRES IN WIRE FENCES. ELMER E. COLE and OSDEN COLE, Hudson, Mich. Filed Jan. 23, 1892. Serial No. 418,961. (No model.)

Claim.—1. In a wire-fence machine, the combination, with a frame and a needle-shaft mounted therein having lateral extensions eccentric to the part mounted in the frame, of needle-pieces mounted at or near the outer ends of such extensions, adapted to allow of placing the needle-shaft in close proximity to the horizontal wire of the fence, and provided each with a slot for the vertical or woof wires, and means to rotate such needle-shaft to attach the woof-wires to said horizontal wire.

2. In a wire-fence machine, the combination, with a frame and a needle-shaft mounted therein having lateral extensions eccentric to the part mounted in the frame, of needle-pieces mounted at or near the outer ends of such extensions, adapted to allow of placing the needle-shaft in close proximity to the horizontal wire of the fence, and provided each with a slot for the vertical or woof wires, clips for holding such woof-wires in starting to wind them, and means to rotate such needle-shaft.

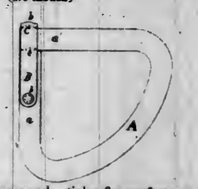


3. In a wire-fence machine, the combination, with a frame and a needle-shaft mounted therein having lateral extensions eccentric to the part mounted in the frame, of needle-pieces mounted at or near the ends of such extensions and provided each with two slots, one for the admission of the horizontal fence-wire and the other for the passage of the vertical or woof wire, clips to hold such woof-wire in starting to wind, and means to rotate such needle-shaft.

4. In a wire-fence machine, the combination, with a frame and a needle-shaft mounted therein having lateral extensions eccentric to the part mounted in the frame, of needle-pieces mounted at or near the outer ends of such extensions, adapted to allow of placing the needle-shaft in close proximity to the horizontal wire of the fence, and provided each with a slot for the vertical or woof wires, a projection or reel adjacent to the eye of each needle and adapted to deliver the transverse wire thereto, and means to rotate the needle-shaft and needles to wind the transverse wires on the horizontal wire.

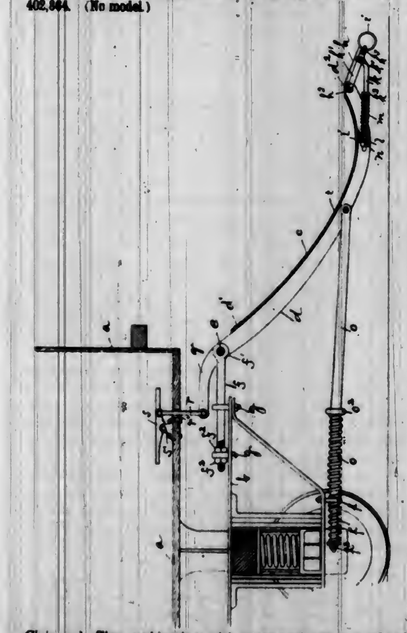
5. In a wire-fence machine, the combination, with a frame and a needle-shaft mounted therein having lateral extensions eccentric to the part mounted in the frame, of needle-pieces mounted at or near the outer ends of each extension, adapted to allow of placing the needle-shaft in close proximity to the horizontal wire of the fence, and provided each with a slot for the vertical or woof wire to constitute the eye therefor, projections or reels, each mounted on said needle-pieces adjacent to the eye thereof to deliver the transverse wire thereto, clips carried by the frame adjacent to said needles and adapted to engage the free ends of the transverse wires to draw them through the needle-eyes in starting to wind said wires, and means to rotate such needle-shaft.

6. In a wire fence machine for constructing wire fences, the combination, with a supporting-frame, a needle-shaft, and means to rotate it, of a plurality of double-slotted needles, said slots being adapted to receive the transverse and longitudinal wires, respectively, and open to admit of placing the respective wires sidewise therein, clips for the free ends of the transverse wires from said needles and carried by said frame, and projections or reels carried by said needles adjacent to the eyes, adapted to carry and deliver suitable coils of transverse wire to form the pickets for said fence.



480,711. CROZING-MACHINE. THEODORE A. COOK, Calicoon Depot, assignor to James Mathison and Walter Mathison, Brooklyn, N. Y. Filed May 1, 1891. Serial No. 391,258. (No model.)

Claim.—1. In a crozing-machine, the combination, with the main frame provided with a way at its upper surface, of the laterally and longitudinally reciprocable tables, a spindle held in bearings supported by the laterally reciprocable table and projecting at one end beyond its bearings at the center of the machine, two circular saws and two sets of cutters secured on said projecting end of the spindle, an annular rotary holder for one end of the barrel, held at the center of the machine in front of the laterally and longitudinally reciprocable tables, and another annular and rotary holder for the opposite end of the barrel, fitted to slide on the way of main frame, substantially as and for the purposes set forth.



2. The spindle mounted on a longitudinally and laterally reciprocable table and projected at one end beyond its bearing and provided at said projecting end with two saws and cutters, in combination with a rotating holding-ring for one end of the barrel, held in a casing fixed in the frame in line with the spindle, and another rotating holding-ring for the barrel, held in a casing mounted upon a reciprocable table in line with the spindle, substantially as described.

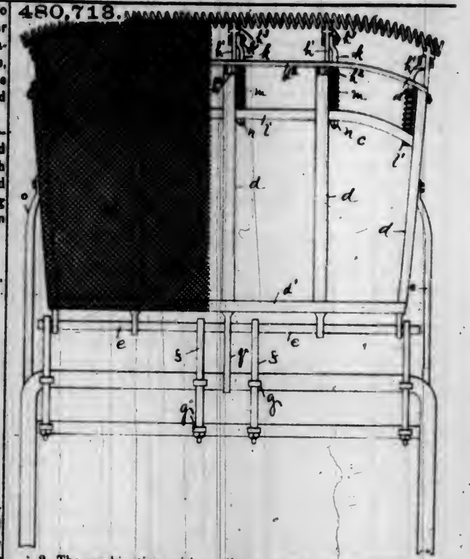
480,712. KEY-HOLDER. NATHAN W. CRANDALL, Meriden, Conn., assignor to George W. Jopson, same place. Filed Apr. 28, 1891. Serial No. 390,867. (No model.)

Claim.—As an improved article of manufacture, a key-holder consisting of a spring-metal body having an arm *a* formed upon its end with a lug or stud, an arm *a'*, having its free end projecting over the end of the arm *a* and normally removed therefrom, said arm *a'* being formed with a depression *c*, adapted to receive said lug or stud, and with a lug or stud C at the outer side of said arm, and an approximately-U shaped locking-loop B, pivoted at its ends to the arm *a* and provided in its connecting portion with a depression *b'*, adapted to receive the lug or stud C, substantially as and for the purpose set forth.

480,718. PILOT OR GUARD FOR LOCOMOTIVES AND CARS. ROBERT A. CRAWFORD, Allegheny, Pa. Filed Aug. 17, 1891. Serial No. 402,864. (No model.)

Claim.—1. The combination, with a locomotive or car, of a pilot or guard pivoted thereto, rods pivoted at their forward ends to said pilot or guard, the rear ends of said rods resting in suitable supports, and springs encircling said rods, said springs being interposed between shoulders on said rods and said supports, substantially as and for the purposes set forth.

2. The combination, with a pilot or guard, of a supplementary pilot or guard pivoted thereto, rods pivoted to said supplementary pilot or guard and resting in suitable supports on said main pilot or guard, and springs interposed between shoulders on said rods and said supports, and nuts engaging the inner ends of said rods, substantially as and for the purposes set forth.



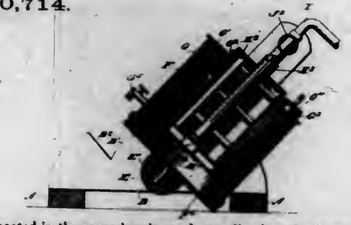
3. A pilot or guard for locomotives or cars, consisting of a series of parallel bars having their inner ends pivoted to a suitable support, the outer ends of said bars engaging with a spiral coil extending across the front of said pilot, substantially as and for the purposes set forth.

4. A pilot or guard for locomotives or cars, consisting of a series of parallel rods having their inner ends pivoted to a suitable support, the outer ends of said bars having notches formed therein adapted to engage a spiral coil extending across the front of said pilot or guard, substantially as and for the purposes set forth.

5. The combination, with a locomotive or car, of a pilot pivoted thereto, rods pivoted to said pilot and extending rearwardly through suitable supports on the truck of the car or car-body, and springs interposed between shoulders on said rods and the said supports and also between said supports and nuts engaging the inner ends of said rods, substantially as and for the purposes set forth.

6. The combination, with a locomotive or car, of a pilot pivoted thereto, rods pivoted to said pilot and extending rearwardly through suitable supports on the truck or car-body, springs interposed between shoulders on said rods and said supports and also between said supports and nuts engaging the inner ends of said rods, and lever connections between said pilot and a lever in the car for lowering and raising said pilot, substantially as and for the purposes set forth.

7. In combination with a locomotive or car, a main pilot pivoted thereto, rods pivoted to said pilot and extending back through supports on the truck or car-body, springs interposed between shoulders on said rods and said supports and also between said supports and nuts engaging the inner ends of said rods, and a supplementary pilot or guard pivoted to said main pilot, said supplementary guard having rods pivoted thereto and said rods extending back through supports on said main pilot, and springs interposed between shoulders on said rods and said supports, and connections between said main pilot and a lever within the car for lowering and raising said main pilot and supplementary pilot, substantially as and for the purposes set forth.

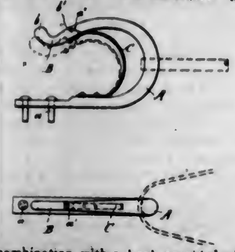


480,714. ICE-CREAM FREEZER. THOMAS W. CROMER, Roanoke, Va. Filed May 31, 1890. Serial No. 354,165. (No model.)

Claim.—1. The combination, with the framework and a swinging frame having bearings, of the cylinder journaled for rotation therein, the inner freezing-cylinder, and an agitator mounted therein, substantially as specified.

2. The combination, with the rectangular base, and the opposite uprights pivoted at their lower ends thereto, and connecting cross-pieces at the upper and lower ends of the uprights and provided with bearings, of a cylinder having a lower bearing-lug journaled in the lower cross-piece, a freezing-cylinder therein, and a cranked agitator-

480,714.



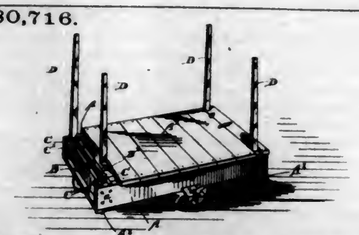
shaft located in the upper bearing and extending into the freezing cylinder, substantially as specified.

3. The combination, with the framework having the opposite bearings, of the outer cylinder having a central bearing upon its under side, the inner conical vessel depending within the cylinder and combining with the latter to form a space for the reception of non-conducting material, the inner freezing-cylinder having the countersunk socket, the cover for the inner cylinder and having the circular flange for the outer cylinder and provided at one side with the opening, the cap for the opening, the shaft extending through the bearing of the framework, through the cover of the freezing-cylinder, and into the latter and terminating in a square end taking into the socket of said cylinder, a handle, the sleeve mounted upon the shaft within the freezing-cylinder, the arms extending from the sleeve, and the blades mounted on the arms, substantially as specified.

4. The combination, with the framework, the opposite side bars of which are provided with the curved edges B' and provided with bearings, of the freezer-carrying frame supported pivotally in the bearings and devices mounted on the pivoted frame and adapted to bind upon the edges B', whereby the freezer-carrying frame may be held in any position, substantially as specified.

5. The combination, with the base, the two pivoted uprights having opposite openings, and the lower cross-bar having the bearing, of the freezer having the bearing-lug taking in the bearing, the inner casing mounted therein and provided with a head having a central opening, the freezing-cylinder mounted in the opening, the cover therefor having an opening, a T-shaped tube depending into the opening, pins passing removably through the openings in the uprights, provided with perforations, and taking into the opposite ends of the tube, short transverse pins passed therethrough for locking the pins, agitators carried by the tube within the freezing-cylinder, and a crank-shaft located in the tube and terminating at its lower end in a square head fitting removably in a socket formed in the bottom of the freezing-cylinder, substantially as specified.

480,715. HOOK FOR CHECKREINS. CHARLES R. CURTIS, Fairland, Mich. Filed Mar. 5, 1892. Serial No. 423,855. (No model.)



Claim.—The combination, with a hook provided with a beveled end, of an extension-piece provided with a beveled end and a projecting lobe and a spring secured to the extension-piece and to the shank of the hook and curved in the same direction as the hook, substantially as set forth, whereby the rein may be slipped between the two beveled ends after pressing it against the said lobe.

480,716. CORNER STRUCTURE FOR TRUCKS. EMIL DIETZ, Indianapolis, Ind. Filed Apr. 9, 1892. Serial No. 428,438. (No model.)

Claim.—1. A truck-frame consisting of sides having gains or grooves therein, ends constructed of two parts entering said gains or grooves, and cross-pieces extending between the two parts of the ends, the whole forming mortise-like recesses for the lower ends of the stakes or posts, substantially as shown and described.

2. The combination, in a truck-frame, of sides having gains or grooves therein, double end pieces entering said grooves or gains and themselves provided with corresponding grooves or gains, and the end

480,716.

pieces and bolts C passing through them and by which they are secured together, substantially as shown and described.

3. The combination, in a truck-frame having the ends each constructed of two parts, whereby a space is provided to receive the lower ends of the stakes or posts, of an opening through the outer part large enough to receive the head of the bolt, and bolts E, passing through the lower ends of the stakes and the inner parts of the ends, and thus holding said stakes to said parts, substantially as shown and described.

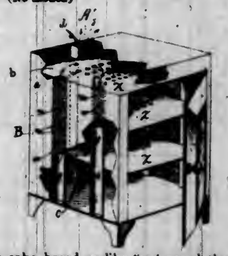
480,717. BLOWPIPE-LAMP. ERASTUS W. ELLSWORTH, East Windsor Hill, assignor of one-half to Charles W. Vibert, South Windsor, Conn. Filed Oct. 5, 1891. Serial No. 407,684. (No model.)

Claim.—1. The combination, in a blowpipe-lamp, of a fuel-chamber, a wick-tube connecting therewith, a moisture-trap, an inlet-opening and an exit-opening in said moisture-trap, and a blowpipe-tube vertically adjustable in the exit-opening, substantially as and for the purpose specified.

2. The combination, in a blowpipe-lamp, of a fuel-chamber, a blowpipe-tube carried by the lamp, a cylindrical casing opening into the fuel-chamber, a wick-tube taking therethrough, and an expanding ring adapted to hold the wick-tube in position, substantially as and for the purpose specified.

3. The combination, in a blowpipe-lamp, of a fuel-chamber, one or more blowpipe-tubes carried by the lamp, a cylindrical casing opening into the fuel-chamber, a wick-tube taking therethrough, and a tube adapted to slide upon the wick-tube, substantially as and for the purpose specified.

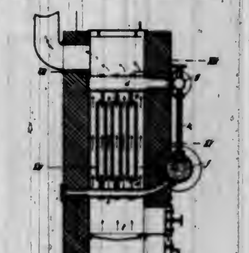
4. The combination, in a blowpipe-lamp, of the fuel-chamber A, the adjustable tube C, carried by the lamp and provided with an air-inlet, one or more blowpipe-tubes *c*, carried by the adjustable tube, the casing D, opening into the fuel-chamber, the wick-tube E, taking into the casing, and the expanding ring F within the casing, substantially as and for the purpose specified.



5. The combination, in a blowpipe-lamp, of the fuel-chamber A, the adjustable tube C, carried by the lamp and provided with an air-inlet, one or more blowpipe-tubes *c*, carried by the adjustable tube, the casing D, opening into the fuel-chamber, the wick-tube E, taking into the casing, and the tube G, sliding thereon, substantially as and for the purpose specified.

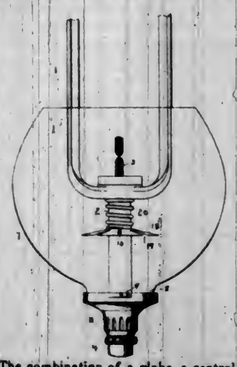
6. The combination, in a blowpipe-lamp, of the fuel-chamber A, the air-chamber B, having air-inlet *b*, the adjustable tube C, taking into the air-chamber, the casing D, opening into the fuel-chamber, the wick-tube E, taking into said casing, the expanding ring F within the casing, and the adjustable tube G, adapted to slide relatively to the wick-tube, substantially as and for the purpose specified.

7. The combination, in a blowpipe-lamp, of the fuel-chamber A, the tube C, having an air-inlet and adjustable on said lamp, one or more blowpipe-tubes *c*, carried thereby, the casing D, opening into the fuel-chamber, the wick-tube E, taking into said casing, the expanding ring F within said casing, and the tube G, adapted to slide upon the wick-tube, substantially as and for the purpose specified.



8. The combination, in a blowpipe-lamp, of the fuel-chamber A, the casing D, opening into the fuel-chamber, the wick-tube E, taking into the casing and having radial projections *e* and *e'*, and the expanding ring F within the casing and between the projections, substantially as and for the purpose specified.

480,718. CAKE OR BREAD BOX. GEORGE H. ENNIS, Troy, N. Y., assignor to Jessie D. Ennis, same place. Filed June 18, 1890. Serial No. 355,901. (No model.)



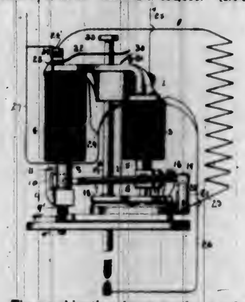
Claim.—In a cake, bread, or like food vessel, the combination of the casing, flues A at the sides of the casing, having numerous air-inlets at its side and opening at the top into the interior of the casing, flue A', open at the bottom and passing through the top of the casing, and a perforated diaphragm *x*, located sufficiently far below the top of the casing to leave an ample air-circulating chamber between them, substantially as set forth.

480,719. STEAM-GENERATOR. HERMANN GOERING, Birkenfeld-on-the-Nahe, Germany. Filed Jan. 20, 1892. Serial No. 418,677. (No model.)

Claim.—In a steam-generator, the combination of concentric tubes united at the ends by rings *a* with sleeves *b* and *c*, the horizontal tubes *d r*, the steam-accumulator *g*, the tube *k*, the water-reservoir *f*, and the feeding-valve *p*, as and for the purpose set forth.

480,720. HOLDER FOR ARC LAMPS AND SIMILAR GLOBES. FREDERICK D'A. GOOLD, New York, N. Y., assignor to the Edison General Electric Company, same place. Filed Dec. 5, 1891. Serial No. 414,165. (No model.)

Claim.—1. The combination of a globe, a central rod or tube, a collar connected to the globe and movable on said rod or tube, and a plate-spring, also on the rod or tube, said globe being held between the collar and plate-spring, substantially as described.



2. The combination of a globe, a central rod or tube, a collar connected to the globe by a spring-clamp and movable on said rod or tube, and a plate-spring, also on said rod or tube, said globe being held between the collar and plate-spring, substantially as described.

3. The combination of a globe, a central rod or tube, a collar connected to the globe and movable on said rod or tube, a bayonet-joint for holding the collar in its raised position, and a plate-spring, also on the rod or tube, said globe being held between the collar and plate-spring, substantially as described.

4. The combination of a globe, a central rod or tube, a collar connected to the globe and movable on said rod or tube, a plate adapted to press against the globe, and a spiral spring on the tube above the plate and adapted to press against it, substantially as described.

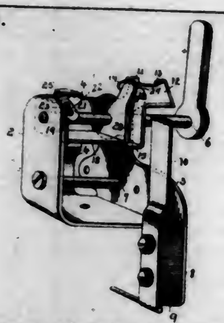
5. The combination of the lamp-frame, the projecting tube, the spiral spring thereon, the ring-plate spring, the pin or pins projecting from the tube, the globe, and the collar holding the same and adapted to slide on the tube, said collar having a notch or notches to allow the passing of said pin or pins, whereby when the globe is raised and turned it is clamped in a yielding spring-clamp and held up in place, substantially as described.

480,721. ELECTRIC-ARC LAMP. FREDERICK D'A. GOOLD, New York, N. Y., assignor to the Edison General Electric Company, same place. Filed Dec. 5, 1891. Serial No. 414,166. (No model.)

Claim.—1. The combination, in an arc lamp, of stationary main and shunt coils, armatures therefor, a tilting arm or frame having a fulcrum on or connected to each armature, one of said fulcrums consisting of a wheel or other bearing adapted to move longitudinally on its seat, and a clutch-plate or other carbon-controlling device connected to said tilting arm or frame, substantially as described.

2. The combination, in an arc lamp, of the stationary main and shunt coils or magnets and armatures therefor, the tilting frame supported and operated thereby and having a fulcrum on each armature and projecting beyond the fulcrum on the armature of the main coil, and a carbon clutch connected to said projecting part, substantially as described.

3. The combination, in an arc lamp, of stationary main and shunt coils, armatures therefor, a tilting arm or frame supported by said armature and having a fulcrum on or connected to each armature, a clutch connected to said tilting arm or frame, a cut-out circuit and circuit-controllers, and a counterbalance-weight on said tilting arm or frame and adapted to move the same when the cut-out circuit is closed, substantially as described.



4. The combination of the main and shunt coils and armatures, the tilting frame supported by the armatures and having two fulcrums, the carbon-clutch, the resistance-shunt circuit, and the circuit controller therefor, closed by an abnormal movement of the armature of the shunt-magnet or by an abnormal movement of the main magnet-armature, and a short circuit closed when the carbons are consumed between the lamp-terminals around the magnets and said resistance-shunts circuit, substantially as described.

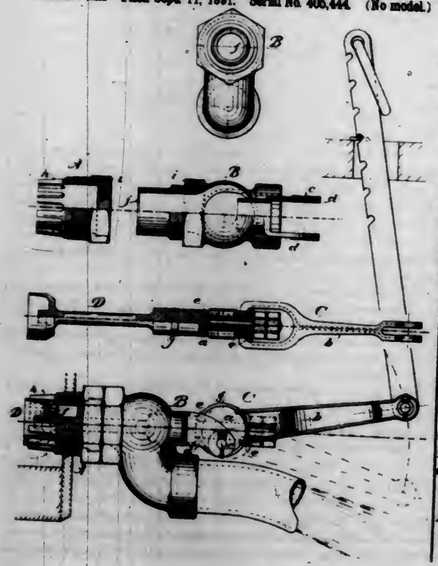
5. The combination of the main and shunt coils and armatures, the tilting frame supported by the armatures and having two fulcrums, the carbon-clutch, the resistance-shunt circuit, and the circuit-controller therefor, one member of the circuit-controller being carried by a part of said tilting frame projecting beyond one of said fulcrums, substantially as described.

480,722. SNAP-SWITCH. FREDERICK D'A. GOOLD, Schenectady, assignor to the Edison General Electric Company, New York, N. Y. Filed Mar 26, 1892. Serial No. 426,669. (No model.)

Claim.—1. The combination, in a switch, of a sheet-metal body or frame having two substantially parallel sides and a spring forming a third side, said parts being formed of one piece of metal, a contact adapted to be connected to one wire of the circuit and insulated from the switch-body, a spindle having bearings in the first-mentioned sides of the switch-body, a switch-arm on said spindle and in position to co-

480.722.

operate with said contact, and a body also on and moved by said spindle, but having a connection therewith, allowing lost or independent motion and co-operating with the switch-arm to move it, substantially as described.



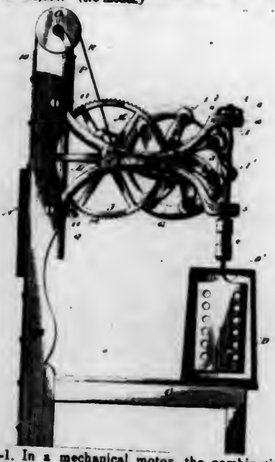
2. The combination, in a snap-switch, of a body having two sides with holes adapted to receive a spindle, a third side bent to form a spring, a spindle in said holes, a switch-arm on said spindle, a body also on the spindle and having a slot in it adapted to receive the pin or screw, a pin or screw projecting from the spindle through said slot, an arm or lug carried by the body, and ears or projections on the switch-arm in position to be struck by said lug, and a stationary spring or contact, substantially as described.

3. The combination, in a snap-switch, of the main body, the spindle, the movable switch-body on the spindle, and the spring forming a part of said main body and bearing against the body on the spindle and adapted to throw it to change the circuit instantaneously, substantially as described.

4. The combination, in a snap-switch, of the main body, the spindle supported thereby, the movable body having sides at an angle with each other, and a switch-arm centered on said spindle, the arm having stops on opposite edges and at a suitable distance apart, the body having an arm or lug projecting between said stops, and the spring resting against one of the sides of the movable body and adapted to throw it, substantially as described.

5. The combination, in a snap-switch, of the main body, the spindle, the movable body, and the switch-arm on said spindle, and the single screw 23, projecting from the spindle and engaging the movable body and through which motion is conveyed from the spindle to the body and switch-arm and which forms the sole device for securing said parts together, substantially as described.

480,723. BOILER-BLOW-OFF VALVE. CHARLES J. GUSTAFSON, Mobile, Ala. Filed Sept. 11, 1891. Serial No. 405,444. (No model.)



Claim.—1. In a boiler-blow-off valve seating with the pressure, the eccentric-lever C, mounted on its fulcrum *e* in the brackets *d* of the body B, operating the valve D positively in both directions—opening and closing—applied in combination with the independent valve-seat *f* and the sleeve or combination valve-guide and strainer A.

2. In a boiler-blow-off valve seating with the pressure, the sleeve or combination strainer A, applied in combination with the body B, having the independent valve-seat *f*, and the eccentric-lever C, operating the valve D, all combined and arranged substantially as shown and described in this specification.

3. In a valve closing with the pressure, the independent valve-seat *f*, forming one piece with the body B and applied in combination with the independent valve-guide and strainer or sleeve A, the eccentric-lever C, and the valve D, all combined and operated as described in this specification.

480,724. MECHANICAL MOTOR. SHELBY HICKS, Providence, Ky., assignor of one-half to John W. Givens, same place. Filed Apr. 28, 1892. Serial No. 431,007. (No model.)

Claim.—1. In a mechanical motor, the combination, with the frame, of a star-wheel bearing an anti-friction roller on each arm, a shaft revolubly mounted in the frame and carrying the star-wheel, an operating-shaft at a right angle to the star-wheel shaft, said operating-shaft having a spiral flange with which the anti-friction rollers engage and a curvature corresponding with the inclination of the flange, and means for driving the star-wheel shaft.

2. In a mechanical motor, the combination, with the frame, of a star-wheel each arm of which carries at its outer end an anti-friction roller in line with its longitudinal center, a shaft revolubly mounted in the frame and carrying the star-wheel, an operating-shaft mounted in the frame at right angles to the star-wheel shaft, said operating-shaft having a spiral flange with which the anti-friction rollers successively engage and a curvature corresponding with the inclination of said flange, and mechanism for driving the star-wheel shaft.

3. In a mechanical motor, the combination, with the frame, of a star-wheel each arm of which carries at its outer end an anti-friction roller in line with its longitudinal center, a shaft revolubly mounted in the frame and carrying the star-wheel, an operating-shaft mounted in the frame at a right angle to the star wheel shaft, said operating-shaft having a spiral flange with which the anti-friction rollers successively engage, and a curvature corresponding with the inclination of said flange, a collar fixed on the operating-shaft and carrying anti-friction rollers which bear on the frame, and mechanism for driving the star-wheel shaft.

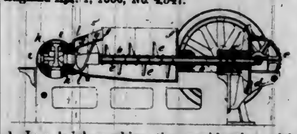
4. A mechanical motor comprising frame A, driving-shaft K, ratchet-wheel L, fixed on said shaft, gear-wheel J, loose on said shaft and carrying spring-actuated pawl M, means for actuating said shaft, star-wheel shaft F, star-wheel E, carried by said shaft F, pinion H, and balance-wheel G, said star-wheel being provided with anti-friction rollers 3, operating-shaft I, having spiral flange I' and a curve corresponding to the inclination of the flanges, and collar *i*, fixed on shaft I and carrying anti-friction rollers 6, all constructed and arranged substantially as described.

480,725. TOY GAME APPARATUS. GEORGE HILL, Lombard, Ill. Filed Apr. 14, 1892. Serial No. 429,095. (No model.)

Claim.—1. The game apparatus adapted to be used upon a table,

480.725.

floor, or other surface suitable for the rolling of marbles, consisting of the folding frame A B B, the part A having openings for the marbles, substantially as specified.



2. The game apparatus adapted to be used upon a table, floor, or other surface suitable for the rolling of marbles, consisting of the folding frame A B B C, the parts A and C having openings for the marbles, substantially as specified.

3. A game apparatus consisting of a front board A, having openings *a*, in combination with pieces B, adapted to form a receptacle at the rear of said board and support the same, said side pieces being pivotally joined to the front board by means of the eyes and staples and fastened at the rear by a suitable device, substantially as specified.

4. A game apparatus consisting of a front board A, having openings *a*, in combination with pieces B, adapted to form a receptacle at the rear of said board and support the same, said side pieces being pivotally joined to the front board by means of the eyes and staples and fastened at the rear by a suitable device, said pieces being provided with grooves for retaining the rear arch board C in place, substantially as specified.

5. The game apparatus adapted to be used upon a table, floor, or other surface suitable for the rolling of marbles, consisting of the folding frame A B B, the part A having openings for the marbles and one part B being hinged to board A by a pivot which permits it to slide to a position alongside of the other part B when folded, substantially as specified.

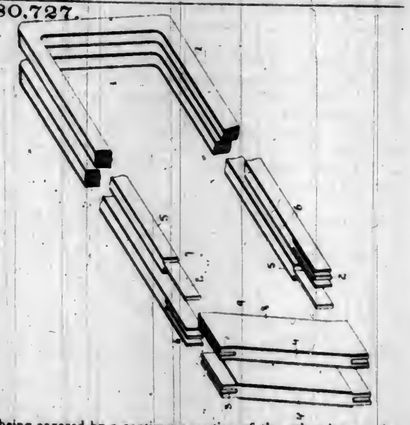
480,726. BRICK-MACHINE. WILLIAM JOHNSON, Armly, Leeds, England. Filed Mar. 13, 1890. Serial No. 343,814. (No model.) Patented in England Apr. 1, 1886, No. 4,547.

Claim.—1. In a brick-machine, the combination, with the pug-mill portion and the mold-cylinder *h*, of the means for driving said pug-mill portion and pulling over the mold-cylinder and the groove for carrying the surplus clay back to the pug-mill from the mold-cylinder, substantially as set forth.

2. In combination with the pug-mill casing, the removable section *g*, constituting the cover, and the nose *l*, having a return-opening for the excess of the material fed, said cover being formed with a passage *s'*, substantially as described.

3. The aperture or groove *s*, leading back to the hopper or pug-mill, whereby the surplus clay from the brick making or molding part of the machine is automatically carried back to the pug-mill, substantially as herein set forth.

480,727. ARMATURE-CONDUCTOR AND MEANS FOR INSULATING THE SAME. EMIL KOLBEN, Schenectady, assignor to the Edison General Electric Company, New York, N. Y. Filed Feb. 8, 1892. Serial No. 420,784. (No model.)



Claim.—1. The combination, with a conductor forming an armature-coil, of strips of insulation on the sides of each convolution, the strips on one face of a convolution breaking joints with the strips on an adjacent face of the next convolution, whereby said convolutions are separated by two thicknesses of insulation and no complete break in said insulation occurs, substantially as described.

2. The combination, with several U-shaped conductors and several cross-conductors connected to form an armature-coil, of insulating-layers on both sides of each U-shaped bar and on both sides of each cross-bar, said insulation being arranged so that the layers overlap each other, substantially as described.

3. The combination, with several U-shaped conductors and cross-conductors connected to form an armature-coil, of U-shaped strips of insulation placed on each side of each U-shaped conductor and insulating material on the sides of the cross-conductors, the connected ends of the U-shaped bars and the cross-bars having, respectively, long and short or short and long insulation, substantially as described.

4. An armature-coil composed of bars connected end to end to form a continuous conductor, the turns of the coil being separated throughout by two layers or sheets of insulating material, joints in one

480.727.

layer being covered by a continuous section of the other layer, substantially as described.

5. The combination of several U-shaped conductors having tongues at the ends and cross-conductors formed to fit the same, said conductors forming an armature-coil, the cross-bars having continuous insulating-layers on their sides and rear edges, and the outer edges of said cross-bars being finished off, whereby the edge of the armature serves as a commutator-surface, substantially as described.

6. The combination, with a conducting-bar serving or adapted to serve as a commutator-bar, of a continuous sheet of insulation on its two sides and rear edge, substantially as described.

7. The combination, with adjacent bars serving or adapted to serve as commutator-bars, of continuous sheets of insulation on their sides and rear edges, whereby the several bars will be separated by two sheets and whereby all danger of said sheets working or being pulled out is avoided, substantially as described.

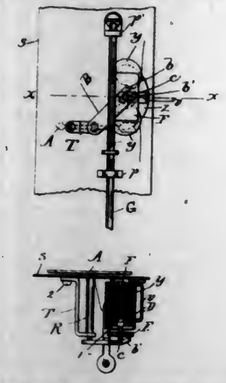
480,728. RING-ARMATURE. EMIL KOLBEN, Schenectady, assignor to the Edison General Electric Company, New York, N. Y. Filed Feb. 8, 1892. Serial No. 420,786. (No model.)

Claim.—1. The combination, in a ring-armature, of an iron core having two series of holes through it near the inner and outer peripheries, respectively, and in the direction of its axis, and insulated conductors in said holes, the ends of the several conductors being connected to form the armature-coil, substantially as described.

2. The combination, in a ring-armature, of an iron core having two series of holes through it near the inner and outer peripheries, respectively, and in the direction of its axis, and insulated conductors in said holes, the ends of the several conductors being connected to form the armature-coil by cross bars or plates forming or adapted to form commutator-segments, substantially as described.

3. The combination, in an armature, of an iron core and insulating-washers at both sides thereof, the core and washers having two series of holes through them near their inner and outer peripheries, respectively, and in the direction of the axis of the armature, conductors in said holes, and insulation between the conductors and the core, the ends of the several conductors being connected across the faces of the core to form the armature-coil, substantially as described.

4. The combination, in an armature, of an iron core and insulating-washers at both sides thereof, the core and washers having two series of holes through them near their inner and outer peripheries, respectively, and in the direction of the axis of the armature, conductors in said holes, the ends of the several conductors being connected to form the armature-coil, and insulating-tubes on the conductors and extending into the washers, substantially as described.



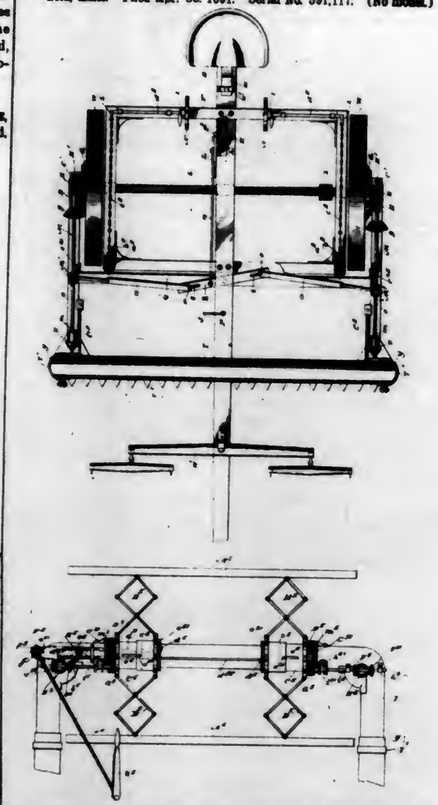
5. The combination, in a ring-armature, of a core, transverse conductors, and cross or connecting conductors at both sides of the arma-

ture, said cross-conductors at both sides being finished or adapted to be finished to form commutator-surfaces, substantially as described.

6. An armature having the conductor comprising its coil bars on two opposite sides of the armature, whereby either side may be employed as a commutator-surface, substantially as described.

7. A symmetrical reversible armature having the conductor comprising its coil bars on two opposite sides of the armature, said sides forming or adapted to form commutator-surfaces, whereby when the conductors at one side become worn the armature may be reversed, so that the commutator-brushes will bear on the opposite side, substantially as described.

480,729. ELECTRICAL DROP-ANNUNCIATOR. THOMAS W. LANE, Boston, Mass., assignor to the Electric Gas Lighting Company, Portland, Me. Filed Dec. 19, 1891. Serial No. 415,621. (No model.)



Claim.—1. In an electro-magnet annunciator, the combination of two magnets mounted upon a common base with a guide-piece, substantially as described, and adapted to carry a rod, a rod supported and retained by the guide-piece and extending beyond the same, an armature rigidly attached to the extension of said rod, a lug or projection beyond the armature, and a helical spring about said rod between the extremities of the guide, adapted to hold the armature in a normal position, all so combined that upon the magnet being energized the armature will be attracted and repress the rod and upon the magnet being de-energized the armature will be repulsed by the operation of the helical spring, substantially as described.

2. In an electro-magnetic annunciator, the combination of a double magnet upon a base affixed to an annunciator face-plate, a guide-piece perforated at its extremities, a rod passing through and adapted not to turn in the perforations of the guide-piece and extending beyond the same, a helical spring about the rod between the extremities of the guide-piece, an armature rigidly fixed to the extremity of said rod, a projection upon or beyond said armature, a standard adapted to be rigidly fixed to an armature-plate face at one end and to offer support for a rod by its other end, a rod supported by this standard, and an index-pointer at one end and a lever-arm at the other end of said rod, which is adapted to swing loosely in the standard aforesaid, all so combined and arranged that upon the magnet being energized the armature will be attracted and withdraw the projection on its face from the support of the lever-arm, allowing it to fall, and upon the magnet being de-energized the armature will move back by force of the helical spring, all substantially as described.

3. The combination, upon an annunciator-plate face, of devices, substantially as described, for moving a pointer-hand, each consisting of a double magnet, support, guide, rod, armature, projection, standard, rod, pointer-arm, and lever-arm, in combination with a lifting device adapted to restore the lever arm or arms to the lug upon the armature after operation of the apparatus, substantially as described.

4. In an electrical annunciator having a finger-index movable upon the face-plate, the combination of a magnet with two helices mounted upon a common base-plate, a support or guide-piece properly located between the said helices, adapted to carry a rod, a rod supported in said support or guide-piece and projecting beyond the same, an armature connected with the projecting end of said rod, a spiral spring surrounding said rod and adapted to normally hold the same in a given position, a standard properly fixed to the annunciator face-plate, and a two-armed lever, its two arms being properly arranged in different planes—viz., one arm the index-pointer, the other the lever-arm—supported or carried by said standard and having its lever-arm properly forked to allow the armature projection or lug to sustain the same, together with a lifting device adapted to the purpose of restoring said lever-arm of said rod to its normal position after each retraction of the armature, all substantially as described and shown.

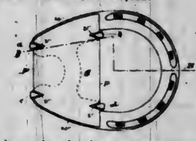
480,730. MOWER AND HEADER. ALBERT D. MARBLE, Winfield, Kans. Filed Apr. 30, 1891. Serial No. 391,117. (No model.)

Claim.—1. In a mowing-machine, the combination, with the oppositely-rotating main shafts M, means for moving said shafts longitudinally, and the gears F^6 on the shafts, of the rollers D^4, having gears E^4 adapted to be engaged alternately by those on the main shafts, and an endless apron passing around said rollers, as and for the purpose set forth.

2. In a mowing-machine, the combination, with a yoke, inner collars thereon, means for turning said collars by the movement of the cutting apparatus, outer collars sliding on said inner collars and turning therewith, and means for adjusting the outer collars longitudinally, of toggle-levers whose feet are connected to the different collars and reel-bars carried by the outer ends of the toggle-levers, as and for the purpose set forth.

3. In a mowing-machine, the combination, with an endless cutting apparatus moving in a yoke over wheels in its corners, a bevel-gear H^5 on the shaft of one of said wheels, a bevel-gear intermeshing therewith, and a collar C^9, surrounding one side of the yoke and rotated by said intermeshing bevel-gear, of a reel connected with said collar, as and for the purpose set forth.

4. In a mowing-machine, the combination, with an endless cutting apparatus moving in a yoke, means for driving it in either direction through said yoke, a bevel-gear driven by said apparatus, a longitudinally-movable shaft i^3, having smaller gears alternately engaging said bevel gear, and a gear G^3 on said shaft, of a gear D^3, intermeshing with said gear G^3, a collar C^3, connected to said gear D^3 and surrounding one side of the yoke, and a reel carried by said collar as and for the purpose set forth.



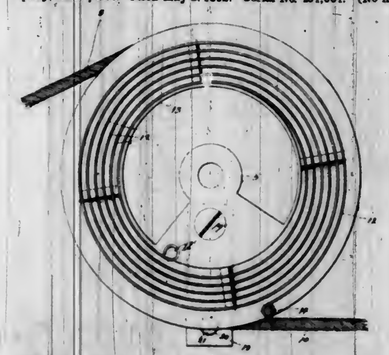
5. In a mowing-machine, the combination, with an endless cutting apparatus, a large bevel-gear driven thereby, a shaft i^3, having smaller gears alternately engaging said larger gear, a collar i^5 on said shaft, a bearing k^3, embracing said collar, a spring-tongue k^{31} therein, and a gear G^3 on said shaft, of a gear D^3, intermeshing with said gear G^3, a collar C^3, connected thereto, and a reel carried by said collars, as and for the purpose set forth.

6. In a mowing-machine, the combination, with a cutting apparatus, an inner collar C^3, driven thereby and having a slot, an outer collar c^3, sliding on the inner collar and having a pin engaging the slot therein, and means for adjusting the outer collar longitudinally, of a toggle-lever connected to the collars and a reel-bar carried by the outer end of the toggle-lever, as and for the purpose set forth.

7. In a mowing-machine, the combination, with a rotating inner collar, an outer collar sliding thereon and turning therewith, a toggle-lever connected to said collars, and a reel-bar carried by said toggle-lever, of a flange c^{31} on the sliding collar, a tongue c^3, loosely embracing said flange, a rod leading from said tongue and having teeth, a gear E^3, engaging said teeth and connected to a sprocket-wheel e^3, a chain leading therefrom to another sprocket f^3, mounted on a shaft F^3, leading to the operator, and having a handle u^3, a universal joint U^3 in said shaft, and means for raising and lowering the collars bodily, as and for the purpose set forth.

8. In a mowing-machine, the combination, with the yoke Y, two inner collars C^3, turning thereon, outer collars c^3 on said inner collars, toggle-levers extending outwardly from the pairs of collars, and reel-bars connected to the toggle-levers, of flanges c^{31} on the outer collars, tongues c^3, loosely embracing said flanges and mounted on independent rods d^{30} and d^{30}, each of which is toothed, as at d^{31}, a single gear E^3 between these teeth and simultaneously engaging both, and means for turning said gear from the driver's seat, as and for the purpose hereinbefore set forth.

480,731. HORSESHOE. GEORG MARTIN, Berlin, Germany. Filed Jan. 9, 1892. Serial No. 417,482. (No model.) Patented in Germany Mar. 10, 1891, No. 59,311; in Austria-Hungary June 22, 1891, No. 13,850, and in England Nov. 28, 1891, No. 20,782.

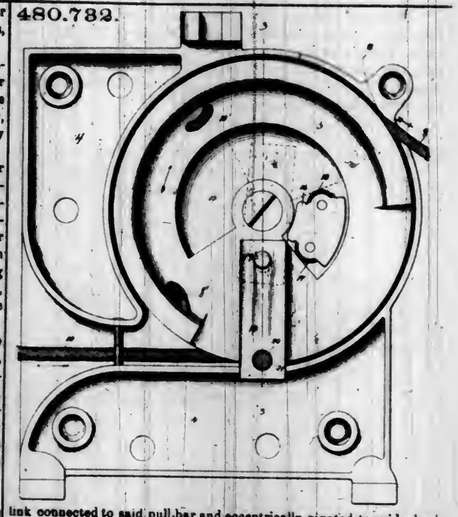


Claim.—1. A horseshoe having vertical walls *w w* and a horizontal plate *g*, extending between the walls, said walls and plate forming a depression across the frog part, and a pad held in said depression, substantially as described.

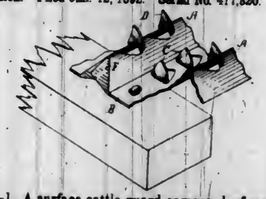
2. A horseshoe having vertical walls *w w* and a horizontal plate *g*, extending between the walls, said walls and plate forming a recess, a pad, and retaining means for said pad, consisting of vertical extensions on each side of the depression, substantially as described.

3. A horseshoe having depressions extending across the frog part thereof, a flexible pad, and retaining means therefor, consisting of the overhanging walls *e f* on each side of the depression, substantially as described.

480,732. OPERATING DEVICE FOR FARE-REGISTERS. JOHN W. MEAKER, Chicago, Ill., assignor to the Meaker Manufacturing Company, same place. Filed May 2, 1892. Serial No. 431,601. (No model.)



Claim.—1. The combination, with the pull-bar of a register, of a wheel, means for rotating said wheel, devices eccentrically connecting said wheel to said pull-bar, whereby the pull-bar may be reciprocated by rotating said wheel, and devices for returning the wheel to its normal position, substantially as described.



2. The combination, with the pull-bar of a register, of a wheel, a link connected to said pull-bar and eccentrically pivoted to said wheel in such position that its pivot will be over and in line with the pivot of the wheel when the pull-bar is at its highest position, and devices for operating said wheel, substantially as described.

3. The combination, with the wheel 5 and devices for rotating said wheel, of the pull-bar of a register, a stop adapted to limit the rotation of said wheel, and devices eccentrically connecting said wheel to the pull-bar of the register, substantially as described.

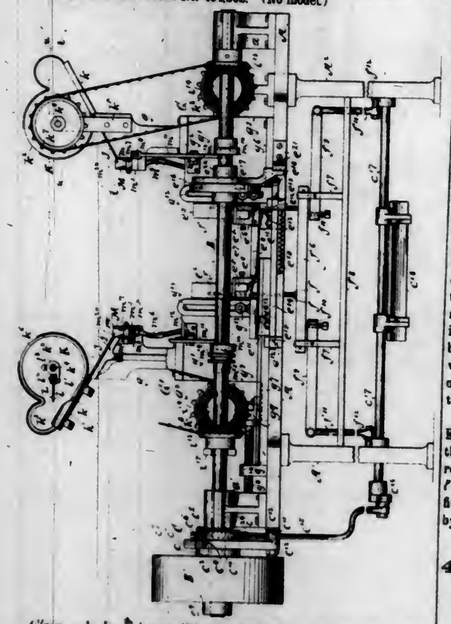
480,782.

480,733. SURFACE CATTLE-GUARD. GEORGE W. MILLER, Kalamazoo, Mich. Filed Jan. 12, 1892. Serial No. 417,820. (No model.)

Claim.—1. A surface cattle-guard composed of sections formed from a single plate of metal bent to form upwardly-projecting ribs alternating with depressed surfaces, the apex or upper portion of said ribs being provided with upwardly-projecting tongues cut and thrown upward from the metal forming said ribs, substantially as set forth.

2. A surface cattle-guard composed of inverted-V-shaped ribs or bars provided with upwardly-extending tongues cut and thrown upward from the metal forming said bars or ribs, substantially as set forth.

3. A surface cattle-guard composed of inverted V-shaped ribs or bars provided with upwardly-extending tongues cut and thrown upward from the metal forming said bars or ribs and strips of wood filling the hollow spaces beneath said bars or ribs, substantially as set forth.



4. A surface cattle-guard composed of sections formed from a single plate of metal bent to form upwardly-projecting ribs alternating with depressed surfaces, the apex of said ribs and the alternating depressed portions being provided with upwardly-projecting tongues cut and thrown upward from the metal forming the guard-sections, substantially as set forth.

480,734. LANTERN. CHARLIE I. MITCHELL, Chicago, Ill., assignor to the Adams & Westlake Company, of Illinois. Filed Dec. 24, 1891. Serial No. 416,071. (No model.)

Claim.—The combination, in a lantern-frame, of a bottom ring of sheet metal and flat vertical ribs disposed edgewise to the burner and having a quarter-twist at their lower ends, so that the latter project downward parallel with the bottom ring, said ring having a bead provided with a series of slots for the reception of the twisted ends of said vertical ribs, substantially as described.

480,735. BOX-NAILING MACHINE. BERNHARD MULLER, New York, N. Y., assignor of one-half to Bertha Strauss, same place. Filed Aug. 31, 1891. Serial No. 404,262. (No model.)

Claim.—1. In a box-nailing machine, the combination, with a bed-plate, means for holding thereon a box-frame to be nailed, and a stationary and a movable frame, each supporting nail-feeding mechanism and having slotted rails g^{15} adjustably secured thereto for supporting nail-chucks, of reciprocating cross-heads i^6, each provided with a right and left handed screw, engaging with rails i' i^5, resting against the cross-heads, and fitted to slide thereon and having hammers h^5 adjustably secured thereto, substantially as described.

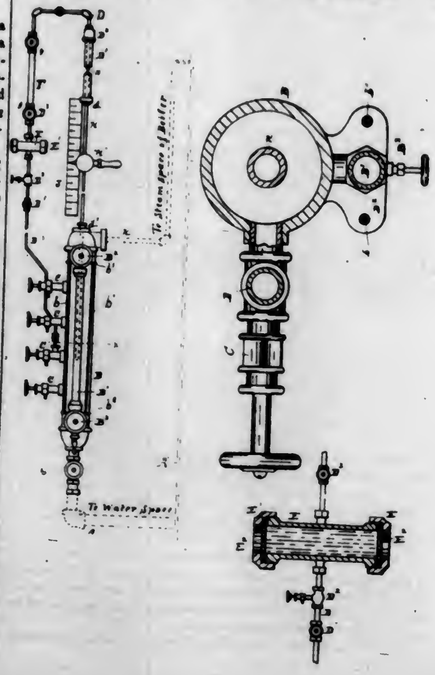
2. In a box-nailing machine, the combination, with nail-driving mechanism, of horizontally-adjustable gages having lugs for supporting the work vertically and sliding arms adjustably secured in boxes connected adjustably to ways attached to the bed-plate, substantially as described.

3. In a box-nailing machine, the combination, with nail-driving mechanism, of a stationary slideway secured to the bed-plate for supporting gages sustaining the work on one side, a movable slideway secured in ways on the bed-plate for supporting gages sustaining the work on its other side, a toggle device for moving the latter gages against the work and comprising a sliding bar pivotally connected by links to the movable slideway, and suitable mechanism operated by the main shaft for reciprocating the sliding bar, substantially as described.

4. In a box-nailing machine, the combination, with gages for supporting a box-frame to be nailed, of clamping-bars fulcrumed between their ends to yielding lugs attached to the gages and arranged to press against the inside surfaces of the side pieces of the box-frame and hold the same securely against the gages and suitable mechanism for operating the clamping-bars, substantially as described.

5. In a box-nailing machine, the combination, with gage bars for supporting a box-frame to be nailed, of clamping-bars pivotally connected to yielding lugs attached to the gage-bars and having bottom portions bent inwardly to rest on a cross-bar and means to impart a vertical and parallel motion to the said cross-bar to rock the clamping-bars simultaneously, substantially as described.

6. In a box-nailing machine, the combination of mechanism for operating both the clutch C and the clamping-bars f from a treadle simultaneously, consisting of a shaft c^{17}, journaled in the legs A' A^3 and provided with the crank-arms f^{14} and c^{16}, the arms f^{13} being connected by rods to levers fulcrumed in stationary supports and provided with adjusting screws bearing against the cross-bar f^6, to which a parallel motion upward, varying in extent, may be imparted, while the crank-arm c^{15} is connected to the rod c^{16} for operating the clutch, being held normally down against a stop-plate c^{22} by a coil-spring c^{23}, substantially as described.



7. In a box-nailing machine, the combination, with an inclined slideway for nails contained in a table, as J, of a picker comprising a tube arranged against the front of the slideway and forming a stop for nails therein, the tube being mounted to oscillate about a vertical axis in line with the slideway and having its annular top surface provided with a notched inclined slideway coinciding with and forming a continuation of that of the table when oscillated in line therewith, a stop-plate adjustably secured to the table and arranged above the tube to admit and suspend a single nail within the notch thereof, and means for oscillating the tube, substantially as described.

8. In a box-nailing machine, the combination of a number of tubular pickers working in conjunction with stop-plates arranged above the same and mounted to oscillate in a cross-bar secured to the framework of the machine, yokes or annular rings adjustably secured to the said tubular pickers and having bifurcated extensions engaging with pins attached to a reciprocating bar, and suitable mechanism for operating the same, substantially as described.

9. In a box-nailing machine, a hopper for feeding nails and mounted to rock on standards secured to the framework of the machine, the hopper comprising a bottom portion adapted to cause nails to arrange themselves in grooves therein, a partially cylindrical shell arranged above the front portion of the bottom thereof and opening into a covered space above the rear grooved portion thereof, and a brush composed of thin metallic and resilient fingers mounted to turn within the cylindrical portion and come in contact with the surface of the bottom of the hopper at its front end and throw nails toward the rear end thereof, substantially as described.

10. In a box-nailing machine, the combination, with the hopper K, of a brush adjustably secured to a shaft mounted to turn therein, the brush consisting of a row of thin metallic and resilient fingers l, resting on a layer of fibrous material contained in a groove in a bar l' and having their ends bent to enter another groove in the bar l', the fingers being held together by shellac or other adhesive material and by a bar l^3, clamped to the bar l', substantially as described.

480,736. LIQUID-LEVEL-INDICATOR SYSTEM. HENRY A. MCGHEE, Detroit, Mich. Filed Aug. 17, 1891. Serial No. 402,877. (No model.)

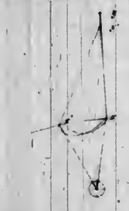
Claim.—1. In an indicator system for steam-boilers, &c., the combination, with a reservoir of a pipe communicating therewith and led to a distance therefrom, an indicator in said pipe distant from the reservoir, said pipe having a return communication with the reservoir, and the extremities of said pipe normally communicating with said reservoir below the water-line to provide for circulation through said pipe, substantially as described.

2. In a water-indicator system for steam-boilers, the combination, with a water-pipe to communicate with the boiler, of a water-column communicating with said pipe, a steam-pipe communicating with the boiler and with the water-column, a series of gage-cocks C, communicating with said column, and an additional water-pipe provided with a water-indicator and communicating with said column, said latter pipe having a return communication with the water-column, the extremities of said additional pipe normally communicating with said column below the water-line, substantially as described.

3. In a water-indicator system for steam-boilers, the combination, with a water-pipe leading from the boiler, of a water-column communicating with said pipe, a steam-pipe communicating with the boiler and water-column, an additional water-pipe leading from said column and having a return communication therewith, and a water-indicator located in said latter pipe, the extremities of said additional pipe normally communicating with the water-column below the water-line therein, substantially as described.

4. In a water-indicator system for steam-boilers, the combination, with a water-pipe leading from the boiler, of a water-column communicating therewith, a steam-pipe communicating with the boiler and water-column, an additional water-pipe leading from said column and provided with a water-indicator, and a pipe H, having a movable connection with said additional pipe and with said column, substantially as described.

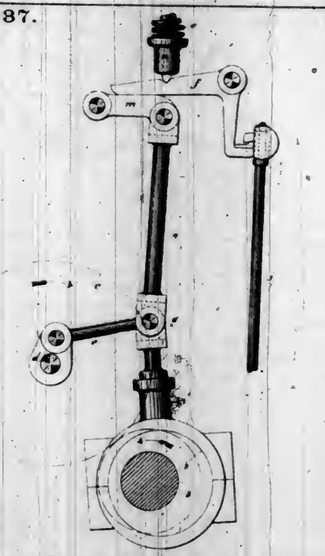
5. In a water-indicator system for steam-boilers, the combination, with a water-pipe leading from the boiler, of a water-column, a steam-pipe communicating with the boiler and with the water-column, an additional water-pipe leading from said column provided with a water-indicator, a pipe H, having a movable connection with said pipe and with the said column, and means for moving said pipe H, substantially as described.



6. In a water-indicator system for steam-boilers, the combination, with a pipe leading from the boiler, of a water-column connected with said pipe, an additional water-pipe leading from said column provided with a water-indicator, a pipe H, having an adjustable connection with said additional pipe and with said column, and a scale to indicate the adjustment of said pipe H, substantially as described.

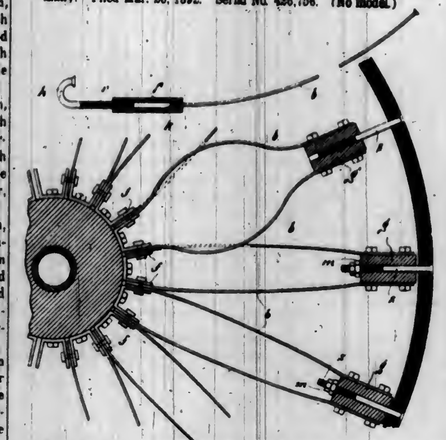
7. In a water-indicator system for steam-boilers, the combination, with a pipe leading from the boiler, of a water-column connected with said pipe, an additional pipe leading from said column having a water-indicator located therein, a pipe H, having telescopic connection with said additional pipe and with said column, means to adjust the pipe H, and a pipe leading from the upper end of said column to the boiler, substantially as described.

8. In a water-indicator system for steam-boilers, the combination, with a water-pipe leading from the boiler and having return communication therewith, of a water-indicator located at a point distant from the boiler-room, having communication with said water-pipe, and cocks to control the communication of said gage with said pipe located at each side of said gage, the extremities of said pipe normally communicating with the boiler below the water-line to provide for water-circulation therethrough, substantially as described.



9. The combination, with a pipe having normal communication with a boiler or reservoir below the water-level thereon to provide for circulation therethrough, of the gage E, located therein, said gage consisting of a horizontal tube provided with end fittings, and observation-glasses located at the extremities of said tube and held in place by said fittings, substantially as described.

480,737. GAS OR PETROLEUM MOTOR. ANTON NIEMCZYK, Leipsic, Germany. Filed Sept. 12, 1891. Serial No. 405,561. (No model.)



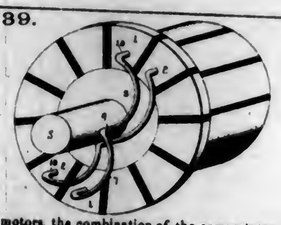
Claim.—In a gas or petroleum motor, the combination of the small toothed wheel *a*, connected with an eccentric *b*, and the large

480,787.

toothed wheel *c*, connected with a crank *d*, with a link *e*, a pivot *g*, an eccentric-rod *h'*, a connecting-rod *h*, a valve-lever *f*, and a valve *n*, as set forth.

480,738. ELASTIC WHEEL. JULIUS VON OLIVIER, Munich, Germany. Filed Mar. 28, 1892. Serial No. 426,756. (No model.)

Claim.—1. In a wheel, the combination of the spokes and the outer portion consisting of a continuous band superimposed upon itself in layers, substantially as described.



2. In combination, the hub, the rim, the block *g*, the two spokes *b b*, secured to said block, one on each side, and secured, also, to the hub, the bolt S, passing through the said block and connected with the rim, and means for adjusting the bolt, substantially as described.

480,739. COMMUTATOR FOR ELECTRO-MAGNETIC MACHINES. HORACE F. PARSHALL, Schenectady, assignor to the Edison General Electric Company, New York, N. Y. Filed Dec. 11, 1891. Serial No. 414,718. (No model.)

Claim.—1. The combination of a commutator-cylinder having several segments or bars and several conductors joining the same in groups, said conductors crossing each other without metallic contact and occupying parallel planes fewer in number than the number of conductors, whereby the space occupied thereby in the direction of the length of the armature-shaft is reduced, substantially as described.

2. In a commutator-cylinder adapted for use with multipolar

480,739.

dynamos or motors, the combination of the commutator segments or bars and conductors connecting separate segments, each of said conductors having sections in separate and substantially parallel planes, each conductor having sections substantially at right angles to the parallel sections, substantially as described.

3. In a commutator-cylinder adapted for use with multipolar dynamos or motors, the combination of the commutator segments or bars and conductors connecting separate segments, said conductors having sections one-half of which lie in one plane and one-half of which in another plane, whereby the conductors can be crossed without contact, substantially as described.

4. The combination, with the segments of a commutator-cylinder, of conductors for connecting them in pairs, each of said conductors having two bent sections in different planes, a section connecting the same, and bent ends or extensions connected to the segments, substantially as described.

480,740. ARMATURE FOR DYNAMO-ELECTRIC MACHINES. HORACE F. PARSHALL, Schenectady, assignor to the Edison General Electric Company, New York, N. Y. Filed Dec. 11, 1891. Serial No. 414,719. (No model.)

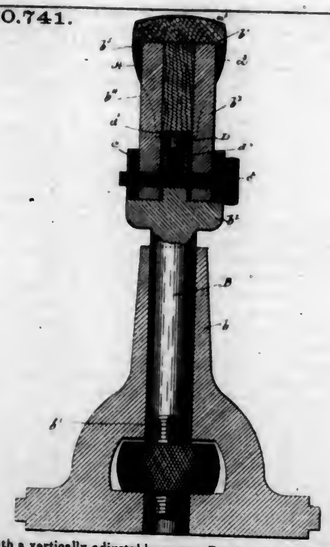
Claim.—1. A toothed or grooved armature-core with one or more perforated sections interposed between grooved sections, said perforations coming in line with the grooves, substantially as described.

2. An armature-core built up of alternating sections of notched and perforated plates, substantially as described.

3. The combination of several notched iron plates placed together so that the notches are in line with each other, forming grooves, and plates having perforations, said plates being interposed at one or more points between the notched plates, the perforations coming in line with the notches, substantially as described.

4. An armature-core built up of sections, a part of the sections being perforated and having their peripheries entire, and the other sections being open in line with said perforations, substantially as described.

480,741. JACK FOR HEEL-NAILING MACHINES. FREEBORN F. RAYMOND, 2d, Newton, Mass. Filed June 15, 1889. Serial No. 314,463. (No model.)



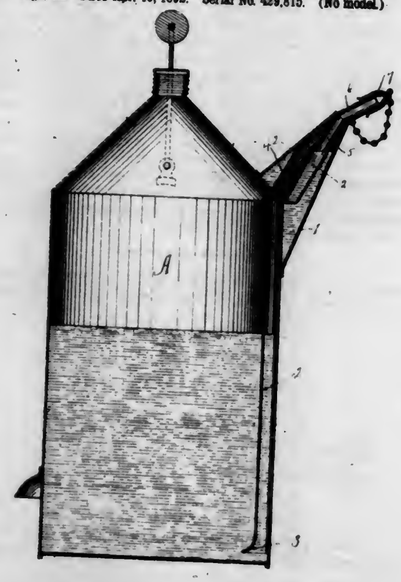
Claim.—1. The improved last for use in connection with a jack having the construction specified and in combination with said jack, comprising a body having its bottom at the heel end formed by the metal plate a' and also having the side recesses a^3, substantially as and for the purposes described.

2. The last A, the metal bottom plate a' for the heel end thereof, having the cross-bar a^3 upon its inner side, and the side recesses a^3, in combination with a supporting-jack, substantially as described.

3. The jack for use in connection with a last having the construction specified having arms b^3 b^4, adapted to enter the side recesses a^3 of the last and to provide supports for the heel-plate a' thereof, combined with a vertically-adjustable support B, substantially as described.

480,741.

4. The jack for use in connection with a last of the character specified, having arms b^3 b^4, and the support B, substantially as described.



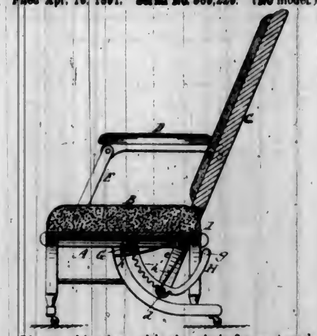
5. A jack for use in connection with the last specified, having the arms b^3 b^4, the adjustable support D, and the adjustable support B, substantially as described.

6. The jack for use in connection with the last of the character specified, having the arms b^3 b^4, horizontally adjustable to and from each other, substantially as described.

7. The jack for use in connection with a last of the character specified, having the arms b^3 b^4, the base b^5, and the spindle-hole b^7, combined with the support D, substantially as described.

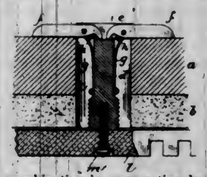
8. The combination of a jack having the arms b^3 b^4, with a last having the metal nailing-plate a' at the heel end, and the side recesses a^3 to receive the said arms b^3 b^4, and the support B, substantially as described.

480,742. OIL-CAN. ULRICH REIFFER and JOHN F. STAUFFER, Chicago, Ill. Filed Apr. 19, 1892. Serial No. 429,815. (No model.)



Claim.—1. A can having a spout 1, a tube 2, leading from the interior of said can into said spout, and an outlet-tube 5, leading from the said spout below the upper end of said tube 2.

2. A can having a spout 1, a tube 2, leading from the lower end portion of said can into said spout, and an outlet-tube 5, leading from said spout below the upper end of said tube 2.



3. A can having a spout 1, a tube 2, having a flared lower end 3, located at the lower end portion of said can and having its upper end leading into said spout, and an outlet-tube 5, leading from said spout below the upper end of said tube 2.

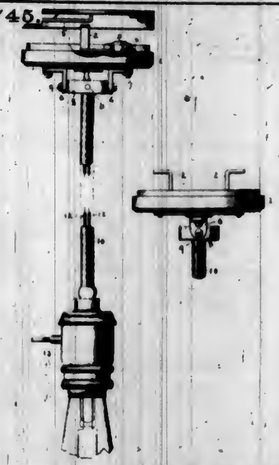
480,743. ADJUSTABLE CHAIR. WILLIAM RICHARDS, Rochester, N. Y. Filed Apr. 16, 1891. Serial No. 389,239. (No model.)

Claim.—The combination, with the chair-frame A and pivoted back C, provided with the cross-rod d, of the ratchet-bar G, pivoted to the frame, the ratchets H H, attached thereto, engaging with the cross-rod, the cross-round I, attached to the frame and lying in axial line with the pivots on which the chair-back turns, and the coiled springs K K, resting on the cross-round and provided each with two projecting ends A A', one operating the ratchet-bar and the other the chair-back, as shown and described, and for the purpose specified.

480,744. DEVICE FOR SUPPORTING FIXTURES. JAMES T. ROSS, Mount Vernon, assignor to Bergmann & Company, New York, N. Y. Filed Dec. 20, 1889. Serial No. 334,439. (No model.)

Claim.—1. The combination, in a supporting device of the character described, of a stem, arms pivoted thereto at its upper end, springs secured to the body of the stem and holding said arms at approximately right angles to the stem, and means to prevent further movement of said arms, substantially as described.

2. A device for suspending electric-light fixtures from hollow ceilings, having, in combination, a stem or shank, two arms pivoted thereto, springs for keeping said arms extended, means for preventing said arms from rising above a horizontal point, and a screw-threaded opening at the lower end of said stem, substantially as set forth.

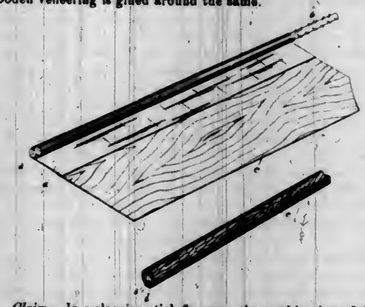


3. In a device for supporting fixtures from hollow ceilings, the combination of the stem or shank d, pivoted arms f, springs g for keeping said arms at right angles to the stem, fingers i, preventing said arms from rising above the horizontal point, and screw-threaded opening k at the lower end of stem d, substantially as set forth.

480,745. ELECTRIC-LIGHT FIXTURE. JAMES T. ROSS, Mount Vernon, assignor to the Edison General Electric Company, New York, N. Y. Filed Aug. 31, 1891. Serial No. 404,229. (No model.)

Claim.—1. The combination of a block or cover carrying terminals on one side, a pipe inclosing or adapted to inclose conductors and adapted to support an electrical device, brackets fixed to the opposite side of said block or cover, and a gimbal-joint between said brackets and pipe, substantially as described.

2. The combination, in an electric-light fixture, of a ceiling block or box carrying within it circuit-terminals, a block carrying hook-shaped terminals adapted to engage the first-mentioned terminals to complete the circuit, conductors from the terminals on the block to an electrical device, and a pipe inclosing the conductors and supporting said device and supported from the block by a gimbal-joint having brackets secured to the lower face of the block, substantially as described.

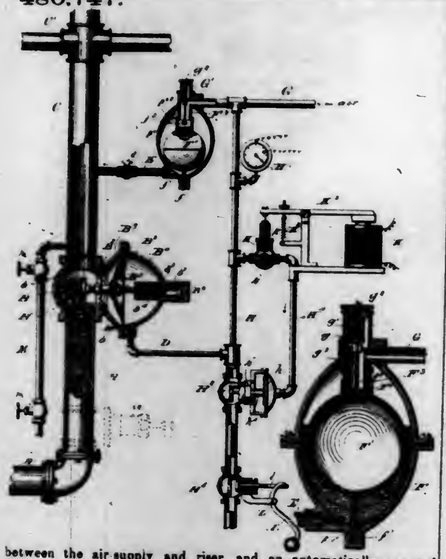


480,745.

3. The combination of a block or cover, metal pieces on one side thereof, to which circuit-wires may be connected, brackets on the opposite side of said block or cover, said metal pieces and brackets being secured to the block by screws, each passing through a bracket and one of said pieces, a pipe adapted to support an electrical device, and a gimbal-joint between said pipe and said brackets, substantially as described.

480,746. VENEERED GUN-ROD. ALBERT SANDBERG, Freystadt, Germany. Filed Feb. 5, 1892. Serial No. 420,457. (No model.) Patented in Germany Aug. 22, 1891; in France Aug. 27, 1891, No. 215,764; in Switzerland Aug. 28, 1891, No. 3,933; in England Sept. 5, 1891, No. 15,185; in Belgium Sept. 7, 1891, No. 96,301, and in Italy Sept. 19, 1891, VIII, 283.

Brief.—A steel rod is covered with a strip of linen and then a wooden veneering is glued around the same.



Claim.—In a cleaning-stick for guns, the combination of the steel rod a, the linen strip d, and the veneer c, as and for the purpose described.

480,747. SPRINKLER SYSTEM. WILLIAM C. SHAFFER, Milwaukee, Wis. Filed Sept. 18, 1891. Serial No. 406,137. (No model.)

Claim.—1. In a sprinkler system, the combination, with the main water-supply pipe, of a valve for closing the same, a diaphragm on the valve, a compressed-air-supply pipe leading into the rear of the diaphragm, and two or more automatically-operated independent means in operative connection with the system for releasing the diaphragm from the air-pressure upon the presence of abnormal heat, substantially as described.

2. In a sprinkler system, the combination, with the main water-supply pipe, the riser, and branch pipes, of a compressed-air-supply pipe, a branch pipe forming communication between the air-supply and riser, a valve actuated by the compressed air to cut off the water-supply, and a valve actuated by the water to close communication

480,747.

between the air-supply and riser, and an automatically-operated escape-valve in the air-pipe, substantially as described.

3. In an automatic sprinkler system, the combination, with the main supply-pipe, the riser, and branch pipes, of a valve located between the riser and main supply pipe, a stem on the valve, a diaphragm on the stem, a compressed-air-supply pipe leading into the rear of the diaphragm, a valve in the air pipe, a magnet for unseating the valve, a branch pipe forming communication between the riser and air-pipes, and a valve in the branch pipe for closing the communication upon the pressure of water in the branch pipe, substantially as described.

4. In a sprinkler system for automatic fire-extinguishers, the combination, with the water-supply pipe, riser, and branch pipes, of an air-supply pipe, a valve actuated by the air-supply to close the water-supply, a communicating passage between the air-supply and riser, a valve in the passage for closing the same, and an escape-valve actuated by the said valve, substantially as described.

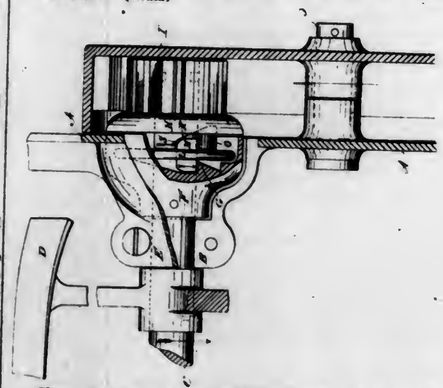
5. In a sprinkler system, the combination, with the water-supply pipe, riser, and branch pipes, of a compressed-air-supply pipe communicating with the riser, a valve between the riser and water-supply, a diaphragm against which the compressed air impinges for closing the valve, a float-valve between the riser and air-supply, and an escape-valve actuated by the float, substantially as described.

6. In a sprinkler system for fire-extinguishers, the combination, with a supply, riser, and branch pipes, of a compressed-air supply, a communicating passage between the same and riser, a float-valve in the passage, a perforated sleeve on the float, a nipple with which said sleeve engages, and an air-discharge valve actuated by the float, substantially as described.

7. In a sprinkler system for automatic fire-extinguishers, the combination, with the supply and riser pipes, of a valve between the same, a diaphragm-chamber in which the valve-stem works, a diaphragm on the valve, means for introducing compressed air in the rear of the diaphragm, and a yielding partition between the diaphragm and valve, substantially as described.

8. In a sprinkler system, the combination, with a water-supply pipe and riser-pipe, of a valve-coupling between, a casing on the coupling, a valve in the coupling, a diaphragm on the valve, and a yielding partition secured to the valve between the casing and coupling, substantially as described.

9. In a sprinkler system, a diaphragm-valve for closing the water-supplying pipe, pipes for supplying compressed air for actuating the diaphragm, valves for releasing the diaphragm from said air-pressure, a valve in the air-pipes, and a weighted lever for normally opening the same, substantially as described.



10. In a sprinkler system, the combination, with the riser, air, and water-supply pipes, and a diaphragm-valve for closing the water-supply, of a communicating pipe between the air-supply and riser pipes, a float-valve in said communicating pipe, an air-discharge valve, and a stem on the air-discharge valve extending down into the path of the float, substantially as described.

11. In a sprinkler system, a float-valve having a perforated collar, a hollow nipple fitting within the collar, and a guide-pin on the float, substantially as described.

12. In a sprinkler system, the combination, with the main supply-pipe, riser, and branch pipes, of a valve between the supply and riser pipes, a stem on the valve, a diaphragm on the stem, a casing surrounding the diaphragm, an air-supply pipe leading into the casing and riser, and a valve in the air-pipe, actuated by the water to close communication between the riser and air pipes, substantially as described.

13. In a sprinkler system, the combination, with the water, riser, branch, and air pipes, of a diaphragm-valve for closing the water-pipe, a diaphragm-valve for closing the air-pipe, an air-exit valve, a plunger for opening and closing the same, an electro-magnet for normally holding the plunger to close the exit-valve, a float-valve, and an exit-valve actuated by the float to prevent the escape of the air from the air-pipe upon the pressure of water in the riser-pipe, substantially as described.

480,748. CLUTCH. ALBERT L. SLAGER, Springfield, Ohio, assignor to the G. S. Foos Company, same place. Filed June 22, 1891. Serial No. 397,127. (Model.)

Claim.—1. In a clutch, the combination, with a head having ratchet-teeth on one end and having a housing extending out beyond said teeth, of a dog consisting of an annulus provided with teeth symmetrically located on each side thereof, so that both sides are alike and matching said ratchet-teeth of the head, and a closing disk or piece adjacent to said housing and having teeth opposite to said ratchet-teeth and matching with the teeth of said dog, and a support for said pieces, whereby the dog constitutes a symmetrical clutching connection between said head and disk and is adapted to be used with right or left hand inclosing members.

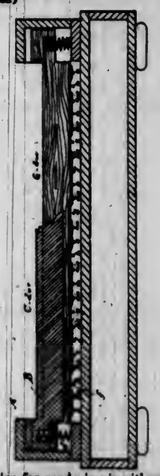
2. In a clutch, the herein-described dog, the same consisting of an annulus of comparatively small thickness to take up as little room axially as possible and provided with teeth or lugs extending out substantially the same from both sides, whereby the dog is symmetrical and adapted to be reversed, the said lugs or teeth being open through the sides of the annulus to allow the operative teeth engaging therewith to extend into or beyond the annulus.

480,749. STANDARD. LUCIUS T. STANLEY, Brooklyn, N. Y. Filed May 15, 1891. Serial No. 392,939. (No model.)

Claim.—1. In combination, a base, a rod or tube, of flexible metal, secured to said base, so as to be adapted to have a revoluble movement in said base, a spiral spring surrounding said rod or tube and connected to said rod or tube, and a socket connected to the upper end of said spring.

2. In combination, a base, a rod or tube, of flexible metal, secured to said base, a sleeve, as H, which surrounds the upper end of said rod or tube, a socket, as J, in said sleeve, and a spiral spring surrounding and connected to said rod or tube, the upper end of said spring being connected to said sleeve H.

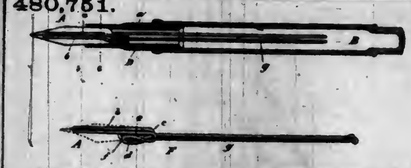
3. In combination, a base, a rod or tube, of flexible metal, secured to said base, so as to be adapted to have revoluble movement in said base, a sleeve, as H, which surrounds the upper end of said tube or rod, a socket, as J, in said sleeve, and a spiral spring surrounding and connected to said rod or tube, the upper end of said spring being connected to said sleeve H.



4. In combination, a base, a rod or rods, as A, of flexible metal, secured to said base, a tube formed of flexible metal surrounding said rod or rods, a sleeve, as H, which surrounds the upper end of said tube and rod, a socket in said sleeve, and a spiral spring which surrounds and is connected to said tube, the upper end of said spring being connected to said sleeve H.

5. In combination, a base, a rod or rods, as A, of flexible material, secured to said base, a tube formed of flexible material surrounding said rod and secured to said base, so as to be adapted to have a revoluble movement upon said base, a sleeve, as H, surrounding the upper end of said rod and tube, a socket in said sleeve, and a spiral spring surrounding and connected to said tube, the upper end of said spring being connected to said sleeve.

6. In combination, a base, a rod or rods formed of copper or other flexible electric conducting material secured to said base, a tube formed of flexible material surrounding said rod or rods, a sleeve, as H, which surrounds the upper end of said tube and rod, a socket in said sleeve, and a spiral spring which surrounds and is connected to said tube, the upper end of said spring being connected to said sleeve H.

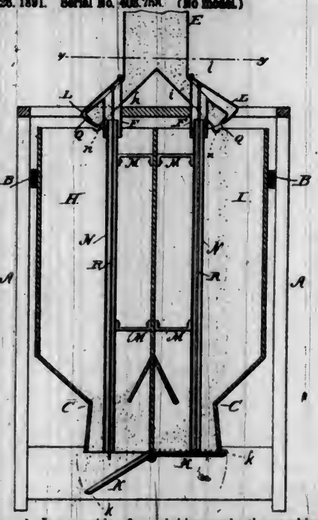


7. In combination, a base, a rod or rods formed of copper or other flexible electric conducting material secured to said base, a tube formed of flexible material surrounding said rod or rods and secured to said base, so as to be adapted to have a revoluble movement upon said base, a sleeve, as H, which surrounds the upper end of said tube and rod, a socket in said sleeve, and a spiral spring which surrounds and is connected to said tube, the upper end of said spring being connected to said sleeve H.

480,750. ATTACHMENT TO ZITHERS. PAUL STARK and KARL A. GÜRTLER, Markneukirchen, Germany. Filed Nov. 12, 1891. Serial No. 411,756. (No model.)

Claim.—In a device for rendering in zithers only certain groups of strings adapted to be sounded, the combination of the frame A, having notches *d*, with the guide-pins C, bearing click-springs *c*, and the bars B, raised by springs *d* and provided with cloth plates *f*, as and for the purpose set forth.

480,751. FOUNTAIN-PEN. WILLIAM W. STEWART, Brooklyn, N. Y. Filed Jan. 20, 1890. Serial No. 337,406. (No model.)



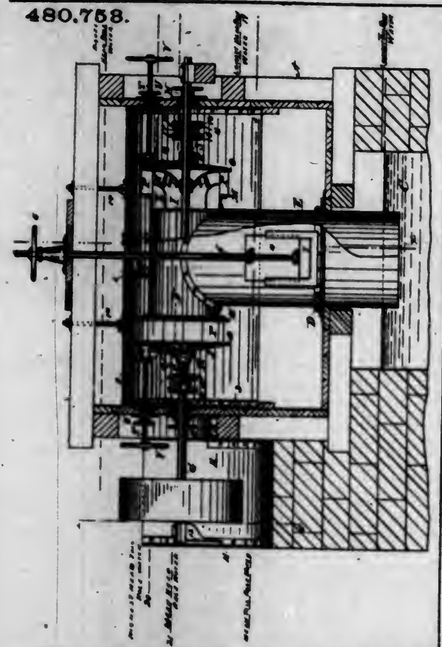
Claim.—1. In a fountain-pen, a wire extending longitudinally against the pen, bent upon itself beneath the heel of the pen, and extending thence upwardly into the reservoir.

2. In a fountain-pen, a double wire extending longitudinally against the pen, bent upon itself beneath the heel of the pen, and extending thence upwardly into the reservoir.

3. In a fountain-pen, a wire doubled upon itself, with its fold adjacent to the slit in the pen, extending thence upwardly along the pen, bent downwardly and forwardly beneath the heel of the pen, and bent backwardly and its end portions extending upwardly into the reservoir.

4. In a fountain-pen, a wire or strand extending upwardly, bent upon itself, and extending downwardly, the two portions having an elastic tendency to press together, whereby on inserting the pen between them it will be clamped in place.

480,752. AUTOMATIC WEIGHING-MACHINE. JOHN R. STOKER, New York, N. Y., assignor to Frances J. Hasbrouck, same place. Filed Aug. 26, 1891. Serial No. 403,758. (No model.)



Claim.—1. In a machine for weighing grain, the combination of, first, a balance-beam bearing on one of its lever-arms a hopper having two compartments, each provided with a door at the bottom for delivering the grain, the door of one compartment adapted to be shut by opening the door of the other; second, a chute having two branches adapted to deliver grain into said compartments, respectively, and, third, a device for operating the cut-offs of said branches, which consists of a rod inclosed from the grain and dirt and adapted to be raised by the shutting of said door, substantially as described.

2. In an automatic machine for weighing grain, the combination of, first, a balance-beam having the hopper for the grain supported on a knife-edge on one arm thereof higher than the fulcrum of said beam on the frame of the machine and the weight supported on a knife-edge on the other arm thereof higher than the said first-mentioned knife-edge and said fulcrum-point; second, a hopper having two compartments adapted to receive and deliver grain alternately from a chute having two branches; third, bottom doors for said compartments having flanges; fourth, cut-offs for said branches, consisting of a plate movable transverse to the opening of said chute, and a plate rigid on the wall of said chute toward which said movable plate is moved when said chute is opened, and, fifth, means of automatically opening said bottom door of one compartment and shutting the branch chute feeding the same and shutting said bottom door of the other compartment and opening the branch chute feeding the same, alternately, as the hopper receives the amount of grain to be weighed and drops, substantially as described.

480,758. WATER-WHEEL. WILLIAM W. TYLER, Springfield, Ohio, assignor to the James Leffel & Company, same place. Filed Dec. 4, 1891. Serial No. 414,082. (No model.)

480,758.

Claim.—1. In a water-wheel, the combination, with a wheel proper and its adjuncts and a discharge flume or passage, of an inclosing flume or structure within which such wheel is located and a valvular device mounted on the top of said hood to admit water into such flume or discharge-passage initially and shut off said water therefrom after the preliminary operation of the wheel, whereby the air is drawn from the chamber within such hood or inclosing structure and the water is raised about and above the wheel and above the head.

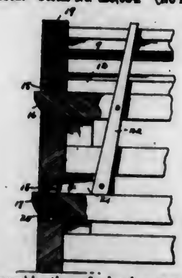
2. In a water-wheel, the combination, with a wheel proper and its adjuncts and a discharge flume or passage having an opening in the discharge-flume below the wheel to admit water into the flume or passage, of an air-discharge pipe or passage leading from the upper part of the chamber within such hood or structure into such flume or discharge-passage, for the purpose set forth.

3. In a water-wheel, the combination, with a hood, of a discharge-flume, an air-discharge pipe bent reversely in a hook shape and connecting the upper part of the hood and the flume, and a float adjacent to said pipe adapted to close the same automatically, as and for the purpose described.

4. In a water-wheel, the combination, with a wheel proper and its adjuncts and a discharge flume or passage, of a hood or inclosing structure within which such wheel is located and an air pipe or passage leading from the chamber formed within such hood or structure to the flume or discharge-passage, whereby the air in such chamber may be exhausted as the water passes down said flume or discharge-passage and whereby vacuum-space is formed to permit the water to rise in such hood or structure.

5. In a water wheel, the combination, with a wheel-case and wheel proper at either end thereof, independent gate-operating devices for each wheel proper, and a discharge-flume connected to such case, of a hood or inclosing structure within which the case and wheels proper are located and a controlled water-opening leading to such flume below the wheels, whereby water may discharge through it and produce vacuum conditions in the chamber within such hood or structure to effect the elevation of the water therein to an altitude above the head.

6. In a water-wheel, the combination, with a case, a wheel proper at each end thereof, independent gate-operating mechanism for such wheels, and a discharge-flume connected to such case, of a controlled opening in the flume for the purpose described and a hood or inclosing structure within which the case and wheels are located, and an air-discharge pipe or passage leading from the chamber within the hood or structure to the flume, for the purpose described.

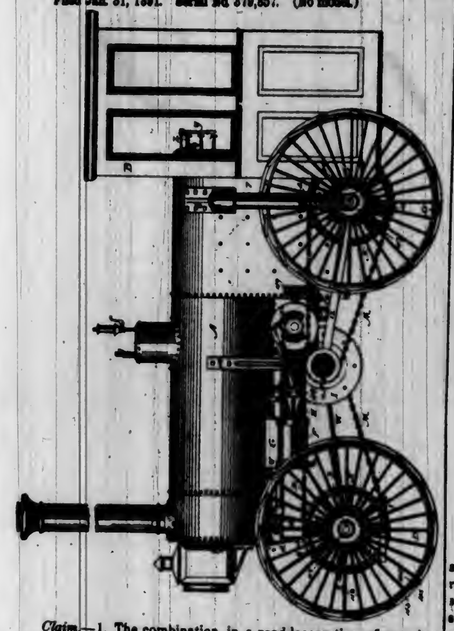


7. In a water-wheel, the combination, with a case, two wheels proper, and a discharge flume or passage, of a hood or inclosing structure within which such case and wheels proper are located and a controlled water-opening in the flume or passage, for the purpose described.

480,754. NECKTIE-FASTENER. LUDWIG UHDENING, Berlin, Germany. Filed Apr. 11, 1892. Serial No. 428,695. (No model.)

Claim.—In a necktie-lock, the combination, with the housing adapted for attachment to the scarf-shield and containing pins *a b*, of a spring-fork having the central loop and spread ends and adapted for connection to a neckband, substantially as set forth.

480,755. SLIDING GATE. MARTIN L. WALTERS, Findlay, Ohio. Filed Mar. 3, 1892. Serial No. 423,634. (No model.)



Claim.—The combination of a latch-post provided with openings and having a transverse pin arranged in one of the openings, a sliding gate provided with projections 16 and 17, the latter being shouldered and adapted to engage the pin, a sliding wedge arranged above the projection 17 to force the latter into engagement with the pin, and a lever fulcrumed on the gate and connected to the wedge, substantially as described.

480,756. ELASTIC PUMP-ROD. WALTER C. WESTAWAY, Decorah, Iowa. Filed Dec. 14, 1891. Serial No. 415,028. (No model.)

Claim.— In an elastic pump-rod, the combination of the pump-rod sections A F, the spring E, the fixed block D', the movable block D, and the connecting members *g'*, with two flat flexible metal straps K K, fastened to the lower block D', serving as guides for the upper movable block D, above which block said straps are secured to an interposed strut G for the purpose of holding them parallel to each other between the blocks D D', said straps extending upward from the strut G to the upper section F and attached to the sides of the latter section at a sufficient distance above the strut G to enable them to be flexed to conform to rod-sections of various sizes, substantially as and for the purpose set forth.

480,757. ROAD-LOCOMOTIVE. HENRY WHITE, Bellville, Ohio. Filed Jan. 31, 1891. Serial No. 379,857. (No model.)

Claim.—1. The combination, in a road-locomotive, of sprocket-wheel L with coupling-joint on ball *k*, all substantially as set forth.

2. In a road-locomotive, the combination of boiler A on shifting-block *c* with spiral screw *b*, around which bevel-gear *d* is made to rotate by steam-power for the purpose of steering, substantially as set forth, for the purpose specified.

3. The wheel D, having the tire 44, provided with rim 43, and spur 45, all as set forth.

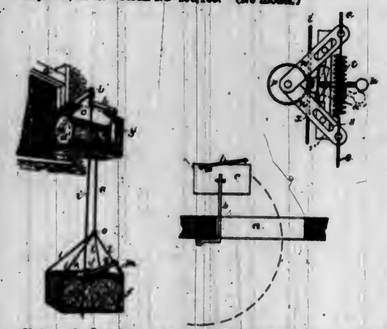
4. The combination, in a road-locomotive, of cushion-wheel E with rubber cushions *o* on drive-wheel axles, substantially as set forth, for the purpose specified.

5. In a road-locomotive, the combined hand and foot lever provided with cross-bars and capable of rotary motion about an axis, in combination with gear-shifting devices for directing the course of the locomotive, as set forth.

480,758. NUT-LOCK. WILLIAM H. WILLS, Buena Vista, Va., assignor of four-fifths to A. Seddon Jones, Julius Graham, Roland F. Hill, Burns Osborne, and Jesse H. Clore, same place. Filed Dec. 10, 1891. Serial No. 414,560. (No model.)

Claim.—1. In a nut-lock, a notched plate having a slideway entering the notch, the slideway having in it a rod free to slide in the direction of its length and also to turn on its axis and lugged at the end with lug in notch, substantially as described.

2. In a nut-lock, a plate provided with a cross-notch having a keeper projecting into it laterally at the top, said plate being also provided with a longitudinal slideway entering the cross-notch and containing a lugged rod with the lug in the cross-notch, substantially as and for the purpose described.



3. In a nut-lock, a plate provided with a longitudinal slideway, and a cross-notch recessed laterally above and below the slideway, in combination with a rod free to slide and also to turn in the slideway and having a lug at an end, the lug being in the cross-notch, all substantially as and for the purpose set forth.

4. The combination, with the plate A, having cross-notches *a*, provided with keepers a^2 in the sides and having a longitudinal slideway a^3 between the notches containing rod B, provided with lugs *b*, adapted to lie in said notches, of a bolt and nut, substantially as described.

5. The combination, with the plate A, having cross-notches *a*, provided with recesses a^5 in the sides at the bottom and having the longitudinal slideway a^3 between the notches containing the rod B, provided with lugs *b*, adapted to lie in the notches, of bolts and nuts, substantially as and for the purpose set forth.

6. The combination, with the plate A, having cross-notches *a*, provided with keepers a^2 in one side and recesses a^5 in the sides at the bottom and having a longitudinal slideway a^3 between the notches containing a rod B, provided with lugs *b*, of a bolt and nut, the whole operating as described.

480,759. FIRE-ESCAPE. CHARLES H. BAKER, Portland, Me. Filed Sept. 19, 1891. Serial No. 406,165. (No model.)

Claim.—1. In a fire-escape, a windlass journaled in a suitable box, a friction-band, a lever attached to one end of said band, and a brake-rope attached to said lever, in combination with a carriage having a supporting-cable adapted to be wound around said windlass and a spring-actuated clutch adapted to clasp the brake-rope with a force proportional to the weight in the carriage, substantially as and for the purposes set forth.

2. In a fire-escape, a windlass journaled in a suitable box, a friction-band, a lever to operate said band, and a brake-rope attached to the end of said lever, in combination with a carriage having a supporting-cable adapted to be wound around said windlass, said cable having a section composed of a V-shaped jointed lever having its ends connected by a spring and a clutch adapted to engage the brake-rope, substantially as and for the purposes set forth.

3. In a fire-escape, a windlass journaled in a suitable box, a coil-spring in one end of said windlass adapted to constantly tend to wind up said windlass, a friction-band, a lever adapted to operate said band, and a brake-rope, in combination with a carriage having a supporting-cable adapted to be wound around said windlass and a spring-actuated clutch adapted to clasp the brake-rope with a force proportional to the weight in the carriage, substantially as and for the purposes set forth.

480,760. SEAT ATTACHMENT FOR BICYCLES. MAURICE R. BLOOD, Kalamazoo, Mich., assignor to the Kalamazoo Cycle Company, same place. Filed Nov. 2, 1891. Serial No. 410,568. (No model.)

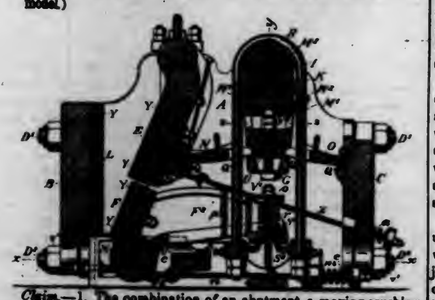
Claim.—1. In combination with the handle-bar of a bicycle, a second handle-bar F and seat or saddle G, suspended between the two handle-bars and connecting them together, substantially as and for the purposes specified.

2. In combination with the handle-bar of a bicycle, the second handles *a a*, braces or guards E E, and seat or saddle G, all arranged substantially as and for the purposes specified.

3. In combination with the front fork of a bicycle, a second fork attached thereto, which is bowed or curved at its lower end to make the two said forks together U-shaped and a seat or saddle suspended across the opening of said U-shaped forks, substantially as and for the purposes specified.

4. In combination with the front fork of a bicycle, a second fork attached thereto that is formed of spring metal and bowed down at its lower part, and the upper part of said second fork projecting up-

480,760.



ward to support on its vertical part the foot-rests r r, seat or saddle G, and handles a a, substantially as and for the purposes set forth.

5. The combination and arrangement of the front fork A, handle-bar C, second fork and support D D, and handles a a, substantially as and for the purposes specified.

6. In combination with a seat or saddle G and the handle-bar C, the wire or spring support H H, having the part m to rest on the handle-bar post, the parts n n, curved to hook over the handle-bar, the side wires then doubling back on themselves to form larger hooks H H, and terminating in the small hooks v v to hang the saddle on, substantially as specified.

7. The seat or saddle G and braces or guards E E, having their forward ends connected to the support D D and the handle-bar F, and secured in place by means of the bolt t, substantially as set forth.

480,761. STONE AND ORE CRUSHING MACHINE. EDGAR H. BOOTH, San Francisco, Cal., assignor to the Risdon Iron and Locomotive Works, of California. Filed Oct. 21, 1891. Serial No. 409,357. (No model.)

Claim.—1. The combination of an abutment, a moving crushing-jaw, a central oscillating pitman, toggle-jointed plates between the abutment, the pitman, and the crushing-jaw, a wedge fitted within said pitman between the toggle-seats therein, and adjusting means for said wedge, substantially as set forth.

2. In a stone or ore crushing-machine, a breaking or safety plate resting upon the pitman and connected to a wedge within the pitman, so as to receive the strain coming upon the wedge, substantially as and for the purpose herein described.

3. In a stone or ore crushing-machine, having two movable jaws, both driven from the same shaft, a connecting-rod or U-bolt passing over the pitman-head on the shaft and connected to the lower jaw by means of a ball-and-socket joint, substantially as and for the purpose herein described.

4. In a stone and ore crushing-machine, the combination, with the moving crushing-jaw F, pivoted below its crushing-face, of side bolts D^2, passing outside of the ends of the pivot-shaft or pin H, and the nuts upon the bolts D^2, between the end frames B C, for receiving the thrust of the pivot shaft-bearings v v, through the sliding bar c substantially as and for the purpose herein described.

5. In a stone or ore crushing-machine, the combination, with the moving crushing-jaw, pivoted below its crushing-face, with side bolts having adjusting-nuts, the sliding bar, and pivot shaft-bearings, substantially as and for the purposes herein described.

6. In a stone or ore crushing-machine, the combination, with the moving crushing-jaw F, pivoted below its crushing-face, the ball-and-socket joint S^2 S^3, bolt R, and pitman-head M^2, of the spring r, a rod e, secured at one end to side frames A A of the machine, and at the other bearing upon the spring r, so as to be held in tension for the purpose of preventing lost motion between the bolt R and the head M^2 as well as between the ball bearing connection and the end of bolt R, all substantially as and for the purpose herein described.

480,762. VENTILATED BRUSH FOR DYNAMOS. HOWARD H CHERRY and SEWARD D. YOUNGLOVE, Syracuse, N. Y. Filed Oct. 2, 1891. Serial No. 407,575. (No model.)

Claim.—1. A ventilated brush for dynamos, consisting of a perforated core or interior portion, a perforated wrapper inclosing the core, and a clasp engagingly connected to the perforated brush-body and adapted to longitudinal movement therewith, substantially as described.

2. In a ventilated brush for dynamos, in combination, a perforated core or interior portion, a perforated wrapper surrounding said core, and a perforated clasp or guide attached to the core's wrapper and adapted to be moved longitudinally thereon, substantially as described.

3. The combination, in a ventilated brush for dynamos, of a perforated core or internal portion composed of folded woven-wire fabric, a perforated wrapper or jacket inclosing same, and a perforated clasp or holder partially encompassing the wrapper portion of the brush in such manner as to adapt the movement of the clasp longitudinally with the brush-body, or vice versa, substantially as described.

4. A ventilated brush for dynamos, consisting of a perforated core or interior portion formed of folds or layers of woven-wire cloth lying contiguous one to the other, a perforated wrapper of woven-wire cloth binding the folds or layers together, and a perforated clasp or plate secured longitudinally movable upon the wrapper of the core by means of lateral guideways or hooks, all combined and operating substantially as described.

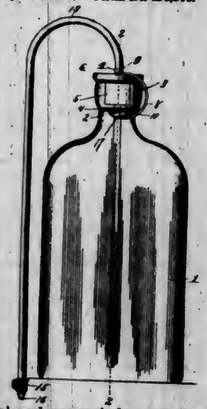
5. The combination, in a brush for dynamos, of the perforated core or interior formed of a single strip of woven-wire fabric folded back and forth to create layers of equal width, a perforated wrapper of woven-wire fabric immovably inclosing same and having its edges coupled together by a lap-joint, and a loosely-attached clasp-plate provided with perforations connected to the wrapper portion of the brush and adapted to longitudinal adjustment thereon, substantially as described, and for the purposes set forth.

6. The combination, in a ventilated brush for dynamos, of the uniformly-perforated core or central portion composed of a sheet of woven-wire cloth alternately folded back and forth and forming adjacent perforated layers of similar width, a perforated wrapper or band of woven-wire cloth inclosing the said core and of corresponding length longitudinally, the meeting side extremities of the wrapper being coupled together by a lap-joint extending longitudinally with the immovably-inclosed core portion, and a perforated clasp-plate secured to a face of the wrapper portion by lateral hook-shaped projections loosely engaging the opposite face of the wrapper and adapted to desired longitudinal adjustment upon the perforated woven-wire body of the brush, substantially as described, and for the purposes specified.

7. In a ventilated brush for dynamos, the core or central portion composed of contiguous folds of equal width formed of a single sheet of woven-wire fabric folded back and forth, square and uniform-sized ventilating-apertures throughout the said core portion created in the weaving of the wire fabric, a wrapper of woven-wire fabric snugly encompassing the perforated core and secured together at its edges by a lap-joint lying parallel with the brush's length, square and uniform-sized ventilating-openings in the wrapper created in the weaving of the fabric, and a clasp formed of a metallic blank bent to shape contiguous to the external face of the wrapper and secured longitudinally adjustable thereon by integral L-shaped guides loosely embracing the lateral edges of the wrapper immovably attached to the core, all combined and operating substantially as described, and for the purposes set forth.

8. In a ventilated brush for dynamos, in combination, the ventilated core or interior portion composed of folds or layers of woven-wire fabric whose spaces are square and of uniform size, one or more raw edges to the combined folds or layers comprising the core portion which terminate in line with the evened longitudinal edges of the aggregated folds or layers, a ventilated wrapper or binder of woven-wire fabric having square and uniform-sized apertures inclosing said core and retaining the folds or layers thereof together and held longitudinally immovable thereon by the contact of the raw edge or edges of the core with the contiguous interstices of the wrapper, the parallel edges of the wrapper fabric being united together and firmly inclosing the core by a lap-joint connection, and a metallic clasp or shield secured longitudinally movable upon the wrapper of the core, substantially as described, and for the objects specified.

9. A ventilated brush for dynamos, comprising a ventilated core or body portion composed of perforated metallic folds or layers disposed together and a ventilated wrapper or band composed of a perforated metallic covering encircling said core and retaining the same stationary within its wrapper, substantially as described.



10. In a ventilated brush for dynamos, a perforated laminated core or body portion formed of suitable electric conducting material, a perforated wrapper or band circumferentially inclosing the said core and retaining it immovably within its wrapper, the contacting ends of the wrapping-band being connected together by a lapped joint, and a perforated clasp-shield movably secured to the wrapper of the core, in combination, substantially as described, and for the purposes specified.

11. The combination, in a brush for dynamos, of the perforated laminated core having a circumferentially inclosing perforated wrapper retaining its parts in place, said core portion and its wrapper being coincidently beveled at one end, and a metallic plate or clasp provided with perforations adjustably secured to the wrapper of the core, substantially as described.

12. A ventilated brush for dynamos, made of perforated metallic layers retained together by a perforated metallic band or wrapper extending the length of the said layers, substantially as described.

13. A ventilated brush for dynamos, formed of layers of wire fabric wherein the individual wires in one direction are parallel to the axis of the commutator and the other individual wires transversely to said axis, substantially as described.

480,768. SIPHON-BOTTLE. PHILO M. CLARK, Bonner Springs, Kans. Filed Apr. 30, 1892. Serial No. 431,313. (No model.)

Claim.—A siphoned receptacle for aerated liquids, &c., comprising a suitable body portion having a neck, head, and mouth, the head forming a shoulder at its point of juncture with the neck, a stopper inserted into the neck of the receptacle, an elastic cap located above the stopper, a siphon-tube composed of a shorter inner leg extending through the cap and stopper and rigidly secured thereto, a longer outer leg united at its upper part by a bend to the upper part of the inner leg, a valve located near the lower end of the outer leg, a pair of oppositely-disposed cross-bars extending from the siphon-tube and lying immediately upon the cap, and a bail pivoted upon the outer ends of the cross-bars and engaging the shoulder of the receptacle, substantially as set forth.

480,764. VEHICLE-BOX. DANIEL R. COOCH, Canandaigua, N. Y. Filed Apr. 18, 1892. Serial No. 429,577. (No model.)

Claim.—1. The combination, with a wagon-box, of an upper removable side section and a hinge having one leaf secured to the removable side section and the other leaf removably engaged with the corresponding side of the box, substantially as and for the purpose described.

2. The combination, with a wagon-box, of an upper removable side section, a loop secured to the corresponding side of the wagon-box, and a hinge having one leaf secured to the movable side section and the other leaf registered with said loop, substantially as and for the purpose specified.

3. The combination, with a wagon-box, of an upper removable side section, a hinge having one leaf secured to the removable side section and the other leaf removably engaged with the corresponding side of the box, and a movable stop-shoulder for securing the latter spring-leaf to the side of the wagon-box, substantially as and for the purpose set forth.

4. The combination, with a wagon-box, of an upper removable side section, a loop secured to the corresponding side of the wagon-box, a hinge having one leaf secured to the movable side section and the other leaf registered with said loop, and a movable stop-shoulder secured to the latter spring-leaf for engaging the loop and securing the removable side section to the wagon-box, substantially as and for the purpose described.

5. The combination, with a wagon-box, of an upper removable side section, a loop secured to the corresponding side of the wagon-box, and a hinge having one leaf secured to the movable side section and the other leaf provided with an arm registered with said loop and with a movable frame having one end formed with a projecting stop-shoulder adapted to engage the lower edge of the loop, substantially as and for the purpose specified.

6. The combination, with a wagon-box, of a pair of removable upper side sections hinged to the corresponding sides of the wagon-box and a rear side section hinged to the rear side of the wagon-box, substantially as and for the purpose described.

7. The combination, with a wagon-box, of a pair of removable upper side sections hinged to the corresponding sides of the wagon-box, a rear side section hinged to the rear side of the wagon-box, and ties between the ends of the rear side section and the adjacent ends of the former side sections, substantially as and for the purpose specified.

8. The combination, with a wagon-box having upright slots in the rear ends of its longitudinal sides and a rear side having its ends removably mounted in said slots, of removable upper side sections hinged to the corresponding sides of the wagon-box and formed of less length than said sides, whereby the upper side sections swing within the vertical planes of the front and rear sides of the wagon-box, and a rear removable upper section hinged to the rear side of the wagon-box and formed of less length than the rear side, whereby said rear upper section swings between the vertical planes of the longitudinal sides of the wagon-box, substantially as set forth.

9. The combination, with a wagon-box, of a pair of removable upper side sections hinged to the corresponding sides of the wagon-box and supporting-legs movably secured to the upper portion of the inner sides of the removable side sections for supporting said sections when swung inwardly into a substantially horizontal plane, substantially as specified.

10. The combination, with a wagon-box, of a pair of removable upper side sections hinged to the corresponding sides of the wagon-box, supporting-legs movably secured to the upper portion of the inner sides of the removable side sections for supporting said sections when swung inwardly into a substantially horizontal plane, and a movable stop for retaining said legs in their cooperative position, substantially as set forth.

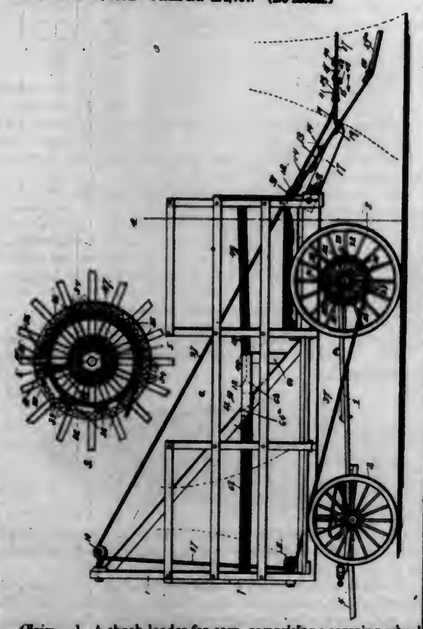
480,765. AXLE-LUBRICATOR. PETER DENNAU, Sr., Montague, Mich. Filed Nov. 17, 1890. Renewed June 25, 1892. Serial No. 438,047. (No model.)

Claim.—1. The combination, with an axle-spindle having longitudinal webs with notches in the edges thereof, of a perforated sleeve and axle-box, substantially as and for the purpose described.

2. The combination, with an axle-spindle having screw-threaded ends and intermediate notched webs, of the perforated sleeve and axle-box, said sleeve having interior screw-threads at its ends to engage with the screw-threads on the spindle, substantially as and for the purpose specified.

3. An axle-spindle having screw-threaded ends and screw-threaded

nipple and longitudinal webs, notched as shown, in combination with a perforated and screw-threaded sleeve, a box having an annular shoulder at its outer end, and a flanged washer and nut, substantially as and for the purpose set forth.

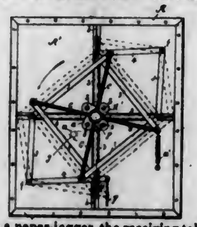


480,766. GUIDE FOR REPLACING ELECTRIC TROLLEYS. CHARLES FORTIN, Florissant, Mo. Filed Apr. 11, 1892. Serial No. 428,607. (No model.)

Claim.—1. In combination with a trolley-pole and trolley secured in the end of same, the herein-described replacing device pivotally secured to the trolley-pole, consisting in bifurcated lever-arm, the lower depending member of which is closed and provided with means of attachment for a rope to operate the same, and the upwardly-extending members of which are inclined outwardly, forming a V-shaped opening between the same at right angles to the line of the trolley-wire, substantially as described, and for the purposes specified.

2. The herein-described device for replacing trolleys, consisting in the combination, with the trolley-pole 5, of a bifurcated lever-arm composed of the inclined arms 7 and 8 and loop 10, by which the arms 7 and 8 are made integral with each other and are operated together, the said bifurcated lever-arm being pivotally secured to the trolley-pole 5 by the axial bolt 11 of the trolley 4, and the operating-rope 9, combined and operating substantially in the manner and for the purposes specified.

480,767. CORN-SHOCK LOADER. DAVID H. GOOD, Canada, Kans. Filed Mar. 14, 1892. Serial No. 424,737. (No model.)



Claim.—1. A shock-loader for corn, comprising a carrying-wheel for a suitable vehicle, a number of brackets embracing the spokes of the wheel, an annulus having a grooved periphery and mounted upon the brackets, and a lever pivoted upon one of the brackets and carrying a bolt for engaging the openings in the annulus and compelling the latter to turn with the wheel and for disengaging the openings and permitting the wheel to turn independently of the annulus, substantially as set forth.

2. A shock-loader for corn, comprising a suitable wheeled vehicle, a number of brackets embracing the spokes of one of the vehicle-wheels and extending outwardly therefrom, an annulus mounted upon the outer portions of said brackets and provided with peripheral flanges having openings or holes, and a lever pivoted upon one of the brackets and carrying at its upper end a bolt or pin for engaging the holes or openings, and thus compelling the annulus to turn with the wheel, and also for disengaging the holes, and thus permitting the wheel and annulus to revolve independently of each other, substantially as set forth.

3. A shock-loader for corn, comprising a suitable wheeled vehicle having at its front end a vertical standard, a pulley mounted upon the upper end of said standard, a brace for said standard extending rearwardly and downwardly therefrom and secured at its lower end to the bottom of the vehicle-body, a pulley mounted upon the front end of the vehicle-body at one side of the standard, a second pulley mounted upon the rear end of the vehicle-body near the corresponding side of the same, a number of brackets embracing one of the rear wheels of the vehicle, an annulus mounted upon said brackets and having a pair of peripheral flanges provided with openings, a lever pivoted upon one of the brackets and carrying at its upper end a bolt for engaging the flange-openings, and a flexible connection attached at one end to the annulus and extending through the rear and front pulleys and also through the pulley of the standard, substantially as set forth.

4. A shock-loader for corn, comprising a suitable wheeled vehicle, a vertical standard provided at its upper end with oppositely disposed oblique horizontal sockets and located in the middle of the bottom of the vehicle-body, a pair of standards located at opposite sides of the rear end of the vehicle-body, a bracket secured to the inner side of each of said standards, and a movable deflecting bar having at one side of its forward end an arm to enter one or the other of the oblique sockets and disposed horizontally in the vehicle-body, the rear end of the bar being engaged with and supported by one or another of the brackets of the rear standards, and said bar serving to direct the incoming shocks to one or another side of the front end of the vehicle-body, substantially as set forth.

480,768. PAPER-JOGGER. RUSSELL A. HART, Battle Creek, Mich. Filed Jan. 23, 1892. Serial No. 419,094. (No model.)

Claim.—1. In a paper-jogger, the receiving table or platform having longitudinal and transverse channels, rods reciprocating in said channels and carrying the supporting-uprights of the jogger-wings, and a fixed support sustaining the outer end of each of the rods and so limiting the range of reciprocation thereof that they shall not travel beyond the table, substantially as described, and for the purpose set forth.

2. In a paper-jogger of the class described, a receiving-table provided with four radial channels, fixed rods therein, chambered rods sliding telescopically on said fixed rods, uprights on said sliding rods removably secured to the jogger-wings, fixed lugs on said sliding rods, links and levers engaging with said fixed lugs, and means, substantially as shown, illustrated, and described, for operating the same.

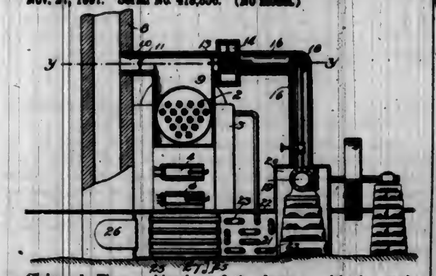
3. In a paper-jogger, a receiving table or platform having longitudinal and transverse channels, chambered rods reciprocating in said channels and carrying the supporting-uprights of the jogger-wings, and fixed supports projecting from the ends of the table or frame, on which said chambered rods slide telescopically, said supports sustaining the outer ends of said rods and limiting the reciprocation thereof to within the area of the table or frame, substantially as specified.

4. In a paper-jogger, the receiving table or platform provided with longitudinal and transverse channels, rods reciprocating in said channels, adjustable uprights on said reciprocating rods, paper-evener wings on said adjustable uprights, and reducing or sub wings detachably secured to said evener-wings, substantially as described.

5. In a paper-jogger, the receiving-platform provided with radiating channels, a hub pivoted contiguous to the adjacent inner ends of said channels and provided with radial arms or spokes, and rods in said channels respectively connected to and reciprocated by said arms or spokes, said rods carrying the supporting-uprights of the jogger-wings, substantially as shown and described.

6. In a paper-jogger, the receiving table or platform provided with channels radiating from a point near the center thereof, a hub pivoted to said table or platform contiguous to the adjacent inner ends of said channels and provided with radiating spokes or arms, rods in said channels, said rods being connected to and reciprocated by said spokes or arms and carrying the supporting-uprights of the jogger-wings, and fixed supports projecting horizontally from the sides of said table or platform and having telescopic engagement with the outer ends of said rods, said supports serving to also limit the outward movement of said rods to within the area of the table or platform, substantially as specified.

7. In a paper-jogger, the table or platform divided into four approximately equal parts so located with respect to each other as to form transverse and longitudinal channels at the center of said platform, a fixed central plate secured to each of said adjacent corners, a pivotal hub provided with arms or spokes engaging in said plate, and links and levers pivotally connecting said arms or spokes with rods reciprocating in said transverse and longitudinal channels, whereby motion is communicated to the paper-jogger wings carried by said reciprocating rods, substantially in the manner and for the purposes set forth.



8. In a paper-jogger, the table consisting of four approximately equal parts so located with respect to each other as to form longitudinal and transverse channels of said table at its center, a central plate attached to each of the inner corners thereof, a pivotal hub situated centrally of said plate having a vertical axis and provided with radial arms or spokes, links and levers pivotally engaging with said arms or spokes, and stay-rods or oscillating braces, one end of which swings on a fixed point or fulcrum of said table, and the opposite ends of said braces having pivotal connection with the adjacent reciprocating-rod and its radial parallel link and operating-levers, the whole arranged substantially as shown and described.

9. In a paper-jogger, a table provided with longitudinal and transverse channels, rods reciprocating and confined therein, adjustable uprights on said rods provided with vertically-attachable and detachable paper-evener wings, sub-wings adapted to be detachably secured to said first-mentioned wings, suitable lugs fixed on said rods, and means connected to said lugs for operating said rods, substantially as shown, illustrated, and described.

10. The combination, with the reciprocatory rods of a table-jogger, of an upright *c*, adjustably secured on each of said rods, each of said uprights having channels on opposite sides of one of its ends, plates D^2, each having depending legs and formed with shoulders at the tops of said legs, said legs being received by said channels and said shoulders engaging the tops of the uprights adjacent to said channels, and evener-wings secured to the upper portion of said plates, substantially as shown.

11. In a paper-jogger, the receiving-table A, divided into four approximately equal parts A', longitudinal and transverse channels provided with the reciprocating rods B, carrying the paper-evener-supporting uprights provided with lateral vertical lugs *h h*, adapted to receive the vertical legs *N N* of the paper-evener wings D, and sub-wings D', provided with spring-clasp *w*, the whole arranged in the manner and for the purpose substantially as shown and described.

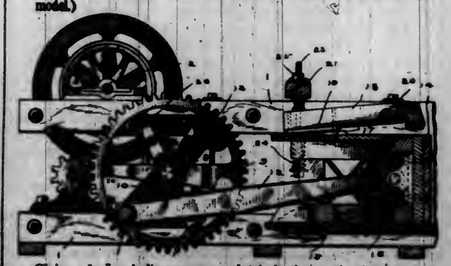
480,769. FURNACE. ANTON I. HOVLAND, Faribault, Minn. Filed Nov. 27, 1891. Serial No. 413,356. (No model.)

Claim.—1. The combination of the furnace, with the smoke-chimney, the furnace-room floor, said chimney extending to a point beneath the same, the ash-pit and fire-box of said furnace, a box arranged beneath said floor, a duct leading from one side of said box into said ash-box, a fresh air-duct leading into the opposite side of said box, a chamber arranged at each end of said box, horizontal flues 24, passing from chamber to chamber and through said box, a smoke-pipe leading from the top of the furnace down to the chamber, surrounding one end of said box, a duct leading from the chamber at the other end to the base of said chimney, and a direct connection 10, having a damper 11, all substantially as described, and for the purpose set forth.

2. The combination, with the furnace, and boiler, of the smoke-flue, the smoke-pipe, one of said smoke-pipes surrounding the live-steam pipe, the engine, a jacket about the same, a feed-water coil, a chamber for the same, a connection therefrom to the smoke-flue, and means for injecting the water from said coil into the boiler, as and for the purpose specified.

3. The combination, with the furnace and the boiler, of a smoke-flue, a smoke-box of said boiler, a direct connection 10 therefrom to the smoke-flue, the engine, the steam-dome of the boiler, the steam-pipe extending therefrom to said engine, a smoke-pipe inclosing said steam-pipe, a jacket about said cylinder of said engine and connected to said smoke-pipe, a suction-pan within said smoke box and pipe, a feed-water coil, a containing-chamber therefor, a radiator, longitudinal flues therein for the passage of the smoke into the lower end of the chimney, openings into said radiator for the air, and an opening therefrom into the ash-pit of the furnace, said radiator and feed-water chamber being arranged below the grate-line of the furnace.

4. The combination, with the furnace, of the air-radiator having horizontal flues 24 and arranged immediately in front of the furnace and beneath the floor, the air-duct 31 to lead the air into the same, a raised valve-grating covering the mouth of the said duct, whereby the supply of air may be regulated, and a smoke-pipe passing into a chamber surrounding the end of the radiator, the smoke passing thence through the flues 24 and thence to the smoke stack, substantially as described.

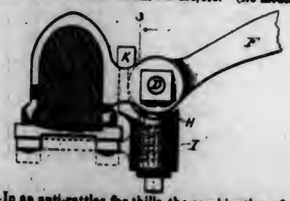


480,770. PAPER-MAKING MACHINE. EDWARD E. JOHNSON, Seneca Falls, N. Y. Filed Mar. 7, 1891. Serial No. 384,169. (No model.)

Claim.—1. In combination, the suction-roll having a perforated periphery and being divided by radial partitions into longitudinal compartments, the sub-partitions extending transversely between the outer ends of the radial partitions to form ways, the adjusting-heads adapted to be slid in said ways, means for sliding said heads in their ways, and the suction-valve connected and successively registering with said compartments as the suction-roll is revolved, substantially as and for the purpose specified.

2. In combination, the suction-roll having a perforated periphery, being divided by radial partitions into longitudinal compartments and being provided with an interior centrally-located chamber to diminish the capacity of the same, the horizontal sub-partitions extending transversely between the outer ends of the radial partitions to form ways, the adjusting-heads adapted to be slidden in said ways, the screws for actuating the adjusting-heads, and the suction-valve connected and successively registering with said compartments as the suction-roll is revolved, substantially as and for the purpose specified.

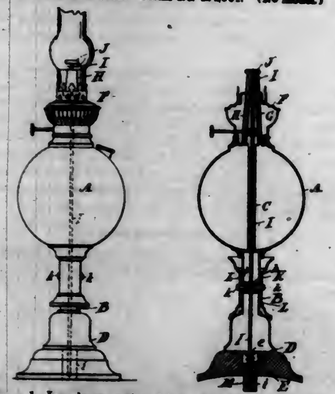
480,771. BALING-PRESS. JESSE S. JOHNSON and JOSEPH R. JOHNSON, Indianapolis, Ind. Filed Nov. 16, 1891. Serial No. 412,100. (No model.)



Claim.—1. In a baling-press, an elastic-brake mechanism consisting of brake-blocks pivotally connected to the framework above the

plunger, the outer ends of such blocks connected to a cross-bar through whose outer ends and the framework pass bolts with springs coiled on their lower ends, and nuts for retaining the same, whereby the tension of the springs is exerted to hold the blocks in contact with the plunger as it rebounds, substantially as shown and described.

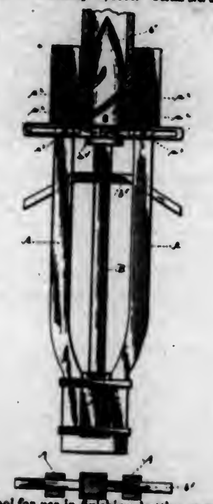
2. In a baling-press, a rebounding plunger, means for actuating the same, a supporting framework, brake-blocks pivoted to such frame above the plunger and contacting therewith as the latter rebounds, the bearing parts protected by metal friction-plates so set as to present inclined faces, the outer ends of the brake-blocks connected to a cross-bar, the ends of such cross-bar connected to the framework by suitable bolts, on the lower end of which springs are coiled and adapted to be tensioned by nuts on the ends of such bolts, substantially as shown and described.



3. In a baling-press, a framework, a rebounding plunger, operating connections thereto, the cranks provided with counter-weights upon their free ends for balancing the weight of the cranks and plunger-bar, and an adjustable friction-brake mechanism pivotally connected to the framework above the plunger, all combined substantially as shown and described.

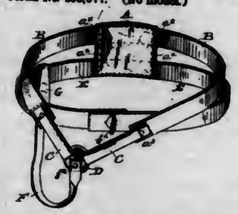
480,772. THILL-COUPLING. JAMES A. KIRBY, Chicago, Ill., assignor of two-thirds to George B. Jenkins and Charles F. Burns, same place. Filed Feb. 18, 1892. Serial No. 421,415. (No model.)

Claim.—In an anti-rattler for thills, the combination of the coiled spring G, the housing I, containing said spring, said housing being open at both ends and provided at its lower end with internal screw-threads, the screw-plug L, closing the lower end of the housing and squared for the reception of a wrench, the follower H, fitting in the upper end of said housing, resting upon the spring, and having its upper face hollowed out to fit the thill-iron, and an arm J, extending upward from the back of the housing and having the cross-head K, adapted to rest on top of the arms of the thill-coupler and support the anti-rattler, substantially as set forth.



480,773. LAMP-EXTINGUISHER. MIHAEL LAJOIE, Montreal, Canada. Filed Mar. 10 1892. Serial No. 424,331. (No model.)

Claim.—1. In a lamp-extinguisher, the combination, with a lamp provided with an Argand burner, of the cap J, secured on the top of the rod I, a sleeve L, sliding on the slotted standard B of the lamp, the collar K, and screws *k*, whereby the said rod I is connected to the sleeve L, the said screws *k* passing through the slots in the said standard B, substantially as set forth.

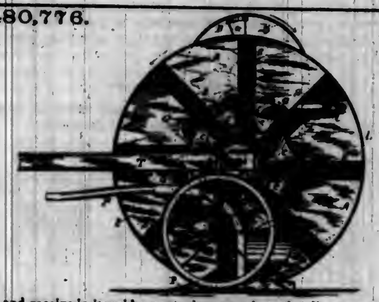


2. In a lamp-extinguisher, the combination, with a lamp provided with an Argand burner, of a slotted tube B, secured to the lower part of the body of the lamp, the tube C, communicating with the said tube B, the chamber E, formed in the base of the said lamp, the rod I, having the cap J and the cylindrical cup *i*, the spring M on the rod in the said chamber, and the sleeve L, secured by set-screws to the said rod, substantially as set forth.

480,774. IMPLEMENT FOR FINISHING THE NECKS OF BOTTLES. CHARLES LEES, Pittsburg, Pa., assignor to Eugene M. Sanger, New York, N. Y. Filed Sept. 6, 1890. Serial No. 364,196. (No model.)

Claim.—A tool for use in finishing bottles, comprising clamping-jaws designed to inclose the interior of the neck of a bottle, a spindle designed to enter the neck of the bottle and having a portion of its length square in cross section, a sliding bar having a square opening receiving the spindle and provided with bent ends, and openings in the jaws receiving the bent ends, substantially as described.

480,775. TRUSS. JOHN A. MARVIN, Lansing, Mich. Filed Oct. 14, 1891. Serial No. 408,677. (No model.)

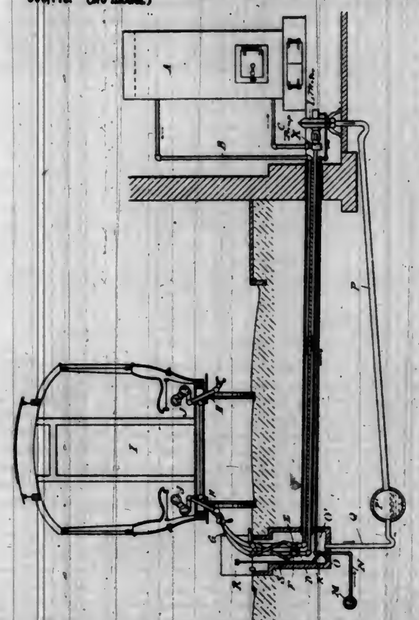


Claim.—In combination with a truss-pad, a central back flexible support or bearing, a single lower body-belt rigidly secured to said bearing and passed entirely around the lower part of the abdomen, unconnected with the truss-pad, with its two ends hooked in front, two upper body-straps secured to the upper part of said back support and to the truss-pad, and a perineal strap, one end movably secured to said lower body-belt and the opposite end to the truss-pad, the truss-pad thus held below the body belt, substantially as described.

480,776. POTATO-HARVESTER. PAUL H. MUNROE, Plainfield, Ill. Filed Mar. 14, 1892. Serial No. 424,768. (No model.)

Claim.—1. The combination, with the disk A, having the discharge-openings G and annular gear F, of the rim L, formed of rods or slats having open spaces between them, radial partitions S, formed of rods or slats having open spaces between them, curved inclined bottoms *c*, rotating sifter B, having the pinion E, and inclined bars D, tongue T, traveling wheel W, bent axle H, and plow P, all arranged to operate substantially as and for the purpose set forth.

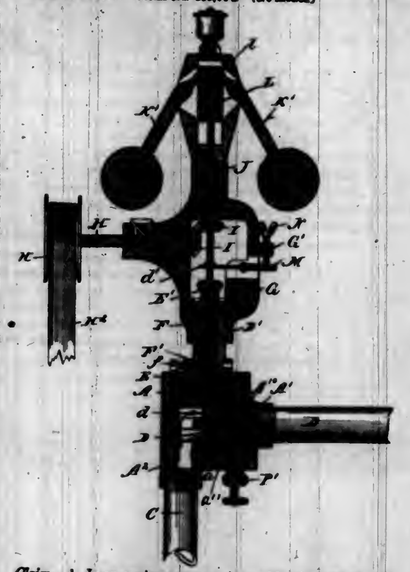
2. In a potato-harvesting machine, the disk A, having the discharge-openings G, and having a series of radial receptacles or pockets arranged on its side formed of the rim L, made of rods having spaces between them, and the radial diagonally-arranged partitions S, made of rods having spaces between them, and the curved inclined bottoms *c* for conducting material to said discharge-openings, the said disk and its rim being arranged to roll on the ground at the side of a



480,776.

plow and receive in its said receptacles or pockets the slice turned by the plow containing the potatoes, substantially as and for the purpose set forth.

3. In a potato-harvester, a wheel or disk adapted to roll on the ground and having radially-arranged sifting receptacles or pockets on its side for receiving the slice containing the potatoes from the plow, and having apertures leading from said receptacles to the opposite side of said disk for discharging the potatoes and unsifted material from said receptacles, in combination with a sifter for receiving the potatoes and unsifted material from said receptacles and discharging the potatoes sifted free from said material, substantially as and for the purpose set forth.



480,777. SUPPLY-STATION FOR CAR-HEATING SYSTEMS. JAMES F. MCELROY, Albany, N. Y., assignor to the Consolidated Car-Heating Company, Wheeling, W. Va. Filed June 13, 1891. Serial No. 396,773. (No model.)

Claim.—1. A supply-station for a car-heating system, in which a receptacle on the car is periodically supplied with a heating medium, said station comprising a fluid heater, a circulating system of piping extending to within proximity of the track, a pump in said circulating system, valves for connecting the outgoing and return pipe of said system with the car, a well in which said valves are located, and a cover for said well controlling the action of the pump, substantially as described.

2. In a supply-station for car-heating systems, the combination, with a heater, of outgoing and return pipes communicating therewith, means for connecting said pipes to tanks on a car, a pump in the return-pipe, a pipe leading from a water-supply to the pump, a valve located in said pipe, an arm on the valve, a casing for the outer ends of the outgoing and return pipes, means for gaining access to said casing, and a connection between said means and arm on the valve in the water-supply pipe, substantially as described.

480,778. ENGINE-GOVERNOR. THOMAS H. MACE, Chicago, Ill. Filed Dec. 4, 1891. Serial No. 413,904. (No model.)

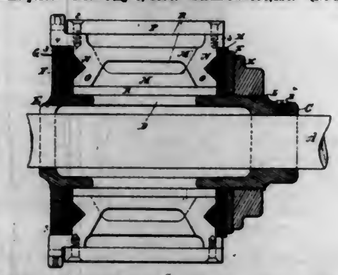
Claim.—1. In an engine-governor, in combination with the valve-body, the governor-frame connected thereto by a joint adapted to permit only substantially helical movement of the frame with respect to the valve-body about a vertical axis, the governor-valve having its stem extending vertically into the frame and connected to the governing devices on said frame, the governor-driving shaft journaled in the frame and extending horizontally, and the driving-pulley thereon, substantially as and for the purpose set forth.

2. In an engine-governor, in combination with the valve-body and the governor-frame connected thereto by a joint adapted to permit only substantially helical movement of the frame with respect to the body about a vertical axis, the valve which controls the steam-passages through the valve-body having its stem extending vertically into the frame and connected to the governing devices thereon, whereby it is adapted to be actuated longitudinally by said governing devices and also by the vertical movement of the frame, the governor-driving shaft extending horizontally and the pulley thereon, the valve-body having two ports, one above the other, connecting the steam-induction passage to the steam-eduction passage, and the valve having one port adapted to register with one of said ports at its highest position and with the other at its lowest and in each position to close the port with which it does not register, the lower port being provided with a cut-off valve or gate adjustable at will to limit the access of steam to such port, substantially as and for the purpose set forth.

3. In a governor, the valve-body provided at its upper end with a rigid cylinder through which the valve-stem emerges, the governor-frame terminating at the lower end in a hub having a cylindrical aperture which fits said cylindrical terminal of the body, said hub being obliquely slotted and the cylindrical terminal being provided with a rigid stud taking into said slot, the valve-stem extending up into the frame and connected to the governing devices, whereby it is adapted to be actuated longitudinally both by said devices and by vertical movement of the frame, the governor-driving shaft journaled horizontally in the frame and protruding therefrom, and the driving-pulley thereon, all combined and operating substantially as and for the purpose set forth.

4. In combination with the valve-body and the sliding valve therein, the plug E, through which the stem of the valve emerges, the sleeve F, encircling said plug and rotatably adjustable thereabout and provided with means for securing it as adjusted, the governor-frame swiveled on said sleeve and having the horizontal governor-driving shaft journaled in it, the hub of said frame having the oblique slot f^2, and the sleeve being provided with the rigid stud f^3, taking into said slot, substantially as set forth.

480,779. CORN-POPPING APPARATUS. NELSON B. OLSON, Kansas City, Mo., assignor to Charles O. Olson, Savenburg, Kans. Filed Mar. 4, 1892. Serial No. 423,736. (No model.)



Claim.—1. In a rotary corn-popping case having exterior perforated sides and suitable discharge-openings and an interior convoluted perforate conveyer, a scattering-plate uniting said conveyer with the inner sides of said case, substantially as and for the purpose described.

2. In a rotary corn-popping case having exterior perforated sides and transverse discharge-openings in said sides, an interior convoluted perforate conveyer and an intermediate scattering-plate within said case, extending over one of said openings and connected with the inner side of said case and the said conveyer, for the purpose described.

3. In a rotary popping-case having ends and exterior perforated sides and transverse openings in said sides, a scattering-plate extending over one of said openings, a convoluted perforate conveyer connected with said scattering-plate, and a valve in said transverse opening beneath said scattering-plate, for the purpose described.

480,780. COMMUTATOR FOR RING-ARMATURES. GUSTAV FRANKENDER, Cleveland, Ohio, assignor to the Brush Electric Company, same place. Filed July 3, 1890. Serial No. 358,120. (No model.)

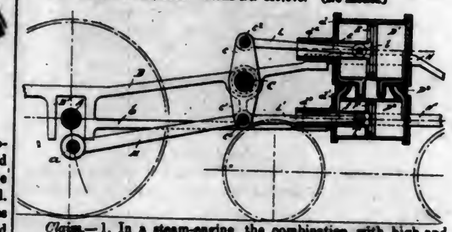
Claim.—1. A commutator having the sections provided with transverse recesses and arranged so that said recesses in adjacent sections overlap, substantially as described.

2. A commutator having sections with flat ends and connecting members of less depth arranged so that said connecting members in one section are opposite vacant spaces in an adjacent section, substantially as described.

3. The commutator-sections recessed or cut away behind the periphery and separated at the periphery by slots or slits, in combination with a perforate mounting giving access from the vicinity of the axis to the spaces formed by said recesses or cut-away portions, which spaces extend to terminate in said slots or slits, and facing-plates located on said cut-away or recessed sections so as to leave an air-space beneath them, substantially as described.

4. In a commutator, the combination, with a hollow bearing, of two series of commutator-sections, each having transverse recesses, the sections of one series being disposed so that their recesses will overlap the recesses of the sections of the other series, the sections of the commutator being separated from each other by slits which communicate at the periphery of the commutator with air-spaces, said hollow bearing having an opening for the passage of air between the commutator-sections, substantially as set forth.

5. The combination of the recessed or cut-away bases of the commutator-sections, the facings for said bases, and the perforate mounting, substantially as described.

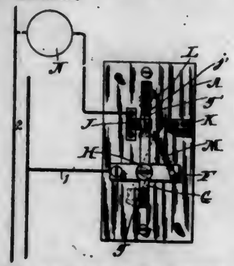


6. The combination of the transversely-recessed bases of the commutator-sections, the facings for said bases, and the perforate mounting, substantially as described.

7. The combination, with a perforate sleeve having heads, of a transversely-recessed sectional base and facing-plates over the recesses in said sectional base, substantially as set forth.

8. A plate or section for a commutator, having a transverse recess therein for producing an air-space, substantially as set forth.

9. The combination, with a commutator plate or section having a recess or cut-away portion in its outer edge, of a plate on said outer edge, adapted to cover said recess or cut-away portion to produce an air-space, substantially as set forth.



480,781. COMPOUND ENGINE. SAMUEL F. PRINCE, Jr., Reading, Pa. Filed Nov. 25, 1891. Serial No. 413,073. (No model.)

Claim.—1. In a steam-engine, the combination, with high and low pressure cylinders and valve mechanism therefor, of oppositely-moving pistons having hollow trunks extended through the cylinder-heads, piston-rods connecting said pistons directly to opposite ends of a rocking arm mounted on the engine-frame, and a connecting-rod between one arm of said rocking shaft and the crank-pin, all substantially as set forth.

2. A steam-engine having the cylinder-casting thereof fastened to the engine-frame by means of cylindrical frame-sections H H', passing through and firmly fitted in corresponding cylindrical openings g g' in said casting, the extended ends of said sections being connected with the main portion of the frame, substantially as described, whereby said cylinder is firmly secured to a continuous frame without being bolted thereto, substantially as set forth.

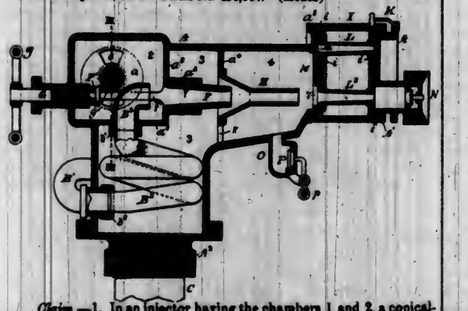
480,782. ELECTRIC-LIGHTING SYSTEM. MICHAEL J. GUREK and CHRISTOPH BACH, Jr., Milwaukee, Wis. Filed Oct. 29, 1891. Serial No. 410,192. (No model.)

Claim.—1. In an electric-light system, the combination of a switch-lever swinging laterally upon a pivot at right angles thereto, a switch-pole arranged to one side of the lever and adapted to engage said lever when the same is swung laterally thereagainst, a stop arranged upon the opposite side of the lever, a spring plate engaging the switch-pole, push-buttons, one of which is adapted to engage directly the end of the lever to throw it laterally into contact with the switch-pole and the other constructed to engage the spring-plate to release the lever from said switch-pole, and electric lights within the circuit, substantially as set forth.

2. In an electric-light system, the combination of a switch-lever having its opposite ends beveled, a stop, a switch-pole having an angular end over which one of the beveled extremities of the lever is adapted to ride, a spring-plate having its free end bearing upon the switch-pole, a push-button adapted to exert a downward pressure upon the spring-plate, a push-button having the extremity of its shank beveled to register with the corresponding beveled end of the lever, a retractile spring, wires leading, respectively, to the lever and switch-pole, and electric lights within the circuit, substantially as set forth.

3. In an electric-light system, the combination of a base-plate, a switch-lever pivoted thereon, contact-points engaged by said switch-lever, an angular cover for inclosing the operating mechanism, provided with apertures and push-button cases having registering apertures, plates upon the inner surface of the cover, push-buttons within their cases, having their shanks projecting through the apertures and through the inner plates, and springs confined between said inner plates and the heads of the buttons, substantially as set forth.

4. In an electric-light system, the combination of duplicate devices located in different portions of the building, each consisting of a casing having thereon a pivoted switch-lever, a switch-pole arranged to one side of the lever and adapted to hold said lever in contact therewith as the lever is swung thereagainst, a spring-plate engaging the switch-pole, a contact arranged upon the opposite side of the lever, push-buttons, one of which is adapted to engage directly the end of the lever to throw it laterally into contact with the switch-pole and the other constructed to engage the spring-plate and cause the lever to be thrown against the opposite contact, connecting-wires leading to the switch-levers at each point, one of said wires having electric lights in its circuits, and wires connecting, respectively, the switch-poles and contacts of each of the duplicate devices, substantially as set forth.



480,788. OVERSEAM. WILLIAM RAEUCHLE, Boston, Mass. Filed Sept. 1, 1891. Serial No. 404,439. (No model.)

Claim.—1. The herein-described overseam, which comprises a series of single needle-thread alternating overedge and depth stitches across the edge of and in the material adjacent to the edge, respectively, the overedge and depth stitch loops of said single thread being interlocked one with the other below the material between the adjacent depth stitches to form a purl contiguous to and in the direction of the lower edge, and an upper purl-thread extending in one direction around adjacent parts of the overedge stitch and in the opposite direction around adjacent parts of the depth stitch at the upper side of the material, an upper purl being thereby formed on and along the edge of the material and parallel thereto above and substantially in line with the lower purl, substantially as described.

2. The herein-described overseam, which comprises a series of alternating overedge and depth stitches across the edge of and in the material adjacent to the edge, respectively, a loop of looper-thread being passed through the overedge-stitch loop, the adjacent depth-stitch loop passing through the loop of looper-thread, the succeeding overedge-edge stitch loop passing through the said depth-stitch loop between adjacent depth stitches, a purl on the under side of the material being formed thereby, and an upper purl-thread extending in one direction around the overedge stitch and in the opposite direction around the depth stitch at the upper side of the material along its edge and parallel thereto, an upper purl being thereby formed, substantially as described.

480,784. INJECTOR. HARRY C. REAGAN, Jr., Philadelphia, Pa. Filed Apr. 28, 1892. Serial No. 430,907. (Model.)

Claim.—1. In an injector having the chambers 1 and 2, a conical-ported seat *a* between the chambers 1 and 2, a conical steam-valve D, fitting said seat and having ports, a stem for rotating said valve, and a sleeve *a'*, extending across the chamber 2 and inclosing said stem, substantially as described.

2. The combination, with the body A, having the partition a^2 and neck a^3, of the sliding nozzle F, having a packing-ring *f* and arms *f'*, a yoke F', a screw-stem G, swiveled to said yoke, a steam-supply pipe located between the arms *f'*, and a combining-tube having a flaring mouth receiving the end of the nozzle, substantially as described.

3. In an injector, the barrel V, containing several combining-tubes *v* of different sizes, all opening into an annular groove *v'*, which receives the end of the steam-nozzle, substantially as described.

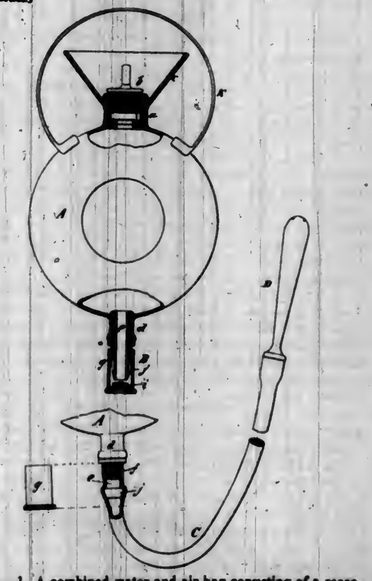
4. In an injector, the combination, with the body having a beveled flange a^3, of a rotatable barrel having beveled flanges *i*, an adjustable beveled ring A' for taking up the wear on said flanges, and a plurality of delivery-tubes of different sizes carried by said barrel, substantially as described.

5. In an injector, the body A, cut away at one end to leave the wings A^3, and a rotatable barrel carrying delivery-tubes of different sizes, mounted between said wings A^3, substantially as described.

6. In an injector, the combination, with the body A, of the rotatable barrel carrying a plurality of delivery-tubes, a detent for holding said barrel when adjusted, and a dash-plate covering the inner ends of all of said tubes except the one in line with the combining-tube, substantially as described.

7. In an injector, the combination, with the body A, of the stationary dash-plate M, having an aperture 7, and the rotatable barrel I, carrying the removable delivery-tubes I, substantially as described.

8. An injector for forcing hot water, having its steam-pipe exposed for a portion of its length to the incoming water, whereby the temperature of the steam is lowered, substantially as described.

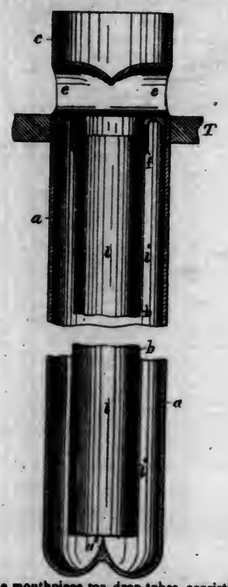


9. An injector for forcing hot water, having a part of its steam-pipe coiled in the water-chamber, substantially as described.

10. The combination, with the body A, having the chambers 1, 2, and 3, of a steam pipe entering the chamber 1 and an auxiliary steam-pipe connected with said chamber and passing through the chamber 3 into the chamber 2, substantially as described.

11. The combination, with the body A, having the chambers 2 and 3, of a steam-pipe coiled in the chamber 3 and entering the chamber 2, said coiled portion being removable, substantially as described.

12. The combination, with the body A, having the chambers 1, 2, and 3, of the steam-pipe B, entering the chamber 1, the steam-valve D between the chambers 1 and 2, the auxiliary steam-pipe B', containing the removable coil B^2, arranged in the chamber 3, and the cap A^4 for giving access to the coil B^2, substantially as described.



480,785. COMBINED FOUNTAIN-SYRINGE AND AIR-CUSHION. JOHN P. SCHAN, Brooklyn, N. Y. Filed Nov. 27, 1891. Serial No. 413,182. (No model.)

Claim.—1. A combined water and air bag consisting of a receptacle of flexible rubber having a stoppered filling-orifice and a separate opening provided with an air-valve, whereby by closing the air-valve the bag may be filled with water as a water-bag or by closing the stopper it may be inflated with air through said air-valve as an air-bag, substantially as specified.

2. A combined water-bag, air-bag, and fountain-syringe reservoir consisting of a receptacle of flexible rubber, a filling-stopper applied thereto, and an outlet therefrom fitted with an air-valve consisting of a thimble, a screw-cap applied thereto, and a flap-valve in said cap, whereby by closing said valved outlet the receptacle may be used as a water-bag, by closing the stopper it may be inflated with air through said air-valve, or by removing said cap and attaching a syringe-tube to the thimble it may be used as the fountain of a syringe.

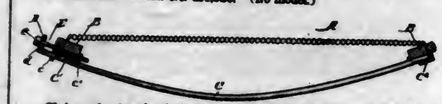
480,786. DROP-TUBE FOR STEAM OR HOT-WATER BOILERS. JOHN A. SOLLAY, Brooklyn, N. Y. Filed Feb. 5, 1892. Serial No. 420,427. (No model.)

Claim.—1. The mouthpiece for drop-tubes, consisting in the upright cast-metal cylinder *c*, adapted to rest upon the top of the tube and provided with a collar *d*, adapted to fit therein and having nozzle *f* threaded to receive a division-tube, the nozzle being closed at the top by an arch and being connected with the walls of the cylinder by means of the inlets *e*, extending from the arch through the sides of the cylinder, as and for the purpose set forth.

2. The mouthpiece for drop-tubes, consisting in the upright cast-metal cylinder *c*, adapted to rest upon the top of the tube and provided with the collar *d*, adapted to fit therein and having a nozzle *f* threaded to receive a division-tube, the nozzle being closed by the forked arch *d'* and being connected with the walls of the cylinder by means of the inlets *e*, extending from the arch through the sides of the cylinder, combined with the wrought-metal division-tube *l*, secured within the nozzle, as and for the purpose set forth.

3. The combination, with the drop-tube, of a cylinder *c*, extended above the tube-plate in which the tube is secured, the inlets *e* in opposite sides of the cylinder, united by the nozzle *f* and forming the vertical passages *g*, connecting the drop-tube with the top of the cylinder, and the nozzle being provided with the division-tube *l*, connected internally with the inlets *e*, as and for the purpose set forth.

480,787. INJECTOR OR INSUFFLATOR FOR THE LARYNX, &c. WILLIAM SCOTT, Leavenworth, Kans. Filed Mar. 14, 1892. Serial No. 424,797. (No model.)

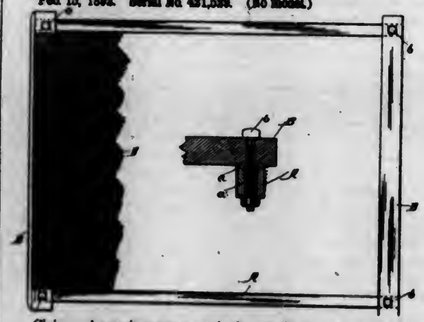


Claim.—1. An injector for the throat, larynx, &c., comprising a bulb of elongated and flattened form, substantially as set forth.

2. An injector for the throat, larynx, &c., comprising a bulb, a plug having enlarged inner and outer ends and inserted into said bulb, and a rigid tube surrounding at its inner end the outer end of the plug and having a laterally-curved outer end, substantially as set forth.

3. An injector for the throat, larynx, &c., comprising a casing for surrounding the tube of the instrument, a mirror pivotally attached to said casing, guides located at the sides of said casing, a rod running through one set of said guides and connected to the mirror, and also having a projecting inner end, an incandescent light carried by the outer end of the casing, conducting-wires leading from said light and through the opposite guides upon the casing, and a hollow handle carried by the casing and designed to contain a battery for connection to the wires, substantially as set forth.

4. An injector for the throat, larynx, &c., comprising a casing for surrounding the injector-tube, a hollow battery-holding handle having its top secured to the under side of the injector-tube casing, and a projection of the top of the casing extending downwardly, forwardly, and laterally and forming a tongue-rest, substantially as set forth.



480,788. BED-BOTTOM. CHARLES T. SEGAR, Chicago, Ill. Filed Feb. 15, 1892. Serial No. 421,523. (No model.)

Claim.—1. An elastic bed-bottom composed of an elastic fabric attached to end rails, as B, one of said rails being provided with a casting, as C, and the other of said rails being provided with a socket C^3, in combination with a rod C, adapted to slide through an opening in said casting C and enter the socket C^3, and a screw-bolt E, engaging the rod C, and the casting C for stretching the fabric, as specified.

2. In a bed-bottom of the class described, and in combination with a longitudinal bar, the casting C, adapted to be secured to the end rail, having a projection, as *c*, provided with an opening sufficient to pass the longitudinal bar, and a threaded opening for a screw-bolt E, engaging a projecting part of said bar, as and for the purpose specified.

480,789. BED-BOTTOM. CHARLES T. SEGAR, Chicago, Ill. Filed Feb. 15, 1892. Serial No. 421,532. (No model.)

Claim.—As an improvement in frames for woven-wire bed-bottoms, the side rails and superimposed end rails having their impinging surfaces formed on a curve transversely of the side rails and secured by a bolt passing through a hole in the end rail of greater diameter than that of the bolt, allowing play of the bolt, for the purpose specified.

480,790. HINGE. THOMAS TARGHEY, South Superior, Wis. Filed Nov. 28, 1891. Serial No. 413,390. (No model.)

Claim.—1. In a hinge, the jamb-plate A, having the casing A', said casing being provided with an inwardly-beveled slot a^2 in one of the sides thereof, and an inwardly-curved and outwardly-projecting wall a^3 adjacent said slot, in combination with the plate B, having the concaved portion *b*, and the curved or V-shaped arm B', the end *b'* of said arm being adapted to be journaled in the inwardly-beveled slot a^2, whereby when the said plate B is swung outwardly the curved portion b^2 thereof will rest on the outwardly-projecting wall a^3 of the casing, substantially as and for the purpose shown and described.

2. In a hinge, the combination, with a plate having upon one side thereof a curved or V-shaped arm, the jamb-plate A, having the casing A', said casing being provided with an inwardly-beveled slot a^2 in one of the sides thereof, and an inwardly-curved and outwardly-projecting wall a^3 adjacent said slot, substantially as described, and for the purpose set forth.

480,791. CAST-OFF BUCKLE. JOSIUS A. TRAUT, New Britain, Conn. Filed May 17, 1892. Serial No. 433,330. (No model.)

Claim.—1. The combination, with the web-engaging members, of the socket and detachable spring-slide having the semicircular flange and semicircular opening, respectively, co-operating to unite the socket and slide, substantially as described.

2. The combination, with the web-engaging members, of the socket having the inwardly-curved semicircular flange at the lower edge and the spring-slide narrowed toward the upper end and having a semicircular opening for the reception of the flange, the projecting finger-piece, and the loop for the attachment of the co-operating end of the web, substantially as described.

3. The combination, with the web-engaging members, of the socket having the semicircular concavity in the lower edge of the inwardly-curved flange around said concavity, and the spring-slide having a semicircular opening therein for the reception of the flange, the tongue projecting into the said concavity in the socket and having the raised portion thereon, and the finger-piece, substantially as described.

480,792. SNAP-HOOK. JOSIUS A. TRAUT, New Britain, Conn. Filed May 16, 1892. Serial No. 433,209. (No model.)

Claim.—1. In a snap-hook formed of sheet metal, the combination, with the hook, hook-shank, and loop, of the tongue formed of sheet metal, engaging the hook at one end, passing through the loop, and having the ears at the opposite end embracing the shank and seating in recesses therein, substantially as described.

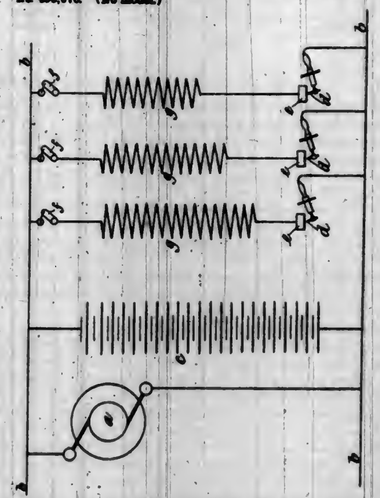
2. In a snap-hook formed of sheet-metal, the combination, with the hook, hook-shank having the bead *b* therein, and the loop, of the tongue having the ears embracing the shank below the bead, passing through the loop, and engaging the end of the hook, substantially as described.

3. In a snap-hook formed of sheet metal, the combination, with the hook, hook-shank having the bifurcated ends, and the loop around which said bifurcated ends are bent, of the tongue united to the shank on the under side, passing between the ends of the shank, and co-operating with the end of the hook, substantially as described.

480,793. SCREW-TOP FOR CANS. CHARLES H. TYLER, Buffalo, N. Y. Filed June 24, 1891. Serial No. 397,233. (No model.)

Claim.—1. A can or similar vessel having a projecting portion forming a valve-seat, said projection having an end opening and one or more side openings, which together constitute a vent, substantially as and for the purpose set forth.

2. A can or similar vessel having a portion struck up to form a projection 5 and having an end opening 3, formed through such projection, the end of the projection around the opening constituting a valve-seat and said opening 3 having branches 4, extending down the sides of the projection, substantially as and for the purpose set forth.



3. A can or similar vessel having a vent-opening adapted to be controlled by an elastic valve, in combination with another valve arranged to regulate the normal flow through such opening, substantially as and for the purpose set forth.

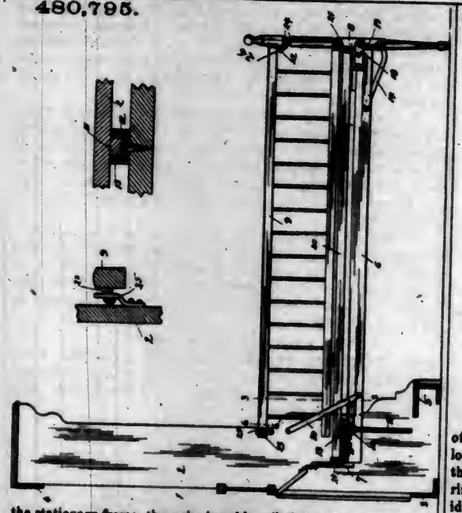
4. A can or similar vessel having a projection provided with a vent-opening partially in the end and partially in the side thereof and adapted to be closed more or less by the finger of the user, and also having a regulating-valve situated inside the can and arranged to regulate the normal flow through the vent, substantially as and for the purpose set forth.

5. A can or similar vessel having a removable cap or cover with a raised portion 5, through which is formed a vent-opening 3, having lateral branches 4, a screw-threaded socket situated on the inside of the cover opposite the said opening, and a screw valve-stem working in such socket and arranged to regulate the amount of normal flow through the said vent-opening, substantially as and for the purpose set forth.

6. As a new article of manufacture, a screw-cap for a can or similar vessel, having its top formed with a raised portion 5 and having formed through this portion 5 an opening 3, with lateral branches 4, extending down the sides of the raised portion, and having a valve-seat 6 around the central portion of the opening 5, substantially as and for the purpose set forth.

480,794. ARC WELDING AND HEATING APPARATUS. PHILIP I. URWIN and HENRY HOWARD, Halesowen, near Birmingham, England, assignors to Lloyd & Lloyd, same place. Filed June 14, 1892. Serial No. 436,670. (No model.)

Claim.—1. In heating and welding by the electric arc, the combination of a continuous-current dynamo, mains connected to the two poles of the dynamo, an accumulator or secondary battery having its poles connected to the mains in parallel with the dynamo, two or more conductors, each having one end connected to one main and the other end to a pencil, two or more conductors, each having one end connected to the other main and the other end to the work or the support of the work, and two or more resistances, each interposed between one of the mains and the pencil or work.



2. In heating and welding by the electric arc, the combination of a continuous-current dynamo, mains connected to the two poles of the dynamo, an accumulator or secondary battery having its poles connected to the mains in parallel with the dynamo, two or more conductors, each having one end connected to one main and the other end to a pencil, two or more conductors, each having one end connected to the other main and the other end to the work or the support of the work, and two or more resistances differing in resistance from each other and interposed between one of the mains and the pencil or work.

480,795. FOLDING BED. CASPER M. WAGNER, Chicago, Ill. Filed Mar. 4, 1892. Serial No. 424,336. (No model.)

Claim.—1. The combination, with a stationary frame, a folding frame having side pieces 6, and straps 10, pivoted to the side pieces and to the stationary frame, of guide-blocks 12, swiveled to the said side pieces and each having a groove 13, and guide-strips 11, rigidly secured to the stationary frame and extending through the grooves in the guide-blocks, substantially as and for the purposes described.

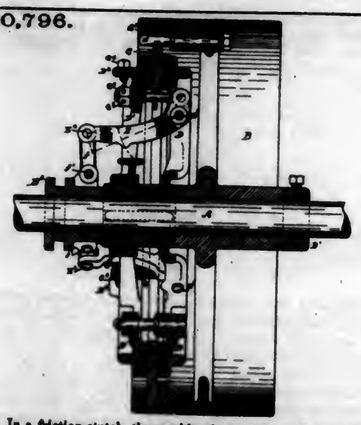
2. The combination, with a stationary frame, of a folding frame having side pieces 6, the straps 10, pivoted to the side pieces and to

480,795.

the stationary frame, the swinging side rails 9, having pivotal connections with the folding frame, the guide-blocks 12, swiveled to the side pieces of the folding frame and each having a groove 13, and the guide-strips 11, rigidly secured to the stationary frame and extending through the grooves in the guide-blocks, substantially as and for the purposes described.

3. The combination, with a stationary frame, of a folding frame having side pieces 6, the straps 10, pivoted to the side pieces and to the stationary frame, the longitudinal strips 20, having end straps 21 pivoted to the folding frame so that the strips can rise and fall, the side rails 9, hinged to the longitudinal strips, and the posts 8, pivotally connected with the side pieces of the folding frame, substantially as and for the purposes described.

4. The combination, with a stationary frame, of a folding frame having side pieces 6, the straps 10, pivoted to the side pieces and to the stationary frame, the guide-blocks 12, swiveled to the side pieces and each having a groove 13, the guide-strips 11, rigidly secured to the stationary frame and extending through the grooves in the guide-blocks, the longitudinal strips 20, having straps 21, pivoted to the folding frame so that the strips can rise and fall, the side rails 9, hinged to the longitudinal strips, and the posts 8, pivotally connected with the side pieces of the folding frame, substantially as and for the purposes described.



5. The combination, with a stationary frame, of a folding frame having side pieces 6, the straps 10, pivoted to the side pieces and to the stationary frame, the guide-blocks 12, swiveled to the side pieces and each having a groove 13, the guide-strips 11, rigidly secured to the stationary frame and extending through the grooves in the guide-blocks, the longitudinal strips 20, having straps 21 pivoted to the folding frame so that the strips can rise and fall, the side rails 9, hinged to the longitudinal strips, the posts 8, pivotally connected with the side pieces of the folding frame and having hooks 22 to engage the side rails, the hooks 23, secured to the stationary frame, and the pins 23, secured to the inner ends of the side rails and detachably engaging the hooks on the stationary frame, substantially as and for the purposes described.

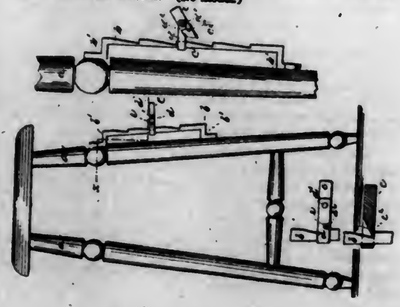
6. The combination, with the side pieces 6, of the end posts 8, provided with laterally-projecting pins 17, and the straps 14, pivoted at one end to the side pieces and at the opposite end pivoted to the posts directly below said laterally-projecting pins and extending past the pivoted points to form the projecting shoulders 16, which strike the pins on the posts when the latter are adjusted to a position at right angles to the side pieces, substantially as and for the purposes described.

480,796. CLUTCH. EDWARD WALDRON, Philadelphia, Pa. Filed June 28, 1890. Renewed May 11, 1892. Serial No. 432,673. (No model.)

Claim.—1. In a friction-clutch, the combination of a shaft, a sleeve movable lengthwise on said shaft, a ring, clutch members for grasping the opposite sides of the ring, lateral pins for loosely supporting said ring, the outer edge or periphery of said ring being rounded, substantially as shown, and for the purpose set forth, and lever mechanism connected with said sleeve and clutch members to cause the latter to clamp or release said ring.

480,796.

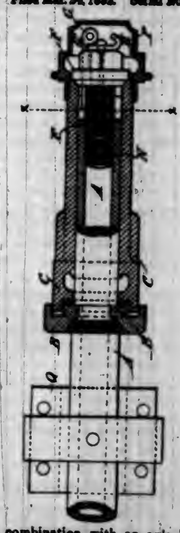
2. In a friction-clutch, the combination, substantially as set forth, of a shaft, a sleeve movable lengthwise on said shaft, a clutch-ring loosely supported by connection at its outer edge to another part of the device, and clutch members for gripping the opposite sides of said ring, the clutch member extending farthest from the sleeve being rigidly fastened to the shaft, and levers fulcrumed to said member, having their long arms linked to the sleeve and their short arms attached to an adjusting-piece connected to the opposite clutch member, substantially as set forth.



3. In a friction-clutch, the combination of a shaft, a sleeve movable lengthwise on said shaft, a ring C, clutch members D and D′ for gripping the opposite sides of the ring, said ring being flexibly connected at its outer edge to another part of the device, the clutch member D extending farthest from the sleeve being rigidly fastened to the shaft, levers E, fulcrumed to member D and connected to the opposite member D′ and to sleeve B³, and pins *d*, secured in the pulley B and extending through the ring C at or near the outer edge of said ring, substantially as and for the purposes set forth.

4. In a friction clutch, the combination of a shaft, a sleeve movable lengthwise on said shaft, a ring, clutch members for grasping the opposite sides of the ring, said ring being loosely connected at or near its outer edge to another part of the device, pins *d*, secured, substantially as shown, to one of said members and passing through the opposite member for the purpose set forth, and lever mechanism connected with said sleeve and clutch members to cause the latter to clamp or release said ring, substantially as set forth.

5. In a friction-clutch, the combination of a shaft, a sleeve movable lengthwise on said shaft, a ring, clutch members for grasping the opposite sides of the ring, said ring being loosely connected at or near its outer edge to another part of the device and having at or near its outer edge holes or openings flared toward the said opposite sides of the ring, and projections from said other part of the device entering said holes, substantially as shown, and for the purpose set forth, and lever mechanism connected with said sleeve and clutch members to cause the latter to clamp or release said ring.



6. In a friction-clutch, the combination of a shaft, a sleeve movable lengthwise on said shaft, the ring C, clutch members D and D′, levers E, adjusting-pieces G, lugs D³, nuts G³, and screws G⁴, which have contact with said nuts, substantially as and for the purpose set forth.

480,797. FOOT-REST. PETER WARD, Rye, N. Y. Filed Sept. 15, 1891. Serial No. 405,801. (No model.)

Claim.—The combination of a chair with a pair of bent racks *b*, secured to the chair-legs, a foot-board *c*, having beveled edge *c′*, supported upon the teeth of the rack, hooks *d*, pivoted to the ends of the board and embracing the racks, and with pins *e*, secured to the foot-board below the hooks, substantially as specified.

480,798. CARRIAGE-AXLE. HENRY WENKER, Offenbach-on-the-Main, Germany. Filed Mar. 24, 1892. Serial No. 426,295. (No model.)

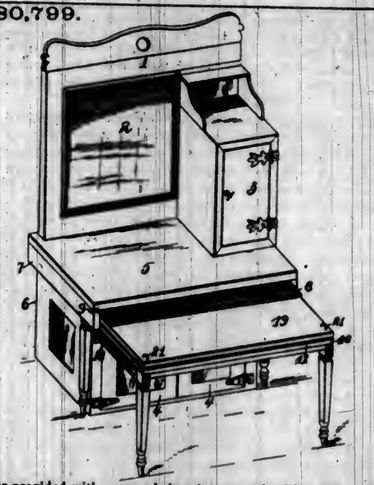
Claim.—1. The combination, with an axle having a collar and having its outer end extending beyond the outer end of the spindle mounted thereon, and having an internally-screw-threaded spindle, of an axle-box mounted on the spindle and abutting at its inner end against the collar, and a screw-threaded pin engaging the internally-screw-threaded spindle and having a head bearing against the outer end of the axle-box, substantially as described.

2. The combination, with an axle having a collar mounted thereon and having an internally-screw-threaded spindle, of an axle-box mounted on the spindle and abutting at its inner end against the collar, and a screw-threaded pin engaging the internally-screw-threaded spindle and having a head bearing against the outer end of the axle box, and means for locking the screw-threaded pin against disengagement, substantially as described.

3. The combination, with an axle having a collar mounted thereon and having an internally-screw-threaded spindle, of an axle-box mounted on the spindle and abutting at its inner end against the collar, and a screw-threaded pin engaging the internally-screw-threaded spindle, and having a beveled head bearing against the beveled outer end of the axle-box, substantially as described.

4. The combination, with an axle having its spindle tubular and screw-threaded in the interior and provided with slots D, of a locking-bolt F, having a feather or key G, with lateral recess G′, and a pivoted locking-plate H, with lateral recess K, for the purposes set forth.

5. The combination, with an axle having a hollow spindle, of an axle-box, a retaining-pin engaging within the hollow spindle, and a filling-nut beyond the pin for preventing the passage of dirt, &c., into the axle beyond, substantially as described.



6. The combination, with an axle, of springs resting thereon, a base and cap-piece through which the axle passes, a bolt passing through the springs, base, and cap-piece, and axle, and a nut for drawing up the bolt, so as to clamp all the parts together, substantially as described.

480,799. COMBINED DRESSER AND TABLE. BERNADINE WILES, St. Louis, Mo. Filed Mar. 15, 1892. Serial No. 425,043. (No model.)

Claim.—1. In a combined dresser and table, the combination, with the dresser provided with a top extending beyond the ends thereof and depending strips secured to said extended ends and forming grooves between the strips and the ends of the dresser, of a table comprising legs and side pieces connecting the pairs of the latter and adapted to be received by said grooves, substantially as and for the purpose set forth.

2. In a combined dresser and table, the combination, with the

480,799.

dresser provided with a space below its top and with grooves at its sides and a door for closing the front of said space and having pivots at its upper end, whereby said door closes by its own gravity, of a table adapted to be received by said space and grooves and having its top concealed by said door, substantially as and for the purpose set forth.

480,800. FOUNTAIN-PEN. LUCIEN B. WOOLFOLK, Cincinnati, Ohio. Filed May 21, 1892. Serial No. 433,898. (No model.)

Claim.—1. In a fountain-pen, the combination of a barrel with a point-section joined to the lower end of the barrel provided with a traversing-hole therein, a pen held in said traversing-hole, and a separate back-stay back of the pen provided with a lip integral therewith, and a stopper-check upon the lip to prevent it from entering the traversing-hole, and ducts and passages whereby air may enter the barrel and ink may flow out of the barrel to the point of the pen.

2. In a fountain-pen, the combination, with a barrel, of a point-section joined to the lower end of the barrel provided with a traversing-hole therein, a pen held in said traversing-hole, and a separate back-stay back of the pen provided with a lip integral with the back-stay, and an air-inlet in the back-stay and lip having the mouth thereof open to the air on the top side of the lip below the lower end of the point-section, and means to allow the outflow of ink from the barrel to the point of the pen.

3. In a fountain-pen, the combination, with a barrel, of a point-section joined to the lower end of the barrel provided with a traversing-hole therein, a pen held in said traversing-hole, a back-stay located back of the pen provided with a groove in the lower part thereof next the pen, a back-strip held in said groove, and ducts and passages to allow the entrance of air into the barrel and the outflow of ink from the barrel to the point of the pen.

4. In a fountain-pen, the combination, with a barrel, of a point-section joined to the lower end thereof and provided with a traversing-hole, a pen secured in said point-section, so as to partition the traversing-hole and form a sub-chamber below the pen, a separate back-stay to hold the pen in said point-section by its pressure upon the back thereof, and means to allow air to enter the barrel and ink to flow from the barrel to the point of the pen.

5. In a fountain-pen, the combination of a barrel, with a point-section joined to the lower end of the barrel provided with a traversing-hole therein, a pen held in said traversing-hole having the sides of the heel thereof in contact with the inner wall of the traversing-hole below the center thereof, a sub-chamber beneath the pen formed between the heel of the pen in contact with the wall of the traversing-hole and that part of the wall of the traversing-hole below the pen, a feed-rod held in said sub-chamber having the under side of the lower end thereof cut away to form a feed-tongue, a back-stay back of the pen, and means to allow the inflow of air into the barrel.

6. In a fountain-pen, the combination of a barrel, a point-section

joined to the lower end of the barrel provided with a traversing-hole therein, a pen held in the traversing-hole, a sub-chamber beneath the pen, a feed-rod held in said sub-chamber, and a back-stay back of the pen provided with a groove in the under side thereof next the pen, and a back-strip held in said groove in the back-stay, substantially as described.

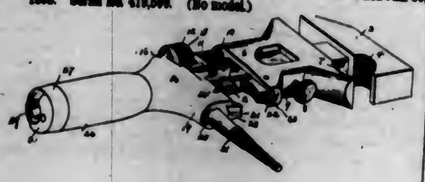
7. In a fountain-pen, the combination, with a barrel, of a point-section joined to the lower end of the barrel provided with a traversing-hole therein, a pen held in said traversing-hole provided with an ink-aperture in the heel thereof, a feed-tongue below the pen, and a separate back-stay back of the pen provided with an air-inlet therein communicating with the ink-aperture in the heel of the pen.

8. In a fountain-pen, the combination, with a barrel, a point-section joined to the lower end of the barrel provided with a traversing-hole therein, a pen held in said traversing-hole, and a sub-chamber in the point-section underneath the pen, of a feed-rod having a portion cut away from the under side of the lower end of the rod to form a feed-tongue, a finger below the feed-tongue integral with the under side of the feed-rod, and a slot between the feed-tongue and finger, substantially as described.

9. In a fountain-pen, the combination of an ink-holder consisting of a barrel and a point-section joined to the lower end thereof, said point-section provided with a traversing-hole therein, a pen held in said traversing-hole, and a sub-chamber in the point-section underneath the pen, with a feed-rod held in said sub-chamber having a portion cut away from the under side of the lower end of the rod to form a feed-tongue, a finger below the feed-tongue integral with the under side of the feed-rod, a slot between the feed-tongue and finger, and an ink-passage communicating between the ink-holder and the sub-chamber below the feed-tongue, substantially as described.

10. In a fountain-pen, the combination, with a barrel, a point-section joined to the lower end of the barrel provided with a traversing-hole therein, a pen held in said traversing-hole, and a separate back-stay back of the pen, of a feed-tongue below the pen provided with ink-spaces cut away on each side thereof, substantially as and for the purpose set forth.

11. In a fountain-pen, the combination, with a barrel, of a point-section joined to the lower end of the barrel provided with a traversing-hole therein, a pen held in said traversing-hole, a separate back-stay back of the pen, a feed-rod below the pen provided with a feed-tongue integral therewith, a finger integral with the under side of the feed-rod located below the feed-tongue, an ink-cup below the pen, and means to allow the inflow of air into the barrel.



12. In a fountain-pen, the combination, with a barrel, of a point-section joined to the lower end of the barrel provided with a traversing-hole therein, a pen held in said traversing-hole, a separate back-stay back of the pen provided with a groove in the lower part thereof next the pen, and means whereby ink may flow out from the barrel to the point of the pen.

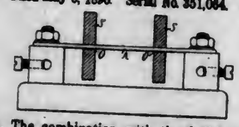
13. In a fountain-pen, the combination, with a barrel, and a point-section joined to the lower end of the barrel provided with a traversing-hole therein, a pen held in the traversing-hole, and a sub-chamber below the pen, of a feed-rod held in the sub-chamber having a portion cut away from the under side of the lower end of the rod to form a feed-tongue and provided with an ink-passage communicating between the barrel and the sub-chamber below the feed-tongue, and means to allow the entrance of air into the barrel.

14. In a fountain-pen, the combination, with a barrel, of a point-section joined to the lower end of the barrel provided with a traversing-hole therein, a pen held in the traversing-hole, a sub-chamber below the pen, a feed-rod held in said sub-chamber having a portion cut away from the under side of the lower end of the rod to form a feed-tongue, said cut-away portion of the feed-rod extending up into the sub-chamber, thereby lengthening the feed-tongue, and means whereby air may enter the barrel.

15. In a fountain-pen, the combination, with a barrel, of a point-section joined to the lower end of the barrel provided with a traversing-hole therein, a pen held in said traversing-hole, a sub-chamber below the pen, a feed-rod held in said sub-chamber having a portion cut away from the under side of the lower end of the rod to form a feed-tongue, and means whereby air may enter the barrel.

480,801. WRENCH. ROLAND BELLIS, Moosic, Pa. Filed Jan. 28, 1892. Serial No. 419,569. (No model.)

Claim.—1. A wrench for the purpose described, comprising a shank terminating at its lower extremity in a tapered tang, a foot having an opening for the reception of the said tang and provided laterally with an annular socket, a handle mounted on the said tang and provided at opposite sides of its center with longitudinal bores, one of which receives the tang, means for securing the handle in position on the tang, and a thread-cutting tap removably insertible in the other bore and terminating at its base in a tenon fitting the socket of the foot, and above the latter fitting threads formed in the lower ends or base of the cap-receiving bore, substantially as set forth.



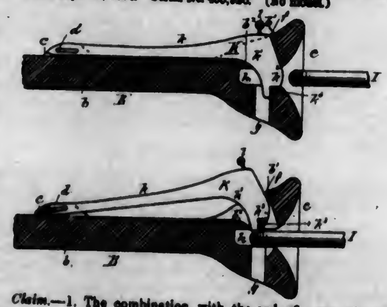
2. A wrench for the purpose described, comprising a rectangular shank, a metal foot having an opening for the reception of the shank and below the same opposite the tang portion of the shank merging into an annular bore, a handle bored to receive the tang and at one side of the same provided with a cap-receiving bore, a cap fitting the lower reduced end of the handle and provided with bores agreeing with those of the handle, and a crescent-shaped nut threaded on the end of the tang below the cap and adapted to cover the cap-receiving bore, substantially as described.

3. In a wrench, the combination, with the shank terminating at its lower end in a handle, a metal foot at the upper end of the handle, and a sliding jaw above the foot, the two being provided at their adjacent faces with recesses, of dies mounted in the recesses and means for adjusting the sliding jaw with relation to the foot, substantially as specified.

4. The combination, with the shank terminating at its lower end in a handle, the metal foot at the upper end of the handle, the sliding jaw above the foot, said jaw and foot being provided at their adjacent faces with dovetailed recesses, of dovetailed dies inserted in the recesses and means for adjusting the jaw, substantially as specified.

5. In a wrench, the combination, with the shank provided upon its rear side with a groove, a metal foot secured to the shank, and a sliding jaw mounted upon the shank, the jaw and foot being provided with recesses, of means for adjusting the jaw and dies inserted in the recesses and having their rear ends tenoned to take within the groove of the shank and the transverse pins passed through the walls of the recesses and the dies, substantially as specified.

480,802. ELECTRIC FUSE. OTTO T. BLATHY, Buda-Pesth, Austria-Hungary. Filed May 8, 1890. Serial No. 351,064. (No model.)

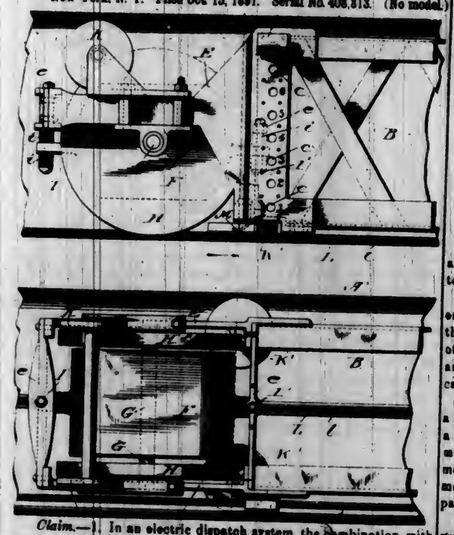


Claim.—1. The combination, with the fusible wire of a safety-fuse, of one or more movable disks threading said wire, the openings in said disks being approximately of the size of the wire.

2. In a safety-fuse, in combination with the supporting-block of a fusible wire and one or more movable disks threading said fusible wire, the openings in said disks being approximately of the size of the wire.

3. In a safety-fuse, the combination, with a cylindrical casing therefor, of one or more partitions located within said casing and provided with a circular opening or openings approximately of the size of the fuse, wire and a fusible wire passing through or threading said opening in said partition or partitions.

480,803. CAR-COUPLING. JOHAN H. BROWER, Salem, Mass. Filed Sept. 16, 1891. Serial No. 405,990. (No model.)



Claim.—1. The combination, with the end of a car, of a rock-shaft *n*, an arm *m*, having a boss at its butt *d* round the rock-shaft, the curved periphery of which boss is partly cut away and flattened, as shown at *m'*, and a spring, all operating together, substantially as and for the purpose described.

2. The combination of the draw-bar and the draw-head B, having the incline b^3 upon the front face of the rear part of the hook-cavity, in combination with the hook K, provided with the forwardly-presented convexity k^3, and the backwardly-sloping incline *k'*, which hook is combined with the draw-head by a slotted connection at the rear end of its horizontal arm, substantially as and for the purpose described.

3. The combination of a draw-head B, provided in its hook-cavity with the backwardly-sloping incline b^3 in the rear of the hook-cavity and *b'* in the front of the hook-cavity with the hook K, provided with the counterpart inclines to engage said inclines in the draw-head, and with the convexity k^3, and increasing slope below the same, and having a slotted connection between the horizontal arm of said hook and the draw-head, substantially as and for the purposes described.

480,804. ELECTRIC DISPATCH SYSTEM. ANDREW BRYSON, Jr. New York, N. Y. Filed Oct. 15, 1891. Serial No. 408,813. (No model.)

Claim.—1. In an electric dispatch system, the combination, with a way and its branches, of an electric motor, a carrier, a guide located at each of said branches, means on the carrier adjustable at the option of the sender to engage automatically with a predetermined guide, and a continuous conductor for supplying a current to the motor, substantially as described.

2. In an electric dispatch system, the combination, with a way and its branches, of a carrier, an electric motor, a continuous conductor located in the main way for supplying a current to the motor, and mutually-engaging guides fixed to the carrier and the way for automatically and mechanically changing the path of the carrier at said branches and breaking the contact between the motor and the conductor, substantially as described.

3. The combination of the tube A, provided with the guides D, the carrier B, provided with the hooks C, the frame E, secured to the carrier, the motor F, having its armature keyed to the axle G and suspended by bolts I I' and collars *i i'* from the frame, the contact M, the conductor L, the wheels H H, and the wheel K, substantially as described.

4. In an electric dispatch system, the combination, with a way and its branches, of a carrier, an electric motor, a continuous conductor located in the main way and in the branches for supplying a current to the motor, and mutually-engaging guides fixed to the carrier, and the way for automatically and mechanically changing the path of the carrier at said branches without interrupting the circuit between the motor and the conductor, substantially as described.

480,805. AUTOMATIC RECEIVER FOR PNEUMATIC OR OTHER DISPATCH SYSTEMS. ANDREW BRYSON, Jr., New York, N. Y. Filed Oct. 15, 1891. Serial No. 408,814. (No model.)

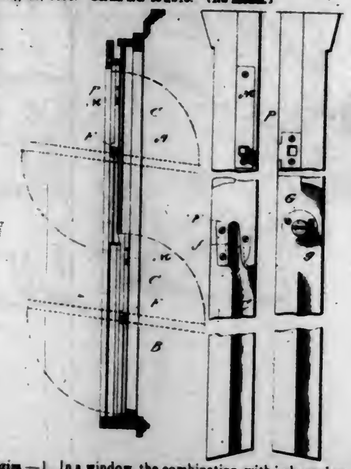
Claim.—1. The combination, with a way and carrier, of a pivoted lever, a gate suspended from one arm of the lever, a lifting-cam mounted on a shaft and engaging with the other arm of the lever, and mechanism automatically actuated by the passage of the carrier to rotate the cam, substantially as described.

2. The combination, with a way and a carrier, of two independently-pivoted levers, each having a gate suspended from one arm thereof, lifting-cams mounted on a shaft engaging with the other arms of the levers in such relation as to alternately raise and depress said arms, and mechanism automatically actuated by the passage of the carrier to rotate the cams, substantially as described.

3. The combination, with a way and a carrier, of a pivoted lever, a gate suspended from one arm of the lever, a lifting-cam mounted on a shaft and engaging with the other arm of the lever, an electric motor, a circuit to operate the motor, suitable gearing between the motor and cam for revolving the cam, and a circuit-breaker automatically operated to make and break the circuit of the motor by the passage of the carrier, substantially as described.

4. The combination, with a way and a carrier, of two independently-pivoted levers, each having a gate suspended from one arm thereof, lifting-cams mounted on a shaft and engaging with the other arms of the levers, an electric motor, a circuit to operate the motor, suitable gearing between the motor and cams for revolving the latter, and a circuit-breaker automatically actuated to make and break the circuit of the motor by the passage of the carrier, substantially as described.

5. The combination, with a way and a carrier, of the lever-arms M'' and M, having the friction-roller *m*, both keyed to the shaft M', rocking in bearings *c'*, the gate Y, suspended from the arm M'', the lever G, keyed to the shaft G', rocking in bearings *c*, the gate X, suspended from the lever G, the lifting-cams L F, mounted on the shaft D, turning in bearings *c*, the gear-wheel C, the electric motor B, having the gear-wheel *b*, its circuit P Q, and a contact-breaker automatically actuated by the passage of the carrier to make and break the circuit, substantially as described.



6. The combination, with a way and a carrier, of the lever-arm G, mounted on the shaft G', the gate X, suspended from one arm of the lever G, the lifting-cam F, engaging with the other arm of the lever G and mounted on the shaft D, turning in bearings *c*, the gear-wheel C, mounted on the shaft D, the electric motor having the gear-wheel *b*, its circuit P Q, and a contact-breaker automatically actuated by the passage of the carrier to make and break the circuit, substantially as described.

7. The combination, with a way and a carrier, of the lever-arm G, mounted on the shaft G', the gate X, suspended from one arm of the lever G, the lifting-cam F, having the lug *f* engaging with the other arm of the lever G and mounted on the shaft D, turning in the bearings *c*, the gear-wheel C, mounted on the shaft D, the electric motor having the gear-wheel *b*, its circuit P Q, the plate S in the path of the carrier, the lever T, the contact R, located in the circuit between the plate and one arm of the lever T, and the rod U, actuated by the other arm of the lever T to engage the lug *f* on cam F, substantially as described.

8. The combination, with a way and a carrier, of an electric motor, a cam rotated by said motor, a circuit to operate the motor, a log

on said cam, the plate S in the path of the carrier, the lever T, the contact R, located in the circuit between the plate and one arm of the lever, and the rod U, actuated by the other arm of the lever to engage the lug on the cam, substantially as described.

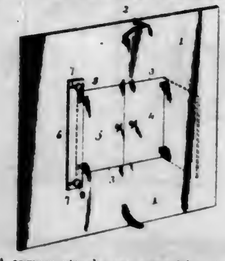
480,806. WINDOW. JOHN W. COOPER, New York, N. Y. Filed Aug. 31, 1891. Serial No. 404,313. (No model.)

Claim.—1. In a window, the combination, with independent counterbalanced slides and pivots projected from the opposing sides of the said slides midway of the ends thereof, of a sash and plates F, secured to the sides of the sash and having slots *f* opening downward through the lower ends of the said plates, substantially as set forth, whereby the sash is pivotally supported and adapted to be removably connected with the said slides.

2. In a window, the combination, with a sash and independent counterbalanced slides, of plates F, secured to the sides of the sash and having slots *f* opening downward, and pivots secured to the said slides and adapted to enter the said slots *f* and having heads to overlap the sides of the slots to lock the sash and slides together, substantially as described.

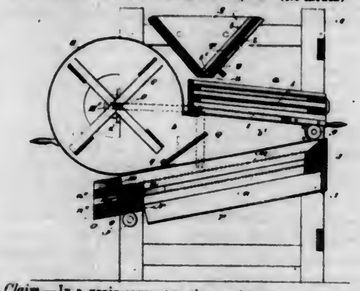
3. In a window, the combination, with the independent counterbalanced slides and the sash pivotally connected together midway of their ends, the meeting edges of the said slides and the side stiles of the sash being rabbeted on opposite edges from a point near the pivotal connection between the said slides and sash, of plates F, secured to the sash and having slots *f* opening downward, headed pivots G, adjustably connected with the said slides, and plates *g* to brace the said pivots, substantially as set forth.

480,807. CAR-COUPLING. RENSSELAER A. COWELL, Cleveland, Ohio. Filed Apr. 21, 1892. Serial No. 430,022. (No model.)



Claim.—1. In a hook car-coupler, a draw-head, a knuckle pivotally connected with said draw-head, and a tilting block located within the draw-head, said tilting block being adapted to retain the knuckle in its open position preparatory to coupling and being operatively connected with the knuckle in such a manner that the elevation of the free end of said tilting block will unlock or open the knuckle, substantially as set forth.

2. In a hook car-coupler, a draw-head, a knuckle pivotally connected with said draw-head, the draw-head being chambered to receive said knuckle, a tilting block located within the chamber of the draw-head, a chain operatively connecting the knuckle with said tilting block, and suitable means connected with said tilting block and extending outside the draw-head, whereby the elevation of the free end of said block will unlock or open the knuckle, substantially as and for the purpose set forth.



3. In a hook car-coupler, a draw-head, a knuckle pivotally connected with said draw-head, the draw-head being chambered to receive said knuckle, a tilting gravity-block located within the chamber of the draw-head, a chain operatively connecting the knuckle with said tilting gravity-block, and a chain connected with said tilting block and leading outward through the top of the draw-head, substantially as and for the purpose set forth.

480,808. CAMERA ATTACHMENT. EDMUND DE MOULIN, Greenville, Ill. Filed Mar. 30, 1892. Serial No. 427,039. (No model.)

Claim.—A camera attachment comprising the plate 1, designed to be secured to the back of a camera and provided with an opening, an adjustable plate provided with slots and arranged at one side of the opening, set-screws arranged in the slots and securing the adjustable plate in its adjustment, and doors hinged at opposite sides of the opening, one of the doors being hinged to and carried by the adjustable plate, substantially as described.

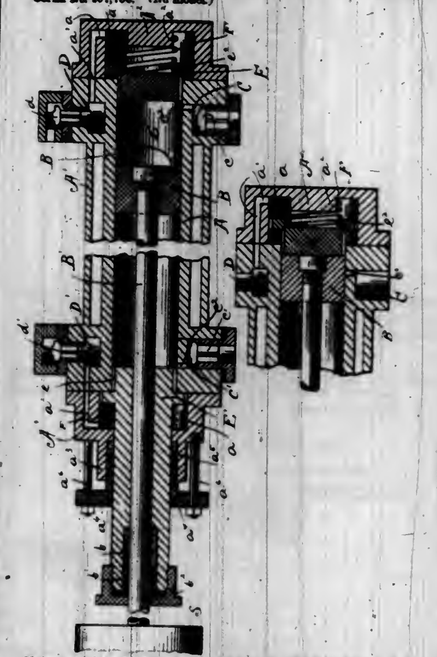
480,809. FANNING-MILL. GILBERT D. DICKEY, Mountain Grove, Mo. Filed Jan. 30, 1892. Serial No. 419,770. (No model.)

Claim.—In a grain-separator, the combination, with the fan-casing and the upper separating-shoe located in the rear of said casing, of a lower grading-shoe extending the full length of the machine and receiving the grain from said upper shoe, opposite pairs of supporting-rollers taking under opposite sides of said lower shoe, said lower shoe having an angular bottom pan and an outer connecting-board arranged above the delivering end of said pan and having a locking-notch, a grading-sieve removably placed within said shoe and having a locking-lug adapted to drop into said notch and an inclined deflecting-strip located at its outer end to form a discharging-mouth, a superposed screen placed above the lowermost sieve and provided with a securing-lug adapted to drop back of said deflecting-strip, and a similar but oppositely-disposed deflecting-strip, and means for moving said shoes, substantially as set forth.

480,810. ROPE-CLAMP. ROBERT M. DOWNIE, New Brighton, assignor to the Keystone Driller Company, Beaver Falls, Pa. Filed Nov. 9, 1891. Serial No. 411,306. (No model.)

480,810.

Claim.—1. In a temper-screw clamp, opposing clamping-jaws loosely suspended from the lower end of a temper-screw, a yoke or shackle rigidly secured to one of said clamping-jaws, leaving the other jaw entirely free, the two arms of the yoke projecting from the rigid jaw on opposite sides of the movable jaw, a straight swinging clamping-arm pivoted at one end to one arm of said yoke and adapted to removably engage the other arm thereof, and a clamping-screw mounted at or about the center of the arm and adapted to bear against the movable jaw, substantially as set forth.



2. In a temper-screw clamp, independent opposing clamping-jaws, a yoke or shackle rigidly secured to one of said clamping-jaws and projecting beyond the same, a straight swinging clamping-arm pivoted to one of the arms of said pivoted yoke and adapted to removably engage over the other arm, and a clamping-screw passing centrally through said clamping-arm intermediate of its pivotal connection and its locking end and having the threads thereof so disposed with relation to the free swinging end of the same that the tightening of the screw will tend to keep it in locking engagement with the yoke-arm and the loosening thereof will unlock and throw the said arm out of engagement with the locking-arm of said yoke, substantially as set forth.

3. In a temper-screw clamp, elongated semi-cylindrical clamping-jaws loosely connected to the lower end of the temper-screw, a U-shaped yoke or shackle having a rounded seat within which is rigidly secured one of said clamping-jaws and terminating at the end of one arm in a reduced locking-shank having a flanged head, the other clamping-jaw being entirely free to move within said yoke, a swinging clamping-arm pivoted to the opposite arm of said yoke and provided with a notch adapted to engage said shank behind said head and with a centrally-located threaded perforation, and a clamping-screw engaging said threaded perforation and bearing directly against the movable clamping-jaw inclosed within the yoke, substantially as set forth.

4. In a temper-screw clamp, opposing elongated semi-cylindrical clamping-jaws loosely connected to the lower end of a temper-screw, a bearing-plate raised from the outer face of one of said jaws and provided with a conical socket, a U-shaped yoke or shackle having a rounded seat within which is rigidly secured the other clamping-jaw, said yoke terminating at the end of one arm in a reduced locking-shank having a flanged head, a swinging clamping-arm pivoted at one end to the opposite arm of said yoke and provided at its other end with a notch adapted to engage said locking-shank behind said head and with a centrally-located threaded perforation, and a clamping-screw engaging said threaded perforation and provided with a tapered or conical end adapted to bear directly in the conical socket of the jaw inclosed within the yoke, substantially as set forth.

5. In a temper-screw clamp, the opposing clamping-jaws loosely suspended from a temper-screw, an approximately-U-shaped yoke or shackle made of a single piece arranged horizontally and secured rigidly to one of the jaws, leaving the other jaw free and movable, a swinging clamping-arm pivoted at one end to one arm of the yoke and adapted to have its other end removably engage the other arm of the yoke, so as to bridge the space between the two arms of the same, and a single clamping-screw mounted in the arm intermediate of its ends and adapted to engage and bear against the movable jaw of the clamp, substantially as set forth.

480,811. FLUID-PUMP OR COMPRESSOR. JOHN J. DUFFY, Cleveland, Ohio, assignor to Edward P. Bates, same place. Filed Oct 5, 1891. Serial No. 407,736. (No model.)

Claim.—1. In a fluid pump or compressor, the combination, with a fluid-cylinder having outlets at its extreme ends, a piston, and valves constructed to move in the ends of the cylinder and having air-passages formed between them and the wall of the cylinder, of air-chambers formed outside of the valves and in communication with the air-passages, valves in the passage-ways constructed to permit the fluid to flow outward, and suction-valves in the cylinder, substantially as set forth.

2. The combination, with a cylinder open at one or both ends and piston, of a delivery-valve seated at the open end or ends of the cylinder and having a reduced section extending into the said cylinder and having alternating depressions and elevations on its periphery, substantially as set forth.

3. In a double-acting fluid pump or compressor, a delivery-valve seated at each end of the fluid-cylinder of the pump or compressor, said valves being adapted to be engaged when having been removed from their respective seats by the piston of the fluid-cylinder, one of said valves having a spring connected therewith and the other delivery-valve being perforated for the passage of the piston-rod and extending outside the adjacent head of the fluid-cylinder and terminating in a stuffing-box for the piston-rod, said adjacent head of the fluid-cylinder also terminating in a stuffing-box for said last-mentioned valve, substantially as set forth.

4. In a fluid pump or compressor, a delivery-valve seated at the end of the fluid-cylinder and having a reduced section extending into said cylinder and having alternating depressions and elevations on its periphery, substantially as and for the purpose set forth.

480,812. DIFFUSION APPARATUS. EDWARD F. DYER and HAROLD F. DYER, Cleveland, Ohio. Filed Apr. 28, 1892. Serial No. 430,964. (No model.)

Claim.—In a diffusion-cell, a central or cylindrical section, as at A, an inverted conically-shaped bottom or lower section B, embracing the lower end of and secured to said central or cylindrical section, said bottom or lower section at one side having a flanged pulp-discharge opening, substantially as indicated, a strainer located within and con-

480,812.

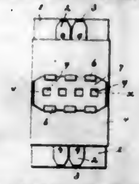
forming to the shape of said lower section, the latter having an internal rim, as at b', a shoulder, as at b^2, and one or more lugs, as at B^4, for supporting said strainer, substantially as set forth.

480,813. COMBINED GAS AND ELECTRIC-LIGHT FIXTURE. ALANSON T. ENGS, New York, N. Y. Filed Oct. 31, 1889. Serial No. 328,872. (No model.)

Claim.—1. The combination, with two gas-pipes pivoted together, of semi-cylindrical pipes having their open sides resting against the gas-pipes, forming conduits carrying an electric conductor, and a joint exterior to the gas-pipe joint and between the gas-pipes connecting with said semi-cylindrical pipes, through which the continuous wires of the conductors pass, substantially as described.

2. The combination, with two gas-pipes pivoted together, of the semi-cylindrical pipes having their open sides resting against the gas-pipes, forming closed conduits, carrying a double electric conductor, and the cylindrical pieces connected to said semi-cylindrical pipes and surrounding the gas-joint, through which pieces the electric wires pass on either side of the gas-joint, substantially as described.

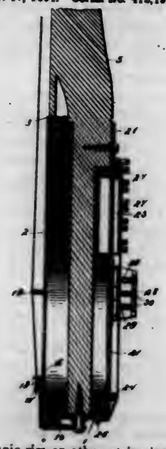
480,814. STEM-WINDING WATCH. FRIEDRICH FREY, Stuttgart, Germany. Filed Apr. 7, 1891. Serial No. 388,053. (No model.)



Claim.—1. In a watch, the combination of a pendant provided with grooves and a spring, as R, attached to the watch-plate and adapted to engage one or the other of said grooves, substantially as set forth.

2. In a watch, the combination of a pendant provided with grooves, a spring, as R, adapted to engage the grooves and provided with a toe, as R^1, and a screw provided with a conical end bearing against the toe, substantially as set forth.

3. In a watch, the combination of a pendant or stem, as W, provided with two notches, of a spring, as R, having a tooth, as R', engaging with one or the other of the notches, and a screw provided with a conical end bearing against the spring R, substantially as set forth.

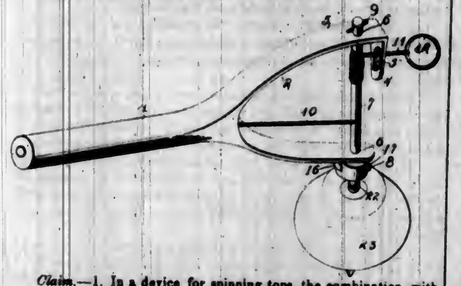


4. In a watch, the combination, with the time mechanism comprising a pendant or stem, as W, a pinion, as C, thereon, and gears, as A and Z, of a barrel consisting of a click-wheel, as S, having an annular flange, an arbor, as *b*, and a spring-wheel, as F, integral therewith, and a removable bridge, as B, having a depending flange, as *a*, upon which the click-wheel S is journaled, substantially as set forth.

480,815. GAME-COUNTER. PHILIP HALE, Jr., Denver, Colo. Filed Apr. 29, 1892. Serial No. 431,147. (No model.)

Claim.—In a game-counter, the combination of a back or support having slide-strips therein bearing numerals thereon, a front plate over said strips having openings therein, and a transversely-adjustable slide carried by said front plate and provided with a series of openings to align with the aforesaid openings, substantially as described.

480,816. MUSICAL INSTRUMENT. FRED G. HANEY, Findlay, Ohio. Filed Nov. 17, 1891. Serial No. 412,198. (No model.)



Claim.—1. A banjo-rim or other string-instrument body having a sounding-board secured to its rear side and an auto-harp mounted thereon, substantially as specified.

2. A banjo rim or body portion having a sounding-board mounted on its rear side, provided with sound-openings, bridges secured to the sounding board at opposite sides of the opening, tuning-pegs located in the sounding-board outside of one of the bridges, studs secured to the rear side of the rim beyond the bridge, strings passed over the bridges and connected at their ends to the studs and pegs, and a series of mutes, and the banjo head and neck, the latter provided with a transverse nut-receiving recess, combined with the notched tail-piece, the pegs, and the reversible nut mounted in the recess and having its opposite edges notched to receive the strings of a guitar or banjo, substantially as specified.

3. The combination, with the head, notched tail-piece, and neck provided with keys and with a transverse nut-receiving recess, of the strings connected with the tail-piece, passing over the nut-receiving recess and secured to the keys, a nut having its opposite edges differently notched, removably mounted in the nut-receiving recess, and the key having the flat blade adapted to be inserted under the strings and to raise the same from the nut, substantially as specified.

4. The combined guitar and banjo, the neck of which is provided with the opposite L-shaped studs opposite those keys adapted for the reception of the second and third bass strings, substantially as specified.

480,817. SPINNING-TOP. FRANCIS M. IDLE, St. Louis, Mo. Filed Feb. 27, 1892. Serial No. 423,090. (No model.)

Claim.—1. In a device for spinning tops, the combination, with a revoluble operating-shaft, of a block carried thereon having a socket to receive the shaft of the top, a spring-actuated dog adapted to hold the top-shaft in the block and release the same when the shaft is revolved, substantially as shown and described.

2. In a device for spinning tops, the combination, with a revoluble operating-shaft and cord attached, of a block fixed upon said shaft and having a socket, a dog pivoted to the block and forming a side of the socket, said dog having a shoulder, the top-shaft having depressions therein, and the spring for holding the dog in contact with the top-shaft, substantially as shown and described.

3. In a device for spinning tops, the combination, with a handle having a forked end, of the revoluble operating shaft, the cord attached thereto, the elastic cord connecting the shaft and handle, the socket-block having a yielding retaining-arm which forms a part of the socket, and the top having a shaft adapted to enter the socket of said block and be released therefrom by the retaining-arm being thrown outward, substantially as shown and described.

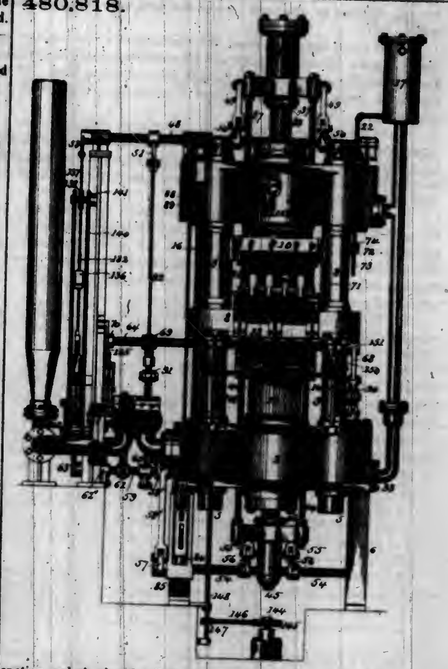
4. The combination, with a revoluble shaft and cord for operating the same, of a block having a socket, a supplemental block pivoted within the socket-block and providing a side to the socket, and a spring-band for holding the said supplemental block in its normal position, substantially as and for the purpose described.

480,818. HYDRAULIC BRICK-PRESS. JULIUS J. KOCH, St. Louis, Mo. Filed June 1, 1891. Serial No. 394,749. (No model.)

Claim.—1. In a hydraulic brick-press, the combination of the upper and lower rams and their respective cylinders, a connecting-pipe 16, and an independently-moving loaded controlling-valve 20, operating automatically to admit pressure to the upper ram-cylinder when a predetermined pressure is attained in the lower ram-cylinder, substantially as set forth.

2. In a hydraulic brick-press, the combination of the upper and lower rams and their respective cylinders, a connecting-pipe 16 between said cylinders, an independently-moving loaded controlling-valve 20, and a loading and unloading attachment for said valve, adapted to automatically change the amount of load upon said valve while the same is held closed, substantially as set forth.

3. In a hydraulic brick-press, the combination of the upper and lower rams and their respective cylinders, a connecting-pipe 16, with the relief-valve 18 and controlling-valve 20, arranged independent of each other, and weighted connections adapted to pull the relief-valve 18 open and hold the controlling valve 20 closed, substantially as set forth.



4. In a hydraulic brick-press, the combination of the upper and lower rams and their respective cylinders, a connecting-pipe 16, relief-valves 18, controlling-valve 20, said valves being arranged independent of each other, weighted connections to the valves, and a hydraulic cylinder and plunger 84 85, adapted to push the weighted connections upward to close the relief-valve 18 and reduce the maximum load by which the controlling-valve 20 is held closed, substantially as set forth.

5. In a hydraulic brick-press, the combination, with the upper ram and ram-cylinder, passages 15 and 21, of the combined inlet and outlet valve 23, having an intermittent operative connection with the upper ram, substantially as set forth.

6. In a hydraulic brick-press, the combination, with the upper ram and ram-cylinder, passage 15, and storage-tank 17, of the independently-arranged combined suction and check valve 24, substantially as set forth.

7. In a hydraulic brick-press, the combination of the upper ram and ram-cylinder, the combined inlet and outlet valve 23, combined

480,818.

suction and check-valve 24 in the passage 15, and the valve 23, having an intermittent operative connection with the upper ram, substantially as set forth.

8. In a hydraulic brick-press, the combination of the upper ram and ram-cylinder, passages 15 21, combined inlet and outlet valve 23, stem 73, collar 74, and arm 72, carried by the upper ram, substantially as set forth.

9. In a hydraulic brick-press, the combination of the upper ram-plunger 10, auxiliary raising-cylinder 38, and tie-rods 37, connecting the two together, essentially as set forth.

10. In a hydraulic brick-press, the combination of the upper ram-plunger 10, auxiliary raising-cylinder having its lower annular chamber in constant communication with low-pressure accumulator, and tie-rods connecting the auxiliary cylinder and plunger 10 together, essentially as set forth.

11. In a hydraulic brick-press, the combination of the upper ram-plunger, the auxiliary raising-cylinder 38, the upper chamber 42 of which is in communication, through its hollow piston, with a valve-chamber 115, a pair of valves 121 122 in said chamber, controlling the pressure-supply to the upper chamber of the auxiliary cylinder, and tie-rods 37, connecting the auxiliary cylinder 38 and upper ram-plunger 10 together, substantially as set forth.

12. In a hydraulic brick-press, the combination of the upper ram-plunger 10, auxiliary raising-cylinder 38, stationary piston 39, having ports 40 and 41, connected, respectively, with chambers 42 and 43, substantially as set forth.

13. In a hydraulic brick-press, the combination, with the auxiliary raising-cylinder 38, for the upper ram or plunger 10, of the valve-casing 115, valves 121 and 122, connected together by a valve-lever 123, and a slotted link 124 for operating the same, substantially as set forth.

14. In a hydraulic brick-press, the combination, with the auxiliary raising-cylinder 38 for the upper ram or plunger 10, of the valve-casing 115, valves 121 and 122, connected together by a valve-lever 123, slotted link 124, actuating-arm 62', operated by lower ram connections, substantially as set forth.

15. In a hydraulic brick-press, the combination, with the auxiliary raising-cylinder 38 for the upper ram or plunger 10, of the valve-casing 115, valves 121 and 122, connected together by a weighted lever 123, spring-latch 125, and operating-tappet 70, substantially as set forth.

16. In a hydraulic brick-press, the combination, with the auxiliary raising-cylinder 38 for the upper ram or plunger 10, of the valve-casing 115, valves 121 and 122, connected together by a weighted lever 123, spring-latch 125, operating-tappet 70, slotted link 124, and actuating-

arm 62', operated by the lower ram connections, substantially as set forth.

17. In a hydraulic brick-press, the combination of the auxiliary raising-cylinder 38, rock-shaft 48, arm 50, connected to and receiving motion from the cylinder 38, arm 52, link 113, and sliding block 114, adapted to release the valve mechanism of the charger, substantially as set forth.

18. In a hydraulic brick-press, the combination of the auxiliary raising-cylinder 38, rock-shaft 48, arm 50, connected to and receiving motion from the cylinder 38, arm 51, and link 92, adapted to operate the lever 91 of the inlet-valve 32 of the lower ram-cylinder, substantially as set forth.

19. In a hydraulic brick-press, the combination of the auxiliary raising-cylinder 38, rock-shaft 48, arm 50, connected to and receiving motion from the cylinder 38, arm 53, chain and pulley connections 137 138, rod 132, and drop-weight 130, adapted to operate the valve mechanism for controlling and relief valves of the upper ram-cylinder, substantially as set forth.

20. The combination, with a hydraulic brick-press, of the pressure-chamber 152, plunger 153, cushion 154, pointer 155, adjustable fulcrum 156, and an electric alarm, substantially as set forth.

21. The combination, with a hydraulic brick-press, of the pressure-chamber 152, plunger 153, cushion 154, pointer 155, adjustable fulcrum 156, and a series of electric alarms 157, 158, and 159, substantially as set forth.

22. In a hydraulic brick-press, the combination of the reciprocating clay-charger 100, imparting intermittent motion to the rock-shaft 64, arm 67, cam 68, and weighted lever adapted to operate the outlet-valve 34 of the lower ram-chamber, substantially as set forth.

23. In a hydraulic brick-press, the combination of the reciprocating clay-charger 100, imparting intermittent motion to the rock-shaft 64, arm 67, cam 69, adapted to operate the valve-lever 91 of the inlet-valve 32 of lower ram-chamber, substantially as set forth.

24. In a hydraulic brick-press, the combination of the reciprocating clay-charger 100, imparting intermittent motion to the rock-shaft 64, arm 67, and tappet 70, adapted to release the spring-latch 125 of the valve mechanism of the auxiliary cylinder 38, substantially as set forth.

25. In a hydraulic brick-press, the combination, with the vertically-adjustable stop 144 of the chain-and-pulley connections 145, 146, and 147, and the vertical hand-wheel shaft 148, substantially as set forth.

26. In a hydraulic brick-press, the combination, with the vertically-adjustable stop 144, of the chain-pulley and shaft connections 145, 146, 147, 148, 149, the traveling pointer 150, and scale 151, substantially as set forth.

27. In a hydraulic brick-press, the combination of the rock-shaft receiving motion from the lower ram and carrying an arm 60, and slotted link 94, adapted to operate the arm 91 of the inlet-valve 32 to lower ram-chamber.

28. In a hydraulic brick-press, the combination, with the lower ram-cylinder and its high and low pressure inlets 27 and 28 and the inlet-valve 32, of the pressure-dividing valve 31, arranged between the high and low pressure inlets and receiving its opening movement from the lower ram, and a holding-latch for retaining said valve in a raised condition independent of the lower ram, substantially as set forth.

29. In a hydraulic brick-press, the combination, with the lower ram-cylinder and its high and low pressure inlets 27 and 28 and the inlet-valve 32, of the pressure-dividing valve 31, arranged between the high and low pressure inlets, a rock-shaft 59, receiving motion from the lower ram and carrying an arm 61, adapted to raise the pressure-dividing valve, and a holding-latch for retaining said valve in a raised condition independent of the lower ram, substantially as set forth.

30. In a hydraulic brick-press, the combination of the rock-shaft 59, receiving motion from the lower ram and carrying an arm 62', a slotted link 124, adapted to operate the valve mechanism of the auxiliary cylinder 30, so that the same will lift the upper ram, and a latch, as 135, to lock the valve mechanism in such condition, substantially as set forth.

31. In a hydraulic brick-press, the combination of the rock-shaft receiving motion from the lower ram and carrying a sector 63, with the pinion 143, chain-and-pulley connections 140, 141, and 142, and the wedge 139, adapted to release the weight 130 that operates the mechanism of valves 128 and 129, substantially as set forth.

32. In a hydraulic brick-press, the combination of the rock-shaft receiving motion from the lower ram and carrying an arm 62, and slotted link 109, adapted to operate the valve of the charger-cylinder, substantially as set forth.

33. In a hydraulic brick-press, the combination, with the charger-cylinder and its valve 103, of the link 111 and shifting overbalancing device 110, substantially as set forth.

34. In a hydraulic brick-press, the combination, with the charger-cylinder and its valve 103, of the valve-lever 108 and latch 112.

35. In a hydraulic brick-press, the combination of the pressure-dividing valve 31, the arm 61, receiving motion from the lower ram and adapted to raise the pressure-dividing valve, and a spring-latch 96, adapted to hold said valve open, substantially as set forth.

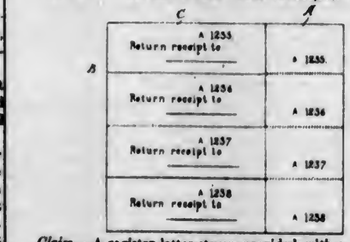
36. In a hydraulic brick-press, the combination of the pressure-dividing valve 31, spring-latch 96, and arm 99, and adjustable link 98, connected to valve-lever 91, substantially as set forth.

37. In a hydraulic brick-press, the combination of the lower ram-plunger 11, the tie-rods 44, and pulling-down cylinder 45 in constant communication with the low-pressure accumulator, for the purpose set forth.

38. In a hydraulic brick-press, the combination, with the mechanism of controlling-valve 20, of a suspended weight 130 and a releasing device adapted to move toward each other and controlled in their movements by the upper and lower rams, substantially as set forth.

39. In a hydraulic brick-press, the combination, with the mechanism of the controlling-valve 20 and relief-valve 18, of a suspended weight 130 and a releasing device adapted to move toward each other and controlled in their movements by the upper and lower rams, substantially as set forth.

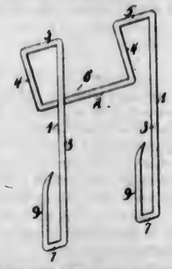
40. In a hydraulic brick-press, the combination, with the relief-valve 18, of the upper ram-cylinder and its operating-lever 88, a weight 130, a coupling device, as 133 134, and releasing devices, as 139, such devices being controlled in their movements by the movement of the upper and lower rams, substantially as set forth.



41. In a hydraulic brick-press, the combination of the controlling-valve 20 and controlling-weight 75, holding the valve closed, the weighted lever 78, and rod 79, substantially as set forth.

42. In a hydraulic brick-press, the combination of the controlling-valve 20 and controlling-weight 75, holding the valve closed, the weighted lever 78, rod 79, and hydraulic cylinder and plunger 84 and 85, substantially as set forth.

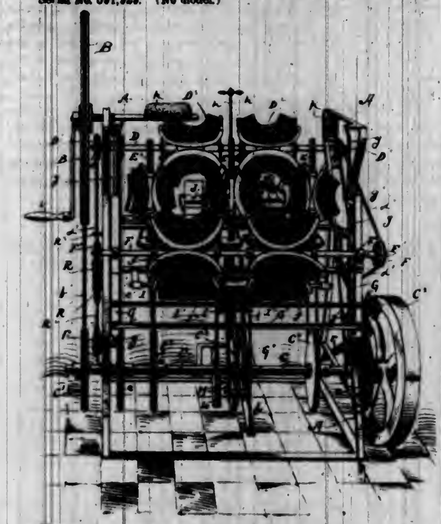
43. In a hydraulic brick-press, the combination of the relief-valve 18, valve-lever 88, and hydraulic cylinder and plunger 84 85, substantially as set forth.



44. In a hydraulic brick-press, the combination of the relief-valve 18, valve-lever 88, connecting-link 87, and weighted lever 86, substantially as set forth.

480,819. REGISTRY-STAMP. FREDERICK A. LOVEGRAFT, New York, N. Y. Filed May 2, 1891. Serial No. 391,378. (No specimens.)

Claim.—A registry-letter stamp provided with a number or indicator and detachably connected with a stub, bound together with others, and having a like number or indicator and a space for the name of the purchaser, substantially as described.



480,820. GARMENT-SUPPORTER. THOMAS MANNING, Denver, Colo. Filed Apr. 19, 1892. Serial No. 429,806. (No model.)

Claim.—1. An improved garment-supporter formed of a single piece of wire and comprising the straight central portion, the upwardly-bent portions 4, the rearwardly-bent portions 5, the depending portions 3, the forwardly-bent portion 7, and the upwardly-bent pin portions 9, all arranged substantially as shown and described.

2. A device for holding up undergarments, consisting of a length of wire, a straight portion 2, formed in the same intermediate of its ends, bends 4, formed at a suitable distance from said straight portion, and bends 5, forming a hook 6, the depending portions 3, straight upwardly-bent pin portions 9, formed by the ends 7, providing hooks for attaching the device to the undergarment, and the terminal ends of said wire bent inwardly and pointed, substantially as described.

480,821. MACHINE FOR CLEANING AND POLISHING BOOTS OR SHOES. JOHN W. MASON, Cleveland, Ohio. Filed May 7, 1891. Serial No. 391,929. (No model.)

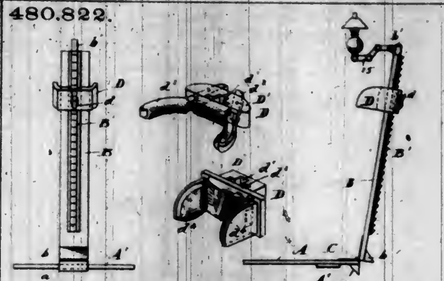
Claim.—1. A polishing-machine for boots or shoes, such machine having reciprocating slides for the shoes, means for clamping shoes thereon, a rocking shaft, means connecting the latter with the slides, and treadles connected to the rocking shaft for rocking the latter back and forth, substantially as set forth.

2. A polishing-machine for boots or shoes, substantially as indicated, such machine having non-rotary slides and clamps for fastening the boots or shoes upon the slides and cams and attached handles for operating the clamps, substantially as set forth.

3. The combination, with non-rotary slides bearing clamps, substantially as indicated, of revolving brushes operating, respectively, between and outside the slides for engaging the sides of the boots or shoes, substantially as set forth.

4. In a polishing-machine, revolving brushes mounted on a horizontal spindle, the spindle being mounted on a vertically-reciprocating frame, and suitable connecting mechanism for reciprocating the frame by hand, substantially as set forth.

5. The combination, with a horizontal spindle bearing brushes and mounted on a vertically-reciprocating frame, of belts for driving such spindle, each belt having a movable spring-actuated tightening-pulley, substantially as set forth.



6. The combination, with non-rotary reciprocating slides and clamps, substantially as indicated, of revolving brushes in position for engaging the tops of the boots or shoes from the toe rearward, substantially as set forth.

7. In a polishing-machine for boots or shoes, revolving brushes, each brush comprising a central sleeve or hub bearing a series of curved arms, such arms having the bristles attached to the concave edges thereof, and set-screws for adjustably securing the sleeve to the supporting spindle or shaft, substantially as set forth.

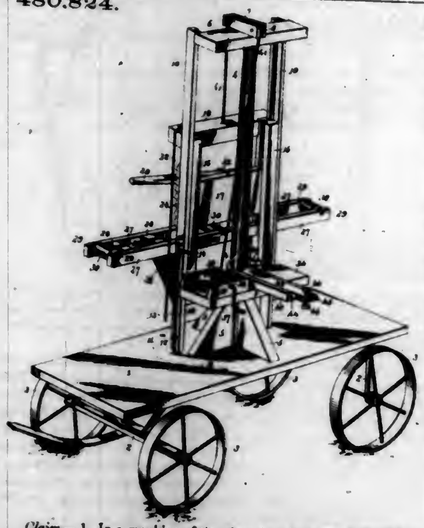
8. In a polishing-machine of the class indicated, a shelf for the blacking and a stationary bracket for supporting the chamois-skin, cloth, or cloths, substantially as set forth.

480,822. FOLDING SUPPORT FOR HEAD-RESTS AND THE LIKE. THOMAS MAYER, Albany, N. Y.; David Muhlfelder administrator of said Mayer, deceased. Filed Jan. 21, 1891. Serial No. 378,508. (No model.)

Claim.—1. The combination, with the bar B to rest against the back of a car-seat and having a vertical rack B' on its rear face and the lower horizontal member adapted to rest on a car-seat under the occupant and hinged at its rear edge to the lower end of the rear bar

B to fold against the front face thereof, of the head-rest D, having a vertical opening through which bar B and its rack passes, and a pawl *d* on the rear of the head-rest, engaging the said rack, substantially as set forth.

2. The combination, with the bar B to rest against the back of a car-seat and having a vertical rack on its rear face, the lower horizontal member A to rest on a car-seat under the occupant and hinged at its rear edge to the lower end of the bar B to fold against the front face thereof, and the blocks *a b* on the backs of member A and bar B at the hinged edges thereof to pass behind the upholstery on the car-seat and under the upholstery on the seat-back, respectively, of the head-rest provided with a vertical opening through which passes the bar B and its rack and provided with a pawl to engage the rack, substantially as set forth.



3. The combination, with the bar B to rest against a car-seat back and provided with a rack on its rear side and a reduced upper end or bracket-receiving projection *b'*, the lower hinged member A, hinged to bar B to fold against the front face thereof, and the blocks *b a* on the adjacent ends of the bar B and member A to enter the space between the car-seat and its back, of the head-rest D, having a vertical opening *d'* for the bar B and its rack, and a pawl *d* to engage the rack.

480,823. COVERING FOR FALSE BOTTOMS OF VESSELS. ALEXANDER MCDOUGALL, Duluth, Minn. Filed Sept. 17, 1891. Serial No. 406,014. (No model.)

Claim.—An improved false bottom for vessels, consisting of a metallic floor 13, bilges or gutters on each side thereof, strengthening gusset-plates 17, perforated and arranged as described, planks 19 19, laid on said floor 13, having passages 20 20 between them, and breaks 21 extending fore and aft, planks 23 23 extending over said bilges or gutters, planks 24 above said planks 23 and secured to the ribs of the vessel, and cement or similar material between said planks 24 and the outer plates of the vessel, substantially as described.

480,824. LUMBER-ELEVATOR. BEATON MCKINNON, Eureka, Cal. Filed May 19, 1892. Serial No. 433,590. (No model.)

480,824.

Claim.—1. In a machine of the class described, the combination, with a base, a mast rising therefrom, a guide-frame swiveled for rotation upon the mast, an elevating-frame mounted for movement in the guide-frame, and means for raising and lowering the elevating-frame, substantially as specified.

2. In a machine of the class described, a base, a mast rising therefrom, a rotatably-mounted guide-frame, an elevating-frame mounted for movement in the guide-frame, means for raising and lowering the elevating-frame for locking the same at any point of elevation, and means for locking the guide-frame at any point of its circle, substantially as specified.

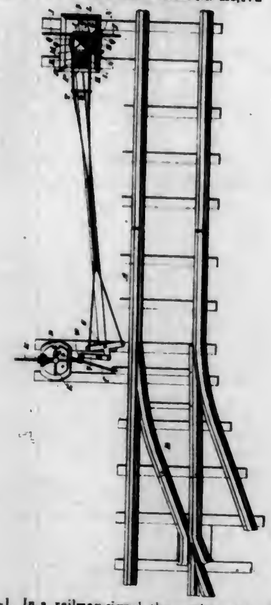
3. In a machine of the class described, a base, a mast rising therefrom, a guide-frame swiveled for rotation upon the mast, in combination with an elevating-frame mounted for vertical reciprocation upon the guide-frame, means for locking the guide-frame, and means for raising and lowering the elevating-frame, substantially as specified.

4. In a machine of the class described, the combination, with the base, the mast rising therefrom, the swiveled guide-frame, and the vertically-movable elevator-frame, of a horizontal frame supported upon the elevating-frame and means for raising and lowering the elevating-frame and for locking it, substantially as specified.

5. In a machine of the class described, the base, the mast rising therefrom, the swiveled guide-frame, the elevating-frame mounted therein, and means for raising and lowering the same, of a horizontal plank-supporting frame supported by the elevating-frame and provided with a series of transverse rollers, substantially as specified.

6. In a machine of the class described, the base, the mast rising therefrom, the swiveled guide-frame, the elevating-frame mounted therein and means for raising and lowering the same, of a horizontal plank-supporting frame comprising opposite parallel bars having pairs of opposite open bearings, rollers having trunnions removably mounted in the bearings, and cross-bars having openings for removably receiving the trunnions of one of the rollers, substantially as specified.

7. In a machine of the class described, the combination, with the base, the mast rising therefrom, the swiveled guide-frame, and means for locking the same, of an elevating-frame mounted for movement in the guide-frame and having a horizontal plank or board support, and a board-clamp mounted over the same, substantially as specified.



8. In a machine of the class described, the combination, with the base, the mast rising therefrom, the swiveled frame having opposite guide-bars and the elevating-frame having opposite guide-bars mounted for vertical movement in the guide-bars of the swiveled frame, of a horizontal plank-supporting-frame secured to the side bars of the elevating-frame, a plunger-block mounted for vertical movement in the ways of the side bars of the elevating-frame, a clamping-block secured to the front face of the same, a lever pivoted to one of the side bars, a keeper connecting the lever with the blocks, a plate upon the lever, and a toothed rack-bar projecting from one of the side bars and adapted to engage the plate, substantially as specified.

9. In a machine of the class described, the combination, with the base, the mast, the cross-bar swiveled thereon, the vertical guide-bars depending from the cross-bar, the rabbeted side bars mounted for movement in the guide-bars and having their upper ends connected by the cross-bar, of the brackets extending from the side bars, the plank-supporting frame mounted on the brackets, the rack-bar extending from one of the side bars and having its upper end bent to form an arm and carrying a pulley, the lever fulcrumed to the other and having a plate for engaging the rack-bar, a rope extending from the lever over the pulley on the arm of the rack-bar and depending from the same, a plunger-block mounted in the rabbets of the side bars and carrying a clamping-block and a keeper connecting the clamping-block and lever, and means for elevating and lowering the side bars and transporting-frame, substantially as specified.

10. In a machine of the class described, the combination, with the base, the mast rising therefrom, and an annular series of concentric perforations formed in the base, of the elevator-frame carrying guide-frames swiveled on the mast and provided with vertically-opposite keepers and a pin and an inverted-L-shaped bolt mounted in the keepers, adapted at its lower end to engage the perforations of the base and at its upper end to be swung over and under the pin, substantially as specified.

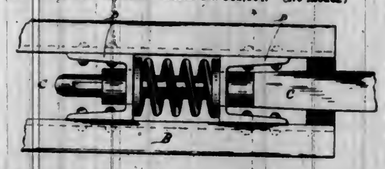
11. In a machine of the class described, the combination, with the base, mast, swiveled guide-frame, elevating-frame, and means for operating the same, of the stay consisting of two telescopic sections adjustably connected, the inner section being swiveled on the mast and the outer section terminating in plank-engaging jaws having a clamping-screw, substantially as specified.

480,825. RAILWAY-SWITCH SIGNAL. FREEMAN M. NYE, Bellevue, Ohio. Filed Feb. 29, 1892. Serial No. 423,174. (No model.)

Claim.—1. In a railway-signal, the combination, with a pole or tower and a signal-lantern secured to one face of said pole near its upper end, of a semaphore pivotally secured to said post and having opposite right-angularly-disposed signal-blades and a U-shaped lens-frame at its upper end working over said post and provided with opposite colored lenses adapted to be thrown into alignment with the opposite lenses of said lamp or lantern, and means for swinging said semaphore, substantially as set forth.

2. In a railway-signal, the combination, with a pole or tower having a strike-plate upon one face near its upper end and a signal-lantern secured to said pole directly opposite said plate, of a semaphore pivoted at its lower end to said pole and provided with opposite right-angularly-disposed signal-blades and a U-shaped lens-frame at its upper end, said lens-frame comprising opposite parallel arms having colored lenses at their outer ends, and a connecting-strap or cross-arm connecting the inner ends of said arms and adapted to be thrown against said strike-plate to limit the movement of the semaphore, and means for swinging said semaphore, substantially as set forth.

3. In a switch-signal, the combination, with a switch-stand, the switch-rod connected to said stand, a pole or tower located at a distance from said stand, and a signal-lantern secured to said tower, of a semaphore pivotally secured to said post and provided with a U-shaped lens-frame working over said post in conjunction with the lantern, guide-pulleys secured to opposite sides of said pole near its lower end, a supplemental offstanding guide-pulley secured to the track side of said pole above one of said guide-pulleys, a T-shaped spreading bracket, a horizontal T-lever adjacent to said switch-stand and connected with the switch-rod, and operating-wires connected at one end to opposite ends of said T-lever, passing through said spreading bracket, under the opposite guide-pulleys, and connected to opposite sides of said semaphore, the wire adjacent to the track passing over said offstanding guide-pulley, substantially as and for the purpose specified.



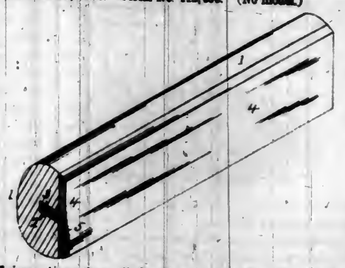
4. In a switch-signal, the combination of a switch-lever, the semaphore-pole having opposite guide-pulleys near its lower end, a swinging semaphore pivoted to said pole, a wire-spreading bracket located adjacent to the pole, a single horizontal T-lever located adjacent to said switch-lever and connected therewith, and operating-wires connected to opposite ends of said T-lever, passing through said bracket and under the opposite guide-pulleys and connected to opposite sides of the swinging semaphore, substantially as set forth.

480,826. LAMP-BURNER. ENOCH OBMSTRAND, Jamestown, N. Y. Filed June 10, 1891. Serial No. 395,781. (No model.)

Claim.—A lamp-burner having an air-tube provided with an integral extension forming a continuation of one side and being bent over the tube and downward to form a continuation of the other side and providing side openings, substantially as and for the purpose described.

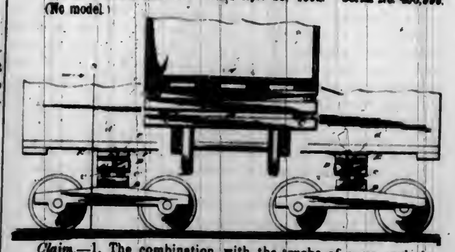
480,827. DRAW-GEAR FOR CARS. WILLARD PENROCK, Minerva, Ohio. Filed Feb. 16, 1891. Serial No. 382,061. (No model.)

Claim.—1. The combination, with the center or draft sills of a car and filling-block located between these sills, of a plate or plates B, secured to the sills, and U-shaped irons secured between the latter, the upper ends of the U-irons projecting above the lower edges of the filling-block, substantially as set forth.



2. The combination, with center or draft sills, of plate or plates secured to said beams, filling-block located between the sills, and draw-bar apparatus connected with the plates, substantially as set forth.

480,828. ATTACHMENT FOR STOVES. WILLIAM PRICE, Mendota, Ill. Filed Apr. 28, 1891. Serial No. 390,782. (No model.)



Claim.—An improved attachment for stoves, consisting of a tube closed at both ends, curved in the form of a circle or a part of a circle, and perforated on the inside of said bent portion of said tube and so arranged as to force the air in a downward direction and which is adapted to be placed above the grate and a part adapted to be placed outside of the stove and arranged in a perpendicular position and perforated near its lower extremity, in combination with a sleeve adapted to slide upon said perpendicular part of the tube, substantially as and for the purposes described.

480,829. PIANO-ACTION RAIL. JOHN W. REED, Chicago, Ill. Filed Nov. 20, 1891. Serial No. 412,486. (No model.)

Claim.—An action-rail for pianos, consisting of a wood body or backing 1, having a plane forward face formed with a longitudinal groove or channel 2, and a T-shaped metal section the rib or web 3 of which is fitted into the channel 2, with the plate portion 5 in close contact with the plane face of the body or backing 1, as herein described, and for the purpose set forth.

480,830. MEANS FOR RADIATING CAR-TRUCKS. HORACE RESLEY, Cumberland, Md. Filed Apr. 28, 1892. Serial No. 430,999. (No model.)

Claim.—1. The combination, with the trucks of a car and the body mounted thereon, of the swinging posts hinged to the car-body and arranged to bear against the truck-bolster and adjust the trucks to a curve of the track, substantially as described.

2. The combination, with the trucks of a car and the body mounted thereon, of the bearing-plates on the lower bolster and the swinging-posts hinged at one end to the car-body and adapted to bear at their free ends against said plates, substantially as and for the purpose described.

3. The combination, with the the trucks of a car and the body mounted thereon, of the bearing-plates secured on the lower bolsters and having depressed seats and the posts depending from the body and fitted in said seats and adapted when rounding a curve to adjust the trucks so that the axles thereof will be in the radial lines of the curve, substantially as described.

4. The combination, with the trucks of a car and the body mounted thereon, of the swinging posts pivotally secured to the car-body or upper bolsters and the bearing-plates on the lower bolsters, having seats to receive the free ends of said posts, substantially as and for the purpose described.

5. The combination, with the trucks of a car and the body mounted thereon, of the swinging posts pivotally hung from the upper bolsters and the bearing-plates secured on the lower bolsters beneath said posts and having seats to receive the free ends of the posts and also provided with the shoulders to sustain the car-body, substantially as described.

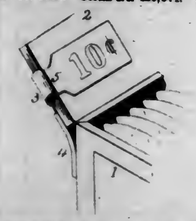
6. The combination, with the trucks of a car and the body mounted thereon, of the lower bolsters on the trucks and the upper bolsters on the body of the car, the bearing-plates secured on the lower bolsters, and the shoulders on said plates to receive the weight of the car, substantially as described.

7. The combination, with the trucks of a car and its body mounted thereon, of the bearing-plates secured on the lower bolsters and having depressed seats therein, the plates secured to the upper bolsters, and the swinging posts pivoted or hinged to said plates and having their free ends fitted in said seats in the bearing-plates, substantially as described.

480,831. HORSE-POWER LAWN-MOWER. ANDREW B. ROBBINS, Minneapolis, Minn., assignor of one-half to Edward W. Loose, same place. Filed Oct. 15, 1891. Serial No. 408,796. (No model.)

Claim.—1. The combination, in a horse-power lawn-mower, of two or more hand lawn-mowers, with flexible connecting bars or straps for the same, the yokes of said mower and draft-rods extending forward from the centers thereof, substantially as described.

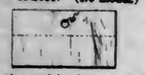
2. The combination, in a horse-power lawn-mower, of two or more hand-mowers provided with yokes and handles, a hinged strap between each two mowers and secured at the bases of said handles, and draft-rods having their forward ends fastened at substantially the same points, as set forth.



3. The combination, in a horse-power lawn-mower, of two or more hand lawn-mowers having the usual yokes, with curved and hinged connecting and brace straps therefor, draft connections, and means whereby said mowers are held against independent forward movement, but allowed a degree of vertical play, substantially as described.

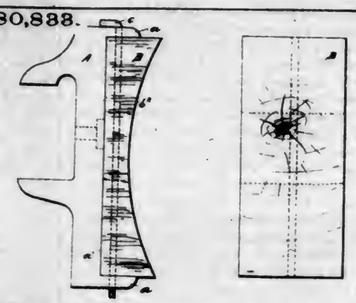
4. The combination, in a horse-power lawn-mower, of two or more hand lawn-mowers provided with handles, with a curved adjustable hinged strap extending between each two mowers to hold the same laterally and longitudinally separate, and an adjustable link or links arranged between the upper portions of each pair of said handles, substantially as described.

5. The combination, in a horse-power lawn-mower, of two or more hand lawn-mowers, with the curved straps secured upon the handles thereof and extending between the same, a hinge adjustably connecting said parts, legs or straps 27, draft-rods hooked therein, means for attaching the forward ends of the same to the whiffletree, and a tie or truss bar 28, extending between the handle of the forward machine and said forward ends, substantially as described.



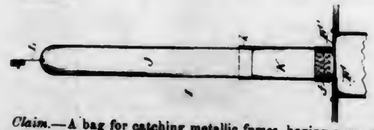
6. The combination, in a horse-power lawn-mower, of two or more small mowers with handles therefor, the backwardly and laterally curved connecting strap or bar, a hinge adjustably arranged therein, the adjustable tie-link between the upper parts of the handles and composed of the rods 18 and 19, provided with a locking device, the straps 27, the draft-rods 26, the hook 24, secured thereto, and a supporting-bar 28, fastened to the forward mower, said mowers being arranged to lap with respect to the cut, substantially as described.

480,832. BOX-LID SUPPORT. CHRISTIAN H. SCHAEFFER, Chicago, Ill. Filed Apr. 18, 1892. Serial No. 429,671. (No model.)



Claim.—The box-cover support consisting of an upper portion 3, provided with a clip 5 for engaging the box-cover, and a lower portion 4, adapted to rest against the back of the box-body, the two portions 3 and 4 being bent at an angle to each other, substantially as herein described.

480,833. BRAKE-SHOE. JACOB SHAARER, Reading, Pa. Filed Dec. 12, 1891. Serial No. 414,835. (No model.)

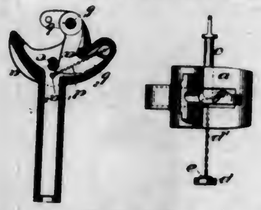


Claim.—The combination, with the metal shoe having top and bottom flanges *a a*, of the friction-block B, fitted to said shoe between

480,838.

the flanges, and the retaining-wire *c*, passed through said flanges and longitudinally through the block, substantially as and for the purpose set forth.

480,834. BAG FOR CATCHING METALLIC FUMES. DENNIS SHEEDY, Denver, Colo. Filed Dec. 3, 1891. Serial No. 414,418. (No specimens.)



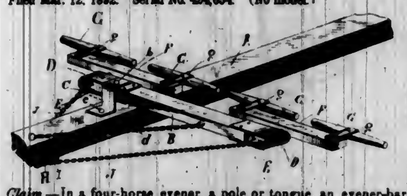
Claim.—A bag for catching metallic fumes, having a mouth-section of strong fabric, such as wool, in combination with a body-section of lighter and less durable material, substantially as and for the purpose specified.

480,835. TOOL FOR EXTRACTING BUNGS. WILLIAM H. STANTON, Anderson, Ind. Filed Dec. 19, 1891. Serial No. 415,591. (No model.)

Claim.—In combination, a rod having two oppositely-flattened sides, a cutting-edge at one end of said rod, said cutting-edge projecting from the rod so as to form flanges, a head of larger diameter than the rod at the other end of the rod, and a hollow weighted handle C, closed at one end and provided with the pins c at the other end, forming guides in which said rod is adapted to slide, substantially as described.

480,836. CAR-COUPLING. CHARLES H. TAYLOR, South Orange, N. J. Filed Nov. 23, 1891. Serial No. 412,763. (No model.)

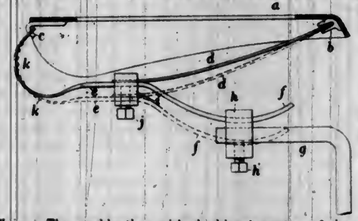
Claim.—1. In a car-coupling, the combination, with the draw head provided with a rotating hook or knuckle hinged thereto, of a weight having a flexible connection with said rotating hook or knuckle in a manner to draw the same to an open or extended position, substantially as described, and for the purpose set forth.



2. In a car coupling, the combination, with the draw-head provided with a rotating hook or knuckle hinged thereto and a device for locking said hook or knuckle in a closed position, of a weight having connection with the inner arm of said hook or knuckle through the medium of a flexible connection and adapted to draw the same to an open position when released by said locking device, substantially as described, and for the purpose set forth.

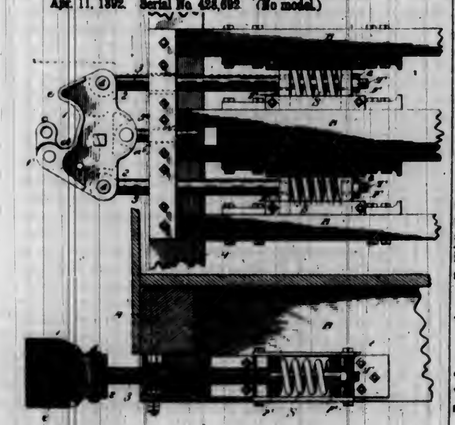
3. In a car-coupling, the combination, with the draw-head provided with a rotating hook or knuckle hinged to said draw-head and

a locking device for engaging said hook or knuckle, of a weight supported by and operating through a section of said draw-head connected with the arm of said hook or knuckle through the medium of a flexible connection, substantially as described, and for the purpose set forth.



4. In a car-coupling, the combination, with the draw-head provided with a hinged hook or knuckle, of a weight having connection with the rear arm of said hook or knuckle through the medium of suitable flexible connection and a buffer for receiving the blow of said weight when contacting with the draw-head, substantially as described, and for the purpose set forth.

480,837. DRAFT-EQUALIZER. GOODMAN WING, Kamrar, Iowa. Filed Mar. 12, 1892. Serial No. 424,654. (No model.)



Claim.—In a four-horse evener, a pole or tongue, an evener-bar pivoted near one of its ends to the tongue and the other end having a stay to limit its forward movement, and pulleys journaled in bearings at each end of the said bar, combined with a pulley journaled on the under side of the tongue in rear of the pivoted evener-bar, a cable or chain passing round the pulley on the tongue and the pulleys at the ends of the said bar, a doubletree attached to each end of the chain, and two singletrees attached to each doubletree, substantially as described.

480,838. SPRING FOR BICYCLE-SADDLES. HENRY BERGFELD, Newark, N. J. Filed Apr. 28, 1892. Serial No. 431,075. (No model.)

Claim.—The combination, with the bicycle-seat *a*, of the spring formed of the flat leaves *d* and *e*, clamped together adjustably, as set forth, the leaf *e* being extended downward and backward from the clamp and terminated in a spring-arm *f*, and the forward end of the leaf *e* being reduced in thickness and bent into the reflex curve *k* and engaged with the forward end of the seat, as set forth.

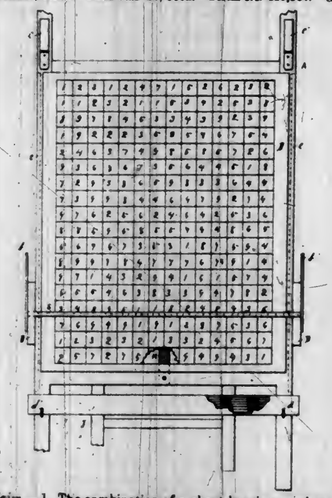
480,839. CAR-COUPLING. HARRY C. BUHOUP, Chicago, Ill. Filed Apr. 11, 1892. Serial No. 428,692. (No model.)

Claim.—1. The combination, with a coupler-head, of two or more stems pivotally attached to the head, substantially as and for the purposes specified.

2. The combination, with a coupler-head, of two or more pivotally-attached stems and a spring or springs actuated thereby, substantially as and for the purposes specified.

3. In a twin-jaw coupler, the combination, with the coupler-head, of one or more pivoted stems and springs arranged with relation to the guard-arm and ears of said head to cause the deflection of buffing force, substantially as and for the purposes specified.

4. The combination, with a coupler-head, of three pivotally-attached stems, one of which is a draft-stem, and balance-springs, substantially as and for the purposes specified.



5. The combination, with a coupler-head, of a draft and buffer stem and a safety stem or stems, substantially as and for the purposes specified.

480,840. SOAP. HENRY J. ECKER and GEORGE F. ECKER, Philadelphia, Pa. Filed Sept. 18, 1891. Serial No. 406,127. (No specimens.)

Claim.—1. In a soap, the combination of quartz soap and oxide of iron, substantially as described, and for the purpose specified.

2. A soap composed of water, white commercial soap, oxide of iron, and pulverized quartz in about the proportions specified.

480,841. ADJUSTABLE-NUMBER DEVICE. JOHN F. EVERY, Mendon, Mich. Filed Jan. 27, 1892. Serial No. 419,387. (No model.)

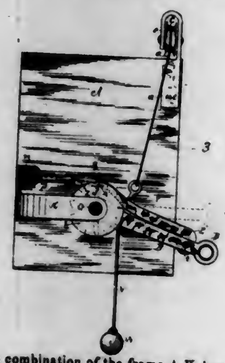
Claim.—1. The combination of a chart bearing numbers, the vertically-adjustable carriage comprising a transverse bar in front of said chart, said bar having adjustable bearings on the sides of the chart-frame and slotted plates at its ends and a longitudinal groove in the upper side of said bar, slides bearing numbers and adapted to be inserted in the end slotted plates of said bar, and a series of individual checks for bearing numbers and to be placed in the groove of the bar of the carriage to show results, substantially as set forth.

2. The combination of a chart bearing numbers, a vertically-adjustable carriage comprising a transverse bar having adjustable bearings on the sides of the chart-frame and slotted plates at the ends of said bar, and slides bearing numbers and adapted to be adjustably inserted in said slots, substantially as set forth.

3. The combination of a frame bearing a figured chart, the transverse bars in front and back of the chart, blocks having sliding bearings on the sides of the chart-frame and attached to the ends of said bars, slotted plates attached to said blocks, slides adapted to be adjustably inserted in said slots, and a spring on the back bar for holding the transverse bars in different vertical positions, substantially as set forth.

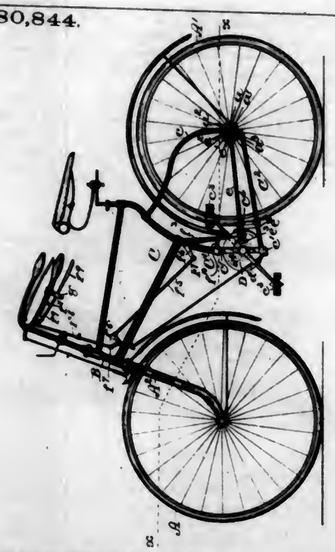
480,842. DISTILLING APPARATUS. ALFRED FELDMANN, Bremen, Germany. Filed Nov. 17, 1891. Serial No. 412,120. (No model.)

Claim.—1. The combination of a lime-chamber D with a series of annular surrounding evaporating-cells that communicate therewith, bells *d*, and steam-pipes *f*, entering such cells, substantially as specified.



480,842.

2. The combination of a central lime-chamber D with a series of annular surrounding evaporating-cells connected with said chamber, tubes A, connecting the cells, steam-pipes *f*, entering the cells, and bells *a* above the steam-pipes, substantially as specified.



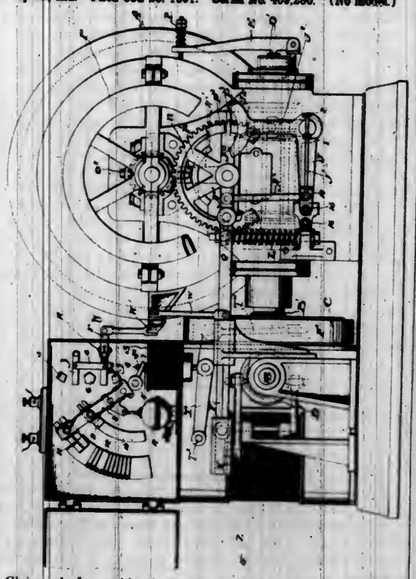
3. The combination, in a distilling apparatus, of the following elements: a lime-chamber, a series of annular distilling-cells, steam-pipes and bells within the cells, an accumulator C, an inlet, an exit-pipe connecting the lime-chamber and the cells, and an exit-pipe *n*, substantially as specified.

480,843. MINER'S REGISTER. BARNA GATELY and DAVID SKINNER, Braidwood, Ill. Filed Apr. 29, 1892. Serial No. 431,114. (No model.)

Claim.—The combination of the frame A K, having dial D, shaft O, hand H, ratchet-wheel L, grooved wheel J, cord and weight V W, arm B, having the pawl E, pawl P, and cord and pulley *a c*, all arranged to operate substantially as and for the purpose set forth.

480,844. BICYCLE. GEORGE F. HALL, Newark, N. J., assignor to the Schrade & Hall Novelty Manufacturing Company, of West Virginia. Filed Dec. 4, 1891. Serial No. 413,978. (No model.)

Claim.—1. In a differential-speed mechanism for a velocipede or other like motor, the combination of the frame, an axle, a speed or drive wheel provided with two sets of concentrically-arranged gear-teeth, a shaft *e*, supported in bearings in the frame and provided with means for actuating the rear axle of the velocipede, two miter-wheels loosely revoluble on said shaft and both in normal inoperative engagement with the concentrically-arranged teeth on the speed or drive wheel, collars e^9 and e^{14}, secured on said shaft, and plates e^{10} and e^{15} for holding said miter-wheels in the same position on said shaft, but allowing them to rotate each independent from the shaft *e* at different speeds, and a shifter or clutch sliding freely on said shaft for causing the operative engagement of the one miter-wheel with said shaft and with the speed or drive wheel and the inoperative engagement of the other miter-wheel, and a system of levers or arms secured to said frame and operated from one of the handle-bars of the machine, substantially as and for the purposes set forth.



2. In a differential-speed mechanism for a velocipede or other like motor, the combination of the frame, an axle, a speed or drive wheel provided with two sets of concentrically-arranged gear-teeth, a shaft *e*, supported in bearings in the frame and provided with means for actuating the rear axle of the velocipede, two miter-wheels loosely revoluble on said shaft and both in normal inoperative engagement with the concentrically-arranged teeth on the speed or drive wheel, collars e^9 and e^{14}, secured on said shaft, and plates e^{10} and e^{15} for holding said miter-wheels in the same position on said shaft, but allowing them to rotate each independent from the shaft *e* at different speeds, and a shifter or clutch sliding freely on said shaft for causing the operative engagement of the one miter-wheel with said shaft and with the speed or drive wheel and the inoperative engagement of the other miter-wheel, and a system of levers or arms secured to said frame and operated from one of the handle-bars of the machine, and means on the handle-bar for holding the hand-lever of the clutch-operating levers in certain locked positions, consisting, essentially, of spring-arms g^2 and g^3, screw g', spring-actuated screw g^5, and notches g^4 and g^7 in one of said spring-arms, as g^3, substantially as and for the purposes set forth.

3. In a differential-speed mechanism for a velocipede or other like motor, the combination of the frame, an axle, a speed or drive wheel provided with two sets of concentrically-arranged gear-teeth, a shaft *e*, supported in bearings in the frame and provided with means for actuating the rear axle of the velocipede, two miter-wheels loosely revoluble on said shaft and both in normal inoperative engagement with the concentrically-arranged teeth on the speed or drive wheel, collars e^9 and e^{14}, secured on said shaft, and plates e^{10} and e^{15} for holding said miter-wheels in the same position on said shaft, but allowing them to rotate each independent from the shaft *e* at different speeds, and a shifter or clutch sliding freely on said shaft for causing the operative engagement of the one miter-wheel with said shaft and with the speed or drive wheel and the inoperative engagement of the other miter-wheel, and a system of levers or arms secured on said frame and operated from one of the handle-bars of the machine, substantially as and for the purposes set forth.

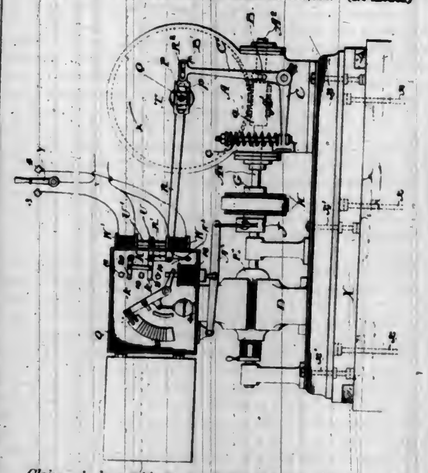
4. In a velocipede or other like motor, a differential-speed mechanism comprising therein an axle, a speed or drive wheel, a pair of actuating mechanisms, each capable of receiving a different revoluble motion from said drive-wheel, a shifter or clutch mechanism for causing the operative engagement of one actuating mechanism and preventing the operation of the other, and said shifter also being capable of disengagement with both actuating mechanisms at the same time, whereby the axle can be held in an inoperative position while "coasting" with the velocipede, and means on the handle-bar for holding said shifter or clutch in its several engaged and disengaged positions, consisting, essentially, of spring-arms g^2 and g^3, screw g', spring-actuated screw g^5, and notches g^4 and g^7 in one of said spring-arms, as g^3, substantially as and for the purposes set forth.

5. The herein-described velocipede, comprising therein the frame C, having reaches *c*, arm C', bifurcated, as at *c'*, and connecting-arms C^2, an axle c^3, a differential-speed or drive wheel having the concentrically-arranged gear-teeth d^2 and d^3, a shaft *e* in engagement with the rear axle of the machine and rotating in bearings c^4 and c^4 on said frame, miter-gears e^9 and e^{14}, loosely revoluble on said shaft *e* and normally in inoperative engagement with the gear-teeth d^2 and d^3 on said speed or drive wheel, and a shifter or clutch sliding on said shaft *e* for causing the operative engagement of said miter-gear e^9 and the inoperative engagement of the miter-gear e^{14}, or vice versa, and means connected with the handle-bar of the machine for shifting said clutch, all arranged substantially as and for the purposes set forth.

480,845. ELECTRIC ELEVATOR. FRANK R. HERDMAN, Indianapolis, Ind. Filed Oct. 30, 1891. Serial No. 409,280. (No model.)

Claim.—1. In combination, a power-shaft, a friction-wheel upon said shaft, an elevator driving-shaft, a friction-wheel upon said shaft, said friction-wheels being in contact with each other, a driving-worm adapted to have a lateral movement upon its shaft, a lever, a resistance device connected to said lever, intermediate connection, substantially as described, between said lever and worm and between said lever and the friction-wheels, whereby the movement of the worm upon the shaft varies the extent of movement of the friction-wheels upon each other.

2. In an elevator, in combination, an operating-sheave, a gear operating with said sheave, an operating-bar, a segmental gear connected with said bar, lugs, as J^3, upon said gear, a power-shaft, a friction-wheel upon said shaft, an elevator-driving shaft, a friction-wheel upon said shaft, said friction-wheels being in contact with each other, and connection, substantially as described, between said bar and the friction-wheels, a driving-worm adapted to have a lateral movement upon its shaft, a lever, a resistance device connected to said lever, connection between said lever and the worm, substantially as described, a bell-crank, connection between said lever and bell-crank, and a projection upon the bell-crank in line with the projection upon the segmental gear.



3. In combination, an operating-sheave, a gear operating with said sheave, an operating-bar, a segmental gear connected with said bar, lugs, as J^3, upon said gear, a driving-worm adapted to have a lateral movement upon its shaft, a lever, a resistance device connected to said lever, connection between said lever and the worm, an arm connected to said lever, and lugs, as J^3, upon said arm, whereby when the worm moves laterally a distance sufficient to move the lugs J^3 upon the arm in line with lugs the segmental gear is locked.

4. In an elevating mechanism, in combination, a driving-worm, a lever, a resistance device connected to said lever, connection, substantially as described, between said lever and worm, a binding-post connected to said lever, and a contact-point, a spring strip, as J', a binding-post on said strip, a brush on said strip, an electric motor, a source of current-supply, a wire connecting binding-post on the lever with source of current-supply, and a wire connecting strip J' with motor or motor-switch.

5. In combination, an electric motor, an electric switch, means to operate said switch, brushes upon said switch, an insulated strip connecting said brushes, contact-points in electrical connection with the source of current-supply, a solenoid, a rod connected to core of solenoid, a lever operated by said rod, a brush, as 9, adapted to be moved by said lever, a brush, as 11, adapted to be moved by said lever, a contact-point, as 10, in electrical connection with field and in path of brush 9, resistances, as 12, in line of travel of said brush 11, and a contact-point, as 13, in electrical connection with resistances and armature of motor and in path of movement of brush 11, direct electrical connection between one pole of the current-supply and field of motor, direct electrical connection from pole of current-supply to brush 9, electrical connection between solenoid and brushes 3 3, direct electrical connection between one of the brushes 3 3 and the armature, and direct connection between the other of brushes 3 3 and the brush 11.

6. In an elevator, in combination, a power-shaft, a friction-disk upon said shaft, an elevator-driving shaft, a friction-disk upon said shaft, said friction-wheels being in contact with each other, an operating-bar, means to operate said bar, a sliding piece, as X, connected to said bar, a bell-crank, as Z, connected to said sliding piece, and connection between said bell-crank and one of the friction-disks.

480,846. ELECTRIC ELEVATOR. FRANK R. HERDMAN, Indianapolis, Ind. Filed Dec. 22, 1891. Serial No. 415,881. (No model.)

Claim.—1. In combination, a drum-shaft, a threaded screw connected to said drum-shaft, a shoulder threaded as described upon said drum-shaft, a nut adapted to travel on said threaded screw, a connecting-rod slotted as described to receive said nut, mechanism, substantially as described, connected to said rod adapted to travel on the threaded end of said drum-shaft, and intermediate connection, substantially as described, between said connecting-rod and the source of power.

2. In combination, a drum-shaft, a threaded screw connected to said drum-shaft, a shoulder threaded as described upon said drum-shaft, a nut adapted to travel on said threaded screw, a connecting-rod slotted as described and surrounding said nut, projections from said rod, said projections being adapted to travel on the threaded shoulders, and connection, substantially as described, between said connecting-rod and the source of power.

3. In combination, a drum-shaft, threaded screw connected to said drum-shaft, a shoulder threaded as described upon said drum-shaft, a nut threaded on the exterior, adapted to be placed at varying distances upon said threaded screw, a nut adapted to travel on said threaded screw, a connecting-rod slotted as described and surrounding said nut, projections from said rod, said projections being adapted to travel on the threaded shoulders, and connection, substantially as described, between said connecting-rod and the source of power.

4. In combination, a drum shaft, a threaded screw connected to said drum-shaft, a shoulder threaded as described upon said drum-shaft, a nut adapted to travel on said threaded screw, a connecting-rod slotted as described to receive said nut, said rod being adapted to be moved on the threaded end of said drum-shaft, a switch connected with the source of current-supply, and electrical connection between said switch and the motor and connection between said switch and connecting-rod.

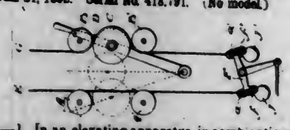
5. In combination, a drum-shaft, a threaded screw connected to said drum-shaft, a shoulder threaded as described upon said drum-shaft, a nut adapted to travel on said threaded screw, a connecting-rod slotted as described and surrounding said nut, projections from said rod, said projections being adapted to travel on the threaded shoulders, and connection, substantially as described, between said connecting-rod and the source of power, a switch connected with the source of current-supply, electrical connection between said switch and the motor, and connection between said switch and connecting-rod.

6. In combination, a drum shaft, a threaded screw connected to said drum shaft, a shoulder threaded as described upon said drum-shaft, a nut threaded on the exterior, adapted to be placed at varying distances upon said threaded screw, a nut adapted to travel on said threaded screw, a connecting-rod slotted as described and surrounding said nut, projections from said rod, said projections being adapted to travel on the threaded shoulders, connection, substantially as described, between said connecting-rod and the source of power, a switch connection with the source of current-supply, and electrical connected between said switch and the motor and connection between said switch and connecting-rod.

7. In combination, a worm-shaft, a worm upon said shaft, a lever adapted to be operated by said worm, a tension device on said lever, a connecting-rod, connection, substantially as described, between said lever and said connecting-rod, and connection between said rod and the source of power, whereby when the movement of the worm exceeds the tension on the lever the connecting-rod is moved.

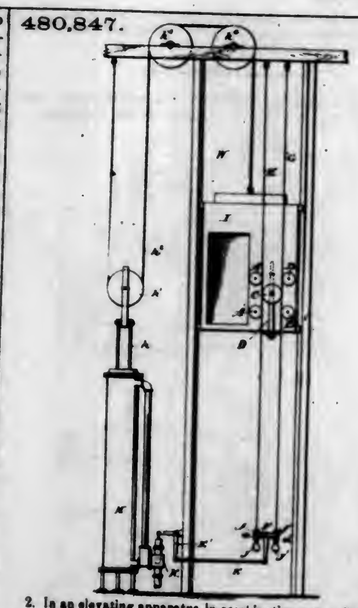
8. In combination, a worm-shaft, a worm upon said shaft, a lever connected to said worm, a tension device connected to said lever, a slotted arm connected to said lever, a connecting-rod provided with a pin and connection between said rod and the source of power, the said pin resting in the slot in the arm, whereby when the lateral movement of the worm exceeds the tension on the lever the lever operates.

9. In an electric elevator, in combination, an electric switch, solenoids, a core common to both magnets, connection between said switch and the core, electric connection between one pole of the source of current-supply and each of the electro-magnets, a lever carried by the car, electric connection between the other pole of the electric-current supply and the lever, contact-points carried by said car, said lever being adapted to be brought in contact with either contact-point, and electric connection between said contact-points and the electro-magnets, respectively.



10. In combination, an electric switch, solenoids, a core common to both solenoids, connection between said switch and the core, electric connection between one pole of the source of current-supply and each of the electro-magnets, a lever carried by the car, electric connection between the other pole of the electric-current supply and said lever, contact-points carried by said car, said lever being adapted to be brought in contact with each contact-point, a secondary switch, contact-points, electrical connection between said contact-points and the contact-points carried by the car, contacts in electrical connection with each of the electro-magnets, a connecting-rod, connection between said switch and connecting-rod, and means, substantially as described, to move said rod laterally, whereby connection can be broken between either contact-point carried by the car and its corresponding electro-magnet.

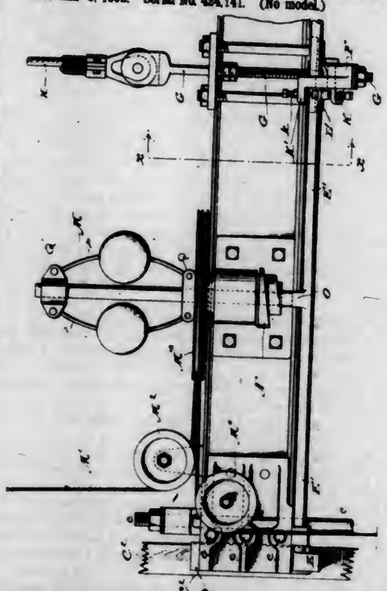
11. The hereinbefore-described method of securing an electric motor to its supporting-foundation, which consists in interposing a wooden frame between the motor and foundation, securing said frame to foundation by bolts passing through said frame and into said foundation, and securing the base-plate of the motor to the frame by bolts passing through said plate and frame, but not projecting into said foundation.



12. In an elevating apparatus, in combination, a connecting-rod slotted as described, a nut in said slot, a drum-shaft, a threaded end connected to said drum-shaft, passing through said nut, devices attached to said connecting-rod, and devices attached to said threaded end of the drum-shaft in line of travel of devices attached to said rod and adapted to give said rod a movement, as described.

13. In an elevating apparatus, in combination, a connecting rod, intermediate connection between said rod and the source of power, a drum-shaft provided with an extension adapted to travel through said rod, devices attached to said rod, and adjustable devices attached to said extension of drum-shaft in line of travel of devices attached to said rod and adapted to give said rod a movement, as described.

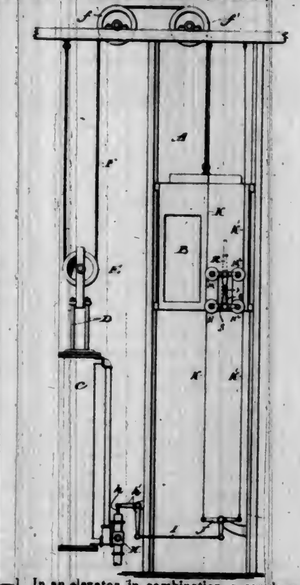
480,847. ELEVATOR. FRANK E. HERDMAN, Indianapolis, Ind. Filed Jan. 21, 1892. Serial No. 418,791. (No model.)



Claim.—1. In an elevating apparatus, in combination, a traveling car, shipper-ropes, sheaves, as A A', in proximity to one of the shipper-ropes, sheaves, as B B', in proximity to the other shipper-rope, a lever, as D, a sheave, as C, carried by said lever and adapted to be forced against either shipper-rope, a weight at the end of each shipper-rope, a lever, as F, provided with slotted ends, pins on the said shipper-ropes which rest in said slots, and intermediate mechanism between said lever and the operating mechanism.

2. In an elevating apparatus, in combination, a traveling car, shipper-ropes, means on the car for drawing up either shipper-rope, a weight at the end of each shipper-rope, a lever, as F, provided with slotted ends, pins on the said shipper-ropes which rest in said slots, and intermediate mechanism between said lever and the operating mechanism.

480,848. ELEVATOR. FRANK E. HERDMAN, Indianapolis, Ind. Filed Mar. 8, 1892. Serial No. 424,141. (No model.)



Claim.—1. In an elevator, in combination, an elevator-car, guides upon which said car travels, a beam secured to the top of said car, jaws secured to said beam, wedges between said jaws and the guides, a shaft adapted to rock extending along said beam, fingers attached to said shaft in line of movement with said wedges, a rocker secured to said beam at or near its center, lifting-cables connected to said rocker, said rocker being provided with lugs, and fingers attached to said shaft in line of movement of the lugs.

2. In an elevator, in combination, an elevator-car, guides upon which said car travels, a beam secured to the top of said car, jaws secured to said beam, wedges between said jaws and the guides, a shaft adapted to rock extending along said beam, fingers attached to said shaft in line of movement with said wedges, a rocker secured to said beam at or near its center, lifting-cables connected to said rocker, said rocker being provided with adjustable lugs, and fingers attached to said shaft in line of movement of the lugs.

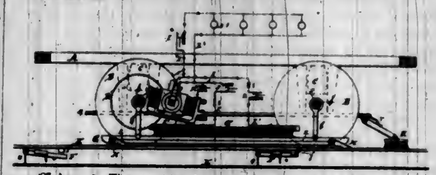
3. In an elevator, in combination, an elevator-car, guides upon which said car travels, a beam secured to the top of said car, jaws secured to said beam, wedges between said jaws and the guides, a shaft adapted to rock extending along said beam, fingers attached to said shaft in line of movement with said wedges, a rocker secured to said beam at or near its center, lifting-cables connected to said rocker, said rocker being provided with lugs, set-screws passing through said lugs, and fingers attached to said shaft in line of movement of the lugs.

4. In an elevator, in combination, an elevator-car, guides upon which said car travels, a beam secured to the top of said car, jaws secured to said beam, wedges between said jaws and the guides, a shaft adapted to rock extending along said beam, fingers attached to said shaft in line of movement with said wedges, a governor connected to said beam, a cam on the shaft of said governor, a finger attached to the same shaft to which the wedge-operating finger is attached, said finger being in line of movement of said cam, and means, substantially as described, to rotate said governor.

480,849. ELEVATOR. FRANK E. HERDMAN, Indianapolis, Ind. Filed Apr. 13, 1892. Serial No. 428,948. (No model.)

Claim.—1. In an elevator, in combination, a car, levers pivoted to said car, intermediate connection between said levers, whereby when one lever is tipped in one direction the other lever will be tipped in an opposite direction, and intermediate connection between said levers and the elevator-operating mechanism.

2. In an elevator, in combination, a car, levers pivoted to said car, sheaves pivoted to the opposite ends of each of said levers, intermediate connection between said levers, whereby when one lever is tipped in one direction the other lever will be tipped in an opposite direction, and intermediate connection between said levers and the elevator-operating mechanism.



3. In an elevator, in combination, a car, levers pivoted to said car, shipper-cables connected to the upper portion of the elevator-shaft and adapted to be operated by said levers, intermediate connection between said levers, whereby when one lever is tipped in one direction the other lever will be tipped in an opposite direction, and connection between the lower ends of said cables and the elevator-operating mechanism.

4. In an elevator, in combination, a car, levers pivoted to said car, sheaves pivoted to opposite ends of each of said levers, shipper-cables connected to the upper portion of the elevator-shaft, one cable passing to and around one sheave of each lever and the other cable passing to and around the other sheave of each lever, intermediate connection between said levers, whereby when one lever is tipped in one direction the other lever will be tipped in an opposite direction, and connection between the lower ends of said cables and the elevator-operating mechanism.

5. In an elevator, in combination, a car, levers pivoted to said car, connecting-rods connected to said levers and extending toward each other, one connecting-rod being provided with a slot and the other connecting-rod with a pin adapted to rest in and slide in said slot, and intermediate connection between said levers and the elevator-operating mechanism.

6. In an elevator, in combination, a car, levers pivoted to said car, sheaves mounted at the opposite ends of said levers, shipper-cables connected to the upper portion of the elevator-shaft, one cable passing to and around one sheave of each lever and the other cable passing to and around the other sheave of each lever, connecting-rods connected to said levers and extending toward each other, one rod being provided with a slot and the other rod with a pin adapted to rest and slide in said slot, and connection between the lower ends of said cables and the elevator-operating mechanism.

480,850. ELECTRIC RAILWAY. RUDOLPH M. HUNTER, Philadelphia, Pa., assignor, by mesne assignments, to the Thomson-Houston Electric Company, Boston, Mass. Filed May 28, 1887. Serial No. 239,021. (No model.)

Claim.—1. The combination of a working conductor arranged parallel to the railway, a supply-conductor, a magnetically-actuated switch to connect or disconnect said supply and working conductor, a traveling vehicle, a motor to propel said vehicle, receiving electricity from said working conductor, and a magnet carried by said vehicle, having its north and south poles brought close together in close proximity to the magnetically-actuated switch.

2. The combination of a working conductor arranged parallel to the railway and made of magnetic material, a supply-conductor, a magnetically-actuated switch to connect or disconnect said supply and working conductor, arranged close to said working conductor, a traveling vehicle, a motor to propel said vehicle, receiving electricity from said working conductor, and a magnet carried by said vehicle, having its north and south poles brought close together in close proximity to the working conductor magnetically-actuated switch.

3. The combination of a working conductor arranged parallel to the railway, a supply-conductor, a magnetically-actuated switch to connect or disconnect said supply and working conductor, a traveling vehicle, a motor to propel said vehicle, receiving electricity from said working conductor, and an electro magnet carried by said vehicle, having its north and south poles brought close together in close proximity to the magnetically-actuated switch.

4. The combination of a working conductor arranged parallel to the railway, a supply-conductor, a magnetically-actuated switch to connect or disconnect said supply and working conductor, a traveling vehicle, a motor to propel said vehicle, receiving electricity from said working conductor, an electro-magnet carried by said vehicle, having its north and south poles brought close together in close proximity to the magnetically-actuated switch, and means to vary the power of said electro-magnet.

5. In an electric railway, a working conductor arranged along the railway, a supply-conductor parallel thereto, magnetic switches to connect and disconnect said working conductor with the supply conductor, a traveling vehicle, a magnet on said vehicle to automatically operate said switches as a vehicle passes over them, and a connection between said magnet and axle or axles of the vehicle, capable of longitudinal movement, whereby the magnet will remain at a substantially fixed distance from the ground, but may easily ride over an obstruction.

6. The combination of a vehicle, a longitudinal collector-frame hung by parallel links from the axles and capable of longitudinal motion, current-collecting devices carried by said frame, and a working conductor over which said collecting devices travel.

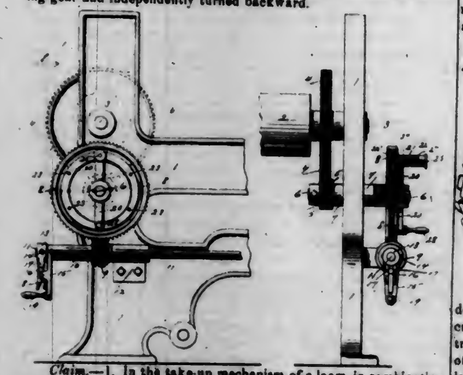
7. In an electric railway, a working conductor arranged along the railway, a supply-conductor parallel thereto, magnetic switches to connect and disconnect said working conductor with the supply-con-

ductor, a traveling vehicle, a magnet on said vehicle to automatically operate said switches as a vehicle passes over them, and a cleaning-brush resting upon the working conductor and connected to the vehicle.

8. In an electric railway, a working conductor arranged along the railway, a supply-conductor parallel thereto, magnetic switches to connect and disconnect said working conductor with the supply-conductor, a traveling vehicle, a magnet on said vehicle to automatically operate said switches as a vehicle passes over them, and a hinged cleaning-brush resting upon the working conductor and connected to the vehicle, and means to press it upon said working conductor.

9. The combination of a sectional working conductor, a supply-conductor, magnetically-actuated switches connecting said supply and working conductor sections, an electrically-propelled vehicle receiving current from said working conductor, means, substantially as described, carried by the vehicle to actuate said switches when the vehicle passes above them, the return-conductor, and an electric generator having its poles connected, respectively, to the supply and return conductor, but to opposite ends thereof, whereby the resistance from the generator through the motor and return is substantially the same for all positions of the motor on the line.

10. The combination of an exposed sectional working conductor, an insulated supply-conductor, magnetically-actuated switches to intermittently connect the supply-conductor with the sections of the working conductor, an electrically-propelled vehicle receiving current from said working conductor, a magnetizing helix carried by the vehicle and arranged within magnetizing distance of the switches, and a collecting device carried by the vehicle and making contact with the working conductor within the range of influence of the helix.

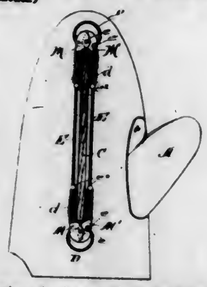


11. The combination of positive and negative line or supply conductors, a branch circuit between them, a switch to break said circuit, an electro magnet in said circuit, a working conductor, a switch actuated by said magnet to connect or disconnect said working conductor with one of the line or supply conductors, a magnetically-actuated switch to close said branch circuit, a traveling vehicle, and means, substantially as described, carried by said vehicle to operate said magnetically-operated switch.

12. The combination of positive and negative line or supply conductors, a branch circuit between them, a switch to break said circuit, an electro-magnet in said circuit, a working conductor, a switch actuated by said magnet to connect or disconnect said working conductor with one of the line or supply conductors, a magnetically-actuated switch to close said branch circuit, a closed circuit including a helix to keep said switch magnetized, a traveling vehicle, and means, substantially as described, carried by said vehicle to operate said magnetically-operated switch.

13. The combination of a vehicle, an electric motor to propel the same, the line-switch-actuating electro-magnet, a source of electric supply, a motor-circuit, a shunt-circuit around the motor and including the switch-actuating electro-magnet, an electric-light circuit in shunt relation with the motor, and independent means to regulate the current passing to the motor and switch-actuating electro-magnet and also to the electric-light circuit.

480,851. TAKE-UP MECHANISM FOR LOOMS. GEORGE F. HUTCHINS, Worcester, Mass., assignor to the Knowles Loom Works, same place. Filed Mar. 18, 1892. Serial No. 425,408. (No model.)



Brief.—The invention consists of mechanism so arranged that the take-up roll may, when desired, be quickly disconnected from its driving-gear and independently turned backward.

Claim.—1. In the take-up mechanism of a loom, in combination, the take-up roll, intervening gearing between the take-up roll and the worm-gear shaft, and said worm-gear shaft, and the worm-gear loose on said shaft, the worm loose on the worm-shaft, and said worm-shaft, and means for connecting the worm to the worm-shaft and for disconnecting it therefrom, and means for connecting the worm-gear to the worm-shaft and for disconnecting it therefrom, and means for turning the worm-gear shaft to cause the take-up roll to be turned independently of the worm-driving mechanism, for the purpose stated, substantially as set forth.

2. In the take-up mechanism of a loom, the combination, with the worm-shaft, the worm fast on a sleeve mounted loose on said worm-shaft, and means for connecting said sleeve with said shaft and for disconnecting it therefrom to allow the worm to be turned independently of the worm-shaft, the said means consisting of a handle-arm fast on the sleeve, carrying a spring-actuated latch which is adapted to engage lugs on a collar fast on the worm-shaft, and said collar, of the worm-gear driven by the worm and loose on the worm-gear shaft, and said worm-gear shaft, and means for connecting said worm-gear to the worm-gear shaft and for disconnecting it therefrom, such means consisting of a handle-arm fast on the worm-gear shaft and provided with a spring-actuated plunger adapted to engage sockets in the worm-gear to lock the gear to said handle-arm and cause it to be revolved therewith and with the worm-gear shaft or to be disengaged from said sockets to allow the worm-gear shaft to be turned by the handle-arm independently of the worm-gear to turn the take-up roll through the intervening gearing, and said take-up roll and intervening gearing between said roll and worm-gear shaft, substantially as set forth.

480,852. MITTEN. FERDINAND J. KAHN, St. Paul, Minn., assignor to Clarence Kahn, Sioux City, Iowa. Filed May 20, 1892. Serial No. 433,738. (No model.)

Claim.—1. A mitten having an elongated opening C, located on the body of the mitten, extending from the point of the index-finger along the side thereof to a point near the wrist, provided with springs D D, to the ends of which are attached by hinged joints d' d' thin plates M M', hinged at e and at their outer ends connected by hinged joints with side pieces E E at e' e^2, by means of which springs and side pieces aperture C may be opened, the free use of the entire hand procured, and the aperture again closed, all as set forth.

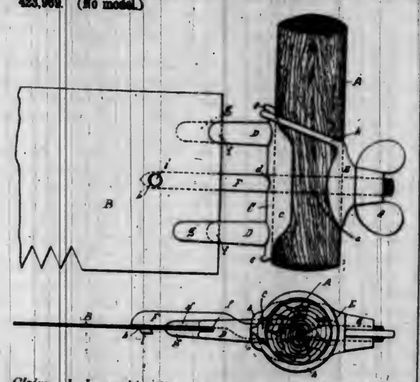
2. A mitten with the thumb portion enlarged where it joins the body of the mitten, so as to permit the thumb to be freely removed, having an elongated opening on the side of the mitten, extending from the point of the index-finger along the side thereof to a point near the wrist, said opening being provided with end springs and side pieces by means of which the aperture may be opened and closed, substantially as set forth.

480,853. DRIVE-CHAIN. CHARLES P. MARS, Rockford, Ill., assignor of one-half to James P. Edie, same place. Filed Jan. 18, 1892. Serial No. 418,442. (No model.)

Claim.—A link for link belting having a frame, a hook extending downwardly and forwardly from one end thereof, said hook having curved wings from its sides, giving to it a U shape or semi-tubular transverse section, a tongue extending rearwardly from the upper end of the hook, and a rearwardly-inclined depression in the upper and lower faces of one side of the link.

480,854. ACTION FOR MECHANICAL MUSICAL INSTRUMENTS. JOHANN L. MÜLLER, Leipsic, Germany. Filed Dec. 23, 1891. Serial No. 415,990. (No model.)

Claim.—1. The combination of lever a, having nose n and disk s, with ring r, having nose i, and with reed z, substantially as specified.



2. The combination of lever a, having nose n and disk s, with ring r, having nose i, and with the reed z, springs f f', and damper s, substantially as specified.

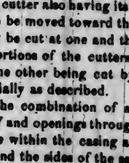
480,855. WOVEN FABRIC. IRVINE MCCALLUM, Philadelphia, Pa. Filed Feb. 26, 1892. Serial No. 422,850. (Specimens.)

Claim.—A homogeneous unmottled figured fabric having rows of picks comprising ground or concealed figuring wefts and a single figuring-weft, with substantially one-half of the warps in four divisions, whereof two lie crosswise between the single figuring-weft and the ground-wefts of every alternate row of picks and at the respective faces of every intervening row of picks, and whereof the other two lie in a similar manner, but at the respective faces of said alternate rows of picks and crosswise between the single figuring-wefts and ground-wefts of said intervening rows of picks, and with substantially the other half of the warps always between the concealed figuring and figuring-wefts, for the purposes set forth.

480,856. SAW-HANDLE. JOHN NEIMEYER, Hamilton, Ohio, assignor to Daniel Shafer, same place. Filed Mar. 7, 1892. Serial No. 423,909. (No model.)

Claim.—1. In combination, a support adapted to intervene between a saw-handle and the end of a saw, a washer, and a ring integral therewith and adapted to encircle a saw-handle and to detachably engage with said support.

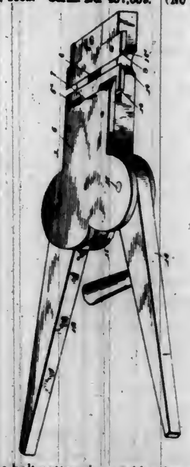
2. In combination, a mechanism adapted to intervene between a saw-handle and the end of a saw, a washer, and means adapted to encircle the handle and to detachably engage said mechanism with said washer.



3. In combination, a base-plate, arms projecting therefrom, a groove in the end of said arms, and a lip on each of said arms, extending beyond one side of said groove therein, said lips on the respective arms being adapted to rest against the opposite sides of a saw.

4. In combination, a curved base-plate, parallel arms projecting vertically from the convex face thereof, a groove in the end of each of said arms in line with each other, and a lip on each of said arms, extending beyond one side of said groove on opposite sides of said line, respectively.

5. In combination, a cylindrical handle, an intervening mechanism adapted to engage with said handle and the end of a saw, a washer, a ring adapted to encircle said handle and to detachably engage said intervening mechanism and said washer together, and a bolt adapted to secure said parts together and to the end of a saw.



6. In combination, a mechanism adapted to intervene between a saw-handle and the end of a saw, integral parallel lips thereon, adapted to extend along and rest against the respective sides of the saw, a washer, and a ring adapted to encircle the saw-handle and to detachably engage said washer with said mechanism.

480,857. LABEL-HOLDER. GUSTAV NEUHACK, Obernigk, near Breslau, Germany. Filed Nov. 18, 1891. Serial No. 412,253. (No model.)

Claim.—The combination of a bottle C with an elastic band encircling its neck, a bail having a rigid cross-arm A' and suspended below the band, and with a flexible label folded around the cross-arm, substantially as specified.

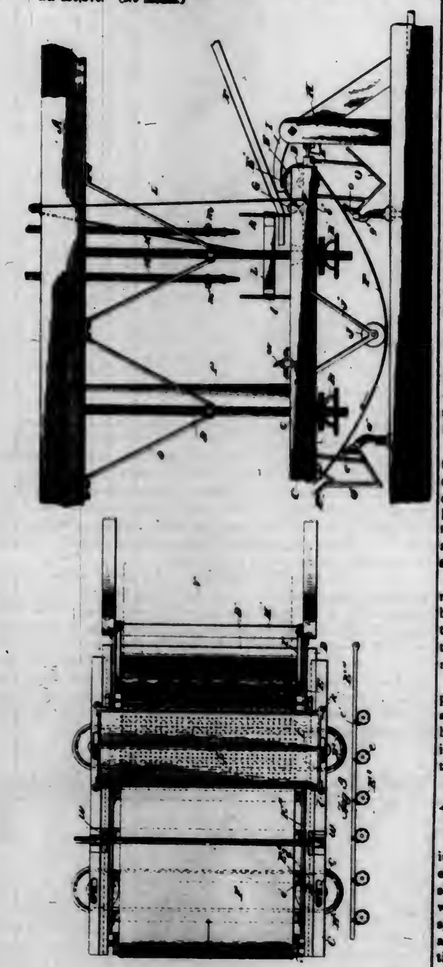
480,858. BOLT-CUTTER. WILLIAM H. RANSOM, Kirksville, Mo. Filed June 24, 1892. Serial No. 437,859. (No model.)

Claim.—1. In a bolt-cutter, the combination of a casing having an opening extending through the same and slots in the opposite edges thereof, a stationary cutter having its end projecting through said slots, and a reciprocating cutter also having its ends projecting through said slots and adapted to be moved toward the said stationary cutter, whereby three bolts may be cut at one and the same time, two of the same being cut by the portions of the cutters projecting beyond the sides of the casing and the other being cut by the central portion of the said cutters, substantially as described.

2. In a bolt-cutter, the combination of a casing having slots in the opposite sides thereof and openings through the said casing, a stationary cutter of T shape within the casing and having its ends projecting through and beyond the sides of the said casing, a reciprocating cutter having a T-shaped head laterally projecting through said slots and adapted to contact with the said stationary cutter and provided with a toothed shank, and handles pivoted in said casing and having toothed sectors engaging the said toothed shank of the cutter set forth, the said casing adjacent to the slots therein being depressed or recessed, substantially as described.

480,859. PORTABLE ROOF. JOHN H. RICE, Henderson County, Ill. Filed Mar. 11, 1890. Serial No. 343,563. (No model.)

Claim.—1. A roof-supporting chain comprising a series of links having holders formed integral therewith and provided at their upper and lower ends with rings for securely connecting the links, substantially as shown and described.



2. An improved chain for connecting and supporting the boards of a portable roof, said chain comprising the links B and B', said links having holders formed thereon and rings formed on their lower ends, the upper ends of the links B having hooks and the links B' having rings whereby the different links are flexibly united, substantially as shown and described.

3. An improved supporting device consisting of a chain composed of a series of link-bars, said link-bars being formed with rings at their upper ends, hooks at their lower ends, and openings below the hooks, adapted to receive the ring upon the upper end of the adjacent lower link, substantially as shown and described.

4. An improved roof-supporting chain consisting of a series of securely-connected links, each link carrying a stationary holder adapted to receive and support the roof-boards, substantially as shown and described.

5. An improved roof-supporting chain consisting of a series of links having stationary holders thereon and provided at their upper and lower ends with rings for securely connecting the links, substantially as shown and described.

480,860. ORE-CONCENTRATOR. PHILIP B. STANROPE, Dumont, Colo., and FRANK. WOOD, Brooklyn, N. Y. Filed Feb. 4, 1892. Serial No. 420,876. (No model.)

Claim.—1. In an ore-concentrator, the combination, with the stationary track, of a reciprocating table mounted thereon, means for reciprocating the table, a stationary bumper at one end of the table, having a cross-bar thereon of a length equal to the width of the table, a cross-bar on the end of the table in direct alignment with the said other cross-bar and arranged to impinge against the same throughout its entire length, carrying-rolls on the table, an endless belt on the rolls, and means for moving the belt, actuated by the movement of the table, substantially as described.

2. In an ore-concentrator, the combination, with a stationary track, of a drum mounted on the track at the forward end thereof, a roll at the rear of the track, a series of intermediate carrying-rolls, means for positively and simultaneously actuating the intermediate rolls and drum upon the vibration of the table, means for vibrating the table, an endless belt on the rolls, and a stationary bumper with which the table engages, substantially as described.

3. In an ore-concentrator, the combination, with a stationary track, of a drum mounted on the track at the forward end thereof, a roll at the rear of the track, a series of intermediate carrying-rolls, means for positively and simultaneously actuating the intermediate rolls and drum upon the vibration of the table, an endless belt on the rolls, a roll above the belt adjacent to the drum, and a stationary bumper with which the table engages, substantially as described.

4. In an ore-concentrator, the combination, with a stationary track, of supports for the track, hand-nuts secured on the support, against which the track rests, sprocket-wheels on the hand-nuts, and chains connecting the sprocket-wheels of the opposite supports, substantially as described.

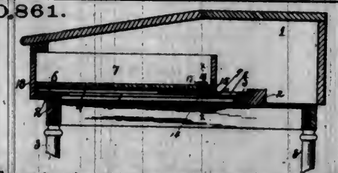
5. In an ore-concentrator, the combination, with a stationary track, of a reciprocating table on the track, means for reciprocating the table, an endless belt on the table, means for rotating the belt, a bumper, a feed-trough, and a vertically-adjustable water-receptacle on the track, having a perforated bottom, substantially as described.

6. In an ore-concentrator, the combination, with a stationary track, of supports for the track, a reciprocating table on the track, an endless belt carried by the table, means for moving the belt, a bumper, a water-distributing receptacle above the belt, and an unobstructed feed-trough or conveyer extending down to a point adjacent to the belt beneath the water-receptacle and formed with a horizontal discharge end and of a width substantially equal to the width of the belt, substantially as described.

7. In an ore-concentrator, the combination, with a stationary track, of a reciprocating table mounted thereon and a traveling belt on the table and a vertically-adjustable water-receptacle mounted on the track above the table and formed with a perforated bottom, substantially as described.

8. In an ore-concentrator, the combination, with a stationary track, a reciprocating table thereon and means for reciprocating the table, of a drum mounted on the table and extending above the same, a carrying-roll on the table in the rear of and below the plane of the upper surface of the drum, an endless belt on the rolls and drum, a stationary bumper with which the table engages, and means on the bumper for rotating the drum, substantially as described.

9. In an ore-concentrator, the combination, with a stationary track, of a reciprocating table mounted thereon, means for reciprocating the table, an endless belt carried on the table, launders or discharge-troughs supported by and arranged below the ends of the table, having their inner walls carried up into close proximity to the belt, nozzles extending through the trough at an inclination, a water-supply, and a flexible connection between the water-supply and the nozzles, substantially as described.



10. In an ore-concentrator, the combination, with a support, a reciprocating table, and the endless belt, of discharge-troughs arranged below the ends of the table, having their inner walls up to and within the path of the belt, nozzles passing through the walls at an inclination and terminating at points slightly in advance of the walls, and means for supplying the nozzles with water, substantially as described.

11. In an ore-concentrator, the combination, with a stationary support, reciprocating table, and endless belt, of a series of nozzles arranged at an incline slightly less than the inclination of the under surface of the belt, means for supplying the nozzles with water, and a dam located in the rear of the nozzles and in close proximity to the belt, substantially as described.

480,861. DRAWER STOP AND GUIDE. HENRY R. SPAUNHORST, St. Louis, Mo. Filed Dec. 21, 1891. Serial No. 415,732. (No model.)

Claim.—1. The herein-described drawer stop and guide, consisting of a guide-plate provided with a longitudinal slot 10, closed at its ends, a guide working in said guide-plate, and an attaching pin or screw 16, adapted to pass through the guide and engage the slot 10, whereby said projecting end of the pin or screw contacts with the respective closed ends of the slot when the drawer is open and closed and acts as a stop for limiting the movement of the drawer, substantially as and for the purpose set forth.

480,861.

2. The combination, with a receptacle and a drawer sliding therein of a fixed guide plate provided with a longitudinal slot 10, a guide working in said guide-plate, and a pin or screw 16, securing said guide to the bottom of the drawer and projecting downwardly into the slot 10, for the purpose described.

3. The combination, with a receptacle provided with the front and rear cross-pieces 2, the latter cross-piece having a recessed block 5 secured at its front edge, and a drawer sliding within said receptacle, of a guide-plate 4, secured at its rear end to the block 5 and having at its forward end projections 6 6, overlapping the front cross-piece 2, said guide-plate being provided with a longitudinal slot 10, closed at its ends, a slide 9, working in the guide-plate, a metallic plate 12, countersunk in the under side of said slide, and a pin or screw 16 passed through the bottom of the drawer and secured within the plate 12, substantially as and for the purpose set forth.

480,862. BILL OR LETTER FILE. JACOB H. STULL, Fremont, Ohio. Filed May 13, 1892. Serial No. 432,897. (No model.)

Claim.—1. A bill or letter file provided with a part mounted on crank-arms and carrying the arched wires and having extensions to guide said part, as set forth.

2. A bill or letter file provided with receiving-wires and a block mounted on crank-arms within a rectangular frame and carrying the arched wires, as set forth.

3. A bill or letter file provided with receiving-wires, a block carrying the arched wires and mounted on crank-arms, a rectangular frame within which the said block is movable, guides for the block, and a catch to hold it in its closed position, as set forth.

4. A bill or letter file provided with a block mounted on crank-arms and carrying a standard provided with a catch, and a rectangular frame in which the crank-arms are mounted and within which the block is movable, as set forth.

5. A bill or letter file provided with a block mounted on crank-arms and carrying the arched wires, a rectangular frame in which the crank-arms are mounted and within which the block is movable, and a standard provided with a spring-actuated catch, as set forth.

6. In a bill or letter file, the combination, with a base and a frame thereon, of a block arranged within the frame and carrying the arched wires, crank-arms mounted in the frame and carrying the block, and extensions on the block guided in the frame, as set forth.

7. In a bill or letter file, the combination, with a base and a frame thereon, of a block mounted on crank-arms held in the frame and arched wires carried by the block, a standard on the block, a spring-actuated catch on the standard, and a spring arranged beneath the block, as and for the purpose specified.

8. In a bill or letter file, a perforator consisting of a bed-plate with its front end turned down to provide room for the cores, as set forth.

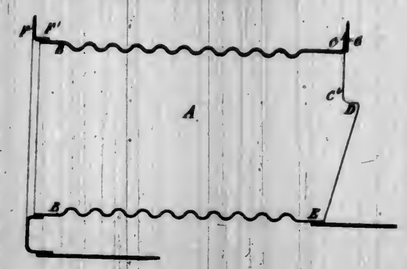
9. In a bill or letter file, a perforator consisting of a bed-plate with its sides turned up and cut away, and a lever and punches, the latter working through holes in the bed-plate, as set forth.

10. A perforator consisting of a bed-plate with perforations, a spring having its ends passed upward into the perforations, and a lever and punches, as set forth.

11. A perforator consisting of a bed-plate with upturned sides cut away, a rod held in said sides, and a combined lever, journal-boxes, and punches journaled on said rod, as set forth.

12. A perforator having perforations for the punches and ridges in proximity to the perforations, as set forth.

13. A perforator consisting of a bed-plate with perforations and ridges in proximity to the ridges, and a combined lever and punches, the latter working through the perforations, as set forth.



14. A punch the cutting part of which is at right angles to the punches or downward-bent wire, of which the same is formed, and beveled, as and for the purpose specified.

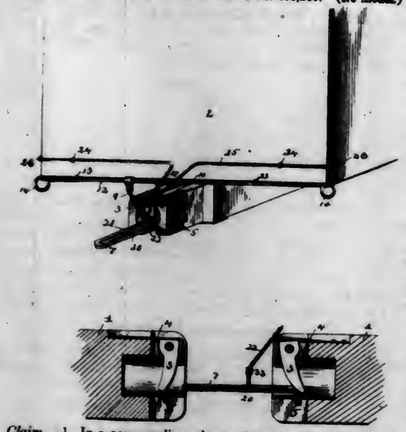
480,868. HINGED EXPANSION-GEAR FOR BRIDGES. CHARLES J. WESTWOOD and HARRY RIGBY, Millwall, England. Filed July 23, 1891. Renewed June 4, 1892. Serial No. 435,503. (No model.) Patented in England Nov. 12, 1890, No. 18,054.

Claim.—The herein-described gear for use as described, consisting in the combination, with the lower and upper saddle-plates *a a'*, provided in their opposing faces with curved or semicircular machined bearing-recesses, as described, of the link *b*, located intermediate to the saddle-plates and provided with rounded or semicircular machined ends *b'*, fitting within the bearing-recesses of the saddle-plates and adapted to have a rocking movement therein, as and for the purpose specified.

480,864. STEAM-BOILER FURNACE. HENRY C. ASHLIN, London, England. Filed Nov. 16, 1891. Serial No. 412,388. (No model.) Patented in England May 1, 1890, No. 6,718.

Claim.—1. A furnace tube having no flange at one end and partly flanged and partly cut away at the opposite end in a direction toward the body of said tube, for the purpose specified.

2. A furnace tube having no flange at one end and provided at its opposite end with a flange C, extending partially around the circumference of the tube, and having the remainder of said circumference cut away obliquely in a direction toward the body of the tube, as at D E, for the purpose specified.

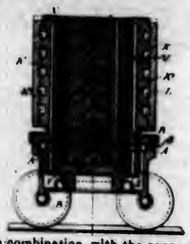


3. The combination, with the front plate F, flanged, as at F', and the back plate G, having no flange, of the furnace-tube, one end having no flange and fitting within the said plate F and the opposite end of the tube being provided with a flange C, fitting against the exterior of the plate G and being cut away, as at D E, for the purpose specified.

480,865. CHECKREIN. SIDNEY R. BROOKS, Uniontown, Pa., assignor of one-half to Park C. Sheldon, Allegany, N. Y. Filed Apr. 25, 1892. Serial No. 430,516. (No model.)

Claim.—The herein described checkrein attachment, consisting of the outer case having an extension, the spring-drum within the case, the spring, the strap wound around the spring-drum, with one end extended through the case, the ratchet-wheel on the drum, the spring-arm secured to the case and having its free end formed into a fork, and a pawl carried by the spring-arm, with its free end extended into the case and turned at right angles to its length to engage the ratchet-wheel, substantially as specified.

480,866. CAR-COUPLING. WILLIAM H. DAVIS, Chapel Hill, Tex., assignor of one-half to William T. Armstrong and Miller F. Armstrong, same place. Filed Oct. 10, 1891. Serial No. 408,289. (No model.)



Claim.—1. In a car-coupling, the combination of a draw head, a depending hook pivotally mounted therein, a transverse pin arranged on the bottom of the mouth of the draw-head and provided intermediate its ends with a notch to permit the passage of the lower end of the hook, a spring for holding the notch away from the hook, and means for sliding the pin to bring the notch opposite the hook, substantially as described.

2. In a car-coupling, the combination, with the draw-head, a hook mounted on a transverse pivot in the upper part of the mouth of said draw-head, and a spring holding said hook normally vertical, of a transverse pin moving across the bottom of said mouth and having a notch in its body adapted to permit the outward passage of the tip of the hook, a slide-rod guided in eyes in the end of the car, an eye in the side of the draw-head, and a rod connected at its ends to said pin and rod and passing intermediately through said eye.

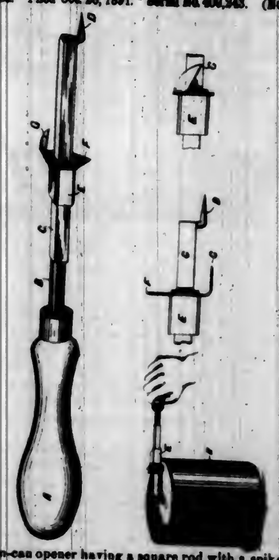
3. In a car-coupling, the combination, with the draw head, a hook mounted on a transverse pivot in the upper part of the mouth of said draw-head, and a spring holding said hook normally vertical, of a transverse pin moving across the bottom of said mouth and having a notch in its body adapted to permit the outward passage of the tip of the hook, a coiled spring drawing said pin to bring its notch normally out of the line of said tip, a link having a bar across its center carrying an eye, a chain having a snap-hook detachably engaging said eye, a link-lifter, to which said chain is connected at its upper end, and means for drawing the pin against the force of said coiled spring.

4. In a car-coupling, the combination, with the draw head, a hook mounted on a transverse pivot in the upper part of the mouth of said draw-head, and a spring holding said hook normally vertical, of a transverse pin moving across the bottom of said mouth and having a notch in its body adapted to permit the outward passage of the tip of the hook, a coiled spring drawing said pin to bring its notch normally out of the line of said tip, a link having a bar across its center carrying an eye, a chain having a snap-hook detachably engaging said eye, a link-lifter, to which said chain is connected at its upper end, a slide-rod guided in eyes in the end of the car, an eye in the side of the draw-head, and a rod connected at its ends to said pin and rod and passing intermediately through said eye.

480,867. OIL-PRESS. AUGUSTIN ESTRAYER, Marseilles, France. Filed Sept. 28, 1891. Serial No. 407,008. (No model.) Patented in France Feb. 22, 1889, No. 196,157.

Claim.—1. The combination, with the cage or frame, of plates U and of oblique channels T, terminating in vertical grooves R, for facilitating the discharge of the oil.

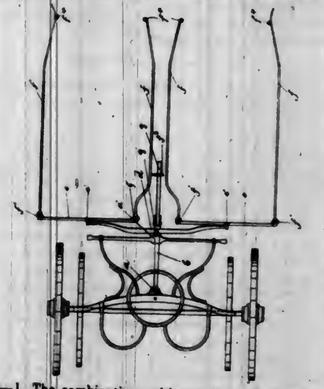
2. In an oil-press frame or cage, the combination, with the frame or cage consisting of a series of circumferentially-arranged sections adapted to be adjusted toward and from each other, as described, and an incline upon the outer surface of each of said sections, of a casing surrounding the said movable sections and adapted for vertical movement thereupon, inclines upon the inner surfaces of said casing adapted to bear upon the inclines of the frame-sections when the casing is moved, and means for operating the said casing, for the purpose specified.



3. In an oil-press frame or cage, the combination, with a base mounted upon supporting-wheels, of the frame or cage mounted upon said base, consisting of a series of circumferentially-arranged sections adapted to be adjusted toward and from each other, as described, an incline upon the outer surface of each of said sections, a casing surrounding said movable sections and adapted for vertical movement thereupon, inclines upon the inner surface of said casing, adapted to bear upon the inclines of the frame-sections, and means carried by the base for operating the said casing, for the purpose specified.

4. In an oil-press frame or cage, the combination, with a base mounted upon supporting-wheels, of the frame or cage consisting of a series of circumferentially-arranged sections adapted to be adjusted toward and from each other, as described, an incline upon the outer surface of each of said sections, a casing surrounding said movable sections and adapted for vertical movement thereupon, inclines upon the inner surface of said casing, adapted to bear upon the inclines of the frame-sections, and means carried by the base for operating the said casing, consisting of screws carried by the casing and extending through the base, toothed nuts working upon said screws, a toothed wheel engaging the nuts, a worm engaging said toothed wheel, and a lever for operating said worm, as described.

5. In an oil-press frame or cage, the combination, with a base mounted upon wheels and a reservoir in said base, of the frame or cage mounted upon said base and consisting of a series of circumferentially-arranged sections adapted to be adjusted toward and from each other, as described, and provided with a series of vertical grooves R, communicating with reservoir S, inclines upon the outer surfaces of said sections, a casing surrounding the latter and adapted for vertical movement thereupon and provided with inclines upon its inner surface adapted to bear upon the inclines of the frame-sections when the casing is moved, and means for operating said casing, for the purpose specified.



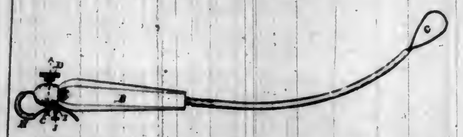
6. In an oil-press frame or cage, the combination, with a base mounted upon wheels and a reservoir S in said base, of the frame or cage mounted upon said base and consisting of a series of circumferentially-arranged sections adapted to be adjusted toward and from each other, as described, and provided with a series of vertical grooves R, communicating with reservoir S, inclined channels T in said sections and communicating with the grooves R, inclines upon the outer surfaces of said sections, a casing surrounding the latter and adapted for vertical movement thereupon and provided with inclines upon its inner surface, adapted to bear upon the inclines of the frame-sections when the casing is moved, and means for operating said casing, for the purpose specified.

480,868. CAN-OPENER. ALFRED PRESTON and JOHN BARRIE, London, England. Filed Oct. 20, 1891. Serial No. 408,943. (No model.)

Claim.—A tin-can opener having a square rod with a spike at end with bend in same, and blades carried on a sleeve arranged to slide on rod, and a rounded part at bottom of rod to enable the sleeve to be turned round to bring either blade underneath, as set forth.

480,869. VEHICLE-SHAFT. GUSTAV A. FRAAS, Dresden, Germany. Filed July 3, 1891. Serial No. 398,356. (No model.)

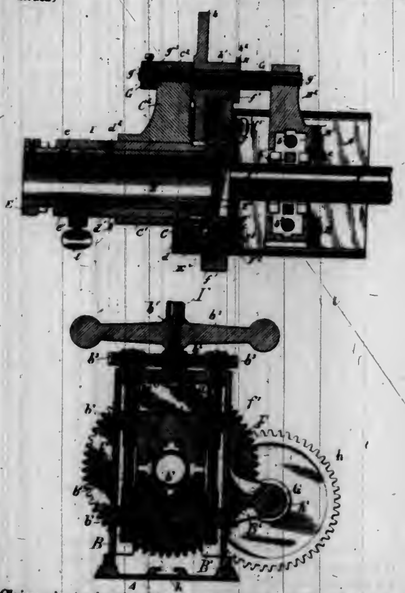
Claim.—1. The combination, with a vehicle, of a longitudinal spindle *b*, pivoted to the vehicle, a whiffletree *d*, pivoted to said spindle, a rod *g*, pivoted to the latter, as described, trees *c*, pivoted to the ends of the whiffletree, shafts pivoted to said trees *c*, and an eye f^3, secured to one of the sections of the shafts and sliding upon the rod *g*, all arranged and combined for co-operation, substantially as and for the purpose specified.



2. The combination, with the trees *c*, of the shafts *f*, provided with eyes f^4, and the fitting *h*, secured to a portion of the harness and provided with lugs h^4, between which fit the eyes f^4, all arranged and combined for co-operation, substantially as and for the purpose specified.

3. In apparatus such as described, the combination, with a forecarriage, of a shaft capable of rotating on a horizontal axis, another shaft jointed to it, so that it may rock in a vertical plane, and a whiffletree jointed to it, so that it may rock in a horizontal plane, substantially as described, and illustrated in the accompany drawings.

4. In apparatus such as described, the combination, with a forecarriage, of a horizontal revoluble shaft, vertically-movable shaft pivoted to its front end, a whiffletree, two pairs of limbers or shafts, and an eye sliding on the vertically-movable shaft, substantially as described, and illustrated in the accompanying drawings.



5. In apparatus such as described, the combination, with a forecarriage, of a horizontal revoluble shaft and a spring to bear frictionally against it, substantially as and for the purpose described, and illustrated in the accompanying drawings.

480,870. SCRASEUR. CHARLES H. HARRIS, Cedartown, Ga. Filed Dec. 21, 1891. Serial No. 415,723. (No model.)

Claim.—In an scraseur, substantially as described, the combination, with the sheath, the hand-grasp thereon having a threaded bore at right angles to the bore of the sheath, the strip or wire lapped to form a protruding loop at the forward end of the sheath and passed through the same, and the elastic sleeve mounted on the strip or wire in rear of the hand-grasp, of the binding-screw seated in the threaded bore of the handle and adapted to bind upon the lapped strip or wire, the loop on the hand-grasp at a diametrically-opposite point to the binding-screw, adapted to receive the free ends of the wire, and a set-screw taking through said loop and fixing the wire or strip with respect thereto, substantially as specified.

480,871. PIPE-THREADING MACHINE. DAVID O. JAMES, Chicago, Ill., assignor, by direct and mesne assignments, to himself and John Grant, same place. Filed Nov. 10, 1891. Serial No. 411,499. (No model.)

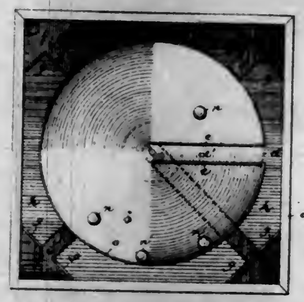
Claim.—1. A pipe-threading machine comprising a pipe-clamp, a revoluble sleeve supported opposite said clamp and carrying a die-stock, a cam-track secured to said sleeve, and a roller arranged to travel upon said cam-track, substantially as described.

2. A pipe-threading machine comprising a pipe-clamp, a revoluble sleeve supported opposite said clamp and carrying a die-stock, two oppositely-arranged cam-tracks secured to said sleeve, and a roller arranged to travel upon each of said cam-tracks, substantially as described.

3. A pipe-threading machine comprising a pipe clamp, a revoluble sleeve supported opposite said clamp and carrying a die-stock, two oppositely-arranged cam-tracks secured to said sleeve, a fixed roll arranged to travel upon one of said cam-tracks, and an adjustable

roll adapted to be projected beyond the fixed roll and travel upon the other cam-track, substantially as described.

4. A pipe-threading machine comprising a pipe-clamp, two revoluble sleeves supported one within the other opposite said clamp and each provided at its inner end with a gear, a shaft arranged parallel with said sleeves and having thereon a hub provided with gears adapted to mesh with the gears of said sleeves, and a die-stock secured to the inner sleeve opposite the pipe-clamp, substantially as described.



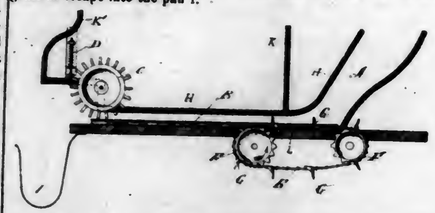
5. A pipe-threading machine comprising a pipe-clamp, two revoluble sleeves supported one within the other opposite said clamp and each provided at its inner end with a gear, a laterally-movable shaft arranged parallel with said sleeves and having thereon a hub provided with gears adapted to mesh with the gears of said sleeves, and a die-stock secured to the inner sleeve opposite the pipe-clamp, substantially as described.

6. A pipe-threading machine comprising a pipe-clamp, two revoluble sleeves supported one within the other opposite said clamp and each provided at its inner end with a gear, a laterally-movable shaft arranged parallel with said sleeves and having thereon a hub provided with gears adapted to mesh with the gears of the said sleeves, an adjustable clutch-collar mounted on the inner sleeve, clutch members carried by each of said sleeves, a die-stock secured to the inner sleeve opposite the pipe-clamp, and means for adjusting the shaft, substantially as described.

7. A pipe-threading machine embodying two standards, one of which is provided with a pipe-clamp, a sleeve journaled in the other standard and provided at its inner and outer ends with a gear and clutch member, respectively, another sleeve of greater length journaled within the first-named sleeve and provided at its inner end with a die-stock having a peripheral gear and at its outer end with a clutch member, a clutch collar mounted on the outer end of the inner sleeve, a laterally-adjustable shaft journaled in arms projecting from the standards, a hub on said shaft provided with gears adapted to mesh with the gears of the sleeves, and a means for adjusting the shaft, substantially as described.

8. A pipe-threading machine comprising a pipe-clamp, two revoluble sleeves supported one within the other opposite said clamp and each provided at its inner end with a gear, a laterally-adjustable shaft arranged parallel with said sleeves and having thereon a hub provided with gears adapted to mesh with the gears of the sleeves, clutch members carried by each of said sleeves, a clutch-collar mounted on the inner sleeve between the clutch members, a die stock secured to the inner sleeve opposite the pipe-clamp, and means for advancing the inner sleeve toward the pipe-clamp as said sleeve is rotated, substantially as described.

480,872. GAME OR PUZZLE. EDMUND KEMBLE, East Orange, N. J. Filed Apr. 9, 1892. Serial No. 428,437. (No model.)



Claim.—1. The combination, with a box *a*, having cribs with ways or openings thereto, of a turn-table having a peripheral rim to retain the balls on the surface thereof, and a path or way *d'*, leading to an opening in said rim, the said path or way *d'* being adapted to coincide with the ways or openings in said crib and said balls, all substantially as set forth.

2. The improved puzzle or game herein described, in which is combined a box *a*, cribs *f*, with ways *j*, leading thereto, a turn-table *b*, having rim *c* and fences *e e* extending toward the center of said turn-table, and balls adapted to roll between said fences and over the ways *j* to said cribs, substantially as set forth.

3. In combination with cribs *f*, having fences *g g* and openings *i*, ways *j*, unguarded, as described, and extending to the periphery of the turn-table, and said turn-table having the opening *d*, substantially as set forth.

480,878. AUTOMATIC FEEDER FOR TWINE-MAKING MACHINES. GEORGE A. LOWRY, Chicago, Ill. Filed June 4, 1891. Serial No. 395,016. (No model.)

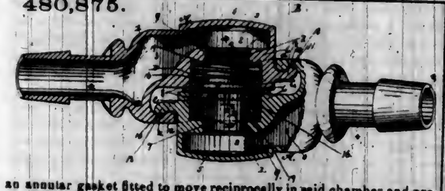
Brief.—The grass is fed forward by the endless chain somewhat faster than used, and when it becomes too great the resistance of the spring-bolt pressing the spider C is overcome, allowing the surplus grass to escape into the pan I.

Claim.—1. In an automatic feeder for a twine-machine, the combination of a feeding mechanism with a revoluble wheel or spider located in the path of the material being fed and normally stopping the passage of the same so as to form a pile, and a yielding stop for normally limiting the revolution of such wheel or spider and periodically releasing the same when the excess of material in the pile or bundle overcomes the action of such stop, substantially as and for the purpose set forth.

2. In an automatic feeder, the combination of mechanism for regularly feeding forward the material with a revoluble wheel or spider arranged in the path of such material and at a suitable distance from the feeding mechanism and a spring-acted bolt resting normally against one of the spokes of the spider and tending normally to limit its revolution, whereby the material will be fed forward into a bundle or pile against the wheel, and when such bundle or pile becomes too large the excess of pressure will overcome the spring-acted bolt, and the wheel or spider will then revolve and carry off a portion of the accumulated material, substantially as and for the purpose set forth.

3. In an automatic feeder, the combination of a feeding-platform and endless chain provided with plates projecting through such platform near one end thereof, a wheel or spider mounted adjacent to the other end of such platform, and a spring-acted bolt resting against one of the spokes of such wheel or spider and acting to restrain the revolution of the latter, except under the accumulation of pressure, substantially as and for the purpose set forth.

480,874. GLOVE-FASTENER. FRIEDRICH MAISCH, Naples, Italy. Filed Apr. 9, 1892. Serial No. 428,444. (No model.)

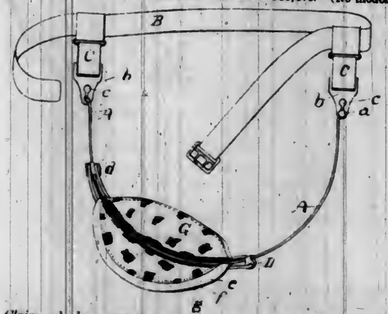


Claim.—1. A fastener comprising an oval stud or pin adapted for attachment to one edge of an article, a revoluble cap adapted to cover said pin or stud and provided with a flange, a locking-plate rigidly secured to the cap, and an eyelet adapted for attachment to the other edge of the article and provided with a lip engaging said flange and constituting a seat for revolubly supporting said cap, substantially as and for the purposes set forth.

2. A fastener comprising an oval stud provided with a flange, an eyelet adapted for attachment to one edge of an article and provided with a lip clamping said flange, a revoluble cap adapted to cover said stud and provided with a flange, a locking-plate rigidly connected with said cap, and an eyelet adapted for attachment to the other edge of the article and provided with a lip engaging the flange of the cap to form a seat for revolubly supporting the latter, substantially as and for the purposes set forth.

480,875. COUPLING FOR FLEXIBLE STEAM-PIPES. JAMES R. MARBLE, Albany, N. Y., assignor, by mesne assignments, of one-half to Joseph Wiltsie Fuller, same place. Filed May 11, 1892. Serial No. 432,599. (No model.)

Claim.—1. A coupling for flexible steam-pipes, the same consisting of two like sections fitted to interlock and having a longitudinal joint between them, each of said sections comprising a chambered head having a tubular neck leading laterally therefrom, a central opening formed in the inner face of said head and having the outer end of its bore enlarged, a sleeve provided with an outer circumferential flange and secured in said opening, so as to form an annular chamber therein,

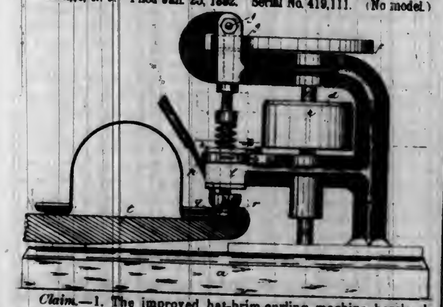


480,875.

an annular gasket fitted to move reciprocally in said chamber and provided with an inner circumferential flange fitted to engage with the flange of said sleeve, and a spring interposed between the inner face of said gasket and the bottom of said annular chamber, as and for the purpose herein specified.

2. In a coupling for flexible steam-pipes, the combination of a hollow head having a central opening whose outer end is enlarged in diameter, a sleeve provided with an outer circumferential flange and fitted to secure in said central opening, so as to form an annular chamber in the latter, said sleeve having a series of steam-openings forming communications from the bore of said sleeve and the annular chamber, an annular gasket fitted to reciprocate in said annular chamber and having an inner circumferential flange that is fitted to engage with the flange of said sleeve, and a spring interposed between said gasket and the bottom of said annular chamber, as and for the purpose herein specified.

480,876. CATAMENIAL APPLIANCE. WILLIAM H. MARSH, Los Angeles, Cal. Filed May 11, 1889. Serial No. 310,478. (No model.)



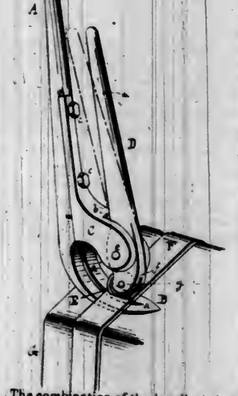
Claim.—1. In a catamenial appliance, the combination of the approximately semicircular frame, the two arms hinged thereto, and the clamp for securing the free ends of the arms to the frame.

2. In a catamenial appliance, the combination of the approximately semicircular wire frame having on its outer under side the downwardly-projecting laterally-perforated hinge lug, the two arms formed of one piece of wire bent at the middle to form a loop, the two members of which form the arms, and the clamp for securing the free ends of such arms to the frame.

3. In a catamenial appliance, the combination of the slotted suspending clasps and the approximately semicircular pad-sustaining frame formed of a wire bent outwardly at its ends and provided with the projecting buttons.

480,877. HAT-CURLING MACHINE. WILLIAM J. MCGALL, West Orange, N. J. Filed Jan. 25, 1892. Serial No. 419,111. (No model.)

Claim.—1. The improved hat-brim-curling machine herein described, comprising a frame, a vertical tool-shaft having bearings in said frame and having a flanged and heated ironing-tool rotating with said shaft, means for rotating said shaft and tool, and means for heating said tool, and a table having a raised and inwardly-turned flange at the edge thereof, which overlaps the flange of the tool and holds the curled brim while the heated ironing-tool is pressing and rapidly rotating against the concaved side of the brim, substantially as set forth.



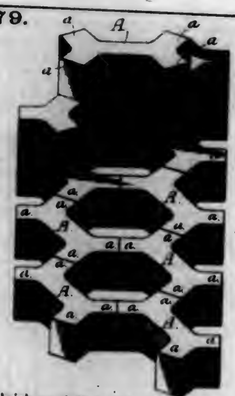
2. The improved hat-brim-curling machine, comprising a heated rotary tool having a cup at the upper part to receive a gas-jet and a flange at the lower part, means for rotating said tool, a gas-jet for heating the said tool, and a turn-table having a flange or bearing at the edge thereof, which extends inwardly over the flange of the heated tool, substantially as set forth.

3. The improved hat-brim-curling machine herein described, comprising a rotary table having at its peripheral edge a raised and inwardly-extending flange and a frame having arms *b' b³*, providing bearings for a vertical tool-shaft *A*, said vertical shaft, a gear-wheel at its upper end and a heated and flanged ironing-tool *A* at its lower end, the flange of which underlies the flange of the turn-table and is adapted to present its heated and rapidly-rotating surface to the concave side of the curled brim, means for heating said rotary tool, and a spring to for raising the flange of the rotary tool against or toward the raised and inwardly-extending flange of the rotary table, and gearing for transmitting power to the gear-wheel or shaft *A*, all said parts being arranged and combined substantially as set forth.

4. The improved hat-brim-curling machine herein described, comprising a table having a raised and inwardly-turned flange at its edge and a frame having arms *b' b³*, providing bearings for a vertical shaft *A*, said vertical shaft, means for transmitting rotary motion thereto and at its lower end having a cup-shaped and flanged ironing-tool adapted to extend under the flange of the table and present its heated ironing-surface to the concave side of the curled brim, means for heating said tool, a sliding shaft-bearing, and an eccentric or cam for throwing the shaft and rotary tool laterally away from the flange of the table, substantially as set forth.

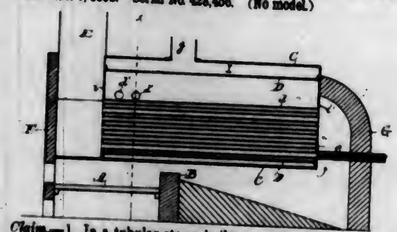
5. In combination with the frame *a b*, a pivoted bearing *i*, sliding bearing *k*, shaft *A* in said bearings, means for rotating said shaft, and means for lifting the same upward, a tool *A'*, arranged on said shaft, means for heating said tool, and a guide to co-operate with the heated tool in giving shape to the fabric, substantially as set forth.

480,878. BALE-TIE CUTTER. GEORGE M. ROUNDS, Taunton, Mass. Filed Apr. 2, 1892. Serial No. 427,444. (No model.)



Claim.—1. The combination of the handle A, having the flat elongated and curved tip B and the extension C, the lever D, bifurcated at its end and mounted on said extension, and the rotary cutter E, mounted in the bifurcation of the lever D, substantially as specified.

2. The combination of the handle A, having the tip B grooved at *a*, the detachable extension C, mounted on said handle by the screws *c*, the lever D, pivotally mounted on said extension and provided with the rotary cutter E, substantially as described.

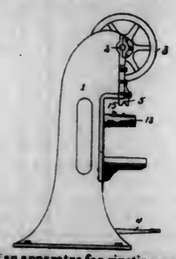


480,879. BRICK. JOHN L. STEVENSON, Chicago, Ill., assignor of one-half to James E. York, same place. Filed Dec. 12, 1891. Serial No. 414,804. (No model.)

480,879.

Claim.—A brick consisting of a central longitudinal part and obliquely-arranged lateral projections at each end thereof, the projections at either end of said longitudinal part being arranged at equal angles with each other and with the said longitudinal part and being equal in thickness to the longitudinal part, whereby a structure may be formed consisting of flues separated by walls of equal thickness, substantially as described.

480,880. STEAM-BOILER. FRED T. STEVENS, Bryant's Pond, Me. Filed Apr. 9, 1892. Serial No. 428,456. (No model.)

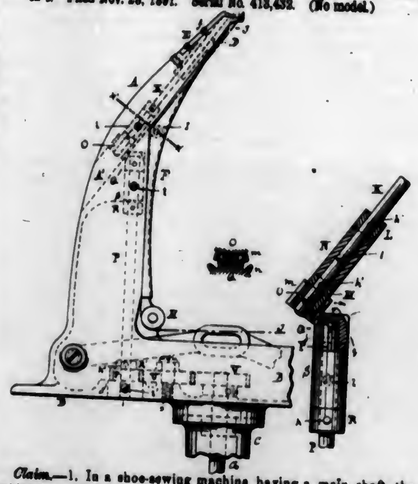


Claim.—1. In a tubular steam-boiler, an inner shell inclosing the tubes, an outer shell surrounding said inner shell, said inner shell having an opening for the flow of water from within to the space between the shells, substantially as described.

2. In a tubular steam-boiler, an inner shell inclosing the tubes, an outer shell surrounding the said inner shell, the center of said inner shell being below that of the outer shell, the said inner shell having one or more openings through its walls, substantially as described.

3. In a tubular steam-boiler, an inner shell inclosing the tubes, an outer shell surrounding the said inner shell, the said inner shell having one or more openings immediately above the tube-level, substantially as described.

480,881. APPARATUS FOR RIVETING EARS UPON BUCKETS. CHARLES STOLLBERG, Toledo, Ohio, assignor to the Toledo Tin-Ware Manufacturing Company, same place. Filed Feb. 8, 1892. Serial No. 420,663. (No model.)



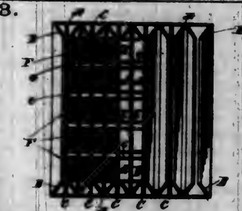
Claim.—1. In an apparatus for riveting ears upon buckets, an anvil or support having recesses to receive the rivet-heads, spring-pressed projections thereon to limit the movement of the bucket, and a reciprocating die formed with openings upon its face, registering with the recesses in the anvil.

2. In an apparatus for riveting ears upon buckets, an anvil or support for the bucket having a projection to limit the movement of the bucket, a reciprocating die formed with openings upon one end to admit the ends of rivets when forced through the metal, an upsetting device upon the opposite end, and a vertically-movable stop upon the anvil in position when raised to limit the movement of the bucket to cause the rivets to align with the riveter.

3. In an apparatus for riveting ears upon buckets, an anvil formed with recesses to receive the rivet-heads, a gage or stop to limit the movement of the bucket, a projection having a recess to receive and limit the movement of the ear, and a die having means for forcing the rivet through the metal and riveting the same.

4. In an apparatus for riveting the ears upon buckets, an anvil or support having recesses to receive the rivet-heads and a projection to limit the major movement of the bucket, a spring-pressed stop to limit the minor movement of the bucket, and a die having recesses registering with those in the anvil.

480,882. SHOE-SEWING MACHINE. JAMES A. TRUE, Pawtucket, R. I. Filed Nov. 28, 1891. Serial No. 413,432. (No model.)



Claim.—1. In a shoe-sewing machine having a main shaft, the combination of a hollow horn having its upper portion bent and provided with an angular aperture near the bend on the outer curve thereof, a thread-carrier rotatably mounted at the top of the horn, a shaft detachably mounted in the upper or bent portion of the horn and having at its top a pinion to engage and operate the thread-carrier and at its bottom a cylindrical gear with straight longitudinal cogs, and a shaft mounted in the lower portion of the horn at an angle with the shaft last aforesaid and deriving motion from the main shaft by a train of gearing and having at its top a gear adapted to engage in an angular direction with the lower gear of the upper shaft, such engagement being on that side of said upper gear of the lower shaft which is nearest the outer curve of the horn, so as to allow the disengagement of said gears of the upper and lower shafts from each other and the outward withdrawal of the upper shaft and its gears from the horn through said aperture, substantially as specified

2. In a shoe-sewing machine having a horn and a thread-carrier mounted at the tip thereon, the combination of the perpendicular shaft P, having the gears Q T, the bushing S', in which said shaft is mounted and which has the conical recess *r*, the conical pointed screw W, passing through the side of the horn and adapted to enter and engage with said recess, and the shaft K, having the gears and pinion O *d*, all arranged and operating substantially as and for the purpose specified.

3. In a shoe-sewing machine, the combination of the horn A, having the aperture A', the tubular tip D, having the thread-carrier *b*, the cap-piece E, secured to the tip and horn by screws or pins, the shaft K, mounted in the tubular tip D and having at its upper end the pinion *d*, engageable with the carrier *b*, and also having at its lower end the gear O, with straight cogs *m*, and the shaft P, having the bevel-gear Q *n*, upon which said gear O *m* can slide while the shaft K is moved longitudinally in the tip D for the purpose of adjusting the pinion *d* to the carrier *b*, substantially as specified.

480,883. STORAGE-BATTERY. EDWARD P. USHER, Grafton, Mass., assignor to the Hopedale Electric Company, of West Virginia. Filed Aug. 22, 1891. Serial No. 403,427. (No model.)

480,883.

Claim.—1. In a storage-battery, a flexible wrapper for the series of plates, such wrapper having inwardly-projecting inclined lips to hold the separator sheets and lead plates in proper alternate position, substantially as set forth.

2. In a storage-battery, the flexible wrapper of rubber compound with yielding inclined lips thereon, in combination with the positive and negative plates and the separators thereby held in position, substantially as set forth.

3. The receptacle lined with rubber, having yielding lips with inclined surfaces, in combination with the alternate plates and the interposed separators, substantially as set forth.

4. The flexible wrapper having yielding inclined lips in parallel rows and the separator-sheets held thereby, in combination with the leaden plate or frame formed with projecting ribs or flanges and with active material introduced into the space between said flanged frame and separators, substantially as set forth.

5. In a storage-battery, flanged plates or frames combined with active material in tablet form and with interposed separators, substantially as set forth.

6. In a storage-battery, a tablet of active material enveloped in lead-foil, substantially as set forth.

7. In a storage-battery, a tablet of active material enveloped in lead-foil finely perforated, substantially as set forth.

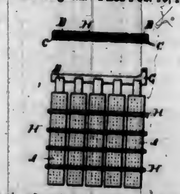
8. In a storage-battery, the flanged leaden plate D E, having lateral spaces for active material, and open vertical wells separating the same, substantially as set forth.

9. A storage-battery cell comprising the following detachable parts, viz: a flexible wrapper having yielding lips, separators held by such lips, flanged plates alternating with said separators, tablets of active material between such plates and separators, all adapted to be placed within the receptacle inclosing such parts with the electrolytic liquid, substantially as set forth.

480,884. BATTERY-CELL. EDWARD P. USHER, Grafton, Mass., assignor to the Hopedale Electric Company, of West Virginia. Filed Feb. 19, 1892. Serial No. 422,093. (No model.)

Claim.—The improved cell or acid-jar described, consisting of an outer wall or receptacle A, a lining of acid-proof gum B applied thereto, and a thin shell C, embedded in said gum lining and coated externally and internally therewith, the parts being permanently united by the hardening of the gum, substantially as set forth.

480,885. STORAGE-BATTERY. EDWARD P. USHER, Grafton, Mass., assignor to the Hopedale Electric Company, of West Virginia. Filed Feb. 19, 1892. Serial No. 422,094. (No model.)



Claim.—1. In combination with the plates of a secondary cell, two wooden separator-plates applied closely on each side of each positive plate, two or more rubber bands or their equivalent interposed between each negative plate and the adjacent separator, leaving an open space on each side of said negative plate, substantially as described.

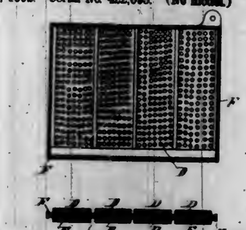
2. A battery-cell composed of alternate positive and negative plates with interposed separator-plates, in combination with a sealing substance or compound in which the lower edges only of said plates are embedded, such substance or compound not adhering to the jar, substantially as set forth.

3. A battery-cell composed of alternate positive and negative plates and interposed separator-plates, in combination with sealing-strips applied to the vertical edges of the several plates along the lower portion thereof, substantially as set forth.

4. The described method of sealing and uniting the several plates and interposed separators of a battery, consisting in erecting such plates and separators in a shallow mass of hot viscous gum and allowing said gum to cool and harden around the base of the plates and separators, and finally applying a strip of similar material to the lower vertical edges of said parts, substantially as set forth.

480,886. BATTERY-PLATE. EDWARD P. USHER, Grafton, and WILLIAM F. DRAPER, Hopedale, Mass., assignors to the Hopedale Electric Company, of West Virginia. Filed Feb. 19, 1892. Serial No. 422,072. (No model.)

Claim.—1. A unit of active material for battery-plates, consisting of a tablet of lead oxide or its equivalent formed of a wrapper of lead-foil and a filling of dry powder, with a conducting-strip embedded therein and protruding therefrom, substantially as set forth.



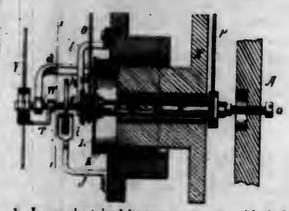
2. A battery-plate consisting of a series of connected tablets A, each composed of a wrapper of lead-foil and a filling of oxide of lead as active material and each having a protruding conducting-strip B, united to a transverse strip or bar G, substantially as set forth.

3. A battery-plate having a series of tablets, each composed of a wrapper of lead-foil and a filling of oxide of lead as active material and each furnished with a protruding conducting-strip B, united to a transverse bar G, such tablets having the transverse binders or spacing-strips H, substantially as set forth.

4. A battery-plate composed of a series of parallel tablets of active material inclosed in a wrapper of perforated lead-foil, with a conducting-strip protruding from each tablet, and a transverse connecting-bar, in combination with wooden separators at each side of the series of tablets and a marginal frame, substantially as set forth.

5. A battery-plate composed of a series of parallel tablets, each composed of a wrapper of lead-foil and a filling of oxide of lead as active material and each having a protruding conducting-strip, said tablets being firmly held with an open space between each tablet and the next one on said plate, substantially as set forth.

480,887. BATTERY-PLATE. EDWARD P. USHER, Grafton, Mass., assignor to the Hopedale Electric Company, of West Virginia. Filed Feb. 19, 1892. Serial No. 422,095. (No model.)



Claim.—1. The battery-plate described, consisting of the marginal frame with open interior spaces and one or more cross-bars, the perforated lead-foil wrapper as distinguished from ordinary sheet-lead adhering to said frame and bars, and the filling of active material within said spaces and inclosed by said perforated foil, the edges of said plate being sealed by an acid-proof gum, substantially as set forth.

2. The method of making battery-plates, which consists in casting a marginal frame with one or more cross-bars joined thereto and with open spaces between said bars and frame, coating one side of said frame

and bars with an adhesive substance and applying a leaf of lead-foil thereto, then filling the open spaces of the frame with a powdered oxide of lead, then applying over the same another leaf of lead-foil similarly caused to adhere to the frame and bars, and then sealing the edges of the plate with an acid-proof gum and perforating such foil, substantially as set forth.

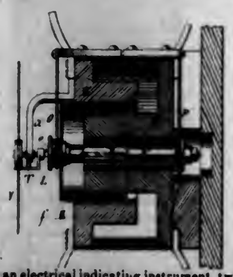
480,888. ELECTRICAL MEASURING-INSTRUMENT. EDWARD WESTON, Newark, N. J. Filed Mar. 11, 1891. Serial No. 384,651. (No model.)

Claim.—1. In an electrical instrument, a movable index-arm, and a body of diamagnetic material in plate or disk form disposed transversely the lines of a field of force and connected to and operating to retard or oppose the oscillatory motion of said index.

2. In an electrical instrument, a movable conductor in coil or loop form, a shaft or arbor free to oscillate and turned by the motion of said conductor, and on said shaft an index-arm and a disk or plate of diamagnetic material disposed in a plane transversely the lines of a field of force, the said disk operating to retard the oscillatory movement of said index-arm.

3. In an electrical instrument, a conductor in coil or loop form bodily movable in an axial direction, and a body of diamagnetic material actuated by said conductor and disposed and moving transversely the lines of a field of force.

4. In an electrical instrument, a movable body, an index, an elastic or resilient transmitting device for conveying motion from said body to said index and disposed in a plane transversely the lines of a field of force, and a body of diamagnetic material connected to and operating to retard or oppose the motion of said index.



5. In an electrical instrument, the combination of the shaft *e*, index-arm V, disk A, of diamagnetic material, on said shaft *e*, and a magnet in the field of force, of which magnet said disk is disposed, substantially as described.

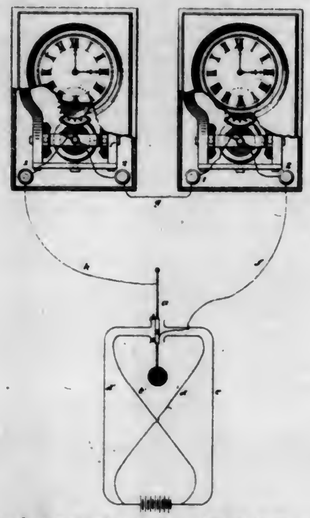
6. In an electrical instrument, the combination of the magnet H F, movable coil K, supported in the field of force of said magnet shaft *e*, vibrated by said coil, index V, and disk A, of diamagnetic material, on said shaft *e*, and pole-pieces *i' i''* of said magnet H F disposed in inductive proximity to opposite sides of said disk A.

7. In an electrical instrument, the vibrating cylinder L, the fixed bracket *l*, and the set-screw *n*, supported by said bracket and constructed to enter a wall of said cylinder.

8. In an electrical instrument, the vibrating cylinder L, support N therefor, fixed bracket *l*, a set-screw *n*, supported by said bracket and bearing upon said cylinder L, and the set-screw *o*, bearing upon said support N, the said screws *n* and *o* operating to clamp and rigidly hold said cylinder.

480,889. APPARATUS FOR RETARDING OR DAMPENING THE MOTION OF MOVING BODIES IN ELECTRICAL INSTRUMENTS. EDWARD WESTON, Newark, N. J. Filed Mar. 11, 1891. Serial No. 384,652. (No model.)

Claim.—1. In an electrical indicating instrument, two conductors, in coil or loop form, mechanically connected and bodily movable in an axial direction in a field of force, one of said conductors being in electrical circuit and the other short-circuited or closed on itself.



2. In an electrical indicating instrument, an annular field of force, two concentric conductors mechanically connected and supported therein and movable in an axial direction, one of said conductors being in electrical circuit and the other short-circuited or closed on itself.

3. In an electrical indicating instrument, an annular field of force, a movable cylinder concentrically disposed therein, and on the periphery of said cylinder two conductors, one of said conductors being in electrical circuit and the other short-circuited or closed on itself.

4. In an electrical indicating instrument, an annular field of force, a movable cylinder concentrically disposed therein, and on the periphery of said cylinder two coils, one superposed on the other, one of said coils being in electrical circuit and the other short-circuited or closed on itself.

5. In an electrical indicating instrument, an annular field of force, a movable support of paper concentrically disposed therein, and on the periphery of said support two conductors, one of said conductors being in electrical circuit and the other short-circuited or closed on itself.

480,890. ELECTRIC TIME-INDICATING APPARATUS. EDWARD WESTON, Newark, N. J. Filed June 4, 1891. Serial No. 395,132. (No model.)

Claim.—1. A means of producing a field of force, a loop-conductor vibrating therein on the passage of a current, and a device actuated by said conductor for showing the number of its vibrations.

2. A means of producing a field of force, a loop-conductor vibrating therein, a means of causing an electric impulse to traverse said conductor at intervals, and an indicating device actuated by said conductor.

3. Transmitting time electrically by causing an electric impulse at predetermined time-intervals to traverse a loop-conductor disposed in a magnetic field, and thereby effecting a series of movements of said conductor and the consequent operation thereby of a time-indicating device.

4. Transmitting time electrically to separated stations by causing from a central station an electric impulse to traverse at predetermined intervals a series of loop-conductors disposed in magnetic fields connected in electrical circuit and located at said separated stations, and thereby effecting a series of simultaneous movements of said conductors and the consequent operation thereby of time-indicating devices.

5. Transmitting time electrically by causing alternately-reversed electric impulses at predetermined intervals to traverse a loop-conductor vibrating or oscillating in a magnetic field, and thereby causing said conductor to vibrate or oscillate in alternately opposite directions, and thus to actuate a time-indicating device.

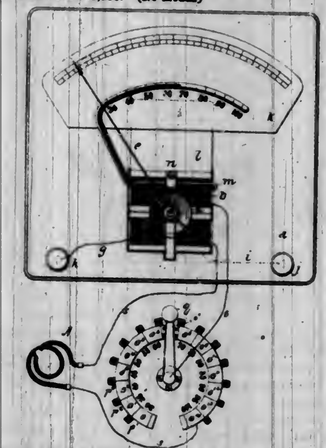
6. A means of producing a field of force, a loop-conductor vibrating therein on the passage of a current, and a time-train actuated by the movement of said conductor.

7. A means of producing a field of force, a loop-conductor vibrating therein, and a time-train intermittently operated by the movement of said conductor due to the passage of a current.

8. A means of producing a field of force, a loop-conductor vibrating therein, a time-train, and a step-by-step transmitting mechanism actuated by said conductor and operating said time-train.

9. A means of producing a field of force, a loop-conductor vibrating therein, a controlling chronometric device for causing an electric impulse to traverse said conductor at definite intervals, and an indicating device controlled by the vibrations of said conductor.

10. At each of a series of separated stations a means of producing a field of force, a loop-conductor vibrating therein, and an indicating device controlled by the vibrations of said conductor, and at a central or transmitting station a chronometric device for causing electrical impulses to pass at definite intervals over a circuit including said loop-conductors.



11. The combination, with a time-train, index, and dial, of a magnet, a coil vibratory in the field of force thereof, and transmitting mechanism between said train and said coil, whereby the motion of said coil is caused to actuate said time-train.

12. The combination, with a time-train, index, and dial, of a magnet, a coil vibratory in the field of force thereof, springs for balancing and adjusting the extent of motion of said coil, and transmitting mechanism between said train and said coil, whereby the motion of said coil is caused to actuate said time-train.

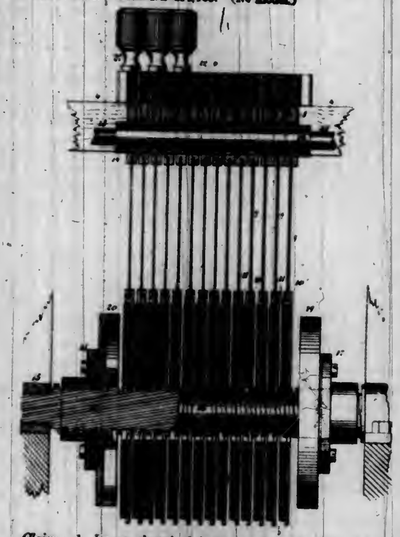
13. The combination, with a time-train, index, and dial, of a magnet, a coil vibratory in the field of force thereof, transmitting mechanism between said train and said coil, whereby the motion of said coil is caused to actuate said time-train, and a chronometric device for establishing alternately-reversed currents in a circuit including said coil.

14. The combination, with a time-train, index, and dial, a magnet A, and coil H, vibrating on an axial pivot in the field of said magnet, of a toothed wheel O, geared with said time-train, and an anchor N on said coil pivot-shaft and engaging with said wheel O.

480,891. TEMPERATURE-REGULATING DEVICE FOR ELECTRICAL CIRCUITS. EDWARD WESTON, Newark, N. J. Filed June 4, 1891. Serial No. 395,135. (No model.)

Claim.—1. In an electrical measuring-instrument, a coil producing a field of force in said instrument and formed of an electrical conductor the resistance of which increases with augmented temperature and connected in series with said coil, a conductor the resistance of which decreases with augmented temperature, the said coil and circuit connections and the said last-named conductor being relatively proportioned and arranged to render their combined resistance substantially constant despite temperature changes.

2. In an electrical measuring-instrument, a coil producing a field of force in said instrument and formed of an electrical conductor the resistance of which increases with augmented temperature, and a strip of carbon connected in series with said coil, the said coil and circuit connections and the said carbon being relatively proportioned and arranged to render their combined resistance constant despite temperature changes.



3. In an electrical measuring-instrument, a metallic coil producing a field of force in said instrument and in series connection therewith, an electrical conductor the resistance of which decreases with augmented temperature, the said conductor being freely exposed to the atmosphere and the said coil and circuit connections and conductor being relatively proportioned and arranged to render their combined resistance constant despite changes in atmospheric temperature.

4. In combination with an electrical measuring-instrument containing in circuit a fixed coil and a movable coil moving in the field of said fixed coil, both of said coils being made of an electrical conductor the resistance of which increases with augmented temperature, an electrical conductor the resistance of which decreases with augmented temperature connected in series with said coils, the said coils and circuit connections and the said last-named conductor being relatively proportioned and arranged to render their combined resistance substantially constant despite temperature changes.

5. In an electrical measuring-instrument, a means of indicating changes in temperature occurring in the instrument-circuit and connected in said circuit, a resistance, and a means of varying the same conformably to the indications of said heat-indicating apparatus, in combination with an electrical conductor interposed in said circuit, the electrical resistance of which conductor decreases with augmented temperature, whereby the resistance of the whole circuit may be maintained constant despite both internal and external temperature variations.

6. In an electrical measuring-instrument, a coil, a means of indicating variations in the temperature of said coil and in circuit with said coil, a variable resistance, and an electrical conductor the resistance of which decreases with augmented temperature.

480,892. RHEOSTAT. EDWARD WESTON, Newark, N. J. Filed Dec. 5, 1891. Serial No. 414,103. (No model.)

Claim.—1. In an electrical instrument and in circuit, two suspended bodies of conducting material in juxtaposition and a means positively acting upon both of said bodies to force them into more or less close contact.

2. In an electrical instrument and in circuit, a body of conducting material having an elastic or resilient support, a movable body of conducting material, and means positively acting upon both of said bodies to force them into more or less close contact against the elastic or resilient resistance of said support.

3. In an electrical instrument and in circuit, two bodies of conducting material in juxtaposition and each provided with an elastic or resilient support and means positively acting upon both of said bodies to force them into more or less close contact against the elastic or resilient resistance of said support.

4. In an electrical instrument and in circuit, two bodies of conducting material, elastic or resilient supports for said bodies, whereby they are held out of contact with one another, and means for positively acting upon both of said bodies to force them into contact against the elastic or resilient resistance of said support.

5. In an electrical instrument and in circuit, a body of high resisting material, a metallic body, elastic or resilient supports for said bodies, and means for positively acting upon both of said bodies to force them into more or less close contact against the elastic or resilient resistance of said supports.

6. In an electrical instrument and in circuit, two bodies of conducting material, elastic or resilient supports for said bodies, whereby they are held out of contact with one another, and screws acting upon both of said bodies to force them into more or less close contact against the elastic or resilient resistance of said supports.

7. In an electrical instrument and in circuit, a body of high resisting material, an elastic or resilient support therefor, an abutment, and a screw operating to force said body of high resisting material against said abutment and in opposition to the elasticity or resiliency of said support.

8. In an electrical instrument and in circuit, two conducting-bodies, one being of high resisting material, elastic or resilient supports for said bodies, and screws acting upon both of said bodies to force them into more or less close contact against the resilient or elastic resistance of said supports.

9. In an electrical instrument and in circuit, two bodies of conducting material, elastic or resilient supports for said bodies, an independently-supported screw passing loosely through said bodies and having reverse threads, and nuts on said screw outside of said bodies, the aforesaid parts being constructed and arranged so that when said screw is rotated said nuts shall force said bodies into more or less close contact against the elastic or resilient resistance of said supports.

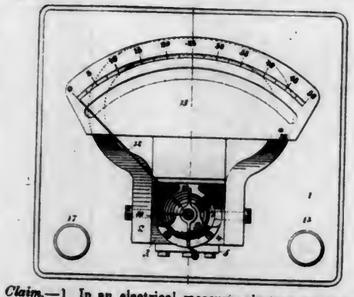
10. In an electrical instrument and in circuit, two conducting-bodies, one being of high resisting material, each of said bodies being disposed at the free end of a leaf-spring, by means of which springs they are normally held out of contact, and means positively acting upon said bodies to force them into contact and to vary their mutual pressure.

11. In an electrical instrument and in circuit, a body of high resisting material, a body of condensing material, each of said bodies being disposed at the free end of a rigidly-held leaf-spring, by means of which spring they are normally held out of contact, an independently-supported screw having reverse threads passing loosely through said bodies, and nuts on said screw outside of said bodies, the aforesaid parts being constructed and arranged so that when said screw is rotated said nuts shall force said bodies into more or less close contact against the elasticity of said springs.

12. The combination, in an electrical instrument and in circuit, of the annular disks 10, the carbon plates 11 thereon, leaf-spring supports 9 for said disks rigidly fastened at their extremities, the independently-supported screw 16, having reverse threads passing through said disks, and nuts 17 18 on said screw outside of said disks and bearing thereon.

13. The combination, in an electrical measuring-instrument and in circuit, of the rigidly-supported arms 6 and 12, blocks 8, carried by said arms, springs 9, carried by said blocks, annular disks 10 11, supported on said springs, independently-supported screw 16, passing through said disks and having reverse threads, and nuts 17 18 on said screw and outside of and bearing upon said disks.

480,893. RHEOSTAT. EDWARD WESTON, Newark, N. J. Filed Dec. 10, 1891. Serial No. 414,569. (No model.)



Claim.—1. The combination of a series of contact-plates and a series of resistances interposed between said plates, a second series of contact-plates and a series of resistances interposed between said plates, two arms of conducting material insulated from one another, and means for moving said arms, respectively, in contact with each of said series, the aforesaid parts being constructed and operating in circuit, so that when one arm cuts out a given resistance of one series the other arm simultaneously puts into circuit an equal resistance of the other series.

2. The combination of two series of contact-plates disposed substantially on the circumference of a circle and opposite to one another, resistances interposed between said contact-plates, and pivoted contact-arms relatively insulated from and disposed diametrically opposite one another.

3. The combination of, first, two series of contact-plates, as c^1 d^1, and interposed resistances, pivoted arms g^1 h^1, relatively insulated from one another and constructed to move over and make contact with said contact-plates c^1 d^1; second, two series of contact-plates, as c^2 d^2, and interposed resistances, pivoted arms g^2 h^2, relatively insulated from one another and constructed to move over and make contact with said contact-plates c^2 d^2, and circuit connections whereby circuit may be established through either of said series of contact-plates, substantially as described.

4. The combination of the several series of contact-plates c^1 c^2 d^1 d^2 and interposed resistances, the pivoted arms g^1 h^1, constructed to move over and make contact with the plates c^1 d^1, the pivoted arms g^2 h^2, constructed to move over and make contact with the plates c^2 d^2, circuit connections, and means for breaking or establishing circuit through either pair of arms g^1 h^1 or g^2 h^2 and their associated contact-plates and resistances, substantially as described.

480,894. ELECTRICAL MEASURING-INSTRUMENT. EDWARD WESTON, Newark, N. J. Filed Jan. 8, 1892. Serial No. 417,415. (No model.)

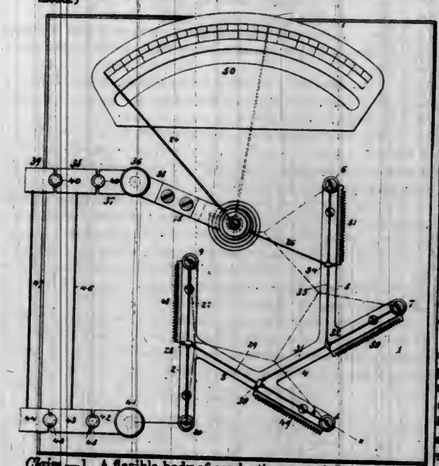
Claim.—1. In an electrical measuring-instrument, in which for equally-applied force increment an index or pointer normally moves over equal scale-divisions, and a means of opposing a gradually-decreasing mechanical resistance to the forward movement of said index, and thereby allowing said index to move over gradually-increasing scale-divisions.

2. In an electrical measuring-instrument, a vibrating or rotating coil, a scale, an index or pointer actuated by said coil to move over said scale, and a means of opposing a gradually-decreasing mechanical resistance to the forward movement of said index.

3. In an electrical measuring-instrument, a vertically-disposed scale, a pivoted index or pointer moving over said scale, and an arm or lever rigidly connected to said index and extending at an angle thereto, the said arm and index being constructed and arranged so that said arm shall tend to assume a more nearly vertical position as said pointer moves forward over the scale.

4. In an electrical measuring-instrument, a vibrating or rotating coil, a vertically-disposed scale, a pivoted index or pointer actuated by said coil to move over said scale, and an arm or lever rigidly connected to said index and extending at an angle thereto, the said arm and index being constructed and arranged so that said arm shall tend to assume a more nearly vertical position as said pointer moves forward over the scale.

5. In an electrical measuring-instrument, a pivoted coil, a vertically-disposed scale, an index or pointer on said coil-pivot and moving over said scale, and an arm or lever rigidly connected to said coil-pivot and extending at an angle to said index, the said arm and index being constructed and arranged so that said arm shall tend to assume a more nearly vertical position as said pointer moves forward over the scale.



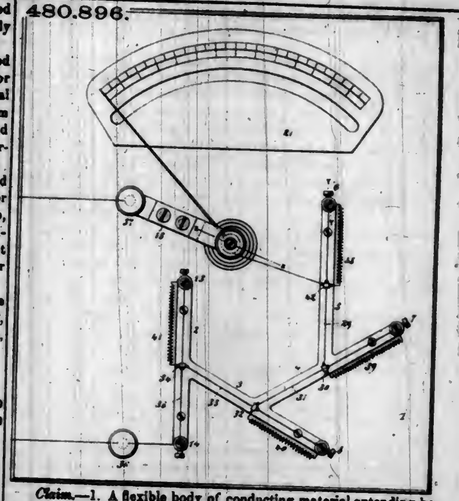
6. In an electrical measuring-instrument, a vibrating or rotating coil, a spring uniformly opposing the motion of said coil, a vertically-disposed scale, an index or pointer actuated by said coil to move over said scale, and an arm or lever rigidly connected to said index and extending at an angle thereto, the said arm and index being constructed and arranged so that said arm shall tend to assume a more nearly vertical position as said pointer moves forward over the scale.

7. In an electrical measuring-instrument, a vertically-disposed scale, a pivoted index or pointer moving over said scale, an arm or lever rigidly connected to said index and extending in a horizontal direction, and a stop whereon said arm normally rests, the said arm and index being constructed and arranged so that said arm shall tend to assume a more nearly vertical position as said pointer moves forward over the scale.

8. In an electrical measuring-instrument, a vertically-disposed scale, a pivoted index or pointer moving over said scale, an arm or lever rigidly connected to said index and extending at an angle thereto, and a stop for preventing said arm being carried past a vertical position, the said arm and index being constructed and arranged so that said arm shall become more nearly vertical as said pointer moves over the scale.

9. In an electrical measuring-instrument, the combination of the magnet 2, pivoted coil 7 in the field of said magnet, scale 13, index 12, and arm 19, extending at an angle to one another from said coil-pivot, and stops 21 22, limiting the movement of said index.

480,895. ELECTRICAL MEASURING-INSTRUMENT. EDWARD WESTON, Newark, N. J. Filed Jan. 14, 1892. Serial No. 418,099. (No model.)



Claim.—1. A flexible body of conducting material extending between abutments and in electrical main circuit, a means of applying strain at an angle to said body at a point thereon between said abutments, and an index or pointer and scale, the said index being controlled by the displacement of said point, due to said strain when said body is traversed by an electric current, in combination with a shunt between the terminals of said main circuit.

2. A flexible body of conducting material extending between abutments and in electrical main circuit, a means of applying strain at an angle to said body at a point thereon between said abutments, and an index or pointer and scale, the said index being controlled by the displacement of said point, due to said strain when said body is traversed by an electric current, in combination with a variable shunt between the terminals of said main circuit.

3. A strip or band of conducting material extending between abutments, a means of applying strain at an angle to said body at a point thereon between said abutments, and an index or pointer and a scale, the said index being controlled by the displacement of said point, due to said strain when said body is traversed by an electric current, in combination with a variable resistance in multiple-arc connection with said strip or band.

4. In an electrical measuring-instrument containing a series of flexible conductors in circuit and connected one to the other, substantially as herein described, a series of plates, as 37 38 39 and 42 43 44, connecting with the circuit-terminals, conductors, as 46 and 47, extending between plates, as 38 and 43 and 39 and 44, and plugs, as 40 and 45, for establishing electrical connection between said plates.

480,896. ELECTRICAL MEASURING-INSTRUMENT. EDWARD WESTON, Newark, N. J. Filed Jan. 14, 1892. Serial No. 418,100. (No model.)

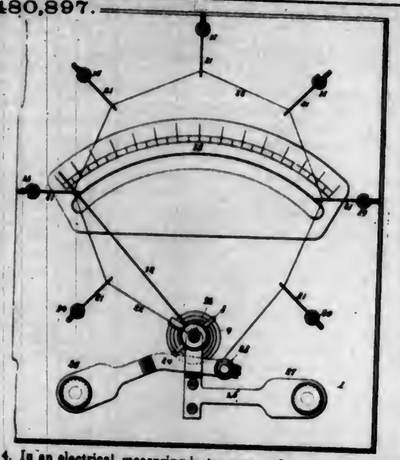
Claim.—1. A flexible body of conducting material extending between abutments, a second flexible body connected to a point on said first body and to an abutment and disposed at an angle to said first body, a means of applying strain at an angle to said second body to a point thereon between its abutment and its place of connection to said first body, and an indicating device showing the displacement of said point on said second body due to said strain when said first body is subjected to the action of electricity.

2. A flexible body of conducting material extending between abutments, a second flexible body of conducting material connected to a point on said first body and to an abutment and disposed at an angle to said first body, a means of applying strain at an angle to said second body to a point thereon between its abutment and its place of connection to said first body, and an indicating device showing the displacement of said point on said second body due to said strain when both of said bodies are subjected to the action of electricity.

3. A flexible body of conducting material extending between abutments, a second flexible body of conducting material connected to a point on said first body and to an abutment and disposed at an angle to said first body, the said bodies being in electrical circuit, a means of applying strain at an angle to said second body to a point thereon between its abutment and its place of connection to said first body, and an indicating device showing the displacement of said point on said second body due to said strain when said bodies are traversed by an electric current.

4. A flexible body of conducting material extending between abutments, a means of applying strain at an angle to said body to a point thereon between said abutments, a means of electrically moving one of said abutments, and an indicating device showing the displacement of said point due to said strain when the distance between said abutments is varied.

5. The combination, in an electrical measuring-instrument, of a wire filament or strip, as 35, extended between abutments, a support upon said wire and insulated therefrom, an extensible conductor 41, extended from one end of said filament to said support, and a circuit-conductor connected to said extensible conductor 41.



480,897. ELECTRICAL MEASURING-INSTRUMENT. EDWARD WESTON, Newark, N. J. Filed Jan. 14, 1892. Serial No. 418,101. (No model.)

Claim.—1. In an electrical measuring-instrument, a flexible expansible body in open-loop form extending between abutments and two or more flexible and practically frictionless supports sustaining said body, the said supports permitting of the longitudinal movement of said body due to variations in the length thereof.

2. In an electrical measuring-instrument, a flexible expansible body in open-loop form extending between abutments, one of said abutments being fixed and the other adjustable, and two or more flexible and practically frictionless supports sustaining said body, the said supports permitting of the longitudinal movement of said body due to variations in the length thereof.

3. In an electrical measuring-instrument operated by the expansion or contraction of an elongated conducting-body in circuit and extending between abutments, a spring-arm supporting said body at its free extremity.

480,897.

4. In an electrical measuring-instrument, a fine wire or filament in open-loop form and in circuit and having its extremities connected to abutments and two or more elastic frictionless supports vibrating in substantially the same plane as and sustaining said loop.

5. In an electrical measuring-instrument, two or more spring-arms extending from fixed supports and capable of vibrating in substantially the same plane and a fine wire or filament of conducting material received by the free ends of said springs and connected at its extremities to abutments.

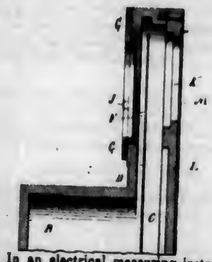
6. In an electrical measuring-instrument, a flexible expansible body in substantially circular form and extending between abutments and a series of radially-projecting, flexible, and practically frictionless supports sustaining said body, the said supports permitting of the longitudinal movement of said body due to the variation in the length thereof.

7. In an electrical measuring-instrument, a shaft, a means for rotating said shaft, a fine filament or wire in loop form connected at one end to said shaft and at the other end to an abutment, and an elastic support for said loop yielding to the expansion of said wire.

8. In an electrical measuring-instrument, a shaft, an index or pointer on said shaft, a scale over which said index moves, a means for rotating said shaft, a fine filament or wire in loop form connected at one end to said shaft and at the other end to an abutment, and an elastic support for said loop yielding to the expansion of said wire.

9. In an electrical measuring-instrument, a shaft, a spring connected to said shaft and to an abutment and normally tending to rotate said shaft, a fine filament or wire in loop form connected at one end to said shaft and at the other end to an abutment, and an elastic support for said loop yielding to the expansion of said wire.

10. In an electrical measuring-instrument, a shaft, a spring connected to said shaft and to an abutment and normally tending to rotate said shaft, a fine filament or wire in loop form connected at one end to said shaft and at the other end to an abutment, an elastic support for said loop yielding to the expansion of said wire, and circuit connections whereby said spring and said filament are connected in circuit.



11. In an electrical measuring-instrument, a shaft, supports of insulating material in which said shaft is pivoted, an adjustable coiled spring of conducting material connected at one end to said shaft and at the other end to an abutment and normally tending to rotate said shaft, a fine filament or wire in loop form connected at one end to said shaft and at the other end to an abutment, an elastic support for said loop yielding to the expansion of said wire, and circuit connections whereby said spring and said filament are connected in circuit.

12. In an electrical measuring-instrument, a series of fixed supports disposed around the circumference of a circle, a spring-arm carried by each of said supports and extending in the direction of a radius of said circumference toward the center thereof, a shaft, a means for rotating said shaft, and a fine filament or wire connected to said shaft and to an abutment and supported by said springs.

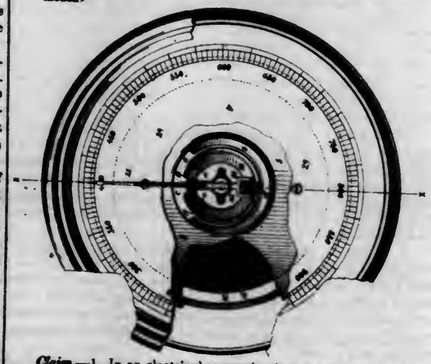
13. In an electrical measuring-instrument, the combination of the base 1, bracket 2, shaft 10, supported by said bracket, spring 9, connected at one end to said shaft and at the other end to an abutment and normally tending to rotate said shaft, the fine filament or wire 22, connected at one end to said shaft and at the other end to an abutment 23 and in loop form, and a series of spring-supports 21, arranged upon said base and receiving the loop of said wire.

14. In an electrical measuring-instrument, the combination of the base 1, fixed supports 15 16, &c., disposed thereon, leaf-springs 21, carried by said supports, bracket 2, shaft 10, supported by said bracket, spring 9, connected at one end to said shaft, adjusting-arm 8, to which the other end of said spring is fastened, a fixed abutment 23, and a fine filament or wire 22, connected at its extremities to said shaft and said abutment and supported by said leaf-springs 21.

480,898. ELECTRICAL MEASURING-INSTRUMENT. EDWARD WESTON, Newark, N. J. Filed Feb. 17, 1892. Serial No. 421,900. (No model.)

Claim.—1. In an electrical measuring-instrument, an inclosing case having a portion of one of its walls detachable and a scale upon said portion.

2. In an electrical measuring-instrument, an inclosing case having an opening in one of its walls, a plate constructed to fit in said opening, and a scale upon said plate.



3. In an electrical measuring-instrument, an inclosing case having an opening in one of its walls, a plate constructed to be received in said opening, a scale upon said plate, and guides whereby said plate may be adjusted in definite position in said opening.

4. In an electrical measuring-instrument, an inclosing case A, having an opening E in one of its walls, a flanged plate, as F, constructed to be received in said opening, and a scale upon said plate.

5. In an electrical measuring-instrument, an inclosing case A, having an opening E in one of its walls, a plate F, constructed to be received in said opening, a scale upon said plate, and fixed pins J on said wall entering apertures in said plate.

6. In an electrical measuring-instrument, an inclosing case having an opening in one of its walls, a flanged frame constructed to be received in said opening, and a plate of translucent material supported in said frame and inscribed with a scale-marking.

480,899. ELECTRICAL MEASURING-INSTRUMENT. EDWARD WESTON, Newark, N. J. Filed Feb. 19, 1892. Serial No. 422,062. (No model.)

Claim.—1. In an electrical measuring-instrument, a magnet having concentric poles, the inner pole being substantially tubular or ring-shaped, and the outer pole curved around the periphery of the inner pole, and a movable coil extending through said inner pole and through the space between said poles.

2. In an electrical measuring-instrument, a magnet having concentric poles, the inner pole being substantially tubular or ring-shaped and the outer pole curved around the periphery of the inner pole, a shaft or arbor supported within said inner pole, and a coil carried by said shaft and extending through the space between said poles.

3. In an electrical measuring-instrument, a magnet having concentric poles, the inner pole being substantially tubular or ring-shaped and the outer pole curved around the periphery of the inner pole, a movable coil extending through said inner pole and through the space between said poles, and an index or pointer carried by said coil.

4. In an electrical measuring-instrument, a magnet having concentric poles, the inner pole being substantially tubular and the outer pole curved around the periphery of the inner pole, bearings secured within said tubular pole, a shaft or arbor journaled in said bearings, and a coil carried by said shaft and extending through the space between said poles.

5. In an electrical measuring-instrument, a magnet having concentric poles, the inner pole being substantially tubular and the outer pole curved around the periphery of the inner pole, bearings secured within said tubular pole, a shaft journaled in said bearings, a coil carried by said shaft and extending through the space between said poles, a fixed scale, and an index or pointer carried by said coil and extending over said scale.

6. In an electrical measuring-instrument, a magnet having concentric poles, the inner pole being substantially tubular or ring-shaped, and the outer pole curved around the periphery of the inner pole, a movable coil extending through said inner pole and through the space between said poles, and a spring opposing the movement of said coil.

7. In an electrical measuring-instrument, a movable coil, a magnet, and a detachable curved pole-piece for said magnet, upon which pole-piece said coil is received and freely moves.

8. In an electrical measuring-instrument, a movable coil, a magnet, and a detachable curved pole-piece, the extremities of said pole-piece being separated for a space sufficient to allow said coil to pass upon the body of said pole-piece.

9. In an electrical measuring-instrument, a movable coil, a magnet having a fixed projecting pole-piece, and a detachable curved pole-piece, upon which said movable coil is received, the said fixed pole-piece entering and closing the opening between the extremities of said curved pole-piece.

10. The combination, with the curved extremity 15, of a magnet pole-piece, and the cylinder 16, having a longitudinal slot or opening receiving said extremity 15.

11. The combination, with the curved extremity 15, of a magnet pole-piece, the cylinder 16, having a longitudinal slot or opening receiving said extremity 15, and the exterior slotted cylinder 17, surrounding said extremity 15 and cylinder 16.

12. In an electrical measuring-instrument, a magnet having a curved pole-piece 15, the cylinder 16, having a longitudinal slot or opening receiving said pole-piece, and a coil 27, received and movable around said cylinder 16.

13. In an electrical measuring-instrument, a magnet having a curved pole-piece 15, the cylinder 16, having a longitudinal slot or opening receiving said pole-piece, the inclosing slotted cylinder 17, and a coil 27, received and movable upon said cylinders 16 and 17.

480,900. ADAPTER OR PLUG FOR INCANDESCENT-LAMP CIRCUITS. EDWARD WESTON, Newark, N. J. Filed Mar. 21, 1892. Serial No. 425,706. (No model.)

Claim.—1. An adapter constructed detachably to engage with the fixed or stationary portion of an electric-lamp socket and provided with two circuit-conductors having their inner extremities disposed to make electrical connection with the circuit-terminals in said stationary socket, in combination with a plug or holding device also provided with circuit-terminals and constructed to engage detachably with said adapter, so that the terminals in said holding device shall make electrical contact with the conductors in said adapter.

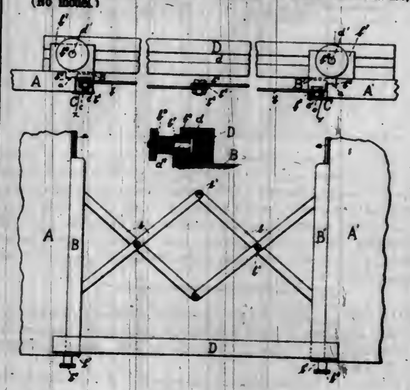
2. An adapter constructed detachably to engage the stationary or fixed portion of an electric-lamp socket and provided with two circuit-conductors having their inner extremities disposed to make electrical connection with circuit-terminals in said stationary socket and their outer extremities arranged in an opening or recess, in combination with a plug or holding device provided with circuit-terminals and adapted to enter said recess, the circuit-terminals on said plug then making electric contact with the circuit-terminals in said recess.

3. An adapter constructed detachably to engage the stationary or fixed portion of an electric-lamp socket and provided with two circuit-conductors having their inner extremities disposed to make electrical connection with the circuit-terminals in said socket and their outer extremities in the form of springs placed in proximity one to the other, in combination with a plug or holding device provided with circuit-terminals and adapted to enter between said springs, the circuit-terminals on said plug then making electrical contact with said springs.

4. An adapter constructed detachably to engage the stationary or fixed portion of an electric-lamp socket and provided with two circuit-conductors having their inner extremities disposed to make electrical connection with the circuit-terminals in said stationary socket and their outer extremities, in the form of leaf-springs, placed in proximity one to the other, in combination with a plug or holding device provided with circuit-terminals and adapted to enter between said springs, the circuit-terminals on said plug then making electrical contact with said springs, in combination with a means of detachably connecting said plug and said springs.

5. As a new article of manufacture, an adapter of insulating material containing two circuit-conductors with exposed terminals, one pair of said terminals being disposed in a recess in said adapter, and a plug of insulating material carrying exposed circuit-terminals and adapted to enter said recess.

6. As a new article of manufacture, the adapter A, of insulating material, having a recess B and containing two circuit-conductors having terminals C D arranged in said recess B, in combination with the plug F, having the fixed circuit-terminals G H and adapted to enter said recess B.



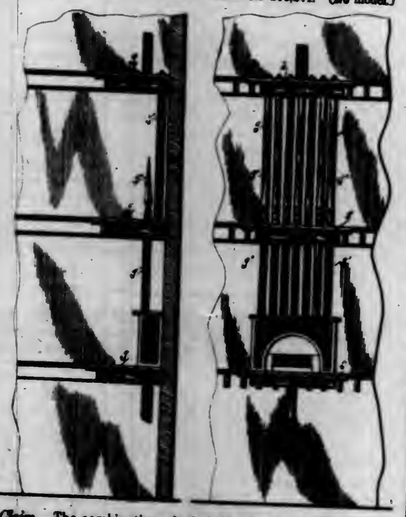
7. As a new article of manufacture, the adapter A, of insulating material, having the recess B and containing two circuit-conductors having the terminals C D in said recess B and provided with projecting ribs or corrugations *o p*, in combination with the plug F, of insulating material, adapted to enter said recess B, and provided with circuit-terminals G H, having the indentations *m n*, adapted to receive said corrugations or projections *o p*.

480,901. FIFTH-WHEEL. PETER ANDERSEN, Fort Wayne, Ind., assignor to Henry G. Olds, same place. Filed Dec. 4, 1891. Serial No. 413,992. (No model.)

Claim.—In a fifth-wheel, the combination, with separate bearing-plates, one on the upper surface of the bolster and the other on the lower surface of the axle and formed with an annular flange to fit a corresponding groove in the lower bearing-plate and provided with oil-openings and clips to bind said parts together, of corresponding bearing-plates having bracket-arms integral therewith, bolts to secure the same rigidly to the reach, clips or equivalent devices to secure the upper of said plates to the vehicle-body, and bolts, one in front and the other in the rear of said axle, connecting said plates together, whereby free rotation of the axle may be obtained without the use of a king-bolt, substantially as shown and described.

480,902. FENCE FOR WOOD-WORKING MACHINES. GEORGE W. BOOBER, Delhi, and FREDERICK DANNER, Home City, assignor to the Egan Company, Cincinnati, Ohio. Filed Mar. 26, 1892. Serial No. 426,496. (No model.)

Claim.—1. In a fence for wood-working machines, the combination of a pair of independent slides, a series of pivotally-connected bars, a pivotal and a sliding connection between the bars at each end of the series and one of the slides, a cross-tie between the slides, and a hand-nut or similar means for clamping the cross-tie and the slides together, substantially as and for the purpose specified.



2. In a fence for wood-working machines, the combination of a pair of slides, a pair of supports for the slides, adjustable to vary the distance between them, with grooves and projections between the slides and supports, arranged to carry the slides with the supports in their adjustment, a series of pivotally-connected bars, a pivotal and a sliding connection between the bars at each end of the series and one of the slides, and a cross-tie between the slides, substantially as and for the purpose specified.

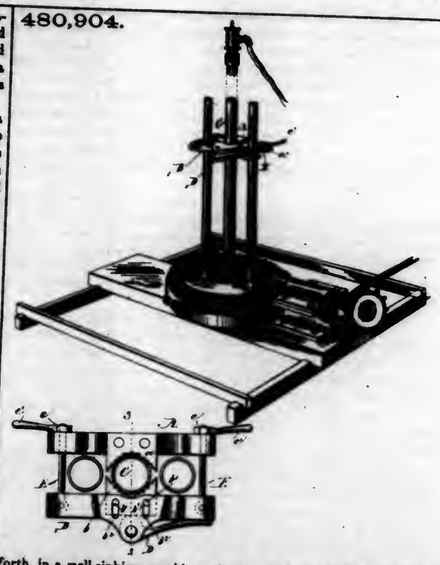
3. The combination of the supports A A', adjustable to vary the distance between them, the slides B B', grooves and projections between the slides and supports, the bars *b*, a pivotal and a sliding connection between the bars *b* and each of the slides, the lugs *x x*, taking under the supports, and the cross-tie D, substantially as and for the purpose specified.

4. The combination of the slides B B', the bars *b*, pivotally connected, as described, a pivotal and a sliding connection between the bars *b* and the slides B B', the ears b^1 on each of the slides B B', the apertures b^2, the cross-tie D, adapted to span the distance between the slides, the groove *d* in the cross-tie, the bolts *d'*, taking into the groove and through the apertures, and the hand-nuts b^3, combined and arranged to permit an adjustment of the distance between the slides and secure the latter in their new relation, substantially as and for the purpose specified.

5. In a fence for wood-working machines, the combination of a pair of slides, grooves therein, buttons in the grooves, a series of pivotally-connected bars, a connection between one bar at each end of the series and one of the slides, a connection between the other bar at each end of the series and one of the buttons, and a projection for the material to be fed to the machine, substantially as and for the purpose specified.

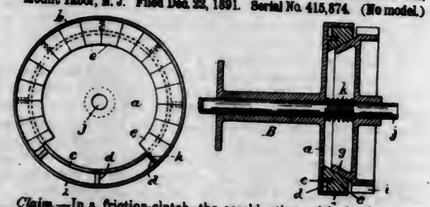
480,903. SYSTEM OF HEATING. DAVID H. BURRELL, Little Falls, N. Y. Filed Mar. 5, 1888. Serial No. 266,271. (No model.)

Claim.—The combination of a building having rooms one above the other, a heater, a pipe for conducting the products of combustion from said heater, a heating-chamber connected to said pipe and supported between said rooms and above the ceiling of the lower room, an outlet-pipe leading from said chamber and out of line with said former pipe, and a radiating-cap removably secured to said chamber above and in line with said former pipe, substantially as and for the purpose specified.



480,904. WELL-SINKING MACHINE. THOMAS G. CHAPMAN, Chicago, and JAMES W. HUNT, Sandwich, Ill., assignors, by mesne assignments, to Anna B. Austin. Filed Oct. 21, 1889. Serial No. 327,662. (No model.)

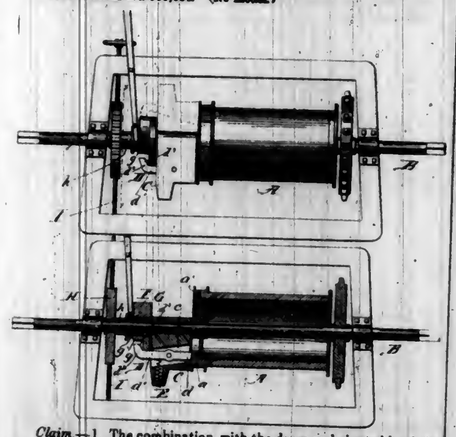
Claim.—1. The combination, substantially as hereinbefore set forth, in a well sinking machine, of a pair of standards F, arranged to rise from a rotary support, and a vertically-movable clamp arranged to slide upon but revolve with the standards and constructed with a pair of oppositely-arranged jaw-holders connected together so as to provide between them a space in which the standards are received, said jaws positioned upon said jaw-holders so as to grip the well-tube or drill-holder at a point between the standards, one of said jaws being adjustable upon its allotted holder, so that the well-tube can be clamped tightly between the jaws without clamping the jaw-holders upon the standards.



2. The combination, substantially as hereinbefore set forth, of the jaw-holders connected together and adapted to provide between them a space for the herein-described standards in a well-sinking machine, a divided jaw *a a*, rigidly secured to one of said holders, and a jaw *b*, adjustable upon the remaining one of said holders and arranged opposite the space between the divisions of the other jaw.

3. The combination, substantially as hereinbefore set forth, of jaw-holders A and B, respectively provided with fixed and movable jaws and connected together to form a clamp having at opposite sides of its jaws suitable space for the herein-described standards in a well-sinking machine, and a cam-lever D for adjusting the movable jaw.

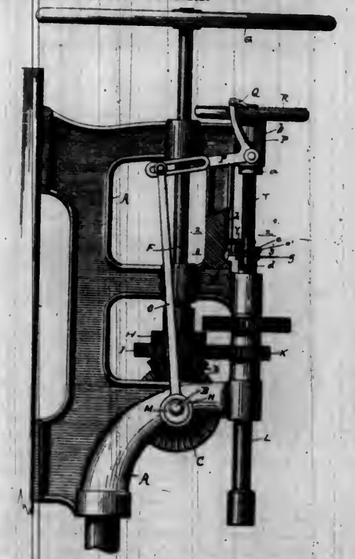
4. The combination, in a well-sinking machine, of a pair of standards F, arranged to rise from a rotary support, and a vertically-movable clamp arranged to slide upon but revolve with the standards and constructed with a pair of oppositely-arranged jaw-holders provided with jaws adapted to grip and hold the well-tube or drill-holder at a point between the standards, rods E, hinged to one jaw-holder and arranged to engage in notches *d'* in the ends of the opposite jaw-holder, and nuts *e*, applied to the free ends of the rods so as to engage said last-specified jaw-holder, substantially as described.



480,905. FRICTIONAL HOISTING-WHEEL. ALBERT J. DAVIS, Mount Tabor, N. J. Filed Dec. 22, 1891. Serial No. 415,574. (No model.)

Claim.—In a friction-clutch, the combination, with the flange *a*, having the rim *b* and the ring *c*, connected with the rim by ribs *d*, of the blocks *e*, provided with notches *f* to fit the ring *c* and fitted between the ribs *d*, as set forth, and the metallic cone *g*, fitted within the blocks, as and for the purpose set forth.

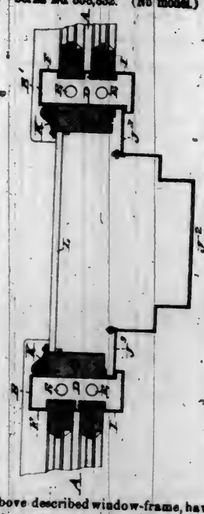
480,906. WELL-DRILLING MACHINE. JOHN GARDNER, Bloomingdale, assignor to Frederick G. Austin, Chicago, Ill. Filed July 17, 1891. Serial No. 399,881. (No model.)



Claim.—1. The combination, with the drum and pivoted latch for engaging and releasing the same and cam for operating the latch, of the adjustable dog, adapted and arranged for engaging and holding the pivoted latch out of position for engaging the cam and the drum, substantially as described.

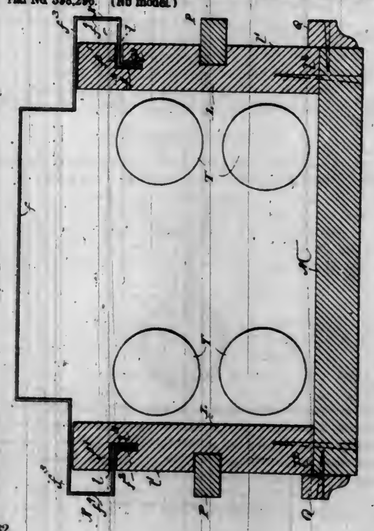
2. The combination, with the drum, of the pivoted latch provided with an incline, and the adjustable annular dog G for engaging said incline on the latch, for the purpose set forth.

3. The combination, with the drum and latch for engaging and releasing the same, of the cam F and dog G, for the purpose set forth, arranged upon a hub or sleeve which is applied to slide along a bearing formed by the hollow journal A of a worm-gear, substantially as described.



480,907. DRILLING-MACHINE. JAMES KINDRED, Worcester, Mass., assignor to Boynton & Plummer, same place. Filed Feb. 27, 1892. Serial No. 422,962. (No model.)

Claim.—1. In a drilling-machine, the combination of the framing, the drill-spindle mounted therein, and means for revolving the same, of a feeding mechanism consisting of a nut, means for turning the nut, and a screw loosely connected to the spindle, said screw having a projection adapted to engage the framing, and thereby keep the feeding-screw from turning, said framing being cut away, so that the said projection will be free from the framing as the spindle reaches the limit of its downward travel, substantially as described.

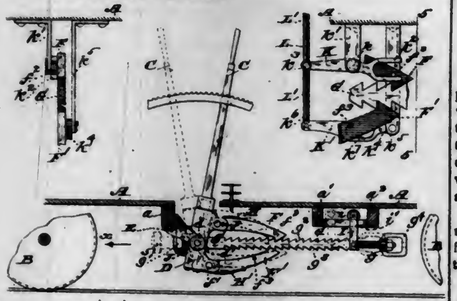


2. In a drilling-machine, the combination of the framing, the drill-spindle, and means for revolving the same, of a feeding mechanism consisting of a nut, means for revolving the same, and a screw connected to the spindle, and means for holding said screw from turning until the drill-spindle reaches the limits of its downward movement, consisting of the screw or pin Y, passing through the feed-screw, and a slot, as *k*, formed in the framing, but cut away, as at *k*, so that the feeding mechanism will be automatically rendered inoperative as the drill-spindle reaches the limits of its downward movement, substantially as described.

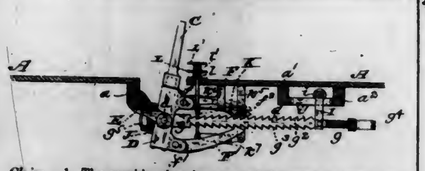
480,908. WINDOW-FRAME. FRANK MEEKER and THOMAS O. ARBOGUST, St. Louis, Mo., assignors to Meeker & Bro., same place. Filed July 15, 1890. Serial No. 358,632. (No model.)

Claim.—The above described window-frame, having formed therewith the parting strips and stops and having connected thereto a sub-column-forming sheet and the latter connected to a column-forming sheet, substantially as set forth.

480,909. BUILDING-FRONT. CHARLES T. RICHARDS, St. Louis, Mo., assignor to Meeker & Bro., same place. Filed July 2, 1891. Serial No. 398,296. (No model.)



Claim.—1. A building-front comprising a metal facing, in combination with the stiles, said metal facing having its inner side edges slipped upon and interlocking with right-angled slots in the stiles, substantially as set forth.



2. A building-front having a metal facing, in combination with the stiles, said facing being extended laterally to form the sash-stops and having its inner side edges slipped upon and interlocking with right-angled slots in the stiles, substantially as specified.

3. A building-front having a metal facing, in combination with the wooden box-frames, said metal facing forming columns and sub-columns and interlocked with right-angled slots in the stiles formed by the sides of said frames, substantially as specified.

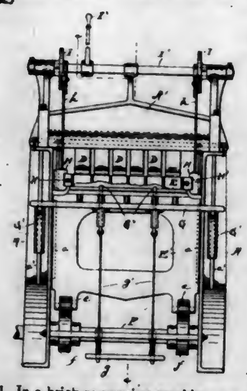
4. A building-front having a metal facing, in combination with the stiles having right-angled slots in their sides, said facing having its inner side edges provided with right-angled flanges to engage and interlock with said slots as said facing is slipped vertically upon said stiles, substantially as set forth.

480,910. CAR-BRAKE. JAMES H. TONE, St. Louis, Mo., assignor of seven-fifteenths to John F. De Lassus, same place. Filed Dec. 26, 1891. Serial No. 416,205. (No model.)

Claim.—1. The combination, in a car, of the ratchet-bar, the two pawls, the pivoted pawl-block, the pedals, and the levers connecting said pedals and pawls, substantially as described.

2. The combination of the car, the double ratchet, the pawls, the pivoted pawl-block, and the brake-lever, said ratchet-bar being upheld at or toward both ends thereof, substantially as described.

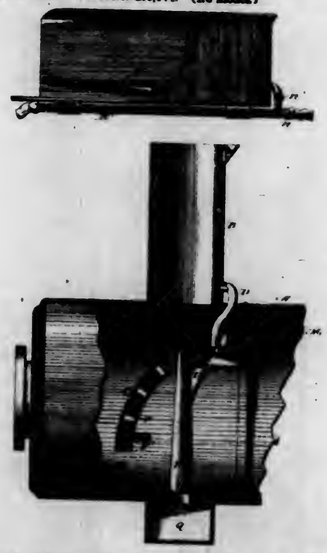
3. The combination of the car, the ratchet-bar, the pawl F, the tilting pawl-block, and the pedal L, substantially as described.



4. The combination of the car, the ratchet-bar, the pawl-block, and the buffer, said ratchet-bar having the shoulder, substantially as described.

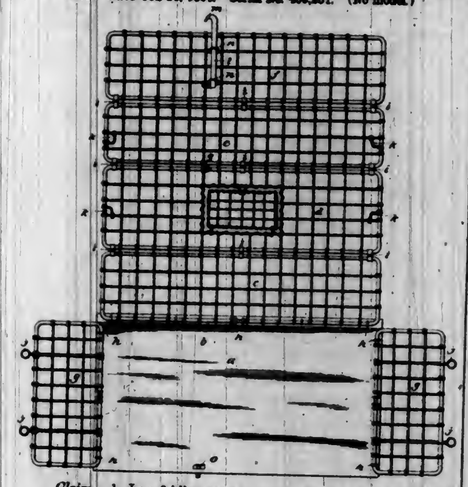
480,911. SURGICAL APPLIANCE. JOSEPH A. VANCE, Plymouth, Ohio. Filed Jan. 15, 1892. Serial No. 418,144. (No model.)

Claim.—The within-described safeguard for receiving and retaining venereal discharges, consisting of the semispherical cap, the spherical receptacle made in two parts connected together by means of screw-threads at their edges, and the tube connecting said cap and receptacle, substantially as set forth.



480,912. MACHINE FOR RE-PRESSING BRICKS. WILLIAM W. WALLACE and RAYMOND C. PENFIELD, Willoughby, Ohio, assignors to J. W. Penfield & Son, same place. Filed Aug. 22, 1891. Serial No. 403,470 (No model.)

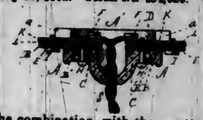
Claim.—1. In a brick-re-pressing machine, a series of stationary plungers, an opposing moving table adapted to receive the mold filled with brick and the bottom board or pallet thereof as they come from the brick-machine, spring-actuated stops, and a treadle for depressing the stops against the action of the springs, combined with a stripping device, substantially as indicated, for stripping the mold from the brick while the latter remain upon the bottom board or pallet, substantially as set forth.



2. In a brick-re-pressing machine, a series of stationary plungers, and an opposing movable table, spring-actuated stops, and a treadle for depressing the stops against the action of their springs, substantially as set forth.

480,913. WATER-HEATER. ROBERT F. WALSH, Peoria, Ill. Filed Feb. 10, 1892. Serial No. 420,971. (No model.)

Claim.—The water-box C, located in front of the boiler-flues, a jacketed smoke-stack over said box, and a pipe connecting the box and jacketed smoke-stack, in combination with the pipe E, leading from the smoke-stack to the tender, and the pipes E' E², leading to the tender and train for the circulation of the heated water, and the coil G within the tender, and the cocks *n n'*, by which the water is cut off from the train and made to circulate through the coil, substantially as described, and for the purpose set forth.



480,914. FOLDING COOP OR CRATE. GEORGE BENDER, Keokuk, Iowa. Filed Oct. 30, 1891. Serial No. 409,951. (No model.)

Claim.—1. In a folding coop or crate, the base *a*, provided with a raised portion *b* of the same vertical height as the thickness of the folded ends *g*, in combination with the sides, ends, and cover, the ends having rings or loops *j*, and the cover openings *k*, substantially as described, and for the purpose specified.

2. In a folding coop or crate, the top frames provided with openings *k k* and the front frame having the hook *m*, in combination with the end frames provided with loops *j j* and the base having the opening *o* to register with said hook, and a latch for securing the same, substantially as described, and for the purpose specified.

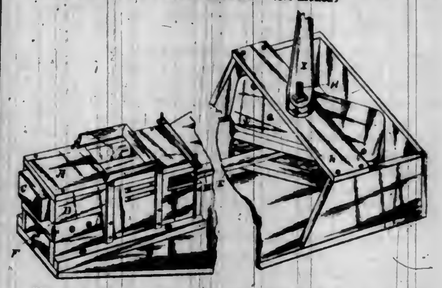
480,915. ROSETTE FOR ELECTRIC LIGHTING. ELISHA W. BUFFINGTON, Fall River, Mass., assignor of one-half to Albert F. Dow, same place. Filed May 27, 1892. Serial No. 434,629. (No model.)

Claim.—1. The combination, with the rosette provided with the grooves or passages *a*, of the two plates or jaws B K, the plate B lying on the bottom of the groove and the plate K lying next above the plate B and rocking on a fulcrum, as B', intermediate with said plates, the outer ends of said plates being adapted to be moved toward and from each other by suitable screws, whereby an electric wire may be grasped and firmly held between them, substantially as described.

2. The combination, with the rosette provided with the grooves or passages *a*, of the two plates or jaws B K, the plate B lying on the bottom of the groove and the plate K lying next above the plate B and rocking on a fulcrum, as B', intermediate with said plates, the outer ends of said plates being grooved at B" and adapted to be moved toward and from each other by suitable screws, whereby an electric wire may be grasped and firmly held between them, substantially as set forth.

3. The combination, with the rosette provided with the grooves or passages *a*, of the plate B, lying on the bottom of the groove and provided with the perforations C D E and protuberances B', and the plate K, resting on said plate B and provided with screw-threaded holes to receive the binding-screw F and adjusting-screws H I, said plates being grooved at B" to receive the electric-light wire, substantially as described.

480,916. RAZOR. FREDERICK A. CLAUSSEN, Jersey City, N. J. Filed Jan. 13, 1892. Serial No. 417,972. (No model.)



Claim.—1. In a razor, the blade and its handle, combined with metallic shields shaped to conform to the sides of the handle and rivets for uniting the blade and handle, passed transversely through and having their ends anchored in said shields, substantially as described.

480,916.

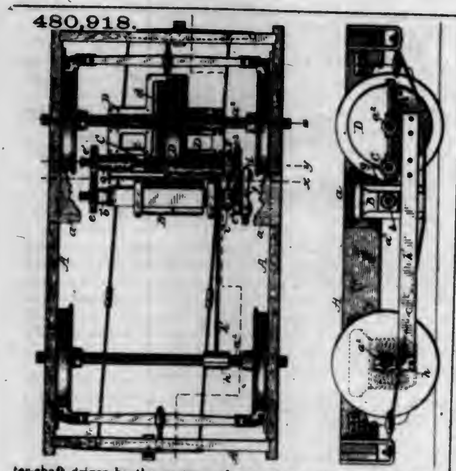
2. A razor-handle having the shell-like shields B, curved longitudinally and transversely to conform to the ends of the sides of such handle and applied exterorally to and inclosing said ends, combined with rivets for uniting the shields and the sides of the handle and other rivets anchored in said shields for uniting the sides of the handle at one end and connecting the sides of the handle and the blade at the other end, substantially as described.

480,917. HAY-PRESS. HENRY COPELAND, Chattanooga, Tenn. Filed Feb. 25, 1892. Serial No. 422,816. (No model.)

Claim.—1. The baling-box having a longitudinal slot in its bottom at one end thereof, a plunger in said box, arranged over said slot, and a retaining-bar for limiting the movement of said plunger, in combination with a rotating cam-block having a cam-groove therein and a pulling pitman having one end engaged with the groove of said block and the other end extending under the pressing-chamber of the baling-box and connected to the plunger through said slot, substantially as described.

2. The combination, with the baling-box and plunger, of a rotating block having a diamond-shaped cam-groove G', rounded at the acute angles and formed with catch-recesses G^2 G^2 at the obtuse angles, and a pitman-rod connecting said plunger and block, substantially as described.

3. The combination, with a block having an approximately-diamond-shaped cam-groove rounded at its acute angles and provided with lateral recesses at its obtuse angles and mechanism for rotating said block, of the baling-box and plunger, the pitman connected to said plunger at one end, and the friction-rollers on the other end of said pitman engaging the cam-groove of the block, substantially as described.



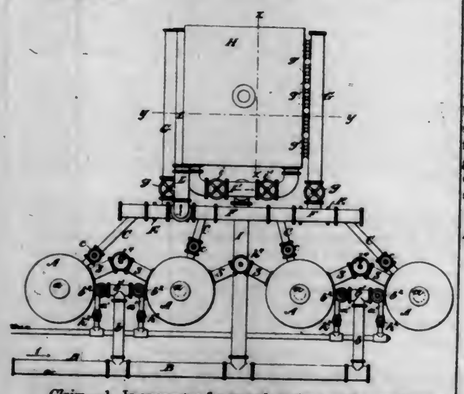
4. The combination of the baling-box having a slotted bottom, the plunger, the pitman-rod connected to said plunger through the slot in the bottom, and a spring for retracting said pitman and plunger, with the rotating cam-block formed of an upper and lower part, each having an approximately-diamond-shaped cam-groove, rounded at the acute angles and recessed at the obtuse angles, substantially as described, and the friction-rollers secured to the end of the pitman-rod and respectively engaging the grooves of the parts, substantially as described.

480,918. ELECTRIC LOCOMOTIVE. RUDOLF EICKEMEYER, Yonkers, N. Y., assignor to the Eickemeyer Field Company, of New York. Filed Dec. 21, 1889. Serial No. 334,487. (No model.)

Claim.—1. In an electric locomotive or car, the combination, substantially as hereinbefore described, of a car-axle, an electric motor secured to and pendent from the truck-frame or bottom of the car and having its armature shaft substantially in the horizontal plane occupied by the axle, a counter-shaft driven by said motor and carried by the axle in the same plane and between the axle and motor, and gearing connecting the counter-shaft and axle.

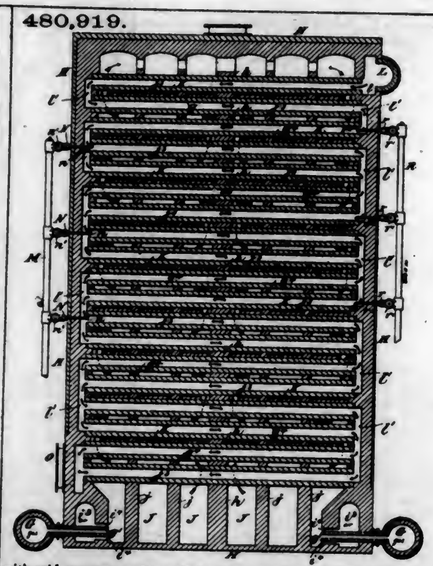
2. In an electric locomotive or car, the combination of an electric motor secured to and pendent from the truck-frame, an axle, a coun-

480,918.



ter-shaft driven by the motor and geared to said axle, a gear-frame which is carried by the axle and supports the counter-shaft and maintains it in the same horizontal plane and parallel with said axle, and hinged arms for flexibly bracing the motor from the gear-frame.

3. In an electric locomotive or car, the combination, substantially as hereinbefore described, of a truck-frame, a motor suspended from said truck-frame between the axles, a counter-shaft driven by the electric motor and geared to one of a pair of car-axles, and a gear-frame which is carried wholly by the geared axle and braced against rotation thereon by means of a brace extending to and connected with the second axle.

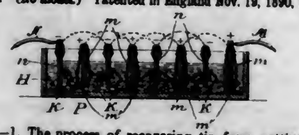


4. In an electric locomotive or car, the combination of a counter-shaft geared to an axle, supported thereon and provided with a crank, an electric motor supported by a spring-mounted frame and having on its armature-shaft a crank, and a connecting-link having at one end a ball-bearing sleeved upon the crank-pin of the armature-shaft and at the other end a cylindrical bearing for the crank-pin of the counter-shaft, substantially as described.

480,919. APPARATUS FOR MANUFACTURING GAS. WALTER P. ELLIOTT, New York, N. Y. Filed Jan. 13, 1890. Serial No. 336,733. (No model.)

Claim.—1. In apparatus for manufacturing gas, the combination, with a generator in which carbonaceous material is burned, of a pipe or passage for the introduction of aeriform fluid containing oxygen thereto, a fixing retort-chamber, a pipe or passage from said generator to the said chamber for conveying to the latter the gaseous products resulting from the introduction of said aeriform fluid to the generator, fixing tubes or retorts arranged in said chamber and externally heated by said gaseous products, a pipe or passage from the generator to and communicating with said tubes or retorts for conveying gaseous products from the generator to said tubes or retorts, and pipes for introducing steam into said tubes or retorts, there to mingle

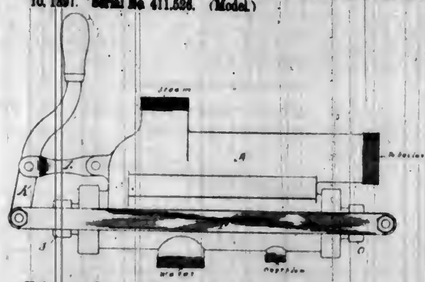
480,919.



with said gaseous products during their passage through said tubes or retorts, substantially as specified.

2. In apparatus for manufacturing gas, the combination, with a generator in which carbonaceous material is burned, of a pipe or passage for the introduction of aeriform fluid containing oxygen thereto, a fixing retort-chamber, a pipe or passage from said generator to said chamber, having branch pipes for conveying to said chamber gaseous products resulting from the introduction of said aeriform fluid to the generator, fixing tubes or retorts arranged in said chamber and externally heated by said gaseous products, and pipes or passages from the generator to the tubes or retorts for conveying gaseous products from the generator to said tubes or retorts, the said fixing-chamber being divided into separate compartments, through both of which said fixing tubes or retorts extend and into either or both of which compartments the gaseous products first referred to may be introduced for the purpose of heating said tubes or retorts, substantially as specified.

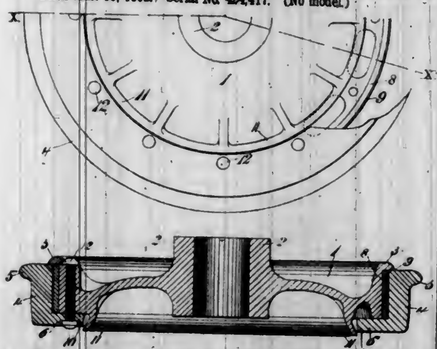
3. In apparatus for manufacturing gas, the combination, with two or more generators in which carbonaceous material is burned, of pipes or passages for the introduction of aeriform fluid containing oxygen thereto, a fixing retort chamber, pipes or passages from the said generators to the said chamber for conveying to the latter gaseous products resulting from the introduction of said aeriform fluid to the generators, fixing tubes or retorts arranged in said chamber and heated by said gaseous products, pipes or passages from the generators to the said chamber for conveying to the tubes or retorts gaseous products from the generators, and intercommunicating passages between said generators, whereby the gaseous products from one generator may be discharged into another near the lower end thereof, substantially as specified.



480,920. PROCESS OF RECOVERING TIN FROM TIN-PLATE. MANUEL R. GARCIA, London, England. Filed Dec. 24, 1890. Serial No. 375,732. (No model.) Patented in England Nov. 19, 1890, No. 18,736.

Claim.—1. The process of recovering tin from cuttings of tin-plate, &c., the same consisting in first subjecting the cuttings and the like to a bath of perchloride of iron to remove the tin, then passing the liquid bath through any suitable filtering substance, then subjecting the same in a suitable apparatus to an electric current to reduce the tin, then subjecting the recovered tin to a suitable bath for washing, and finally drying the same, substantially as set forth.

2. The process of recovering the tin from old articles of tinware, the same comprising the following steps: first, subjecting said articles to the action of fire or heat to unsolder the parts and remove therefrom the grease, &c.; second, subjecting said articles to a bath of perchloride of iron to remove the tin; third, passing the liquid bath containing the tin through a filtering substance; fourth, subjecting the liquid bath to an electric current to reduce the tin, and, fifth, subjecting the recovered and reduced tin to a suitable bath to wash and dry the same, substantially as set forth.

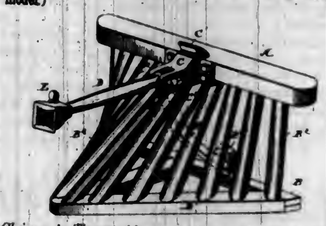


480,921. INJECTOR. ROBERT HARRISON, Erie, Pa. Filed Nov. 10, 1891. Serial No. 411,536. (Model.)

Claim.—1. The combination, in an injector, of a combined piston and disk steam-inlet valve with a combined piston and disk overflow-valve, a bar connecting said two valves together, so that they will move in unison, and a lever pivoted thereto for operating said valves, substantially as and for the purpose set forth.

2. The combination, in a combined ejector and injector, of a combined piston and disk steam-inlet valve adapted to admit the steam into the ejector first and afterward into the injector, with a combined piston and disk overflow-valve adapted to control the overflows of both the ejector and injector, a bar connecting said valves together, and an operating-lever connected therewith, whereby both of said valves are moved simultaneously, substantially as and for the purpose set forth.

480,922. CAR-WHEEL. BENJAMIN F. HAUGH, Indianapolis, Ind. Filed Mar. 10, 1892. Serial No. 424,417. (No model.)



Claim.—1. In a cushioned car-wheel, the combination, with the center and the tire thereof having an interposing elastic cushion, of an inwardly-projecting flange formed on said tire and adapted to contact with the outer face of said center, an annular outwardly-flaring flange or shield projecting over the inner edge of said flange of tire, and suitable means for securing said tire to said center, substantially as set forth.

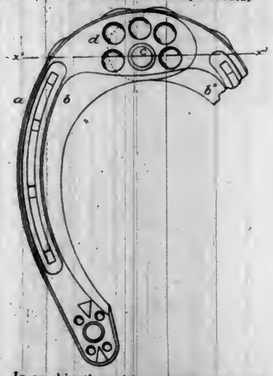
2. In a cushioned car-wheel, the combination, with the center and the tire thereof having an interposing elastic cushion, of an inwardly-projecting flange formed on said tire and adapted to contact with the outer face of said center, said flange having its inner edge flaring slightly outwardly, as described, an annular outwardly-flaring flange or shield projecting over and beyond the outer face of the flange of said tire, and suitable means for securing said tire and center, substantially as described.

3. In a cushioned car-wheel, the combination, with the tire and the center thereof having an inwardly-projecting peripheral thrust-flange formed on the inner face of said center and an inwardly-projecting flange formed on the outer face of said tire, of an interposing elastic cushion extending along the face of the bearing-periphery of said center and between said thrust-flange of center and flange of tire, an annular outwardly-flaring flange formed on the outer face of said center and projecting slightly over the outer face of the flange of said tire, and suitable securing-bolts passing through said flange and periphery of the wheel center, all substantially as and for the purpose described.

480,923. DRAW-BAR FOR LOCOMOTIVES. SAMUEL R. HEIDELBERG, Palestine, Tex. Filed Apr. 20, 1892. Serial No. 429,936. (No model.)

Claim.—1. The combination, with the frame of the locomotive, of the counterbalanced draw-bar mounted thereon, substantially as described.

2. The combination, with the frame of the locomotive and pilot, of a draw-bar mounted on the frame above the pilot, the draw-bar being provided with a counter-weight, substantially as described.



3. The combination, with the frame of the locomotive and pilot mounted thereon, of the draw-bar connected to the frame, devices for locking and holding the draw-bar on the pilot, and a counter-weight for automatically elevating the draw-bar when released, substantially as described.

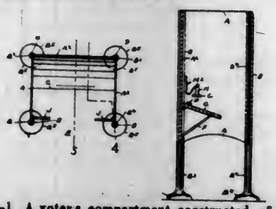
4. The combination, with the locomotive-frame having a bumper-head provided with elongated slots, of a counterbalanced draw-bar having knife-edge bearings fitting said elongated slots, substantially as described.

5. The combination, with the frame, the pilot, and counterweighted draw-bar, of the automatic locking devices for holding the draw-bar in its normal position and means for releasing the locking device from the outside of the frame, substantially as described.

6. The combination, with the frame and pilot, of the cross-bar of the pilot having downwardly-extending projections forming guides, substantially as described.

480,924. HORSESHOE. EDWIN A. HILLS, Wethersfield, Conn. Filed Oct. 17, 1889. Serial No. 327,356. (No model.)

Claim.—1. In combination with a sectional horseshoe provided with a calk-socket, a calk having a central stem fitting such socket, and cone-shaped projections on said calk fitting corresponding recesses in the surface of the shoe and the cone-shaped recesses, all substantially as described.

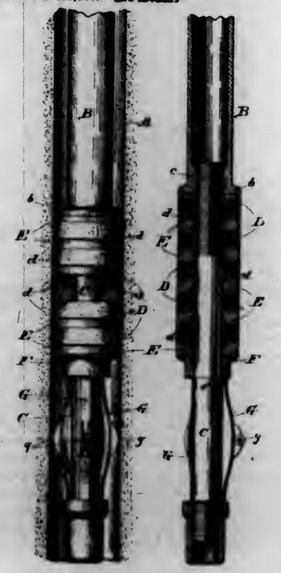


2. In combination, in a sectional horseshoe composed of two sections, an integral pivot located on one of the sections eccentrically thereof and taking into a socket on the other section, the two sections being halved together and having their meeting faces provided with intermeshing tongues and grooves, and an integral toe-weight located on the shoe adjacent to the pivot, all substantially as described.

3. In combination, in a sectional horseshoe, the two sections halved together and provided with pivot-holes and a renewable calk having its wearing-face formed of a number of thin edges disposed at an angle with each other and provided with a projecting stem fitting the pivot-holes in the two sections and forming a pivot, all substantially as described.

4. In combination, in a sectional horseshoe the two sections of which are halved together and having their meeting faces provided with intermeshing tongues and grooves, the pivot-holes formed in each section in line with each other and a renewable calk having its wearing-face formed of a number of thin edges disposed at an angle with each other and having an integral stem adapted to fit the pivot-holes in each section of the shoe, thereby forming the pivot, all substantially as described.

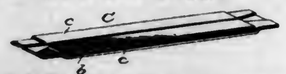
5. In combination, in a sectional horseshoe halved together and having the meeting faces of the sections provided with intermeshing grooves and tongues, an integral hollow pivot of one of the sections taking into a corresponding pivot-hole in the opposite section, and a renewable calk provided with a projecting stem taking into the hole in the hollow pivot, whereby the calk is secured to the shoe, all substantially as described.



480,925. VOTER'S COMPARTMENT AND SHELF. AARON A. HINKLEY, Lakeville, and JOHN S. WELCH, Lynn, Mass. Filed Apr. 3, 1890. Serial No. 346,445. (No model.)

Claim.—1. A voter's compartment constructed of partitions or walls and open at one side and corner-posts on which said partitions are hung and each having a foot or base and severally adapted to be folded together and opened from each other, in combination with a shelf within and a guard or guards at the open side of and held on the compartment and severally adapted to be placed into and out of position for use, substantially as described, for the purposes specified.

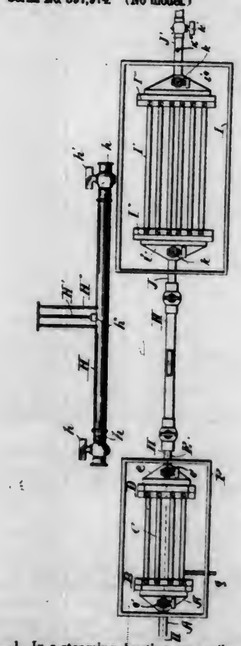
2. A series of voters' compartments constructed of partitions or walls and each open at one side and corner-posts on which said partitions are hung and each having a foot or base and said partitions and posts of the series of compartments adapted to be folded together and opened from each other, in combination with a shelf within and a guard or guards at the open side of and held on each of said compartments and severally adapted to be placed into and out of position for use, substantially as described, for the purposes specified.



480,926. WELL-PACKER. ISAAC N. HOADLEY, Bradford, Pa., assignor to the Monitor Packer Company, same place. Filed Nov. 2, 1891. Serial No. 410,577. (No model.)

Claim.—1. In an oil-well, a gas-well, or an Artesian well, the combination, with the well-tubes, of a packer composed, essentially, of alternate inverted-cup-shaped washers of rubber or other elastic material and flat rings of wood or metal, the said rubber washers being pressed between the said rings and expanding beyond the edges thereof, substantially as and for the purposes described.

2. In a packer for oil, gas, and Artesian wells, the combination, with the tube-section C, having screw-thread *c* and shoulder *c'* thereon, of the ring F, bearing against said shoulder, the rubber cups D and disks E, slipped on said tube-section over said ring, and the tube-section B, adapted to screw down on said screw *c* and compress said rubber cups between said disks, substantially as described.

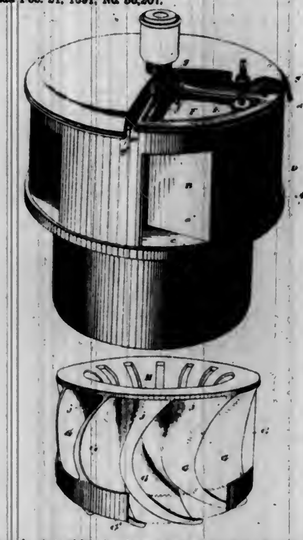


480,927. CEILING. ANDREW KAISER, Columbus, Ohio. Filed Mar. 2, 1892. Serial No. 423,506. (No model.)

Claim.—1. In metal ceilings, &c., the combination, with grooved moldings, panels supported in the moldings, of strips between the contiguous edges of the panels, produced from sheet metal, the same being folded to form channels or grooves in opposite edges and having reduced ends to fit in the grooves of said moldings, substantially as described.

2. A strip for uniting the contiguous edges of panels, produced from sheet metal, the same being folded to form channels or grooves in opposite edges and having one of the walls of the grooves cut away to reduce the ends of the strip, substantially as and for the purpose described.

480,928. HEATER AND COOLER FOR FERMENTED MALT LIQUORS. JOHN H. KERSENBROCK, Columbus, Nebr. Filed June 30, 1891. Serial No. 397,974. (No model.)



Claim.—1. In a steaming, heating, or cooling apparatus for beer or other malt liquors, the combination of a vat, a single inlet-pipe, and a single outlet-pipe, located, respectively, at opposite ends of and projecting into the vat, funnel-shaped or flared portions at the inner ends of the pipes, a series of circulating-pipes located wholly within the vat, heads at the ends of the pipes secured to the funnel-shaped or flared portions and provided with openings receiving the ends of the pipes, set-screws for securing the heads to the pipes, and means, located between the ends of the vat, for supporting the heads directly from the bottom of the vat, substantially as set forth.

2. In a steaming, heating, or cooling apparatus for beer or other malt liquors, the combination of a vat, inlet and outlet pipes at the ends of the vats, respectively, provided with funnel-shaped or flared portions at their inner ends, a series of circulating-pipes, located within the vat-heads at the ends of said series of pipes, having openings to receive the ends of the latter, and flanges projecting from the heads and surrounding the openings, over which said funnel-shaped or flared portions fit, substantially as set forth.

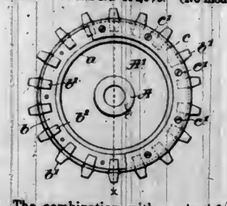
3. The combination of a vat, a series of parallel circulating-pipes contained therein and arranged in a horizontal plane, outlet and inlet pipes communicating with the ends of the circulating-pipes at each end of and projecting through the ends of the vat, and a series of parallel steam-pipes parallel with and situated below the circulating-pipes and provided with perforations, whereby the circulating-pipes will be uniformly heated throughout, substantially as set forth.

480,929. TURBINE WHEEL. JOHN C. LADUKE, Shelbourne, Canada. Filed Nov. 23, 1891. Serial No. 412,826. (Model.) Patented in Canada Feb. 21, 1891, No. 36,207.

Claim.—1. A turbine having a wheel contained within the casing provided with a series of buckets, the lower portion of each bucket of which extends from outside to inside back from the radial line, passing through the outer end of the bucket in the opposite direction to that in which the wheel revolves, the top, however, being flared in the direction in which the wheel revolves, substantially as specified.

2. A turbine having a wheel contained within the casing provided with a series of buckets, the lower portion of each bucket of which extends from outside to inside back from the radial line, passing through the outer end of the bucket in the opposite direction to that in which the wheel revolves, the top, however, being flared in the direction in which the wheel revolves, and the bucket being also constructed lengthwise, with the upper portion curved downwardly and inwardly, so as to recede in the direction in which the wheel revolves and the lower portion continuing the curve in the opposite direction, the cross-section of the bucket at the top being slightly concaved and the concavity and width gradually increased from top to bottom, substantially as and for the purpose specified.

3. A turbine having a wheel contained within the casing A, provided with a series of buckets G, having the upper portion curved downward and inward, so as to recede in the direction in which the wheel revolves and the lower portion continuing the curve in the opposite direction, in combination with the chutes *a*, designed to direct the water against the upper receding portion of the buckets G, from which it sweeps down and is carried through the wheel, substantially as and for the purpose specified.



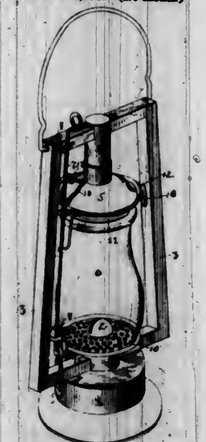
4. In combination, the casing, the wheel thereon having a series of buckets G, the guides B of the casing with spaces between them forming the chutes *a*, said guides having curved sides *d* and the sides *f''* and *f'*, converging at the edge of the wheel-space, the ring-gate D, and the gates C, carried thereby, said gates having the curved wings *d'*, adapted to the face of the guide, and the wings *f'*, adapted to bear alternately on the sides *f''* and *f'* of the guides, the inner ends of the wings *f'* bearing against the side *f''*, substantially as described.

5. In combination, the casing, the wheel therein having a series of buckets G, the guides B of the casing with spaces between them forming the chutes *a*, said guides having the curved side *d* and the sides *f''*, with a curved portion *e'*, the ring-gate D, provided with the gates C, said gates having the curved wings *d'*, adapted to the face *d* of the guides, and the wings *f'*, adapted to sides *f''* and bearing against the curved part thereof, substantially as described.

6. In a turbine, the casing, the wheel therein, the shaft I therefor, the ring-gate D for controlling the openings of the chutes, the toothed quadrant F, the lugs *g'* on the ring-gate for holding the quadrant in place, and the pinion engaging the quadrant, substantially as described.

7. In a turbine, the casing, the wheel, the shaft therefor, the covering or dome J, the standards K, and the bolts for supporting and holding the dome, the top ring *d*, and the top L, held thereto by the bolts *l*, substantially as described.

480,930. TOOTHED WHEEL. JOHN LINDSAY, Millbury, Mass. Filed Sept. 7, 1891. Serial No. 404,978. (No model.)

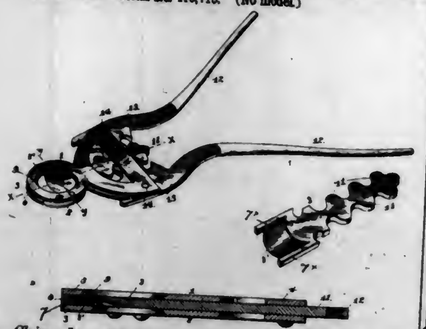


Claim.—1. The combination, with a wheel-frame, of a recessed tooth-carrying ring carried thereby, a series of independent teeth inserted in said recesses, a clamping-plate bearing against said teeth, and fastenings extended through the said plate, ring, and frame, substantially as described.

2. A wheel-frame, a tooth-carrying ring, and a series of teeth carried thereby of greater thickness than said ring, combined with a clamping-plate adapted to bear against said teeth, and means to clamp the plate in position, substantially as described.

3. A wheel-frame, a tooth-carrying ring, and a series of teeth carried thereby of greater thickness than the thickness of the said ring, and provided with grooves, combined with a clamping-plate having an annular projection to enter the grooves in said teeth, substantially as described.

480,931. LANTERN. HUGH P. MERRIMAN, Morris, N. Y. Filed May 7, 1891. Serial No. 391,938. (No model.)



Claim.—1. The combination of the lantern-frame having vertical air-tubes, the U-shaped keeper arranged on one of the air-tubes, the vertically-movable rod 7, journaled on the other air-tube and carrying the chimney, and the clamping-ring receiving the upper end of the chimney and secured to the rod 7 and provided with a projection arranged diametrically opposite the rod 7 and adapted to engage the U-shaped keeper, substantially as described.

2. In a lantern, the combination, with the oil-reservoir, burner, and air-tubes, of the eyes 8 and 9, arranged on the air-tubes at one

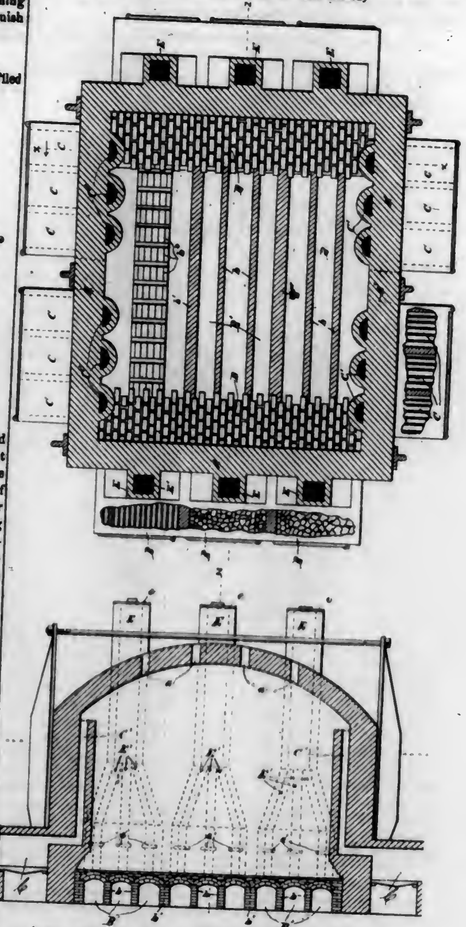
side of the lantern, the U shaped keeper constructed of wire and arranged at the opposite side of the lantern, the rod journaled in the eyes and provided at its upper end with a handle, the globe-seat attached to the lower end of the rod, the globe-cap attached to the rod near the upper end thereof, and the clamping-ring secured to the rod and arranged below the globe cap and provided with a projection arranged diametrically opposite the rod and adapted to engage the keeper when the parts are in operative position, substantially as described.

3. The combination, with a lantern provided with the vertical depending tube 4, of the vertical rod 7, secured to the lantern, the globe-cap sliding on the tube 4, and the V-shaped wire provided at its ends with eyes to receive the rod and having its lower arm secured to the globe-cap and provided in its upper arm with a bend forming a thumb-piece 17, whereby the globe-cap can be raised to extinguish the light, substantially as described.

480,932. DEHORNER. JAMES M. MILLS, Modesto, Ill. Filed Dec. 31, 1891. Serial No. 416,718. (No model.)

Claim.—In a dehorner, the combination of oppositely-situated semicircular plates with integral rings projecting from the central front portions thereof, space-blocks inserted between and secured to the said rings and having outer curved edges conformed to the shape of the rings and inner straight edges to form parallel guides, a rubber block interposed between the front portions of said rings and resting against said space-blocks to shield the cutting-edge of the knife, handles with toothed heads pivotally mounted in the corners of the aforesaid semicircular plates, and a cutting-blade having parallel guide-bars at the front thereof of rectangular form and embracing the opposite sides of an inclined or beveled knife, and a rear toothed shank to be engaged by the aforesaid toothed heads of the handles, the said parallel guide-bars having the front ends thereof extending beyond the front end of the cutting-blade and adapted to move against the inner straight edges of the said space-blocks, substantially as described.

480,933. TYPE-PLATE AND BLANK FOR THE SAME. GEORGE D. MORSE and MILTON CHASE, Haverhill, Mass. Filed July 30, 1891. Serial No. 400,052. (No model.)



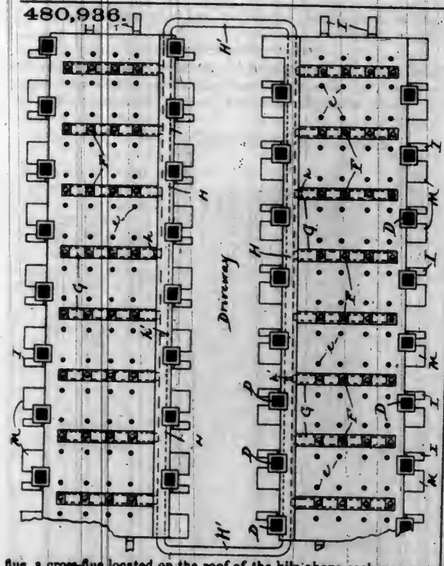
Claim.—A type-plate blank consisting of a plate having a smooth surface *a* to receive the imprint from a die or matrix and the under side having a series of recesses *c*, whereby the superfluous material is taken up when an imprint is made upon the face *a*, substantially as set forth.

480,934. ACID-RESISTING COMPOSITION FOR LINING TANKS. JOSHUA NORTON, Jr., Chatham, Canada. Filed Nov. 22, 1890. Serial No. 372,368. (No specimens.)

Claim.—1. In an acid-resisting lining of a wood-pulp digester, a first or preparatory coating or layer composed of asbestus fiber, sulphate of baryta, and hydraulic cement and having a thickness of not more than about one-sixteenth of an inch, a second layer consisting of the same ingredients mixed with pulverized fire-brick, seggar, stoneware, and glass or glass-sand, and a third layer consisting of asbestus fiber, sulphate of baryta, and hydraulic cement, each layer containing silicate of soda, substantially as set forth.

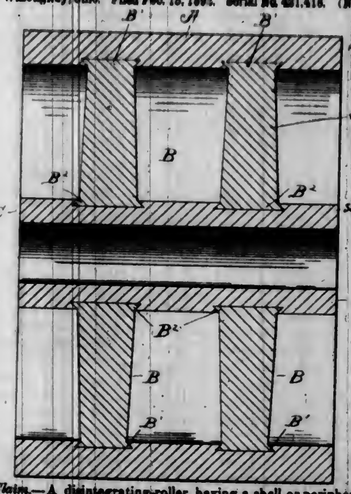
2. A lining of a digester, composed of three superimposed layers or coats, the first consisting of hydraulic cement and other refractory material applied to the metal of the digester, the second containing hydraulic cement mingled with pulverized fire-brick and other refractory material and imposed upon the first, and the third containing hydraulic cement and refractory materials imposed upon the second, substantially as set forth.

480,935. BRICK-KILN. JAMES W. PENFIELD, Willoughby, Ohio. Filed May 10, 1890. Serial No. 351,314. (No model.)



Claim.—In a brick-kiln, the combination of two series of furnaces, one series provided with flues discharging under the dome of the kiln and the dome having openings for regulating the updraft inside the kiln, the other series provided with flues leading under the floor of the kiln, said flues having chimneys with dampers for regulating the draft therein, whereby the latter or updraft furnaces may be utilized in discharging the products of combustion from the downdraft-furnaces, substantially as set forth.

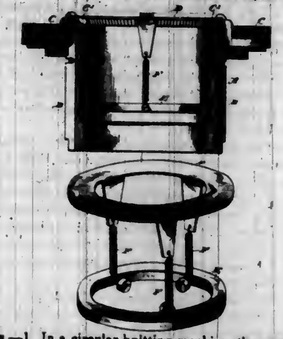
480,936. BRICK-KILN. JAMES W. PENFIELD, Willoughby, Ohio. Filed Aug. 18, 1891. Serial No. 403,034. (No model.)



Claim.—1. A brick-kiln comprising two opposing series of compartments and corresponding series of furnaces and co-operating flues arranged substantially as indicated, whereby communication may be had between next adjacent compartments by means of a furnace and flue, a cross-flue located on the roof of the kiln above each compartment, such cross-flues discharging in common into a longitudinal flue, and means, substantially as shown, for opening and closing communication between each cross-flue and the compartment below it and between each cross-flue and the longitudinal flue, substantially as set forth.

2. A brick-kiln comprising two opposing series of compartments with furnaces and flues below the floor furnishing communication from one compartment to another, substantially as indicated, and a series of cross-flues and a longitudinal flue located on the roof of each section of the kiln and arranged substantially as indicated, whereby communication may be had between different compartments of the same section, the two series of furnaces and flues below the floor being connected at their extremes to form an endless series and the two series of flues on the roof being connected at their extremes to constitute an endless series, substantially as set forth.

480,936.



480,937. DISINTEGRATING-ROLLER. RAYMOND C. PENFIELD Willoughby, Ohio. Filed Feb. 13, 1892. Serial No. 421,416. (No model.)

Claim.—A disintegrating-roller having a shell or periphery cast of hard metal, a hub cast of comparatively soft metal, and wrought-metal arms firmly united to the shell and hub in the operation of casting said hub and shell, substantially as and for the purpose set forth.

480,938. KNITTING-MACHINE. EDSON E. RANDALL, West Winsted, Conn. Filed Mar. 19, 1892. Serial No. 425,613. (No model.)

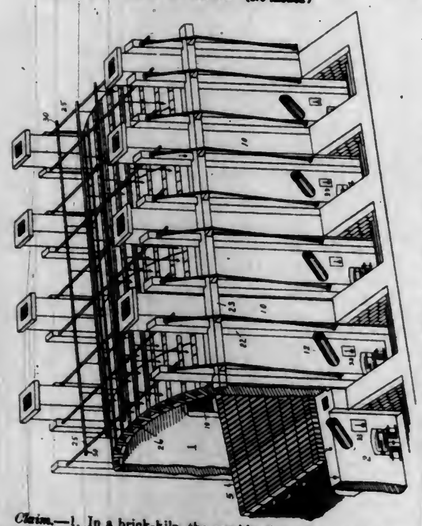
Claim.—1. In a circular-knitting machine, the combination of a cylinder having jack-sinkers or loop-holders thereon and a disk or ring bearing on parts of said jack-sinkers or loop-holders and located over the opening through said cylinder, substantially as described.

2. The combination of a knitting-machine cylinder having jack-sinkers or loop-holders in connection therewith and a ring or disk loosely and removably engaging said jack-sinkers or loop-holders, substantially as described.

3. In a circular-knitting machine, the combination of a cylinder having jack-sinkers or loop-holders thereon, a disk or ring loosely bearing on parts of said jack-sinkers or loop-holders, and springs for holding said disk or ring in proper position, substantially as described.

4. In a circular-knitting machine, the combination of a needle-cylinder having jack-sinkers or loop-holders thereon, a disk or ring loosely and removably engaging said jack-sinkers or loop-holders, a rib or ring within the said cylinder, and springs connecting said disk or ring with said rib or ring, substantially as described.

480,939. CONVEYER. JOHN H. SHULL and GEORGE S. DORNEY, Findlay, Ohio. Filed July 29, 1891. Serial No. 401,078. (No model.)

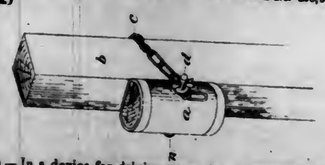


Claim.—1. The combination of supporting-frames, the vertical shafts, a pair of horizontal sprocket-wheels on each of the shafts, a conveyer-belt consisting of two endless chains connecting the sprocket-wheels, a horizontal shaft and gear-wheels connecting the vertical shafts, driving mechanism connected with one of the shafts, the tracks located above the conveyer-belt, and the pallets having stems secured to the chains of the conveyer-belt and provided with hangers having rollers running on the tracks, substantially as described.

2. The combination of supporting-frames, the vertical shafts, a pair of horizontal sprocket-wheels on each of the shafts, a conveyer-belt consisting of two endless chains, connecting the sprocket-wheels, a horizontal shaft and gear-wheels connecting the vertical shafts, driving mechanism connected with one of the shafts, the outer broad track, the inner narrow track, and the pallets having stems secured to the chains of the conveyer-belt and provided with outer hangers having rollers formed with broad treads, and inner hangers projecting downward for engaging the narrow track, having rollers formed with narrow treads, substantially as described.

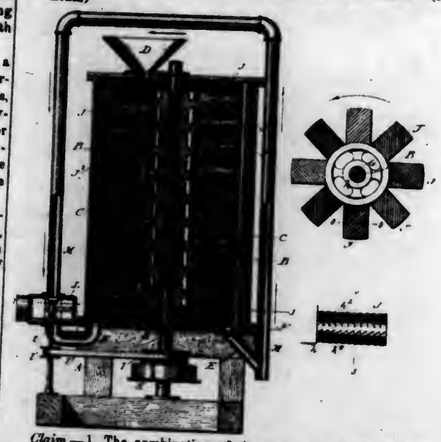
3. The combination of supporting-frames, the vertical shafts, a pair of horizontal sprocket-wheels on each of the shafts, a conveyer-belt consisting of two endless chains, connecting the sprocket-wheels, a horizontal shaft and gear-wheels connecting the vertical shafts, driving mechanism connected with one of the shafts, the outer and inner tracks, and the pallets having stems secured to the chains of the conveyer-belt and provided with hangers having rollers running on the tracks and with scrapers located at diagonally-opposite corners of the pallets, substantially as described.

4. The combination, with the belt of a conveyer, of a pallet having a pendent stem secured to the belt, a hanger having a broad roller, a hanger having a narrow roller and having its ends extending beneath the roller, and the scrapers located at diagonally-opposite corners of the pallets, substantially as described.



480,940. BRICK-KILN. WILLIAM H. B. STOUT, Chicago, Ill. Filed Aug. 15, 1891. Serial No. 402,764. (No model.)

Claim.—1. In a brick-kiln, the combination, with a suitable furnace or other heat-supplying means, of an open floor having a converging bottom heat-chamber underneath into which the heat is led and disseminated, said floor being supported by a series of open walls running lengthwise of the kiln, substantially as set forth.

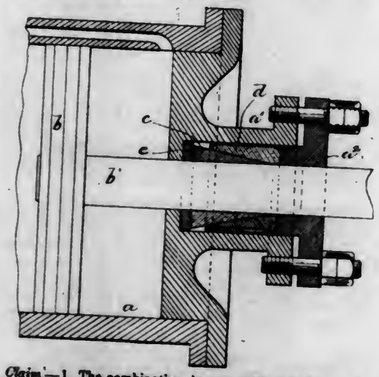


2. In a brick-kiln, the combination, with a suitable heat-supplying means, of an open floor having a converging bottom heat-chamber underneath into which the heat is led at the lowest point, substantially as shown and described.

480,941. DEVICE FOR DRIVING FENCE-POSTS, &c. FRANKLIN STOW, Kirkwood, N. Y. Filed Apr. 11, 1892. Serial No. 428,656. (No model.)

Claim.—In a device for driving posts, &c., the combination of a block adapted to bear against the side of the post, a transverse bolt passing through the block, a chain attached to said bolt and adapted to embrace the object to be driven, and a removable key, substantially as described.

480,942. GRAIN-SCOURING MACHINE. ROSLA W. WELOH, Baltimore, Md., assignor of two-thirds to William A. Dunn and Louis D. Passano, same place. Filed Nov. 13, 1891. Serial No. 411,833. (No model.)

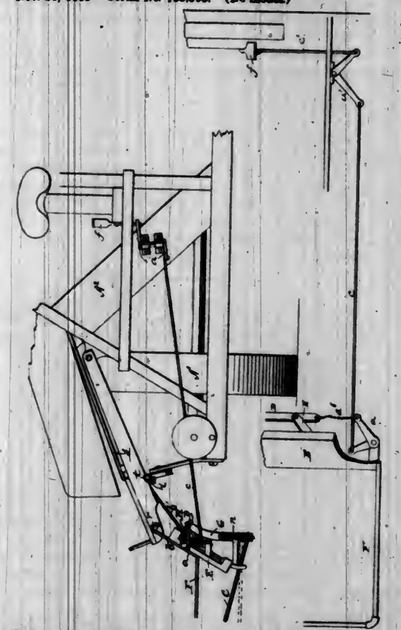


Claim.—1. The combination of the pervious cylinder, the surrounding casing, and the fan arranged to exhaust the casing, in combination with the central shaft, and the scourer-blades having obliquely and reversely arranged teeth, as described, the forward or working faces of the teeth standing at a greater angle to the plane of the blades than the rear faces, whereby the grain is caused, in addition to its other movements, to flow inward and outward to carry the free foreign matters to the pervious cylinder that they may speedily escape.

2. In a grain-scouring machine, the pervious cylinder, the jacket, the exhaust-fan, and the delivery-controlling gate, in combination with the central shaft and the hubs, each having at different levels blades constructed of increasing thickness from front to rear with reversely-arranged oblique teeth on their upper and under sides, the forward or working faces of the teeth standing at a greater angle to the plane of the blade than the rear faces.

3. In a grain-scourer, and in combination with a surrounding cylinder, rotary blades each having obliquely-arranged teeth, those on one face with vertical front walls or surfaces and those on the other face with backwardly-inclined front surfaces.

480,943. METALLIC PACKING. WILLIAM H. BODFISH, Everett, assignor of one-half to Roswell Carleton, Boston, Mass. Filed Oct. 26, 1891. Serial No. 409,570. (No model.)



Claim.—1. The combination, in a metallic packing, of an externally-tapered compressible metal sleeve formed internally to fit a piston-rod, a collar of rigid construction having an internally-tapered surface fitting the exterior of the sleeve, and a ring or gasket having an annular rib formed to bear against the larger end of the sleeve, said parts being formed for insertion in the cavity of a stuffing-box, as set forth.

2. A metallic packing composed of an externally-tapered compressible metal sleeve made in separable longitudinal sections having tongue-and-grooved joints, the larger ends of said sections being provided with grooves, a ring adapted to bear against the inner end of the cavity of the stuffing-box and provided with an annular rib adapted to enter the grooves in the sleeve-sections, and a collar of rigid construction internally tapered to fit the exterior of the sleeve and arranged to bear against the gland of the stuffing-box, as set forth.

3. The collar composed of two separable sections collectively forming an internally-tapered ring adapted to surround an externally-tapered sleeve, and a binding or locking section formed to unite said sections and cover the joints thereof, said locking section being fitted in recesses formed for it in the other sections, the whole forming a rigid or unyielding divisible collar presenting a cylindrical exterior combined with an externally-tapered sleeve formed to fit the tapered interior of the collar, said sleeve being composed of separable sections, as set forth.

4. The sleeve-compressing collar composed of the semicircular section 5, externally reduced at its ends to form shoulders 7 7 and flanges 8 8, the reduced portions having slots 10 10, the semicircular section 6, externally reduced from end to end and having a flange 9, constituting a continuation of the flanges 8 8, and the segmental section 4, formed to fit the reduced portions of the sections 5 6, and provided with tongues 12 12, formed to engage the slots 10 10, the ends of said segmental section being separated by a space wider than the diameter of the piston-rod, as set forth.

480,944. BUNDLE-CARRIER FOR HARVESTERS. LUCIEN W. ELLIS, Anamosa, Iowa, assignor to William Deering, Chicago, Ill. Filed Nov. 20, 1885. Serial No. 183,395. (No model.)

Claim.—1. A sheaf-carrier consisting of fingers that form a platform upon which sheaves are discharged, each finger being secured to a support by means of a joint having an axis obliquely inclined relative to the length of the body or supporting portion of the finger to cause it to move downwardly, backwardly, and sidewardly toward its support, and means for preventing the movement of the sheaves sideward off from the said supporting-fingers.

2. A sheaf-carrier consisting of fingers and a support for each finger adapted to form a bottom to support sheaves and sides to prevent their escape in lateral directions, said fingers being connected to the framework by means of joints having inclined axes, whereby they are adapted to move downwardly, rearwardly, and sidewardly toward their supports to draw from beneath the load.

3. A sheaf-carrier having side limits that prevent the bundles from escaping, fingers adapted to lie beneath the sheaves and sustain the load, said fingers secured to the framework of the machine by means of joints having axes inclined, whereby the weight of said sheaves is instrumental in turning the fingers downward and sideward to permit the discharge of the load.

4. A sheaf-carrier for self-binding harvesters, consisting of a receptacle having a bottom for sustaining the weight of the sheaves and sides to prevent the escape of the sheaves in lateral directions, said bottom consisting of fingers connected to the framework of the machine by joints having inclined axes, whereby they are permitted to swing rearwardly, downwardly, and sidewardly to draw from beneath the load.

5. In a sheaf-carrier for harvesters, a series of laterally-extending carrier-fingers, each mounted at one end of an axis inclined from the vertical in position to allow them to swing rearward and downward in an oblique path sideward toward their support, and a guard or side limit to retain the sheaves on the carrier-fingers until discharged.

6. In a sheaf-carrier, the combination of a bar E, lying in a fore-and-aft direction, a series of sheaf-receiving fingers, each having a journal or pivot mounted on the bar at an inclination from the vertical in position to allow the finger to swing rearward and downward sideward toward its support and each having a crank-arm, a connection between said crank-arms, and an operating device extending thence to a point adjacent to the driver's seat, and a guard or side limit to retain the sheaves on the carrier-fingers until discharged.

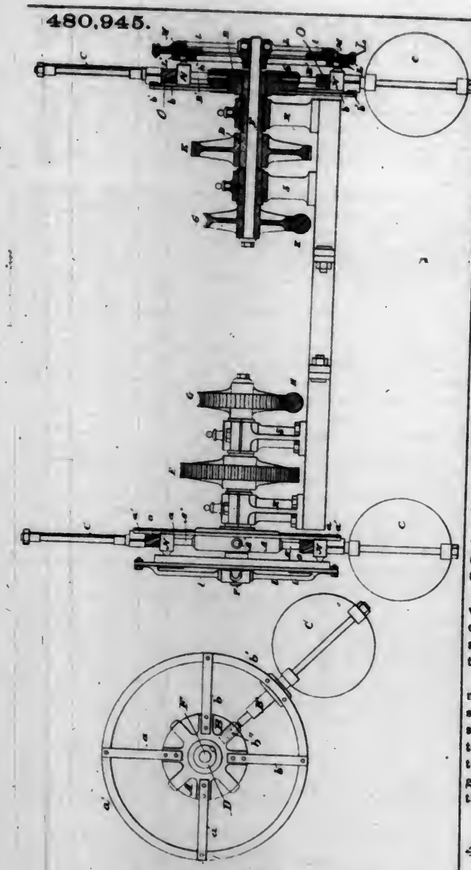
7. In a sheaf-carrier, the combination of a sustaining-bar, a series of sheaf-receiving fingers extending normally in a lateral direction therefrom and each sustained at the inner end by an axis obliquely inclined relative to the length of the body or supporting portion of the finger, around which it may swing rearwardly, backwardly, and sidewardly toward its support, a bar connecting said fingers to compel their movement in unison, operating devices extending from the bar to a point adjacent to the driver's seat, and a latch or lock to hold such bar, and thus the fingers, in the receiving position, and a guard or side limit to retain the sheaves on the carrier-fingers until discharged, substantially as described.

8. The combination, with a grain harvester and binder, of a supporting board or bar extending in a fore-and-aft direction, a series of outreaching sheaf-carrying fingers, each having at the inner end a supporting journal or axis inclined, as shown and described, in relation to the body of the finger and to the vertical in a plane at right angles to the line in which the machine advances, whereby the fingers are permitted to swing rearward, downward, and inward toward their support and toward each other, and a guard or side limit to retain the sheaves on the carrier-fingers until discharged.

9. In a sheaf-carrier, a fore-and-aft board or bar E, in combination with a series of laterally-projecting sheaf-receiving fingers, each having at its inner end a sustaining-journal inclined, as described and shown, in relation to the body of the finger and also inclined in the direction of the length of the board.

10. In a sheaf-carrier, and in combination with a sustaining-bar, a series of laterally-extending sheaf-receiving fingers, inclined journals or axes by which said fingers are sustained and around which they swing with a rearward, downward, and sideward movement toward their support, a bar connecting said fingers to compel their movement in unison, and a spring tending to hold the fingers in their normal or receiving position, and a guard or side limit to retain the sheaves on the carrier-fingers until discharged.

11. In combination with a sheaf-carrier composed of fingers individually pivoted to swing rearward, the stationary guard F, extending over the end and along the outer side of the carrier to prevent the accidental escape of the sheaves therefrom.



12. In a sheaf-carrier, a series of sheaf-receiving fingers pivoted upon approximately vertical axes to swing rearwardly and each provided with a crank, in combination with an operating-bar D, provided with latches *v* and pins *e* to operate the respective cranks.

480,945. PROPELLER. LEON GAYON, Paris, France. Filed Aug. 14, 1891. Serial No. 402,614. (No model.)

Claim.—1. In combination, the wheel carrying the radial shaft with the blades at the ends thereof, the cam arranged with its face adjacent to the said wheel and having a cam-groove in the said face, the nut N, in connection with the said cam-groove, whereby it is moved toward and from the center of the wheel, and the threaded connection between the said nut and the radial shafts, whereby the said shafts are given a rotary reciprocation and the blades are feathered, substantially as described.

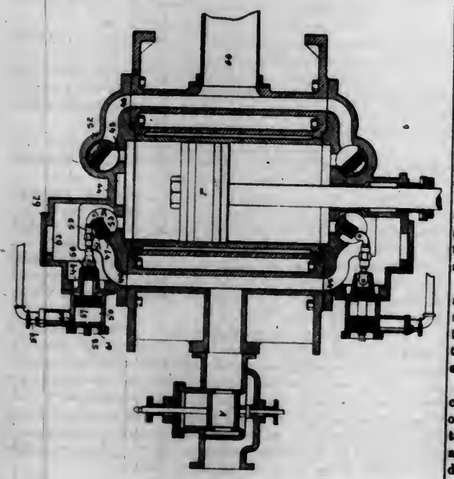
2. In combination, the wheel carrying the radial shafts and the blades at the ends thereof, the cam arranged with its face adjacent to the side of the wheel, the connection between the radial shafts and the cam, and the means for rotating the wheel and cam independently of each other, said means consisting of the hollow sleeve D, carrying the wheel, the means for rotating said sleeve, the shaft extending through the sleeve and carrying at its outer end the cam, and the means at the inner end of the shaft for rotating it and turning the cam about the axial line of the wheel, substantially as described.

480,945.

Claim.—1. The combination of a speed-governor, a valve the operation of which is controlled by said governor, and means for transferring motion from the governor to the valve mechanism, said means having a pivoted arm adapted to be tilted by the governor, two rods or connecting devices extending from the arm on opposite sides of its pivot, whereby one acts as a pull-rod and the other as a push-rod, a second pivoted arm, to which the two rods are connected on opposite sides of its pivot, and a working connection between the same and the valve mechanism, substantially as described.

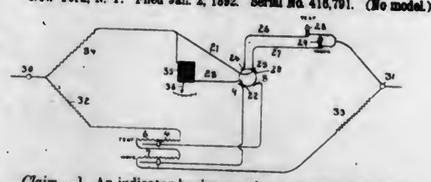
2. The combination of a speed-governor, one or more valves the operations of which are controlled by said governor, and means for transferring motion from the governor to the valve mechanism, said means having a pivoted arm adapted to be tilted by the governor, the two rods extending from the arm on opposite sides of its pivot and one or more other pivoted arms, to which the two rods are connected, and working connections between said arm or arms and valve mechanism, substantially as described.

3. The combination of a steam-valve mechanism, a speed-governor, and means for transferring motion from the governor to the valve mechanism, said means having two pivoted arms connected by rods on opposite sides of the pivots, one of the arms being provided with two angular extensions, rods connected thereto and to a T-shaped lever, one arm of which is connected to the movable part of the governor, the other pivoted arm having an extension, and a rod connected thereto and to the controlling device of the valve mechanism, substantially as described.



4. The combination of a cylinder, a head therefor having in it a valve port and seat, a valve in said seat, and a dash-pot, also on the cylinder-head, connected to the valve, substantially as described.

5. The combination of a cylinder, a head therefor having in it a valve port and seat, a rotary valve in said seat, and a steam-operated dash-pot, also on the cylinder-head, connected to the valve, substantially as described.



6. The combination of a cylinder, a head therefor having in it a valve port and seat, a valve in said seat, and a dash-pot, also on the cylinder-head, connected to the valve, said cover being provided with a hand-hole, and a cover therefor, whereby access may be obtained to the valve and dash-pot connection, substantially as described.

7. The combination of a valve and stem, a pawl operatively connected to said stem, a sleeve on the stem, a connecting-rod for moving said sleeve, pawl, and valve in one direction, a second sleeve on the stem operatively connected to the governor, a cam on said sleeve, a trip-toe adjacent to said sleeve and adapted to be moved by the cam, the toe and pawl being connected by a shaft 35, so as to move together, and means for reversing movement of the valve when said trip is operated, substantially as described.

480,946. STEAM-ENGINE. JOHN C. HENDERSON, New York, and FREDERICK A. PHELPS, Jr., Schenectady, assignors to the Edison General Electric Company, New York, N. Y. Filed Oct. 26, 1891. Serial No. 409,905. (No model.)

480,947. ELECTRICAL PRESSURE-INDICATOR. JOHN W. HOWELL, Newark, N. J., assignor to the Edison General Electric Company, New York, N. Y. Filed Jan. 2, 1892. Serial No. 416,791. (No model.)

Claim.—1. An indicator having a resistance sensitive to changes of current and having another such resistance normally not in use, but reserved as a test-resistance, and a switch constructed to throw either one of these resistances in circuit and at the same time to change the galvanometer-contact from one point of connection to another, as described.

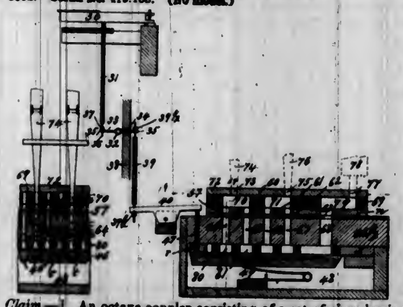
2. The combination, in an indicator of the character described, of a galvanometer, two adjustable galvanometer-contacts making contact at different points, and a work and a test resistance, one of said contacts being for the work-resistance circuit and one for the test-resistance circuit, substantially as described.

3. In an indicator of the character described, having two resistances sensitive to current changes, the combination, with said resistances, of a galvanometer and a switch constructed to throw one or the other resistance in circuit and at the same time to open and close the galvanometer-circuit, the changes being made in the order described.

4. The combination, in an indicator, of a conductor subject to changes of resistance and a practically constant resistance in one side of a Wheatstone bridge, two constant resistances in the other side of the bridge, a current-indicator connected between the two sides, an adjustable galvanometer-contact in use with the first-mentioned conductor, a constant test-conductor, means for substituting it for the changeable conductor, and an adjustable contact device in use with the test-conductor, substantially as described.

5. The combination, in an indicator having resistances sensitive to changes of current, of a work-lamp forming one of said resistances, a test-lamp normally out of use forming a second resistance, and two sockets for said lamps, each adapted to receive its lamp, but not to receive the other, substantially as described.

480,948. SNAP-SWITCH. JOSEPH HUTCHINSON, New York, N. Y., assignor to the Edison General Electric Company, same place. Filed Jan. 12, 1891. Serial No. 377,408. (No model.)



Claim.—1. A circuit making and breaking switch having a circular track with a series of double inclines, contacts in the alternate depressions, and one end of each contact being in the form of a free spring formed by the inclines, said contacts being fitted onto the two inclined faces of the depressions, and a rotary cross-arm movable over the inclines for connecting said contacts, substantially as described.

2. The combination, in a circuit making and breaking switch, of a circular track having a series of double inclines and contacts in the alternate depressions formed by said inclines, said contacts covering a portion of one incline and one end of each contact being in the form of a free spring and all of the opposite inclines, substantially as described.

3. The combination, in a circuit making and breaking switch, of a circular track for a switch-arm, having a series of double inclines, and contact-plates in the alternate depressions formed by said inclines, one end of each of said contact-plates being in the form of a spring, substantially as described.

480,949. PIPE-ORGAN. RICHARD W. JACKSON, Chester, Ill., assignor to the Jackson Pipe Organ Company, same place. Filed Jan. 25, 1892. Serial No. 419,163. (No model.)

Claim.—1. An octave-coupler consisting of a set of pipes having the octaves of any pipe grouped together, with air communication between the adjoining octaves, whereby when any pipe is caused to speak its octave or octaves also will respond.

2. An octave-coupler consisting of a set of pipes having air communication between the adjoining octaves and partitions for preventing any other pipes than the said octaves from responding.

3. An octave-coupler consisting of a set of pipes having the octaves of any pipe grouped together, with diagonal grooves between the adjoining octaves, whereby when any pipe is caused to speak its octave will respond.

4. An octave-coupler consisting of a set of pipes having the octaves of any pipe grouped together, with diagonal grooves between the adjoining octaves, and means for preventing any other pipes than the said octaves from responding.

5. An octave-coupler consisting of a set of pipes having the octaves of any pipe grouped together, with diagonal grooves between the adjoining octaves, and partitions for preventing any other pipe than the said octaves from responding.

6. A pipe-organ having a set of pipes common to two stops or slides representing different qualities of tones of the organ and means for affording air communication between the octaves of one stop and the octaves of another stop.

7. A pipe-organ having a set of pipes common to two stops or slides representing different qualities of tones of the organ, the pipe or pipes of any note and its octaves being grouped together, and means for affording communication between the octaves of one stop and the octaves of another stop.

8. A pipe-organ having a set of pipes common to two stops or slides representing different qualities of tones of the organ, the pipe or pipes of any note and its octaves being grouped together, and diagonal grooves for affording communication between the octaves of one stop and the octaves of another stop.

9. A pipe-organ having a set of pipes common to two stops or slides, with air communication between the octaves of one stop or slide and the adjoining octaves of another slide, valves operated by the keys, controlling the admission of air to the pipes, and means for preventing the indiscriminate speaking of the pipes when the keys are actuated.

10. A pipe-organ having a set of pipes common to two stops or slides, means for affording air communication between the octaves of one stop and the octaves of another stop, valves operated by the keys, controlling the admission of air to the pipes, and longitudinal partitions interposed between the said valves and slides.

11. A pipe-organ having a set of pipes common to two stops or slides, the pipe or pipes of any note and its octaves being grouped together, means for affording communication between the octaves of one stop and the octaves of another stop, valves operated by the keys, controlling the admission of air to the pipes, and longitudinal partitions interposed between the said valves and slats.

12. A pipe-organ having a set of pipes common to two stops or slides, diagonal grooves affording communication between the octaves of one stop and the octaves of another stop, valves operated by the keys, permitting the admission of air to the pipes, and longitudinal partitions interposed between the said valves and slides.

13. In a pipe-organ, a partitioned valve-seat, substantially as and for the purpose described.

14. An organ having the octaves of the pipe or pipes of the different qualities of tones and notes arranged in groups, those of the same pipe and its octaves being arranged in the same group, whereby economy of space is secured.

15. An organ having the pipe or pipes of the different qualities of tones and notes and their octaves of the chromatic scale arranged in groups alternately at opposite sides of the organ, whereby economy of space is secured.

16. An organ having the rollers or rock-shafts of the roller-board corresponding to the different keys arranged to bring the valves corresponding to the octaves of any note together in groups.

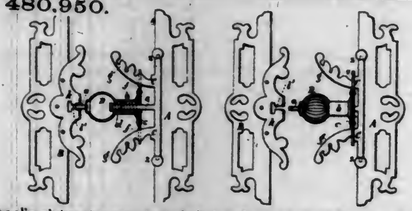
17. An organ having the rollers or rock-shafts of the roller-board corresponding to the different qualities of tones and notes and their octaves of the chromatic scale arranged to bring the valves corresponding to the octaves of any notes together in groups alternately on opposite sides of the organ.

18. An organ having the rollers or rock-shafts of its roller-board composed of metal tubes, with a plug in the ends thereof and a journal-pin extending from said plug, substantially as and for the purpose set forth.

19. In a pipe-organ, a rotary valve 82, having suitable perforations, substantially as and for the purpose described.

20. The combination, with the slides of an organ, of two stops for each slide, each of which stops is positively connected together and is pushed in or out by operating the other and left in whatever position it is placed by the operation of the other, and connections intermediate the stops and slides, for the purpose described.

21. The combination, with the slides of an organ, of two stops for each slide, a T-lever for each set of stops, to an arm of which T-lever each of the stops is respectively connected, and connections from the third arm of the T-lever to the slides, substantially as and for the purpose set forth.



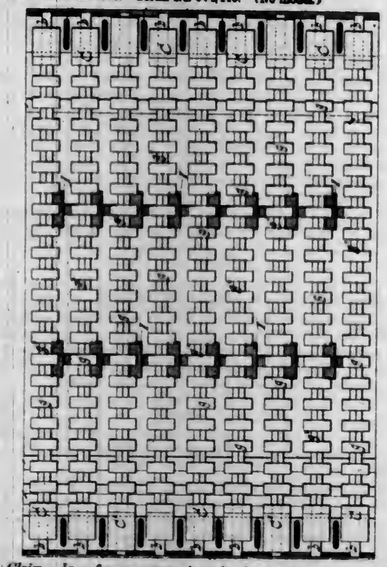
22. In an organ, the combination of a bellows, means for actuating the same, an inflatable storage-reservoir, and a plurality of pipes connecting the storage-reservoir with the bellows at different points, whereby vibration of the storage-reservoir is prevented.

23. In an organ, the combination of a bellows and foot means or treadles for actuating the same by suitable connections, an inflatable storage-reservoir at the bottom of the organ beneath the bellows, and means for affording air communication between the said bellows and reservoir and between the latter and the wind chest.

480,950. ALBUM-CLASP. JOHN C. KOCH, Berlin, Germany. Filed Oct. 14, 1889. Serial No. 326,939. (No model.) Patented in Germany May 3, 1889, No. 49,743

Claim.—1. The combination, in a clasp for albums, books, &c., of two clip plates, one of which is provided with locking projections, a swinging clasp, hinges by which the swinging clasp is connected to the other clip-plate, a rotary locking bolt wider in one direction than the other and connected to the swinging clasp, and a thumb-piece by which the locking-bolt can be partially rotated to engage the projections on

480,950.

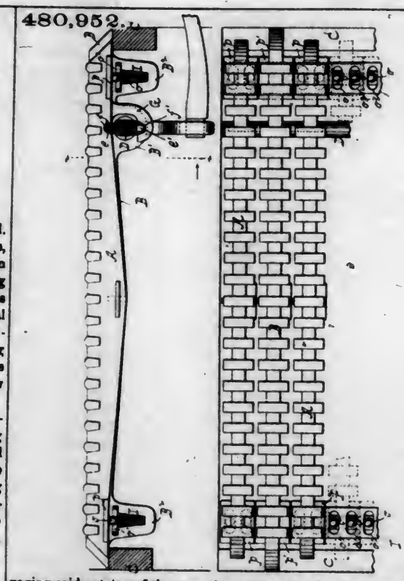


the clip-plate or to separate the bolt therefrom, substantially as specified.

2. The combination, in a clasp for albums, books, &c., of clip-plates, one of which is provided with locking projections, a swinging clasp in the form of an open bow, guide-cylinders for the ends of the swinging clasp, springs within the same, and two hinges for connecting the parts to the other clip-plate, a locking-bolt passing through a cylindrical opening in the swinging clasp, a thumb-piece at one end of the locking-bolt by which it may be partially revolved, said locking-bolt being wider in one direction than the other for engaging the projections upon the clip-plate, and a spring to act on the locking device and draw the covers toward each other, substantially as set forth.

3. The combination, in a clasp for albums, books, &c., of the clip-plates, one of which is provided with locking projections, a swinging clasp hinged to the other clip-plate, a locking device movable toward and from the hinge and having interlocking parts that are wider in one direction than the other, a thumb-piece connected with the locking device for partially rotating the same to engage or disengage the locking devices, a cylinder supporting the locking device, and a spring to act on the locking device and draw the covers toward each other, substantially as specified.

480,951. FURNACE-GRATE. JOHN L. MASON, Brooklyn, N. Y. Filed Dec. 12, 1890. Serial No. 374,440. (No model.)



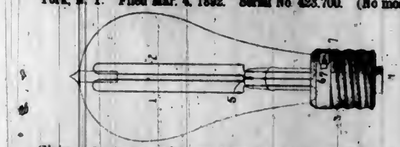
Claim.—In a furnace-grate, bars having on their upper edges a series of transverse teeth projecting beyond the sides thereof and at a point below said teeth blades or wings with beveled upper edges, said blades or wings upon one bar being horizontal and on the next bar vertical, with their contiguous edges in close proximity, thereby forming spacing-lugs, substantially as set forth.

480,952. FURNACE-GRATE. JOHN L. MASON, Brooklyn, N. Y. Filed Aug. 7, 1891. Serial No. 401,965. (No model.)

Claim.—1. In a furnace-grate, the combination of longitudinally-movable grate-bars having alternately a notch in the lower edge thereof and a pendent hook-shaped arm with a notch in its upper edge, the rocking cross-bar having upwardly and downwardly projecting lugs, the former engaging said notches of the grate-bars and the latter engaging said notches of the arms thereof, the fixed grate-bars supporting the rocking cross-bar and also the stationary cross-bars, and the laterally-contacting base-plates of the movable and fixed grate-bars, said plates of the movable grate-bars resting on said balls of the stationary cross-bars, substantially as herein described.

480,952.

3. In a furnace-grate, the combination of longitudinally-movable grate-bars having alternately a notch in the lower edge thereof and a pendent hook-shaped arm with a notch in its upper edge, the rocking cross-bar having upwardly and downwardly projecting lugs, the former engaging said notches of the movable grate-bars and the latter engaging said notches of the arms thereof, the two stationary cross-bars, each having on its upper part the transverse grooves, the balls fitted loosely in said grooves of the stationary bars, the fixed grate-bars supporting the rocking cross-bar and also the stationary cross-bars, and the laterally-contacting base-plates of the movable and fixed grate-bars, said plates of the movable grate-bars resting on said balls of the stationary cross-bars, substantially as herein described.

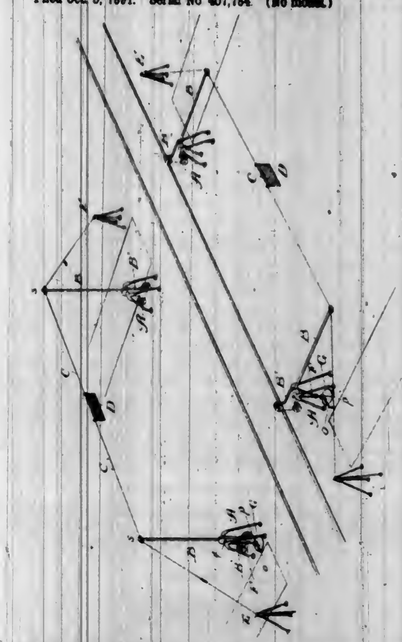


480,958. PICTURE-FRAME. JOHN MAURHOFER, New York, N. Y. Filed Mar. 1, 1892. Serial No. 423,391. (No model.)

Claim.—1. A picture-frame composed of an exterior molding having an overlapping flange, an interior molding, and a panel clamped between said moldings and provided with an overlapping flange, said panel being covered with a suitable fabric.

2. A picture-frame composed of an exterior molding having an overlapping flange, an interior molding, and a panel clamped between said moldings and provided with an overlapping flange, said panel being covered with a suitable fabric overlapping the edges of the panel and being retained by the moldings.

480,954. INCANDESCENT ELECTRIC LAMP. GEORGE F. MELIOR, Metuchen, N. J., assignor to the Edison General Electric Company, New York, N. Y. Filed Mar. 4, 1892. Serial No. 423,700. (No model.)

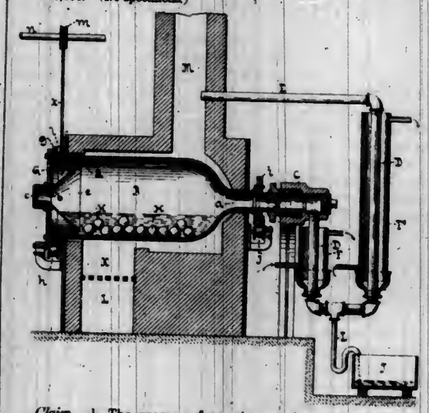


Claim.—1. An incandescent lamp having several filaments connected in series, the two ends of the connected filaments being permanently connected to the lamp-terminals, and a short-circuiting switch for one of said filaments, substantially as described.

2. An incandescent lamp having several filaments connected in series and a short-circuiting switch mounted on a metal sleeve on the base of the lamp, substantially as described.

3. An incandescent lamp having several filaments connected in the same circuit, one of said filaments being connected to a metal sleeve on the base of the lamp, the opposite terminal being connected to an insulated contact, and a switch device adapted to connect said contact with the sleeve, thereby short-circuiting said filament, substantially as described.

4. An incandescent lamp having two filaments in series, one end of one filament being connected to a metal sleeve on the base of the lamp, forming one lamp-terminal, one end of the other filament being connected to a lamp terminal or contact, the other two limbs of the filaments being connected to an insulated contact, and a switch device adapted to connect said contact with one of the lamp-terminals, substantially as described.

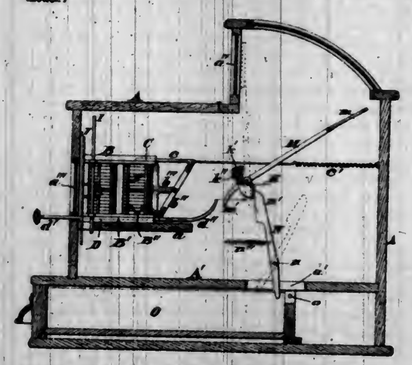


480,955. RAILWAY-GATE. MORTIMER B. MILLS, Chicago, Ill. Filed Oct. 5, 1891. Serial No. 407,784. (No model.)

Claim.—1. A railway-gate comprising standards on opposite sides of the roadway, arms connected with each other and pivoted in the standards, respectively, to rise and fall parallel with each other, and cables extending from each arm laterally to a point beyond the standard, substantially as described.

2. A railway-gate comprising, in combination, the standards A located, respectively, on opposite sides of the roadway, the standards E, adjacent to standards A, gate-arms B, pivoted in the standards A, respectively, and having the weighted lower ends B', cable C, carrying the sign D and connecting the extremities of the arms B, the cables C', connecting the extremities of each arm with the standards E, and gate-arm-operating mechanism, such as the pneumatic pump K, rod F, connected to the arm, and intermediate mechanism, substantially as described.

480,956. PROCESS OF TREATING BASE-BULLION AMALGAM. BERNARD MOSHUS, New York, N. Y. Filed Dec. 31, 1891. Serial No. 416,663. (No specimens.)



Claim.—1. The process of treating amalgam of the character specified, which consists in charging the same into an apparatus for distilling off and collecting the mercury and subjecting the heated charge to a comminuting action, while at the same time oxidizing the base metals by a current of air.

2. The process of treating amalgam of the character specified, which consists in charging the same into an apparatus for distilling off and collecting the mercury, subjecting the heated charge to a comminuting action, while at the same time oxidizing the base metals by a current of air, and leaching the finely-divided residue substantially as specified.

3. The process of treating amalgam of the character specified, which consists in charging the same into an apparatus for distilling off and collecting the mercury, subjecting the heated charge to a comminuting action, while at the same time oxidizing the base metals by a current of air, and leaching the finely-divided residue by sulphuric acid, substantially as specified.

480,957. CASH REGISTER AND INDICATOR. EDWIN H. MURDOCK, Cincinnati, Ohio. Filed Apr. 23, 1892. Serial No. 430,311. (No model.)

Claim.—1. The within-described method of counting, which method consists in inserting two independent columns of caged and numbered checks side by side within a housing and simultaneously shifting the end check of each column laterally and in opposite directions, whereby the checks are continuously moved forward in an endless circuit and without removing either of them bodily from said housing, substantially as herein described.

2. The within-described method of counting, which method consists in inserting two independent columns of caged checks within a housing, providing a special check, and shifting the checks from one column to another, whereby said special check is caused to indicate its movements on a numbered strip, substantially as set forth.

3. The within-described method of counting, which method consists in inserting two independent columns of caged checks within a housing, providing a special check capable of operating a registering device, and shifting the checks from one column to another, whereby the same pieces are used continuously without removal and the special check is caused to make a record every time it traverses said columns, substantially as set forth.

4. The within-described method of counting, which method consists in inserting two independent columns of caged checks within a housing, providing a special check capable of operating an escapement and registering-bar, and shifting the checks from one column to another, whereby the same pieces are used continuously without removal, and the special check is caused to shift said bar a certain distance every time it traverses the ascending or descending column, substantially as set forth.

5. The combination, in a counting and registering apparatus, of a housing inclosing two independent columns of caged checks, a special notched check F f', inserted in each column, an adjustable escapement G g g', operated by said notched checks, a toothed and numbered registering-bar I i, supported by said escapement, a rigid strip J, carried by a slide, to which said escapement is pivoted, and a pair of reversely-acting coupled slides C D for shifting the upper and lower checks in the manner described, said strip J being provided with a double set of numbers, arranged as herein stated.

6. The combination, in a counting and registering apparatus, of an upper head B and lower head B', united by suitable connections, slides C D, fitted within said heads and so coupled together as to act reversely, and a spring *e*, attached to said lower head and adapted to elevate a column of checks or counters, as herein described.

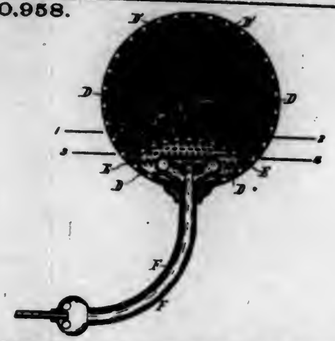
7. The combination, in a cash indicator and register, of the cage B B' B", two independent columns of counters inserted within said cage, slides C D, fitted within the heads B B' thereof and so coupled together as to act reversely, a projection *d"* at the rear end of the slide D, and a swinging tablet-stem M, having a short arm *m'*, adapted to be struck by said projection *d"*, for the purpose described.

8. The combination, in a cash indicator and register, of a rocking bar K, journaled in the sides of the case and having pivoted to it the tablet-stems M, said bar being provided with a bearing *l'* for each stem, as herein described.

9. The combination, in a cash indicator and register, of a column of shiftable counters, a special check inserted in said column, and an adjustable numbered slip, said numbers being in duplicate and each of them occupying the space of one counter, for the purpose described.

10. A registering apparatus provided with two independent columns of checks or counters and devices that shift them in such a manner as to compel one column to ascend and the other to descend, substantially as described.

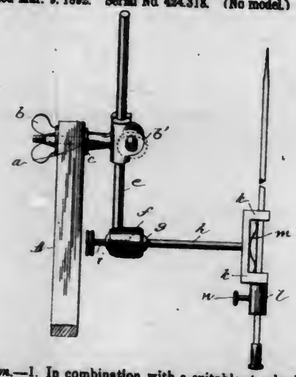
11. A registering apparatus provided with two independent columns of checks or counters, devices that shift them in such a manner as to compel one column to ascend and the other to descend, and a registering appliance automatically operated at regular intervals, substantially as described.



12. A registering apparatus provided with two independent columns of checks or counters, devices that shift them in such a manner as to compel one column to ascend and the other to descend, a registering appliance automatically operated at regular intervals, and an adjustable strip provided with a duplicate set of numbers, substantially as herein described.

480,958. APPLIANCE FOR VENTILATING SEWERS, &c. ROBERT MCKENZIE, Sydney, New South Wales. Filed Mar. 26, 1892. Serial No. 426,517. (No model.) Patented in New South Wales Mar. 21, 1891, No. 2,873; in Victoria Apr. 15, 1891, No. 3,656; in Queensland July 31, 1891, No. 1,815, and in South Australia Aug. 4, 1891, No. 2,001.

Claim.—1. In combination with an uptake-shaft from a sewer, a globular perforated shell located in said uptake-shaft and provided with a perforated partition to form a chamber between said partition and the wall of the shell, an incombustible filling for said shell above said partition, and a burner located in said chamber, formed between the perforated partition and the shell, substantially as and for the purpose described



2. In combination with an uptake-shaft from the sewer, a perforated shell located in said uptake-shaft and provided with a perforated partition to form a chamber between said partition and the wall of the shell, an incombustible filling to said shell above said partition, a removable lid to said shell, constituting a part of the wall thereof, and a burner located in the chamber, formed between the perforated partition and the wall of the shell, substantially as and for the purposes described.

480,958.

3. In combination with the take-up shaft having an enlargement C and an opening in one side of said enlargement for the introduction of a combustion-shell, a perforated shell located in said enlargement and having an incombustible filling and a chamber for a burner, a burner located in said chamber, and means for closing the opening in the side of the enlargement to the take-up shaft, substantially as and for the purposes described.

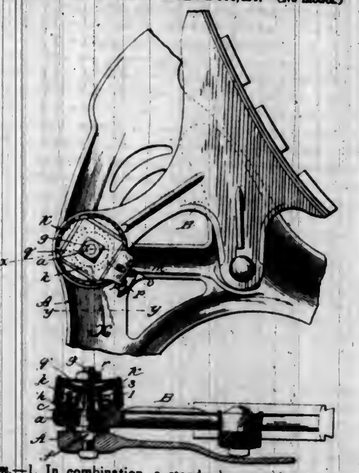
480,959. SURFACE-GAGE. CONTENTO NERI, Friendship, Me. Filed Mar. 9, 1892. Serial No. 424,318. (No model.)

Claim.—1. In combination with a suitable standard, a socket, a stem having a ball connection therewith, a holder carried by the stem, and a needle or pointer carried by the holder, substantially as described

2. In combination, a standard, a socket, a stem having a ball connection therewith, a holder carried by said stem, and a needle adjustably supported by said holder, substantially as described.

3. In combination with a standard, a holder, universally-adjustable connections between said standard and the holder, and a needle carried by said holder adjustable therein, substantially as described.

4. In combination with a standard, a holder, a needle adjustably held therein, a stem carrying said holder, a clamp carried by the standard, and a ball-and-socket connection between said clamp and stem adjustably supported by the clamp, substantially as described.



480,960. COIN-HOLDER. GERALD DE C. O'GRADY and JOHN R. COLLINS, Toronto, Canada. Filed Dec. 9, 1891. Serial No. 414,463. (No model.) Patented in Canada Nov. 26, 1891. No. 37,851.

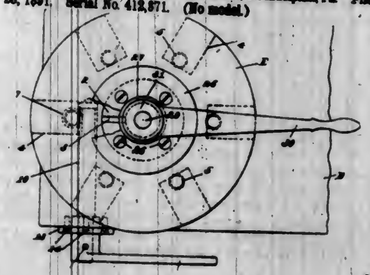
Claim.—1. A coin-holder formed of sheet metal having curved sides and flat ends, with a tongue on one end, a bent-over portion A on the upper end of one of the sides, and with a slit in the end of the side adjacent to the tongue beneath the bent-over portion, fitted to receive said tongue, substantially as described.

2. A coin-holder formed of sheet metal having curved sides and flat countersunk ends and with a connecting device, substantially as described.

480,961. TILTING SEAT. SEYMOUR W. PERRIGINE, Grand Rapids, Mich. Filed Apr. 25, 1891. Serial No. 390,459. (No model.)

Claim.—1. In combination, a standard, a seat-bracket hinged thereto, a coiled spring surrounding the bolt of said hinge, and a cap inclosing the spring and connected to the standard independently of the pivotal bolt, one end of said spring being connected to the seat-bracket and the other end to the cap, substantially as described.

2. In combination, a standard, a seat-bracket hinged thereto, a coiled spring surrounding the bolt of said hinge, and a cap inclosing the spring and adjustably secured to the standard independently of the pivotal bolt, one end of the spring being connected to the seat-bracket and the other to the cap, substantially as described.



3. In combination, a standard, a seat-bracket hinged thereto, a coiled spring surrounding the pivot, a cap inclosing said spring and having slight lateral movement, and a loose connection between the cap and standard permitting lateral movement of said cap without disengaging its connection with the standard, the spring being connected to the seat-bracket at one end and to the cap at the other, substantially as described.

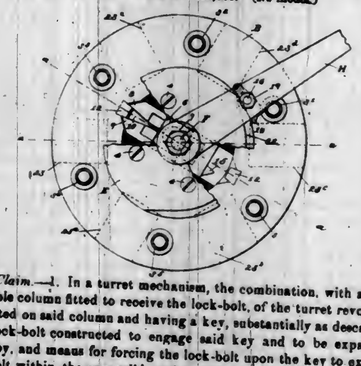
4. In combination, a standard, a seat-bracket hinged thereto, a coiled spring surrounding the pivot, a cap inclosing said spring, one end of the spring being connected to the seat-bracket and the other to the cap, an extension on the cap having its end toothed, and a notch in the standard adapted to be engaged by said teeth, substantially as described.

5. In combination with the standard, a seat-bracket pivoted upon a stud supported from the standard, a pivotal bolt passing through said standard and stud, a cap inclosing the end of said pivot-bolt, a spring between said cap and the seat-bracket, and means for securing said cap to the bolt, said cap and spring being located between the seat-bracket and the end of the bolt and removable without displacing the connections between the seat-bracket and standard, substantially as described.

6. In combination with the standard and seat-bracket, a pivotal bolt, a cap having a hollow stud, through which the pivot-bolt is passed, a spring at the hinge, inclosed within the cap between its outer wall and its hollow stud, and means for securing the cap, substantially as described.

480,962. TURRET-CLAMPING DEVICE. FRANCIS H. RICHARDS, Hartford, Conn., assignor to Walter Wood, Philadelphia, Pa. Filed Nov. 23, 1891. Serial No. 412,871. (No model.)

Claim.—1. In a turret mechanism, the combination, with an expansible column fitted to receive the lock-bolt, of the turret revolubly mounted on said column and having a key, substantially as described, the lock-bolt constructed to engage said key and to be expanded thereby, and means for forcing the lock-bolt upon the key to expand the bolt within the expansible column, whereby the turret is simultaneously locked and clamped, substantially as described.



2. In a turret mechanism, the combination, with the expansible column constructed to receive the lock-bolt, of the turret revolubly mounted on said column and having a lock-bolt-expanding key, the lock-bolt constructed to engage said key and be expanded thereby, a shaft having a crank engaging the lock-bolt and standing adjacent to the dead-center when the turret is locked, and means for turning said shaft to engage and disengage the lock-bolt with and from said key, whereby the turret is simultaneously locked and clamped and the lock-bolt frictionally held from retraction, substantially as described.

3. In a turret mechanism, the combination, with the expansible column fitted to receive the lock-bolt, of the turret revolubly mounted on said column and having a series of wedge-shaped keys, the expansible lock-bolt constructed at one end to engage said key and at the other end having a stop, substantially as described, and means for first actuating said bolt to withdraw the same from one of said keys and afterward to turn forward the turret and bring said stop into engagement with another of said keys, substantially as described.

4. In a turret mechanism, the combination, with the expansible column constructed to receive the lock-bolt, of the turret revolubly mounted on said column and having a lock-bolt-expanding key, the lock-bolt fitted to slide in said column to engage said key and be expanded thereby, the cap fixed to the column for retaining the turret thereon, and the crank-shaft journaled in said cap and having a crank-pin engaging the lock-bolt to slide the same from and into engagement with said key, and means for turning said shaft, substantially as described.

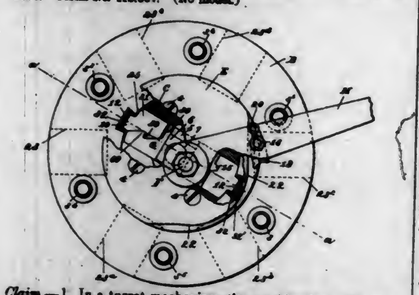
5. In a turret mechanism, the combination, with the expansible column constructed to receive the lock-bolt, of the turret revolubly mounted on said column and having keys, substantially as described, the lock-bolt fitted to slide in said column from and into engagement with said keys, a series of studs on the turret corresponding to said keys, the lever carrying a pawl adapted to engage said studs for turning the turret, and means, substantially as described, intermediate to the lever and lock-bolt and constructed to withdraw said bolt from the

480,963. TURRET MECHANISM FOR LATHES. FRANCIS H. RICHARDS, Hartford, Conn., assignor to Walter Wood, Philadelphia, Pa. Filed Nov. 23, 1891. Serial No. 412,866. (No model.)

Claim.—1. In a turret mechanism, the combination, with an expansible column fitted to receive the lock-bolt, of the turret revolubly mounted on said column and having a key, substantially as described, the lock-bolt constructed to engage said key and to be expanded thereby, and means for forcing the wedge to expand the column within the turret, whereby the turret may be clamped and unclamped, substantially as described.

2. The combination, with an expansible column, substantially as described, of the turret mounted on said column to normally turn freely thereon, a column-expanding wedge fitting in the column radially thereof, and means for forcing the wedge outwardly to expand the column within the turret, whereby the turret may be clamped and unclamped, substantially as described.

3. The combination, with an expansible turret-carrying column slotted on one side thereof and constructed to carry the wedge 33, of the turret mounted on said column to normally turn freely thereon, the wedge 33, fitting in the column and constructed to expand the column on the outward movement thereof, a cam bearing against said wedge, and means for operating the cam to actuate the wedge, substantially as described.



4. The combination, with an expansible turret-carrying column, of the turret mounted on said column to normally turn freely thereon and column-expanding means for expanding the column within the turret, whereby the turret may be clamped, substantially as described.

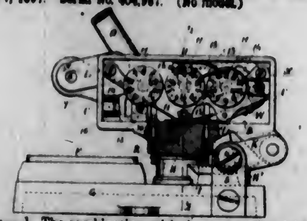
key prior to the engagement of the pawl with a turret-stop, substantially as described.

6. In a turret mechanism, the combination, with the expansible column constructed to receive the lock-bolt, of the turret revolubly mounted on said column and a column-expanding lock-bolt engaging the turret to lock the same from rotation, substantially as described.

7. In a turret mechanism, the combination, with the revoluble turret having a series of studs, substantially as described, of the cap having the cam-face, the lever, the pawl carried on said lever and adapted to engage said studs, and means for swinging the pawl into working position against said cam-face, substantially as shown and described.

480,964. TURRET MECHANISM. FRANCIS H. RICHARDS, Hartford, Conn., assignor to Walter Wood, Philadelphia, Pa. Filed Nov. 23, 1891. Serial No. 412,867. (No model.)

Claim.—1. In a turret mechanism, the combination, with an expansible column fitted to receive the lock-bolt and its slide, of the turret revolubly mounted on said column and having lock-bolt notches, the lock-bolt constructed to engage said turret-notches and having an incline, the slide engaging the lock-bolt by said incline, and means actuating the slide to force the lock-bolt into engagement with the turret and expand the column, whereby the turret is simultaneously locked and clamped, substantially as described.



2. In a turret mechanism, the combination, with the expansible column fitted to receive the lock-bolt and lock-bolt slide, of the turret revolubly mounted on said column and having the lock-bolt notches, the lock-bolt slide supported in the column and having an incline and a hook, substantially as described, the lock-bolt having a corresponding incline and a hook engaging the hook of the slide, and means actuating the slide to force the lock-bolt into engagement with the turret and expand the column and to retract the slide for withdrawing the lock-bolt by the engagement of said hooks, substantially as described.

3. In a turret mechanism, the combination, with the expansible column C and the turret revolubly mounted thereon, of the lock-bolt having the incline and the hook 50 and the slide having the corresponding incline, and the hook 60, engaging said lock-bolt hook, substantially as described.

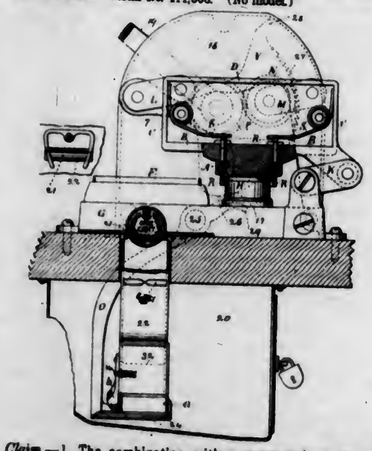
4. In a turret mechanism, the combination, with the expansible column fitted to receive a lock-bolt and with a turret revolubly on said column, of a lock-bolt consisting of two parts and expansible within the column by the movement of one part relatively to the other part, substantially as described

---

480,965. REGISTERING-STAMP. HENRY W. ROSENBAUM and ERNST NEUBERT, New York, N. Y., assignors to said Rosenbaum. Filed Sept. 7, 1891. Serial No. 404,967. (No model.)

Claim.—1. The combination, with the stamp, of a yielding guard, means for projecting the guard beyond the face of the stamp, a registering apparatus, and mechanism for giving motion to the registering apparatus by the movement of the guard, substantially as set forth.

2. A box and a stamp permanently connected thereto, a tubular guard surrounding the stamp and having pushers passing into the box, springs for projecting the tubular guard, registering mechanism within the box, and a rocker or pawl for giving motion to the registering mechanism, such rocker being moved by the action of the tubular guard when the stamp is impressed, substantially as set forth.



3. The combination, with the stamp and the box with which it is connected, of a registering mechanism within the box, a yielding guard and means for projecting the same beyond the face of the stamp and a connection from the guard to the registering mechanism, and a locking mechanism brought into action by the registering mechanism for holding the guard in a projected condition, substantially as specified.

4. The combination, with the stamp and the box to which the stamp is connected and the registering mechanism within the box, of a tubular guard surrounding the stamp and a connection therefrom to the registering mechanism for giving motion to the same when an impression is made, a bed and projections therewith connected, an inking-pad and an impression-pad, toggle-links pivoted at their ends, respectively, to the box and to the projections of the bed, a lever for giving motion to the toggle-links, and a spring for returning the parts to their normal positions, substantially as set forth.

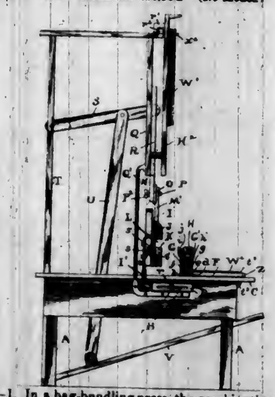
5. The combination, with the stamp, of a guard and means for projecting the guard beyond the face of the stamp, a registering apparatus and mechanism for giving motion to the registering apparatus by the movement of the guard, and a locking device brought into action by the registering mechanism for holding the guard, substantially as specified.

6. The combination, with the stamp, of a box with which the stamp is connected, a registering mechanism within the box and mechanism for moving the register each impression of the stamp, and a lock brought into action by the register for holding the parts that are moved by the impression of the stamp so as to prevent the use of the stamp after a designated number of impressions, substantially as specified.

480,966. COIN-ACTUATED STAMP. HENRY W. ROSENBAUM and ERNST NEUBERT, New York, N. Y., assignors to said Rosenbaum. Filed Nov. 14, 1891. Serial No. 411,863. (No model.)

Claim.—1. The combination, with a stamp and mechanism for moving and impressing the same, of a coin-actuated lever and a segmental cam-rack acted upon by the coin-lever for holding the parts in position and preventing the impression of the stamp until the lever is acted upon by a coin, substantially as set forth.

2. The combination, with a stamp, the inking-pad, and the impression-pad, of a tubular guard around the stamp, springs for moving the same downwardly, toggle-links, and an actuating-lever for moving the stamp, a segmental cam having rack-teeth and a finger, a coin-slide and a coin-lever having a pan for the reception of the coin, and a pawl acting in connection with the segmental cam and rack, substantially as and for the purposes set forth.



3. The combination, in a coin-actuated machine, of a coin-receiving slide, a coin-lever, with a pan for the reception of the coin, and a stationary projection at a slight distance above the coin-pan and beneath which the pan is free to swing when empty or with but one coin, so that the coin-lever is not stopped in its free movement until a second coin is received upon the first coin, substantially as set forth.

4. The combination, in a coin-actuated mechanism, of a coin-lever having a pan upon which the coin or coins fall flatwise, a coin-slide, with a slot for the reception of the coin, and a fixed discharge-finger over the pan and at one side of the coins for holding the same as the pan is swung from beneath it, substantially as set forth.

5. The combination, in a coin actuated mechanism, of a stamp, a

lever and connections for moving the same, a segmental cam-rack connected to and moving with the actuating-lever, a coin-lever and pan or receiver for the coin, and a pawl at the upper end of such coin-lever acting in conjunction with the segmental cam and rack, substantially as set forth.

480,967. BAG-BUNDLING PRESS. JOHN SABOLD, Boyertown, Pa. Filed Feb. 4, 1892. Serial No. 420,304. (No model.)

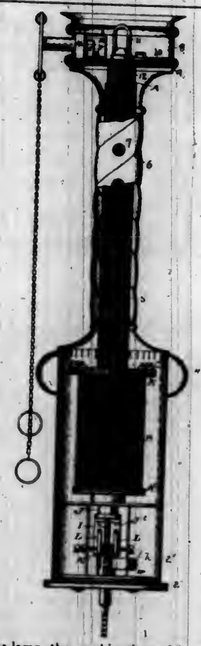
Claim.—1. In a bag-bundling press, the combination of a suitable stand, a movable carriage on which the bags are placed, a back board, side boards, a plunger to press the bags, and standards on the carriage, adjustable by means of a cross-groove in said carriage and suitable locking mechanism and having adjustable extensions with sliding plates to take over the bags and hold them compressed after the plunger has acted.

2. In a bag-bundling press, the combination of a suitable stand, a vertically-reciprocating plunger for pressing the bags, a sliding carriage which takes the bags in and out from under the plunger, a vertical back board having a cross-groove in its front side, and suitable side boards having means of engagement with said cross-groove, and devices for locking them at different adjustments.

3. In a bag-bundling press, the combination of a suitable stand, a movable carriage on which the bags are placed, a back board, side boards, a plunger-head or follower fitting between the side boards and having a stem, a plunger-bar, a flanged plate between the stem and bar, and a bolt passing through the stem, plate, and bar and securing them together.

4. In a bag-bundling press, the combination of a suitable stand, a movable carriage on which the bags are placed, a back board, side boards, a plunger for pressing the bags, a holder for the bundle-wrapper, hinged to the sliding carriage, and means for throwing said holder to a vertical position upon the sliding outward of the carriage.

5. In a bag-bundling press, the combination of a suitable stand, a movable carriage on which the bags are placed, a back board, side boards, a plunger for pressing the bags, a frame hinged to the sliding carriage and supporting the bundle-wrapper, said frame having a projecting arm, and a stationary cam-block in the path of said arm, operating substantially as described.



6. In a bag-bundling machine, the combination of a suitable stand, a movable carriage on which the bags are placed, a back board, side boards, a plunger for pressing the bags, a frame hinged to the movable carriage and supporting the bundle-wrapper and tying-twine, said frame having a projecting arm and notches in its outer edge to receive the ends of the twine, and a stationary cam-block in the path of said projecting arm, operating substantially as described.

480,968. ELECTRIC-ARC LAMP. RUPERT SCHNEBAUER, Paterson, N. J., assignor to the Edison General Electric Company, New York, N. Y. Filed Nov. 24, 1891. Serial No. 412,969. (No model.)

Claim.—1. An electric-arc lamp constructed with a differential solenoid and a suction-core in the same, a carbon-carrying rod passing into said core, and a magnetic friction device, one part of which is connected to the core and one part of which is geared to the carbon-carrying rod for raising the upper carbon and retarding the descent of the same, substantially as set forth.

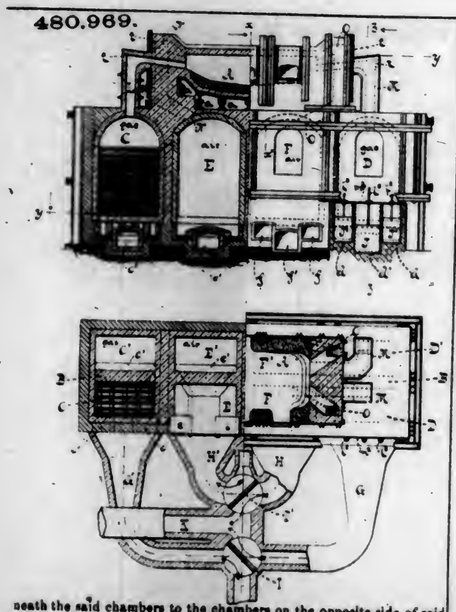
2. In an electric lamp, the combination, with a differential solenoid, of a suction-core in the same, a carbon-holding rack passed into said core, one or more iron disks on which the core or part of the same can act frictionally, and a pinion connected with said disk, which pinion engages the carbon-holding rack, substantially as set forth.

480,968.

3. In an electric lamp, the combination, with a differential solenoid, of a suction-core in the same, an extension on the lower end of the said core, which extension is covered with non-magnetic material, a rotative iron disk with which said extension can come in frictional contact, a pinion connected with said disk, and a carbon-holding rack engaged with said pinion and passing into said core, substantially as set forth.

4. In an electric-arc lamp, the combination, with a central tube, of a differential solenoid formed on the lower part of said tube, a resistance-coil formed on the upper part of said tube, and a second resistance-wire connected with the main wire of the solenoid and wound on said tube, substantially as set forth.

5. The combination, in an arc lamp, of gear for controlling the movable carbon, a solenoid and core for moving the same, a tube above the solenoid, a wire coiled thereon, and a casing for the lamp mechanism, consisting of a large metal tube around the lower part of the mechanism, an enlarged sheet-metal head resting directly on said large tube, the upper end of the head being made approximately the diameter of the tube above the solenoid, a tube fitting the end of the head, a cap fitting the upper end of the last-mentioned tube and containing a suitable disk or cross-piece, and a single screw in said piece and extending into the upper tube of the lamp-body for securing all parts of said casing together, substantially as set forth.



6. In an electric lamp, a carbon-clamp formed of two segmental stamped and punched sheet-metal pieces, of which one is provided with an aperture and the other of which is provided with two apertures, a screw-bolt passed through said two pieces, a nut on said screw, and a body-piece having a hook that is passed through one of the apertures in one of the said segmental pieces, substantially as set forth.

480,969. FURNACE. HEINRICH SCHOENWALDER, Friedenshütte, Germany. Filed Nov. 30, 1891. Serial No. 413,561. (No model.)

Claim.—1. In a regenerative furnace, the combination, with the regenerator-chambers and their roof arches, of a central longitudinal wall subdividing the regenerator-chambers into separate air and gas chambers C C', D D', &c., and centrally supporting the hearth to relieve the arches, a separate flue leading from each of the said chambers to the furnace, and flues G G' and H H', having entrance-ports into the chambers on one side of the partition-wall, and channels leading beneath the said chambers to the chambers on the opposite side of the wall, substantially as described.

2. In a regenerative furnace, a central longitudinal wall subdividing the regenerator-chambers into separate air and gas chambers C C', D D', &c., a separate flue leading from each of said chambers to the furnace, and the flues G G' and H H', having entrance-ports into the chambers on one side of the partition-wall, and channels leading be-

480,969.

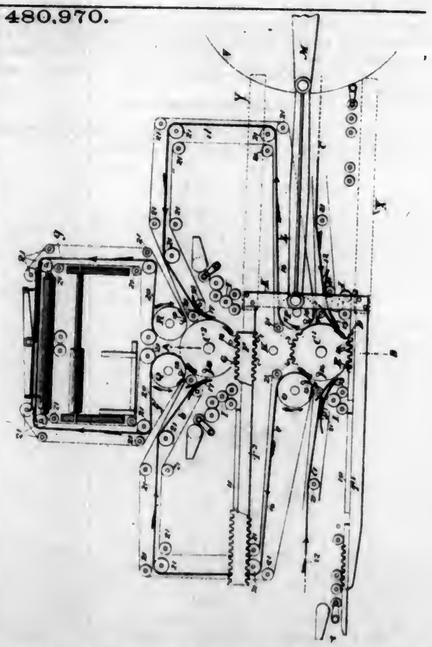
neath the said chambers to the chambers on the opposite side of said wall, substantially as and for the purpose set forth.

3. In a regenerative furnace, a central longitudinal wall subdividing the regenerator-chambers into separate air and gas chambers C C', D D', &c., a separate flue leading from each of said chambers to the furnace, and the flues G G' and H H', having entrance-ports into the chambers on one side of the partition-wall, and channels leading beneath said chambers to the chambers on the opposite side of said wall, the ports and channels from the flues G G' and H H' being diagonally opposite the exit-ports of the flues to the furnace, substantially as described.

4. In a regenerative furnace, the combination of separate air and gas chambers C C', D D', &c., a separate flue leading from each of said chambers to the furnace, flues G G' and H H', having entrance-ports into the chambers on one side of the partition-wall, and channels leading beneath said chambers to the chambers on the opposite side of said wall, air-flues built in the ends of the furnace and leading from the regenerator-chambers to the furnace, and gas-flues built up separate and independent of the furnace, all substantially as described.

5. In a regenerative furnace, a central longitudinal wall subdividing the regenerator-chambers into separate air and gas chambers C C', D D', &c., a separate flue leading from each of said chambers to the furnace, flues G G' and H H', having entrance-ports into the chambers on one side of the partition-wall, and channels leading beneath the said chambers to the chambers on the opposite side of said wall, and a separate damper for each port and channel, substantially as described.

480,970. PRINTING-MACHINE. WALTER SCOTT, Plainfield, N. J. Filed Feb. 10, 1891. Serial No. 380,991. (No model.)



Claim.—1. In a printing-machine, the combination of two reciprocating type-beds, two oscillating impression-cylinders, a sheet-feeding appliance for each cylinder, a sheet-delivery device for the cylinder taking the first impression, and a sheet-carrier between the delivery of the first and the feed of the second impression-cylinder, substantially as described.

2. In a printing-machine, the combination of two reciprocating type-beds, two oscillating impression-cylinders, two sheet-feeding appliances for each impression-cylinder, two sheet-delivery devices for the cylinder taking the first impression, and two sets of sheet-carriers connecting the delivery devices of the first cylinder with the feeding appliances of the second cylinders in pairs, substantially as described.

3. In a printing-machine, the combination of two reciprocating type-beds, two oscillating impression-cylinders, two sheet-feeding appliances, and two sheet-delivery devices for each cylinder, and two sets of sheet-carriers, connecting the delivery devices of the first cylinder and the feeding appliances of the second cylinder in pairs, substantially as and for the purposes described.

4. In a printing-machine, the combination of two reciprocating

480,970.

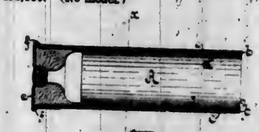
type-beds, two impression-cylinders, two feeding appliances for each cylinder, a pair of delivery-cylinders for each impression-cylinder, and sheet-carriers connecting the delivery-cylinders of the first and the feeding appliances of the second impression-cylinders in pairs, substantially as described.

5. In a printing-machine, the combination of two reciprocating type-beds, two oscillating impression-cylinders, these parts being in pairs one above the other, two feeding appliances and two delivery devices for each cylinder, and two sets of sheet-carriers connecting the delivery devices of the first and the feeding appliances of the second impression cylinder, substantially as and for the purposes described.

6. In a printing-machine, the combination of two reciprocating type-beds, two oscillating impression-cylinders, two feeding appliances, and two delivery devices for each cylinder, two sets of sheet-carriers connecting the delivery devices of the first and the feeding appliances of the second cylinder in pairs, and gearing between one of the type-beds and both the cylinders, substantially as described.

7. In a printing-machine, the combination of two reciprocating type-beds, two oscillating impression-cylinders, their sheet feeding and delivering means, the sheet-carriers, the driving-crank, connecting-rod, and frame connecting the beds together, substantially as described.

8. In a printing-machine, the combination of two reciprocating type-beds, each carrying a printing-surface, an oscillating impression-cylinder coacting with each bed, appliances for supplying sheets to one of the impression-cylinders, and means for carrying the sheets printed on one side to the second impression-cylinder to print the other side, substantially as and for the purposes described.

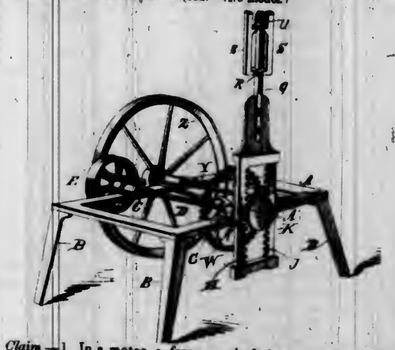


9. In a printing-machine, the combination of two reciprocating type-beds simultaneously moving in one direction, an oscillating impression-cylinder coacting with each bed, appliances for supplying sheets to one of the impression-cylinders, and means for carrying the sheets printed upon one side to the second cylinder, substantially as described.

10. In a printing-machine, the combination of a reciprocating type-bed carrying an inner and an outer form, an oscillating impression-cylinder, devices for delivering the sheets at two points, and sheet-carrying means connected with each delivery and to opposite sides of a folder, whereby the perfected sheets from one delivery enter at one side of the folder and the perfected sheets from the other delivery enter the folder at its other side, both sheets being folded with the same printed side out, substantially as described.

11. In a printing-machine, the combination of two reciprocating type-beds, an oscillating impression-cylinder coacting with each bed, appliances for supplying sheets to one of the cylinders, means for carrying the sheets printed upon one side from the first to the second cylinder, devices for delivering the perfected sheets from the second cylinder, and sheet-carrying means connecting the delivery and a folder whereby the sheets are delivered to the folder, substantially as described.

12. In a printing-machine, the combination of two reciprocating type-beds, an oscillating impression-cylinder coacting with each bed and taking an impression as it moves in each direction, appliances for supplying sheets to one of the cylinders at two points, means for carrying the sheets from the first cylinder and delivering them to the second cylinder at two points, sheet-carrying means connecting from the deliveries of the second cylinder to the opposite sides of a folder, whereby the perfected sheets are folded with the same printed side out, substantially as described.

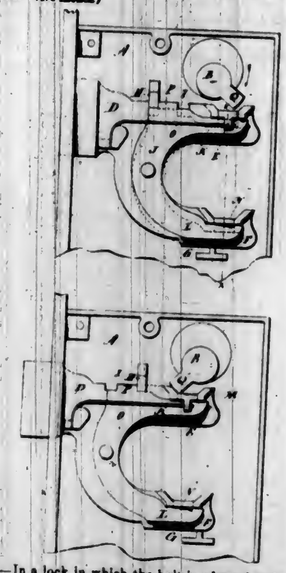


480,971. CARTRIDGE-SHELL. OTTO F. SEIBOLD, Mount Vernon, N. Y., assignor to Henry Hoyt, New York, N. Y. Filed May 7, 1892. Serial No. 432,160. (No model.)

Claim.—1. As a new article of manufacture, a cartridge-shell embodying a foraminous metallic cylinder and an external and internal covering of paper, substantially as described.

2. As a new article of manufacture, a cartridge shell embodying a cylinder of wire-gauze and an internal and external covering of paper, substantially as described.

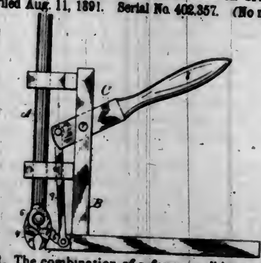
480,972. MOTOR. GEORGE B. SELLERS, Marshalltown, Iowa. Filed Jan. 26, 1892. Serial No. 419,132. (No model.)



Claim.—1. In a motor, a frame, a shaft journaled thereon, two wheels mounted on said shaft to rotate therewith, each having ratchet-teeth on one side thereof, said teeth being reversed on the different wheels, two gear-wheels loosely mounted on said shaft, each having recesses in their sides, with pawls loosely inserted thereon and adapted to engage said ratchet-teeth, and a frame with racks on opposite sides engaging said gear-wheels, said parts being combined substantially as described.

2. A motor consisting of a frame, a shaft suitably journaled on said frame, ratchet-wheels keyed on said shaft, cog-wheels freely mounted on said shaft and having pawls engaging said ratchet-wheels, a frame with racks on its opposite interior faces engaging said cog-wheels, respectively, a staff connected with said rack-frame, and a governor loosely mounted on said staff and adapted to support a wind-wheel, said parts being combined substantially as described.

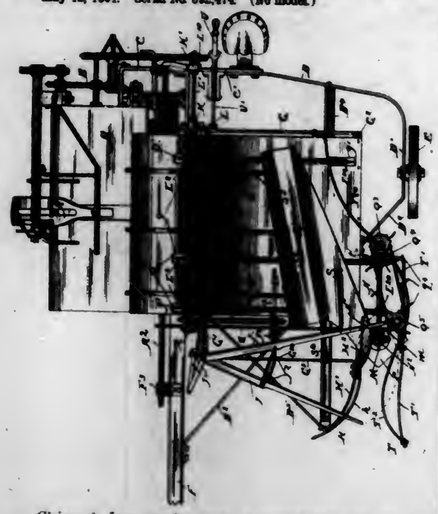
3. A motor consisting of a frame, a shaft journaled thereon, two ratchet-wheels keyed to said shaft and having their teeth in opposite directions, cog-wheels loosely mounted on said shaft, with pawls adapted to engage said ratchet-wheels, a frame with racks on its opposite interior faces engaging said cog-wheels, respectively, a staff connected with said rack-frame and adapted to support a wind-wheel, a second shaft journaled in the frame and having a pinion meshing with a cog-wheel mounted on the first-mentioned shaft so as to rotate therewith, and a balance-wheel on the last-mentioned shaft, said parts being combined substantially as described.



4. A motor consisting of a frame, a shaft journaled thereon, two ratchet-wheels having teeth in opposite directions keyed on said shaft, two cog-wheels loosely mounted on said shaft and having pawls fitted in recesses in their faces engaging said ratchet-wheels, a rising frame with racks on its interior faces engaging said cog-wheels, respectively, a staff connected with said rack-frame, and a rising and falling governor rotatably mounted on said staff and adapted to support the axle of a wind-wheel, said parts being combined substantially as described.

480,973. LOCK. WILLIAM E. SPARKS, New Haven, Conn., assignor to the Sargent & Company, same place. Filed May 2, 1892. Serial No. 431,558. (No model.)

Claim.—In a lock in which the bolt is adapted to be thrown by a cylinder having a talon upon its inner end to engage the bolt, the combination of the bolt constructed with two rearwardly-projecting arms E F, one above the other, and each arm constructed with a transverse recess, a stationary stump in the case, the bolt constructed with a recess I, the ends of which are adapted to engage the corresponding sides of said stump, with a tumbler J constructed with two arms K L, the said arms being an integral part of the tumbler and corresponding to the two arms E F of the bolt and arranged thereon, the two arms of the tumbler each constructed with a projection, respectively, M N, extending into the recesses in the arms of the bolt, one or both of said projections on the arms of the tumbler being adapted for the operation of the talon of the cylinder, while they serve as guides for the vertical movement of the tumbler, and the tumbler constructed with a projection P upon its upper side and in front of the recess I of the tumbler, but the said projection shorter than the said recess, so as to form notches in the bolt forward of and in rear of said projection, substantially as and for the purpose described.



480,974. NAIL-PULLER. CHRISTOPHER M. SPENCER, Windsor, Conn. Filed Aug. 11, 1891. Serial No. 402,357. (No model.)

Claim.—1. The combination of a frame, a slide mounted thereon, a pair of jaws mounted to move with said slide, one of which is provided with a rigid shank, and a lever connected with said shank for operating said jaws, substantially as described, and for the purpose specified.

2. The combination of a frame, a slide mounted thereon, a pair of jaws mounted to move with said slide, a jaw-operating device, and a combined lever and link connected with said jaw-operating device, substantially as described, and for the purpose specified.

480,975. CORN-HARVESTER. ANDREW STARK, Chicago, Ill. Filed May 12, 1891. Serial No. 392,474. (No model.)

Claim.—1. In a corn-harvester, in combination with the main frame and rear-driven binder mounted thereon at the stubbleward side of the drive-wheel, a frame supported on the main frame and movable backward and forward thereon at the grainward side of the drive-wheel, and cutting mechanism mounted on such movable frame, substantially as set forth.

2. In a corn-harvester, in combination with a main frame and a rear-driven binder mounted thereon at the stubbleward side of the drive-wheel, a frame supported on the main frame at the grainward side of the drive-wheel and movable backward and forward with respect to the main frame, and cutting and elevating mechanisms mounted on such movable frame, substantially as set forth.

3. In a corn-harvester, in combination with the main frame and the binder adjustable fore and aft thereon, a frame supported and adjustable fore and aft on the main frame and carrying the cutting mechanism, substantially as set forth.

4. In a corn-harvester, in combination with the cutting mechanism, a stalk-gathering arm projecting forward from the stubbleward side of the cutting mechanism and diverging stubbleward from the line of the cut and open or in skeleton, and a stalk-lifting arm oscillating and reciprocating through the gathering-arm in a plane inclined obliquely rearward and upward from the point of the stalk-gathering arm to the vertical plane of the cutter, substantially as set forth.

5. In a corn-harvester, in combination with the stalk-cutting mechanism, a stalk-gathering arm which projects forward of the same, a pair of stalk-lifting arms pivoted to the frame which carries the cutting mechanism at a point stubblewardly remote from the stalk-gathering arms, and mechanism which operates said stalk-lifting arms with an oscillating and reciprocating movement to thrust them grainwardly past the vertical plane of the gatherer at the forward part thereof and with an upwardly and rearwardly sweeping movement thence to the vertical plane of the cutter and withdraw them thence stubblewardly at the rearward limit of such rearward movement, whereby such stalk-lifting arms each traverse substantially the fore-and-aft space between the stalk-gathering arms, substantially as set forth.

6. In a corn-harvester, in combination with the stalk-cutter, the inclined elevator located rearward from the cutter, and the stalk-guide arm T^9, extending in an oblique direction from a point above the foot of the elevator rearward and stubbleward to guide the heads of the stalks toward the upper end of the elevator as they fall rearward, substantially as set forth.

7. In a corn-harvester, in combination with the cutter and an inclined elevator in the rear thereof, a prostrating mechanism overhanging the lower portion of the elevator and operating obliquely rearward and stubbleward, and the stalk-guiding arm T^9, overhanging the rear portion of the elevator and extending obliquely rearward and stubbleward from the rear end of the prostating mechanism, substantially as and for the purpose set forth.

8. In a corn-harvester, in combination with the stalk-cutter and an elevator located rearward therefrom and inclined stubbleward and upward at right angles to the direction of travel, stalk-prostrating mechanism comprising an endless toothed chain located rearward from the vertical plane of the cutter and at the grainward side of the path of the stalks, and having its stalk-actuating movement in a direction obliquely rearward and stubbleward and at its discharge end overhanging the elevator, substantially as set forth.

480,976. DEVICE FOR SHARPENING RAZORS. EDWARD A. SUTPHEN, Aurora, assignor to himself and Herbert T. Windsor, Chicago, Ill. Filed Aug. 24, 1891. Serial No. 403,629. (No model.)

Claim.—1. The combination, with a rectangular frame 2, having a rod 3, of a flexible wire handle inclosing the rod, rigidly secured to the outer end thereof and movable laterally in relation to the rectangular frame, a razor-support journaled in the flexible handle and adapted to rest upon the rectangular frame, and devices for turning the razor-support by the lateral movements of the handle, substantially as described.

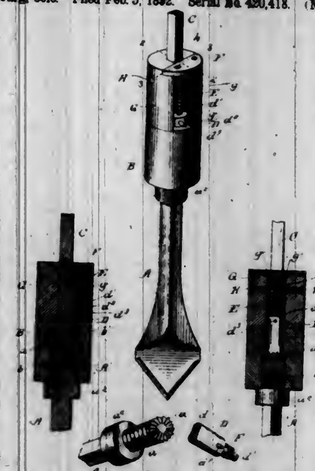
2. The combination, with an angular frame 2, having a rod 3, of flexible-wire handle inclosing the rod, rigidly secured to the outer end thereof and movable laterally in relation to the rectangular frame, a razor-support journaled in the handle and adapted to rest upon the rectangular frame, and a cord 12, extending horizontally across the handle near its inner end and wound on a part of the razor-support for turning the latter alternately in opposite directions, substantially as described.

3. The combination, with a frame 2, rod 3, extending centrally from one end of said frame, and an elastic handle rigidly secured at its outer end to the outer end of the rod 3, of a razor-supporting frame, the outer end of which is adapted to rest upon the frame 2 and being pivoted at its inner end within the handle, and a cord 12, extending horizontally across the handle near its inner end, said cord being wound around the inner end of the razor-supporting frame in such manner that as the frame 2 is moved back and forth upon the razor strop by means of the handle the razor-supporting frame will be partially rotated alternately in opposite directions to cause the razor carried thereby to rest upon the razor-strop, substantially as described.

4. The combination, with a frame 2, rod 3, extending centrally from one end of said frame, a coil 4, rigidly secured at its outer end to the outer end of the rod 3 and extending toward the frame 2 around said rod, and a cord 12, extending horizontally across the inner end of said coil, of a razor-supporting frame 6, having a shaft 10 on its inner end, brackets 11, secured to said rod 3 and depending therefrom in such position that they will be adapted to support the shaft 10, said cord 12 being wound around said shaft, substantially as and for the purpose specified.

5. A razor-sharpener consisting of a rectangular frame 2, a rod 3, and a flexible-handle coil 4, all formed of a single continuous piece of wire, with the rod extending through the handle-coil, a razor-support adapted to rest upon the said frame, and devices for turning the razor-support when the said frame is moved upon a razor-strop by means of the handle-coil, substantially as described.

6. In a razor-sharpening device, the combination, with a handle and a frame secured thereto and projecting therefrom, of a razor-supporting frame carried thereby, and a cord secured to said handle and wound around a portion of said razor-supporting frame, the arrangement being such that the razor-supporting frame will be partially rotated alternately in opposite directions by the movement of the handle, substantially as and for the purpose specified.

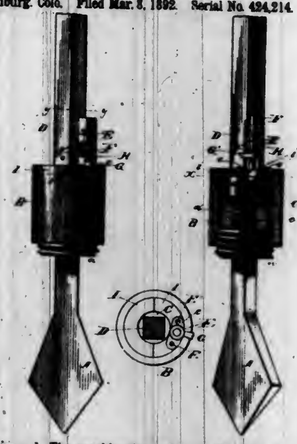


480,977. DETACHABLE STEP FOR POLES. VAN A. THOMAS, Providence, R. I. Filed Nov. 9, 1891. Serial No. 411,320. (No model.)

Claim.—1. The combination of the base-plate arranged to be permanently secured to a pole provided with a single socket located at the upper portion of the base-plate and having side ribs, as c^3, extending downwardly therefrom, and the detachable step or bracket a, having an end thereof arranged to enter and interlock with said socket, the side ribs c^3 at the same time serving as a lateral guide for the step, substantially as described.

2. The detachable pole-step, substantially as hereinbefore described, the same consisting of the base b, having a protected top socket, the front or outer wall of which is provided with an inwardly-extending projection, as c', and the detachable step or bracket a, having an end thereof provided with an upwardly-bent hook h, arranged to enter the base-socket and rest upon and be supported by the said projection c'.

480,978. DRILL. ALONZO G. TURNER, Durango, Colo., assignor of two-thirds to Frank A. Kimball, same place, and Alexander Levy, Walsenburg, Colo. Filed Feb. 5, 1892. Serial No. 420,418. (No model.)



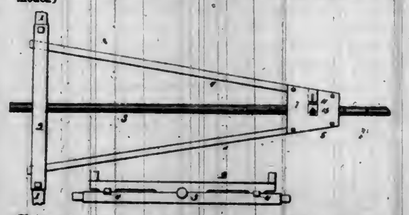
Claim.—1. The combination, with a drill-holder and a drill having a serrated upper surface, of a spring-actuated locking-bolt provided with serrations working through the holder and engaging the drill, and a casing supported on the holder and protecting the bolt and its spring, substantially as described.

2. The combination, with a drill-holder and a drill having a serrated upper surface, said serrations being radially disposed, of a spring-actuated locking-bolt provided with serrations working through the holder and engaging the drill and a casing supported on the holder and protecting the bolt and its spring, substantially as described.

3. The combination, with a drill and its holder having a rigid shank, of a sliding locking-bolt and a casing supported on the holder and having passage for the shank and open upon one side and a removable cap-piece to said casing, as set forth.

4. The combination, with a drill-holder having a rigid shank and a drill having a serrated upper surface, of a spring-actuated locking-bolt working through the holder and engaging the drill and a casing supported on the holder and having passage for the shank and open upon one side and a removable cap-piece to said casing, substantially as described.

480,979. DRILL. ALONZO G. TURNER, Durango, Colo., assignor of two-thirds to Frank A. Kimball, same place, and Alexander Levy, Walsenburg, Colo. Filed Mar. 3, 1892. Serial No. 424,214. (No model.)

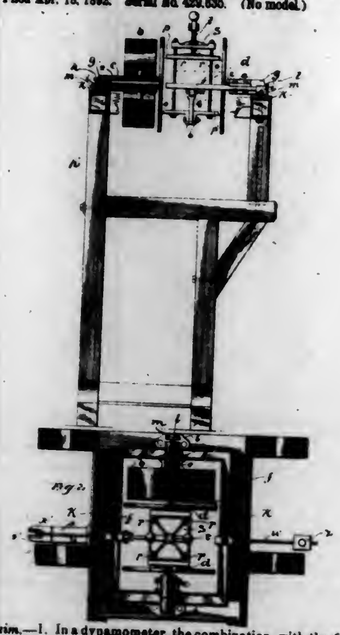


Claim.—1. The combination, with a drill-rod having an interiorly-threaded boss, of an interiorly-threaded sleeve surrounding said boss, a drill having oppositely-threaded portions to engage with said boss and said sleeve, and a detachable sectional collar within the upper end of said sleeve, substantially as described.

2. The combination, with a drill-rod having an interiorly-threaded boss having notches in its upper surface, and an interiorly-threaded sleeve surrounding said boss and provided with a detachable sectional collar, of a spring-actuated pawl mounted on the upper end of the sleeve and working through an opening in the collar, and a drill having a shank provided with oppositely-threaded portions, substantially as described.

3. The combination, with a drill-rod having an interiorly-threaded boss having notches in its upper surface, and an interiorly-threaded sleeve surrounding said boss, of a spring-actuated pawl mounted on the upper end of said sleeve, a casing surrounding and supporting said pawl, and a drill provided with oppositely-threaded portions, substantially as described.

480,980. WAGON-FRAME. ALONZO G. TURNER, Durango, Colo., assignor of two-thirds to Frank A. Kimball, same place, and Alexander Levy, Walsenburg, Colo. Filed Mar. 3, 1892. Serial No. 424,215. (No model.)

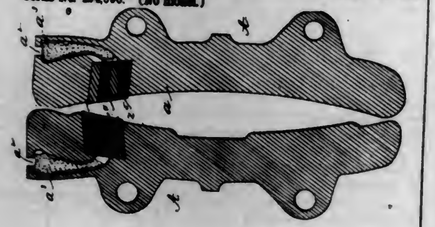


Claim.—1. In a wagon body or frame, the combination, with the hounds and reach, of a two-part box having a longitudinal and cylindrical opening therethrough, the upper part of said box having a rectangular slot therein for the reception of a removable cover held in place by a spring-pressed pin, the lower part of said box being provided with an opening for drawing out the securing-pin, substantially as described.

2. In a wagon body or frame, the combination, with the reach provided with an adjustable encircling band, of a two-part box with a

cylindrical opening therethrough secured to the bounds and having in its upper part a rectangular slot adapted to secure a removable cover therein, held in place by a spring-pressed pin, and a bolt or pin passing through the band encircling the reach, whereby the wagon-body may be lengthened or shortened, substantially as described.

3. In a wagon body or frame, a box for connecting the reach and bounds, formed in two parts, having flanges for the reception of the bounds, and registering semicircular and longitudinal recesses forming a cylindrical aperture for the reception of the reach, said aperture having a transverse groove midway of its length, and a band secured to the reach and fitting into said groove for transmitting the pull from the reach to the bounds, substantially as described.

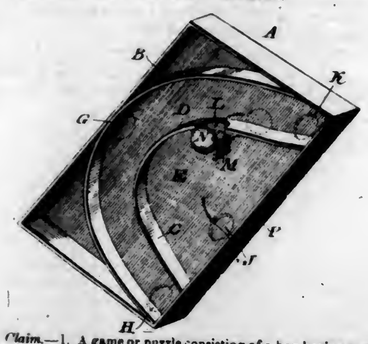


480,981. **DYNAMOMETER.** HENRY F. WARNER, Chicago, Ill. Filed Apr. 18, 1892. Serial No. 429,635. (No model.)

Claim.—1. In a dynamometer, the combination, with the friction-drum and its friction-blocks, of a shaft carrying said friction-drum and journaled in bearings supported upon knife-edges placed in alignment with the center of said shaft and means whereby the friction of said shaft-journals in their bearings is joined in effect to that given by the friction drum and blocks.

2. In a dynamometer, the combination, with the pulley *b*, the friction-drum *d*, and its blocks *o o*, of the shaft *c*, journaled in bearings *e e* upon the frame *f*, the knife-edge bearings supported upon blocks *i i*, said knife-edge bearings being in alignment with the center of said shaft *c*, and the link *g*, connecting the friction-blocks with the frame *f*, whereby the friction of the friction-blocks *o o* upon drum *d* and the friction of the shaft-journals in bearings *e e* communicate their added torque to the frame *f*, substantially as and for the purpose specified.

480,982. **BRAKE-SHOE.** CHARLES F. WOHLFARTH, Norwich, Conn., assignor to Thomas Milburn, Toronto, Canada. Filed Mar. 14, 1892. Serial No. 424,896. (No model.)



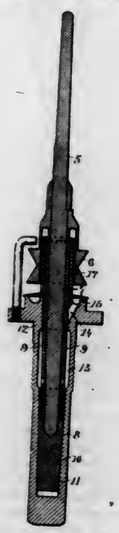
Claim.—1. A brake-shoe having a recess in its face and a moist packing in said recess.

2. A brake-shoe having a recess in its face, a packing in the recess, and a chamber connected with said recess.

3. A brake-shoe having a recess in its face, a packing made of rubber belting, and a chamber connected with said recess.

4. A brake-shoe having a recess in its face, a packing in the recess, a chamber connected with said recess, and oil in said chamber for keeping the packing moist.

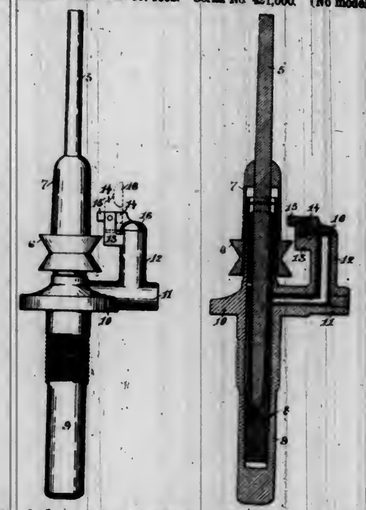
480,983. **PUZZLE.** CLARENCE WOLF, Philadelphia, Pa. Filed Apr. 11, 1892. Serial No. 428,624. (No model.)



Claim.—1. A game or puzzle consisting of a box having a passage and a chamber therein, with a valve opening into said chamber from said passage, said chamber and passage having openings in the lid of the box, said parts being combined substantially as described.

2. A game or puzzle consisting of a box with the walls B and C therein forming the passage D and the chamber E, said passage D having openings at its crown and ends and the chamber having an opening in its wall, the division-wall of the passage and chamber having a valve opening into the chamber, said parts being combined substantially as described.

480,984. **SPINNING AND TWISTING MACHINE SPINDLE.** HENRY F. WOODHAUCT, Whitinsville, Mass. Filed Nov. 4, 1891. Serial No. 410,818. (No model.)



Brief.—To provide a rigid support for the spindle, the bolster-case has a long conical socket into which the combined bolster and step-tube closely fits, and extends above the bolster whose upper end fits therein closely, being grooved, however, for the passage of oil. The bolster-case is provided near the foot of the spindle with an oil-chamber.

Claim.—1. A spindle-support consisting of the rigid bolster-case 12, having the long conical socket 11; the upwardly-extending tube 17, and the enlargement 13, forming the oil-reservoir, and the combined bolster and step-tube 9, having the conical pin 10 at its lower end, held in the socket 11 with a rigid fit, the upper end of the bolster fitting the bolster-case with a close sliding fit, the bolster-case extending above the bolster-tube and provided with a groove or channel forming a passage for the return of the oil, the whole adapted to form a rigid support for the spindle, as described.

2. The combination, with the spindle-support consisting of the rigid bolster-case 12, provided with the long conical socket 11, the tube 17, extending upward above the bolster-tube and having the oil-chamber 13, and the combined bolster and step-tube 9, rigidly secured in the conical socket by the pin 10 and closely fitting the upper part of the bolster, of the spindle 5, provided with the sleeve-whirl 6, extending down over and surrounding the upper extension of the bolster-case, the whole adapted to support the spindle and hold the same against lateral or oscillating motion, as described.

480,985. **SPINDLE-SUPPORT.** HENRY F. WOODHAUCT, Whitinsville, Mass. Filed Feb. 10, 1892. Serial No. 421,000. (No model.)

Claim.—1. In a support for spindles, a doffer-guard consisting of a lever, the outer end of which is weighted, pivoted on a rigid post, the whole adapted to support the pivoted lever in the horizontal position in its normal condition and permit the tilting of the lever, as described.

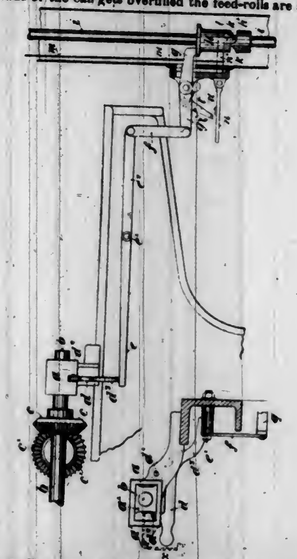
2. A spindle-support having a rigid vertical post on one side beyond the driving-whirl, a bracket extending from the post toward the spindle, and a hinged lever pivoted near its inner end, having the outer end weighted, the whole adapted to form a stop for the whirl in its normal position and open a passage for the whirl when the weighted end of the lever is raised, as described.

3. In a support for spindles, consisting of the bolster case 9, having the usual oil-chamber, the laterally extending hollow arm 11, and vertical hollow post 12, forming a communication with the interior of the bolster case, the combination therewith of a doffer-guard pivoted to the upper portion of said post, as described.

4. In a support for spindles, consisting of the bolster-case 9, having the usual oil-chamber, the laterally-extending hollow arm 11, and vertical hollow post 12, forming extensions of the oil-chamber, the combination therewith of a doffer-guard pivoted to the upper end of said post 12 and having a counter-weight adapted to serve as a cover for the open end of the post, as described.

5. The combination, with a spindle, a sleeve-whirl secured to the spindle, and a bolster-case closed at the bottom, adapted to be secured to a bolster-rail provided with a tube extending upward within the sleeve-whirl and having an interior oil-chamber, of the hollow arm 11, extending laterally beyond the whirl, the vertical hollow post 12, forming with the hollow arm an inlet to the oil-chamber in the bolster-case, the bracket 13, extending inward toward the spindle above the whirl when the same is in its normal position, and the arm 14, pivoted to said bracket and having the doffer-guard 15 and counter-weight 16, as and for the purpose described.

480,986. **COFFIN-SHELL MOLD.** WILLIAM J. APTHORPE, London, Canada. Filed Apr. 20, 1892. Serial No. 429,826. (No model.)

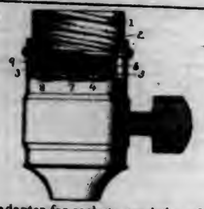


Claim.—1. The combination, with the mold-flask or exterior shell, of the inner core having sides E E', provided with nuts 6 and connected by rods F F', provided with right and left threads screwing into said nuts, and the extensible ends G G', having side flanges provided with nuts 14 and connected by a rod 13, provided with right and left threads screwing into said nuts, said ends provided with a nut 9 and connected by a rod 8, provided with right and left threads screwing into said nuts to elongate, widen, and contract said core, as set forth.

2. The combination, with the shell or flask having a removable bottom A and slotted sides B B', ends C C', having arms 2, said sides and ends connected by keys 4, as set forth, of the inner core having a bottom and sides, the sides having nuts 6, connected by screw-rods F F', the ends G G', having flanges telescoping against said sides and bottom, said ends having nuts 9 and connected by a screw-rod 8, and said side flanges having nuts 14, connected by a screw-rod 13, the lid M, fitting upon said shell and core, and the clamps fastening said lid and base or bottom A removably, as set forth.

480,987. **STOPPING MECHANISM FOR CARDING-ENGINES.** ELIJAH ASHWORTH, Manchester, England. Filed Sept. 2, 1891. Serial No. 404,506. (No model.) Patented in England Aug. 17, 1889, No. 12,968.

Brief.—The invention comprises mechanism whereby when the silver breaks or the can gets overfilled the feed-rolls are stopped.



Claim.—1. The combination of the side shaft *b* of a carding-engine having a laterally-movable bearing and provided with a bevel-pinion *c* and a driving bevel-pinion therefor, with a locking-detent *d* for the laterally-movable bearing, and mechanism, substantially as described, whereby the said bearing is released automatically to allow the said side shaft to move laterally, substantially as set forth.

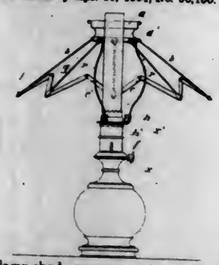
2. The side shaft *b* of a carding-engine having a laterally-movable bearing for one end of the said shaft, and bevel-gears *c d*, in combination with a detent *d* for the laterally-movable bearing, the lever *e* to act upon the detent, a pivoted lever *g*, having a link *f*, connecting it with the said lever *e*, and mechanism, substantially as described, to act upon the lever *g* to automatically free the detent, all substantially as set forth.

480,988. **ADAPTER FOR INCANDESCENT-LAMP SOCKETS.** HENRY P. BALL, Schenectady, assignor to the Edison General Electric Company, New York, N. Y. Filed May 7, 1892. Serial No. 432,196. (No model.)

480,988.

Claim.—1. An adapter for sockets, consisting of a sleeve suitable to receive the base of a lamp or other electrical device, the sleeve having an inwardly-exteading flange or part at its base, an insulating or insulated disk in said end of the sleeve and having a central screw-threaded hole, substantially as described.

2. An adapter for sockets, consisting of a sleeve suitable to receive the base of a lamp or other electrical device, the sleeve having an inwardly-turned flange or part at its base, an insulating or insulated disk in said end of the sleeve and having a central screw-threaded hole, and means for insulating the upper end of said sleeve, substantially as described.



3. The combination, with a socket having two terminals adapted to make contact with two terminals of a lamp or other device, of an adapter having but one terminal and utilizing one terminal of said socket, whereby the socket can be used for lamps of different characters, substantially as described.

4. The combination, with a socket having a central terminal and an edge or side terminal and adapted to receive a lamp or other device, of an adapter having a sleeve-terminal only, said adapter being held in the socket, but not entirely covering the central socket-terminal, whereby by adding a single terminal and by employing one of the socket-terminals the same socket can be used for different characters of lamps or devices, substantially as described.

5. The combination, with a socket having a central screw and an edge or side terminal, of an adapter having a sleeve to receive a lamp or other electrical device, and a base, the latter adapted to screw onto the central screw, substantially as described.

6. The combination, with a socket having a central screw and an edge or side terminal, of an adapter having a sleeve to receive a lamp or other electrical device, an outer insulating sleeve or coating, and a base, the latter adapted to screw onto the central screw, substantially as described.

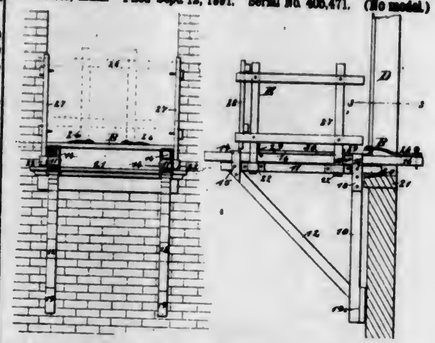
480,989. LAMP-SHADE SUPPORT. CHARLES BERTHELEMY, Paris, France. Filed Sept. 28, 1891. Serial No. 406,974. (No model.) Patented in France Feb. 28, 1891, No. 211,775; in England Mar. 3, 1891, No. 3,784, and in Germany Apr. 11, 1891, No. 60,155.

Claim.—1. A lamp-shade support consisting of a collar, a number of branches jointed to said collar, and a set of jointed connecting-pieces arranged between and jointed to each two adjacent branches, substantially as described.

2. A lamp-shade support consisting of a collar, a number of springs arranged to press inwardly and attached at their upper ends to said collar, their lower ends being free, provided each with seating means, and extended downward sufficiently to find a seat on the lamp below the chimney, the force exerted by the springs keeping said free ends in contact with the lamp, substantially as described.

480,990. LAMP-BLACK MACHINE. ERASTUS R. BLOOD, Kane, Pa., assignor to Martha P. Blood, same place. Filed Oct. 28, 1891. Serial No. 410,116. (No model.)

Claim.—1. In a lamp-black machine, the combination, with the plates A and A', arranged substantially as shown, with an opening *a* between their contiguous edges, and a gas-burner arranged to impinge its flame upon said plates on opposite sides of said opening, of means

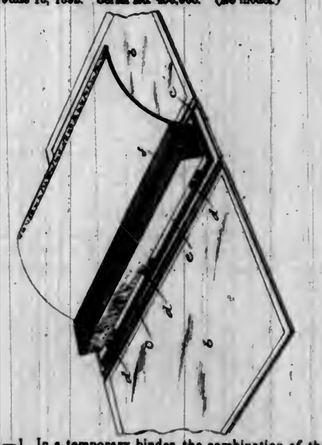


substantially as shown, for moving said plates in a common horizontal plane over said flame differentially, whereby the said opening will be kept clear of lamp-black, as set forth.

2. In a lamp-black machine, the combination, with the circular concentric plates A and A', arranged substantially as shown, with an opening *a* between their contiguous edges, and a gas-burner arranged to impinge its flame upon said plates on opposite sides of said opening, of means, substantially as shown, for moving said plates in a common horizontal plane over said flame differentially, whereby the said opening will be kept clear of lamp-black, as set forth.

3. In a lamp-black machine, the combination of the burners *e*, the circular concentric plates A A', arranged in a common horizontal plane and having an opening *a* between them directly over said burners, and the gearing C D and C' D' for moving said plates rotatively and differentially, substantially as set forth.

480,991. WINDOW-CHAIR. ADOLPH BOETTCHER, South Stillwater, Minn. Filed Sept. 12, 1891. Serial No. 405,471. (No model.)

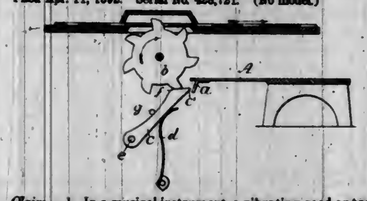


Claim.—1. A window chair or scaffold consisting of two essentially triangular base-sections, straps projected upward from the base-sections above the upper edge thereof, beams passed through said straps and provided with clamping-blocks at their inner ends, a cross-bar adjustably connecting the clamp-beams of the two sections, and brace-beams uniting the connecting-bar and base-sections, as and for the purpose specified.

2. In a window chair or scaffold, the combination, with base frames essentially triangular in general contour, straps projected beyond the tops of the base-frames, and beams engaging with the tops of the said base-frames, passed through the straps thereof, and provided with stop-pins, of blocks secured to the inner ends of the upper beams, adapted for engagement with the inner face of a window-frame, a connecting-bar adjustably uniting the base-frames, and a flooring and guard-rail removably secured upon the frames, as and for the purpose specified.

3. In a window chair or scaffold, the combination, with two essentially triangular base-frames provided with sockets upon their side faces and straps projected upward near the ends beyond the upper edge of said base-frames, of beams passed through the straps, stop-pins carried by said beams, clamping-blocks attached to the inner ends of the beams and adapted for engagement with the inner face of the window-frame, and a connecting-bar adjustably uniting the clamping-beams, braces connected with the clamping-bar and the connecting-bar, a sectional guard-rail fitted in the sockets of the base-frames, locking devices locking the guard-rail and the clamp-beams, and a removable flooring crossing the clamping-beams within the space surrounded by the guard-rails, as and for the purpose specified.

480,992. TEMPORARY BINDER. FRANK BOWMAN, Brooklyn, N. Y. Filed June 16, 1892. Serial No. 436,963. (No model.)



Claim.—1. In a temporary binder, the combination of the outer back and covers, malleable fastening-prongs secured permanently to the inner side of the outer back, and a book removably clamped to the outer back by said malleable fastenings, the fastenings being bent down upon the stub-book back, so as to removably clamp the same, substantially as described.

2. In a temporary binder for files, consisting of an outer back and covers flexibly secured thereto, a removable book provided with back, and metal fastenings secured to the inner side of the outer back and detachably securing the book to the outer back, substantially as described.

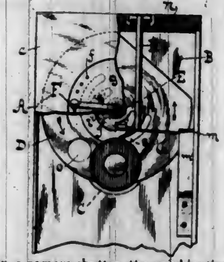
3. A temporary binder or holder for files, consisting of a rigid outer back, covers flexibly secured thereto, a removable book having a rigid back provided with perforations, and malleable metal fastenings secured to the inner side and projecting through the perforations in the back of the book, the upper ends of the fastenings being bent down to removably secure the book to the outer back, substantially as described.

4. A temporary binder for files, consisting of an outer back, covers flexibly secured thereto, an inner back rigidly and permanently secured to the outer back, a removable book consisting of a rigid back and leaves rigidly secured thereto, and malleable metal staples or fastenings secured between the outer and inner backs, their prongs projecting upwardly through the inner back and through perforations in the back of the book and their upper ends being turned or bent down upon the removable book-back to removably secure the book to the inner back, substantially as described.

480,993. DAMPING DEVICE FOR MUSIC-BOXES. GUSTAV A. BRACKHAUEN and PAUL RIEBNER, Entritzsch, near Leipsic, Germany. Filed Apr. 11, 1892. Serial No. 428,731. (No model.)

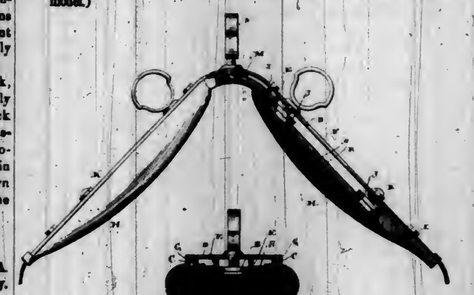
Claim.—1. In a musical instrument, a vibrating reed or tooth and its complemental pin-barrel and a damping-lever provided with a curved free extremity interposed in the path of a pin as it escapes from the reed or tooth, substantially as and for the purposes set forth.

2. In a musical instrument, a vibrating reed or tooth and its complemental pin-barrel, a finger applied to said tooth, a pivotal damping-lever provided with a curved free extremity disposed in range of the pin that previously actuated the reed or tooth, substantially as and for the purposes set forth.



480,994. DRESS-STAY. ISABELLA BRAY, New York, N. Y. Filed Apr. 11, 1892. Serial No. 428,604. (No model.)

Claim.—The herein-described dress-stay, consisting of two flat



thin springs A B, placed one upon the other and secured together at one end, the springs of a length to give a projection of single thickness at each end, the projecting ends of the springs pierced, combined with a fabric pocket longer than the springs and so as to project beyond each end of the springs, the projecting ends of the pockets turned over onto the face, and with eyelets through the projecting ends and the pierced ends of the springs, substantially as described.

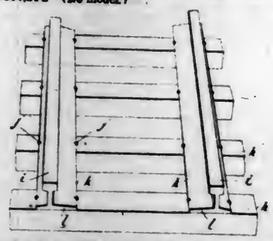
480,995. CAMERA-SHUTTER. WILLIAM H. BRISTOL, Hoboken, N. J. Filed June 17, 1892. Serial No. 437,029. (No model.)

Claim.—In a camera-shutter, the combination of a shutter provided with a shoulder and with an inclined surface, means for propelling the shutter, a detent arranged to engage with the shoulder, and means for effecting the disengagement of the detent from the shoulder and throwing the same under applied pressure into the range of the inclined surface, substantially as described.

480,996. HARNESS-SADDLE. JOHN G. BRUGGEMAN and HERMAN BRUGGEMAN, Clyde, Ohio. Filed Apr. 16, 1892. Serial No. 429,451. (No model.)

Claim.—The combination, in a harness saddle, of a bottom plate having a longitudinal downward bulge, pins projecting upward from the edge of the plate, a top plate, a flange depending therefrom which has the same outline as the bulge in the bottom plate into which it extends, parallel flanges G on the under edges of the plate and between which the pins of the bottom plate project, a pad-covering which is confined between the said last-named flanges and pins, and screws for holding together the plates, substantially as shown and described.

480,997. ANIMAL-SHEARS. CHARLES BURGON and HARRY BURGON, Malin Bridge, near Sheffield, England. Filed Mar. 5, 1892. Serial No. 423,941. (No model.)

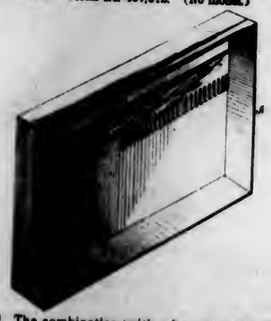


Claim.—1. In the herein-described shearing or clipping machine, the combination, with the vibrating lever C and with the rocking base-

plate E, carrying the lever-axis D, of spring-plate *k*, forked adjusting-screw *l l*, and nut *m*, taking a bearing on the top of casing *n* for regulating the pressure of the cutters, substantially as specified.

2. In the herein-described shearing or clipping machine, the combination, with the vibrating lever C and with the rocking base-plate E, carrying the lever-axis D, of spring-plate *k*, forked adjusting-screw *l l*, and nut *m*, taking a bearing on the top of casing *n*, and of the means for locking the adjusting nut, consisting of the spring-pin *o p*, mounted in casing *n* and adapted to engage with a circle of holes *m'* in the head of the nut *m*, the end of the pin being rounded, so as to be easily forced out of engagement, as specified.

3. In the herein-described shearing or clipping machine, the combination, with the vibrating lever C and with the rocking base-plate E, carrying the lever-axis D, and with the mechanism for adjusting the pressure of said lever, as described, of the conical friction-roller *i*, mounted in the tail end of lever C and bearing on the tail end of plate E for transferring the upward pressure directly from E to C without causing a bending strain of the axis D, as specified.

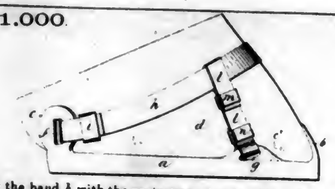


480,998. DEVICE FOR PREVENTING RAILROAD-RAILS FROM SPREADING. JAMES H. BURNS, Spokane, Wash. Filed June 23, 1891. Serial No. 397,264. (No model.)

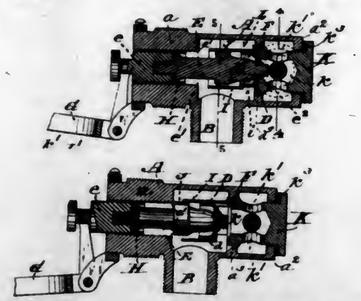
Claim.—1. A railway-rail having its base expanded or extended on its inner side, substantially as and for the purpose specified.

2. A railway comprising cross-ties and rails secured thereto, said rails having broadened bases extending toward each other, substantially as and for the purpose specified.

480,999. BOX ATTACHMENT. EDWARD BUYER, New York, N. Y. Filed Oct. 3, 1891. Serial No. 407,612. (No model.)



Claim.—1. The combination, with a box, of a flat plate or strip of thin metal fastened in the box and slotted at its edge to form a series of teeth, which are turned outward and upward, forming a series of hooks which stand out from the bottom of the box in front of the plane of the plate or strip, substantially as described.



2. As a new and improved article of manufacture, a suspending-strip for the interior of boxes, formed of a flat plate or strip of metal having a series of small hooks at its edge projecting in front of the plane of the plate or strip and formed with integral clutching-points, substantially as described.

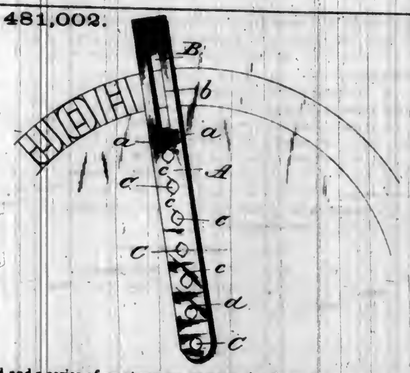
481,000. HORSESHOE-FASTENING. GEORGE CALLS and FREDERICK J. TEFLEY, London, England. Filed Feb. 3, 1892. Serial No. 420,177. (No model.)

Claim.—The combination, with a horseshoe provided with projections *b*, *c*, *d*, and *e* for engaging the hoof of the animal, of the flat band A, passing over the hoof and bent back upon itself after passing through the projections *c*, the loops *i*, securing the ends of the band A, the flat bands *l*, having their ends bent back upon themselves and connecting the band *h* with the projections *c'* at the sides of the shoe, and the loops *m* and *n*, securing the ends of the bands *l*, substantially as and for the purpose set forth.

481,001. VALVE. JAMES R. CARR, Webster Groves, and WILLIAM H. HENDRICK, St. Louis, assignors to the N. O. Nelson Manufacturing Company, St. Louis, Mo. Filed Aug. 1, 1891. Serial No. 401,412. (No model.)

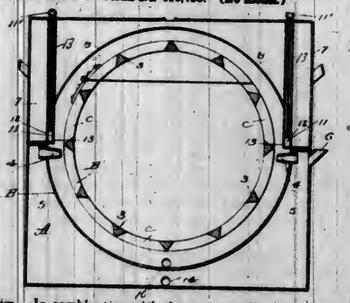
Claim.—1. The combination of a casing provided with an inlet and an outlet and having each end provided with an opening, a detachable plug in each opening, one of which is recessed at its inner end, the walls of the recessed portion being provided with two series of perforations, one communicating with the inlet and the other series with the outlet, and an interior valve-seat between the series of openings and the plug in the opening at the other end of the casing being provided with a valve which fits within the recess of the first-mentioned plug and is adapted to be seated upon the valve-seat end, closing the opening between the inlet and the outlet, substantially as set forth.

2. The combination of a casing provided with an inlet and an outlet chamber and an opening at each end, the partition between the two chambers being screw-threaded, a plug in each end of the casing, one of which is provided with a tubular and a recessed portion at its inner end and is provided with an external screw-thread to engage with the screw-threaded partition, the walls of the tubular and of the recessed portions of the plug being each provided with perforations and with an interior valve-seat between the two series of perforations, and a plug in the opening in the opposite end of the casing, provided with a valve which fits the tubular portion of the other plug, substantially as set forth.



3. The combination of a casing provided with an inlet and an outlet and an opening at each end, a detachable plug in each opening, one of which is provided with a tubular and a recessed portion at its inner end, the walls of which are provided with two series of perforations and having an interior valve-seat between said series of perforations, and the plug in the other opening is provided with a valve, the middle portion of which is provided with projections to fit the bore of the tubular portion of the other plug, said projections being larger than the opening in the casing at that end, whereby the accidental removal of the valve is prevented, substantially as set forth.

4. The combination of the casing having the inlet and outlet chambers, as described, the detachable plug chambered and perforated and having the valve-seat and perforated tube, as described, the valve-stem, the main cup-leather valve, the cup leather H, the projections J, and the float-lever G, the flange of said main cup-leather valve fitting said tube and extending past the perforations therein when said valve is seated, said tube normally opening into the inlet-chamber and said chambered plug opening into the outlet-chamber and having its screw-threaded connection with the casing adapted to form said inlet and outlet chambers, substantially as described.

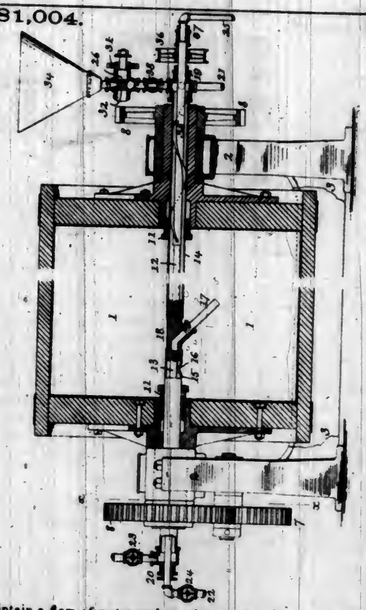


481,002. LETTERING-TABLET. ABRAHAM CLARK, Greenville, S. C. Filed Apr. 14, 1892. Serial No. 429,155. (No model.)

Claim.—1. A device for laying off letters, consisting of a plate or bar A, having an aperture B with parallel side walls adjacent to one end and a series of apertures *c c*, commencing from the opposite end, substantially as shown, and for the purpose set forth.

2. In a device for laying off letters, the combination of a plate or bar A, having parallel edges *a a*, a series of apertures C C with notches, and an aperture B with parallel side walls, the width of said aperture being greater than the portions of the implement on each side thereof, substantially as shown.

481,003. WASHING-MACHINE. GEORGE A. COFFEE, Dalton, Ga. Filed Jan. 2, 1892. Serial No. 416,753. (No model.)



Claim.—In combination with the steam-tank and cylinder-chamber, the nozzles leading from the steam-tank into the cylinder-chamber, a cylinder within said chamber, and the cover having the water-space, said water-space comprising the two depending portions extending downward to the cylinder and steam-space on each side of the cylinder, the said water-space being formed by the curved inner wall attached to the cover, each of the depending portions of the water-chamber being contracted toward the lower end and the valves in said contracted portions leading into the cylinder-chamber, substantially as described.

481,004. APPARATUS FOR CORRODING LEAD. GEORGE D. COLEMAN, Chicago, Ill. Filed Aug. 17, 1891. Serial No. 402,921. (No model.)

Claim.—1. In a lead-corroding apparatus, the combination, with the horizontally-arranged revolving cylinder, of a water-induction pipe extending in through the trunnion or axis of the cylinder, and a water-eduction pipe extending out through the trunnion or axis of such cylinder and having its inner end extending downwardly from the center of the cylinder, such pipes being adapted to maintain a flow of water through the cylinder, for the purpose set forth.

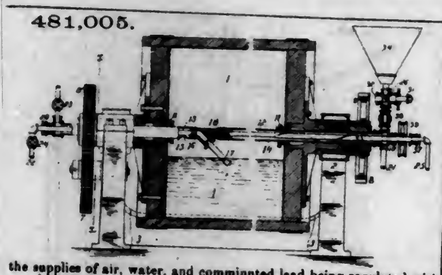
2. In a lead-corroding apparatus, the combination, with the horizontally-arranged revolving cylinder, of water and gas induction pipes extending in through the trunnion or axis of the cylinder, and water-eduction pipes extending out through the trunnion or axis of such cylinder and having its inner end extending downwardly from the center of the cylinder, such pipes being adapted to maintain a flow of water through the cylinder, for the purpose set forth.

3. In a lead-corroding apparatus, the combination, with the horizontally-arranged revolving cylinder, of water and gas induction pipes extending in through the trunnion or axis of the cylinder and water and gas eduction pipes extending out through the trunnion or axis of the cylinder, the inner end of the water-eduction pipe being extended downwardly from the center of the cylinder, such pipes being adapted to maintain a flow of water and gas through the cylinder, for the purpose set forth.

4. In a lead-corroding apparatus, the horizontally-arranged revolving cylinder provided with ribs on its inner periphery of an oblong square form arranged a distance apart, so as to form spaces or cavities of a width nearly equal to that of the face of the ribs, as described, and for the purpose set forth.

5. In a lead-corroding apparatus, the combination, with the horizontally-arranged revolving cylinder, of water and gas induction pipes extending in through the trunnion or axis of the cylinder and water and gas eduction pipes extending out through the trunnion or axis of the cylinder, the downwardly-extending branch pipe 17, and a Y-shaped plug 18, connecting the inner ends of said pipes together, for the purpose set forth.

6. In a lead-corroding apparatus, the combination, with the horizontally-arranged revolving cylinder, of an induction pipe or passage extending in through the axis or trunnion of the cylinder, a rotatable cylinder 26, having peripheral pockets 32, and a casing inclosing said cylinder and having communication with the supply-hopper and the axial induction-pipe of the main cylinder, for the purpose set forth.

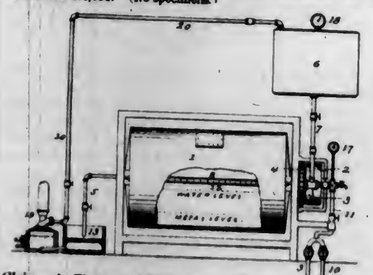


7. In a lead-corroding apparatus, the combination, with the horizontally-arranged revolving cylinder, of an induction pipe or passage extending in through the axis or trunnion of the cylinder, a rotatable cylinder 26, having peripheral feed-pockets 32, a casing inclosing said cylinder and having communication with the supply-hopper and the axial induction-pipe of the main cylinder, and a means for imparting intermittent rotation to the feeding-cylinder, consisting of the ratchet-wheel 31, pawl 30, arm 29, eccentric-rod 28, and eccentric 27, for the purpose set forth.

8. In a lead-corroding apparatus, the combination, with the horizontally-arranged revolving cylinder, of an induction pipe or passage extending in through the axis or trunnion of the cylinder, a spiral conveyer arranged to rotate in said induction pipe or passage, a rotatable cylinder 26, having peripheral pockets 32, and a casing inclosing said cylinder and having communication with the supply-hopper, and the axial induction-pipe of the main cylinder, for the purpose set forth.

481,005. ART OF MAKING LEAD PROTOXIDE. GEORGE D. COLEMAN, Chicago, Ill. Filed Aug. 17, 1891. Serial No. 402,923. (No specimens.)

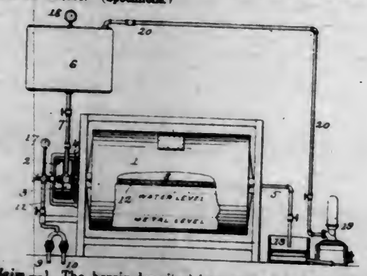
Claim.—1. The herein-described improvement in the art of making lead protoxide, which consists, first, in subjecting a body of comminuted lead in a state of agitation within a suitable vessel to the action of atmospheric air and water; secondly, removing the oxide as fast as formed and controlling the temperature during the process by a regulated inflow and outflow of water through the corroding-vessel and its contents, and, thirdly, replacing the lead removed during the process in the form of oxide by a regulated supply of comminuted lead,



481,005.

the supplies of air, water, and comminuted lead being regulated with regard to each other.

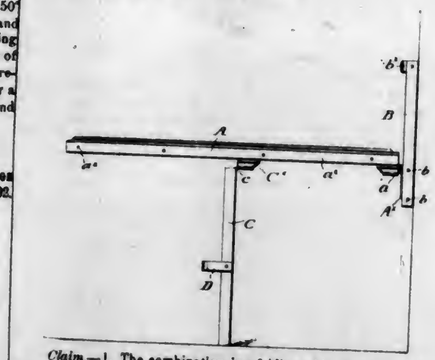
2. The herein-described improvement in the art of making lead protoxide, which consists, first, in subjecting a body of comminuted lead in a state of agitation and at a temperature between 75° and 150° Fahrenheit within a suitable vessel to the action of atmospheric air and water; secondly, removing the oxide as fast as formed and controlling the temperature during the process by a regulated inflow and outflow of water through the corroding vessel and its contents, and, thirdly, replacing the lead removed during the process in the form of oxide by a regulated supply of comminuted lead, the supplies of air, water, and comminuted lead being regulated with regard to each other.



481,006. PROCESS OF MANUFACTURING WHITE LEAD. GEORGE D. COLEMAN, Chicago, Ill. Filed May 20, 1891. Renewed Feb. 10, 1892. Serial No. 421,033. (No specimens.)

Claim.—1. The herein-described improvement in the art of making white lead by the agitation of lead in a comminuted state in the presence of water, air, and carbonic acid, the same consisting in carrying on the process at a regulated temperature of from 75° to 150° Fahrenheit and under a pressure of from fifteen to thirty pounds, substantially as herein described.

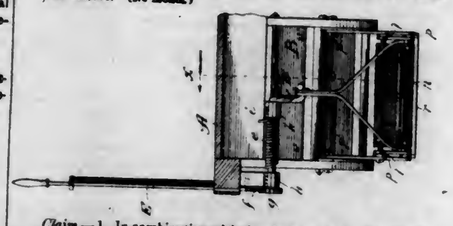
2. The herein-described improvement in the art of making white lead by the agitation of lead in a comminuted state in the presence of water, air, and carbonic acid, the same consisting in carrying on the process at a regulated temperature of from 75° to 150° Fahrenheit and under a pressure of from fifteen to thirty pounds and preventing by a flow of water an abnormal rise in such temperature due to physical and chemical reactions in the apparatus, substantially as herein described.



481,007. ART OF MAKING WHITE LEAD. GEORGE D. COLEMAN, Chicago, Ill. Filed Aug. 12, 1890. Renewed May 23, 1892. Serial No. 434,105. (Specimens.)

Claim.—1. The herein-described improvement in the art of corroding lead in the presence of water and a suitable corroding-gas, the same consisting in preserving the surface of the lead particles in a clean condition best adapted for corrosive action by a flow of water that acts to remove the corroded lead as fast as formed, substantially as herein described.

2. The herein-described improvement in the art of corroding lead in the presence of water and a suitable corroding-gas, the same consisting in conducting the corroding process under definite and controllable degrees of pressure and temperature and at the same time preserving the surfaces of the lead particles in a clean condition best adapted for corrosive action by a flow of water that acts to remove the corroded lead as fast as formed as well as to carry off the surplus heat generated by the physical and chemical reactions in the process, substantially as herein described.



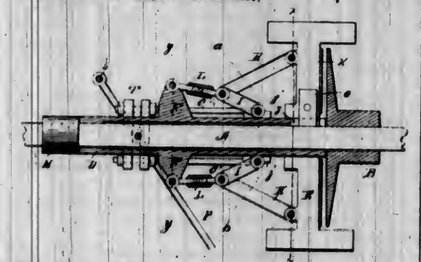
481,008. WALL-TABLE. GEORGE W. CURTIS, New York, N. Y., assignor to the Unique Table Company, same place. Filed Mar. 28, 1892. Serial No. 426,852. (No model.)

Claim.—1. The combination, in a folding table, of a table body or frame, a retaining-strip hinged to said body and adapted to be permanently secured against a wall or other fixed surface, and a spring-keeper fixedly attached at its lower extremity to said retaining-strip and at its free upper extremity provided with an inturned clip adapted for engagement with the edge of the body or frame, substantially as set forth.

2. The combination, in a folding table, of a table body or frame, a retaining-strip hinged to said body and adapted to be permanently secured against a wall or other fixed surface, a spring-keeper fixedly attached at its lower extremity to said retaining-strip and at its free upper extremity provided with an inturned clip adapted for engagement with the edge of the body or frame, and a folding leg hinged to the body of the frame and provided with a spring-clip adapted to engage with the edge of said body or frame, substantially as set forth.

481,009. CAR-STEP EXTENSION. WILLIAM DALENBERG and CORNELIUS VERDUIN, South Holland, Ill. Filed Apr. 18, 1892. Serial No. 429,670. (No model.)

Claim.—1. In combination with the platform and a stairway of a car, a folding extension for the stairway, having a toggle-lever support carrying a step and operating when folded to raise and support the step behind the stairway and when extended to protrude the said step beyond the lowermost step of the stairway, and means for operating the folding extension from the platform, substantially as described.



2. In combination with the platform and stairway of a car, a folding extension for the stairway, having a toggle-lever support carrying a step and operating when folded to raise and support the step behind the stairway and when extended to protrude the said step beyond the lowermost step of the stairway, and means for operating the folding extension from the platform, substantially as described.

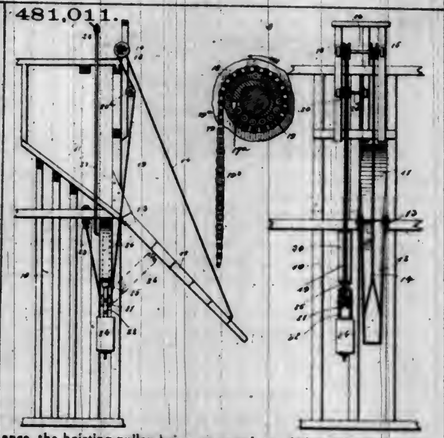
3. In combination with the platform and stairway of a car, a folding extension for the stairway, having a toggle-lever support carrying a step and operating when folded to raise and support the step behind the stairway and when extended to protrude the said step beyond the lowermost step of the stairway, a crank journaled on the platform, an operating-lever connected with the crank, and a locking-brace connecting the crank with the said toggle-lever support, substantially as described.

4. In combination with the platform and stairway of a car, a folding extension C for the stairway, formed with pivotal arms *p* and *p'* depending from the stairway, pivotal cross-bars *l*, links *o*, and a step *r*, having arms *q* at its opposite ends pivotally connected with the links *o* and arms *p*, whereby the said extension may be folded behind the stairway and extended to protrude the step *r* beyond the lowermost step of the stairway, and means for operating the folding extension from the platform, substantially as described.

5. In combination with the platform and stairway of a car, a folding extension C for the stairway, formed with pivotal arms *p* and *p'* depending from the stairway, pivotal cross-bars *l*, connected links *o*, and a step *r*, having arms *q* at its opposite ends pivotally connected with the links *o* and arms *p*, whereby the said extension may be folded behind the stairway and extended to protrude the step *r* beyond the lowermost step of the stairway, a crank D', journaled on the platform, and operating-lever E, connected with the crank, and a brace D, connecting the crank with the links *o*, the whole being constructed and arranged to operate substantially as described.

481,010. CLUTCH. DANIEL T. DENTON, Duluth, Minn. Filed Nov. 7, 1891. Serial No. 411,229. (No model.)

Claim.—1. In combination, the shaft, a friction-disk rigid therewith, a sleeve between said disk and a stop, in which sleeve the shaft is free to turn, a pulley rotating with and capable of a limited longitudinal movement on the end of the sleeve into and out of contact with the disk, toggle-links and their supports, and operating means carried by said sleeve for moving said pulley, whereby the pulley, sleeve, and operating means remain at rest when the pulley is disengaged from the disk, as described.



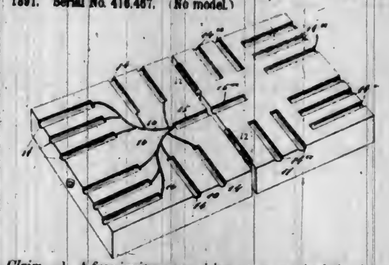
2. In combination, a shaft, the rigid friction-disk thereon, a sleeve on the shaft in which the same can freely turn and hold against longitudinal movement on the shaft, said sleeve provided with a longitudinal slot at the inner end, a pulley mounted on said inner end of the sleeve and provided with a key extending into said slot, whereby the pulley rotates with the sleeve and has a limited longitudinal movement toward or from the friction-disk, and the operative parts of the clutch carried by said sleeve and connected to throw the pulley, substantially as described.

3. In a friction-clutch, the combination of the shaft, the friction-disk rigid thereon, a sleeve loosely mounted on the shaft, a split pulley on one end of the sleeve mounted to turn with the sleeve and having limited longitudinal movement on the sleeve toward or from said disk, toggle-links connected to the pulley and to the loose ring on said sleeve, fulcrum-arms rigid with the sleeve and connected to the joints of the links, and the shifting hub connected to said ring, the sleeve and arms being formed in sections, so that they can be secured on the shaft with the split pulley, in the manner and for the purposes described.

481,011. COUNTERBALANCING MECHANISM FOR CHUTES. DANIEL T. DENTON, Lake View, Minn. Filed May 3, 1892. Serial No. 431,543. (No model.)

Claim.—1. The combination of the swinging chute, the shaft journaled above the chute, the hoisting-cable connected with the chute and with a pulley on the shaft, and the chain thickened or thinned at intervals, connected with a pulley on the shaft and with a counter-balance, the hoisting-pulley being arranged to wind up the cable when the counterbalancing-chain is unwound, substantially as shown and described.

481,011.



2. The combination of the swinging chute, the shaft journaled above the chute and carrying two pulleys, a cable secured to the chute and to one of the pulleys, a chain secured to the other pulley and winding in opposite direction to the cable, a counter-balance for the chain, and a power-cylinder and piston operatively connected with the chute, substantially as described.

3. The combination of the swinging chute, the shaft journaled above the chute and carrying two pulleys, the cable secured to the chute and to one of the pulleys, a chain secured to the other pulley and winding in opposite direction to the cable, and a power-cylinder having a piston-rod attached to the chain, substantially as described.

4. The combination of the swinging chute, the shaft journaled above the chute and carrying flanged pulleys, the cable secured to the chute and to one of the pulleys, a power-cylinder arranged adjacent to the chute and having a depending piston-rod provided with a counter-balance at its lower end, a pulley carried by the piston rod, and a chain secured to one of the pulleys above the chute and extending beneath the piston-rod pulley, the lower end of the chain being fixed to a support, substantially as described.

481,012. FUSE-IGNITOR. WILLIAM J. C. DOYLE, Aspen, Colo., assignor of one-half to Timothy Buckley, same place. Filed Dec. 29, 1891. Serial No. 416,467. (No model.)

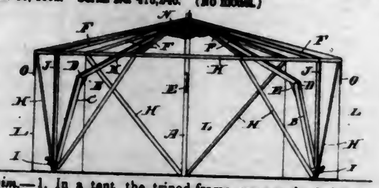
Claim.—1. A fuse-ignitor comprising a two-part body having registering grooves therein adapted to hold fuses, branch grooves connecting the fuse holding grooves, and a fastening device to hold the parts of the body together, substantially as described.

2. A fuse-ignitor comprising a two-part body, the members of which are hinged together and provided with a suitable fastening, a series of fuse-holding grooves produced in the body and extending to the sides thereof, and branch grooves connecting the fuse-holding grooves, substantially as described.

481,013. SLIDE-VALVE. ALBERT T. DOYLE, Pendleton, Oreg. Filed Apr. 20, 1892. Serial No. 429,908. (No model.)

Claim.—1. The combination, with the slide-valve of an engine, of a plate secured to the upper face of the valve by suitable standards and having a recessed upper face and a bearing-plate fitted within the valve-chest above the valve, the plate having an opening over the re-

481,018.

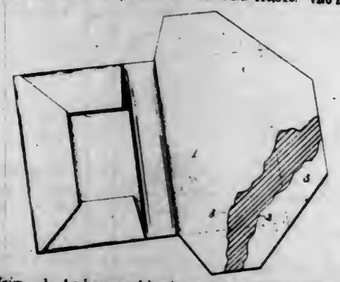


cess in the plate and adapted to hold the valve positively against its seat, substantially as specified.

2. The combination, with the slide-valve and the plate D, secured thereto by suitable standards, of the rabbeted plate G, having an upwardly-extending flange, and the downwardly-extended flange on the chest-cover surrounding the flange on the bearing-plate for the purpose of holding packing, substantially as and for the purpose described.

3. The combination, with the slide-valve, of the plate D, recessed on its upper face, and the bearing-plate provided with a central opening, the chest-cover provided with a coincident opening, and the packing-flanges on the cover and bearing-plate, substantially as and for the purpose specified.

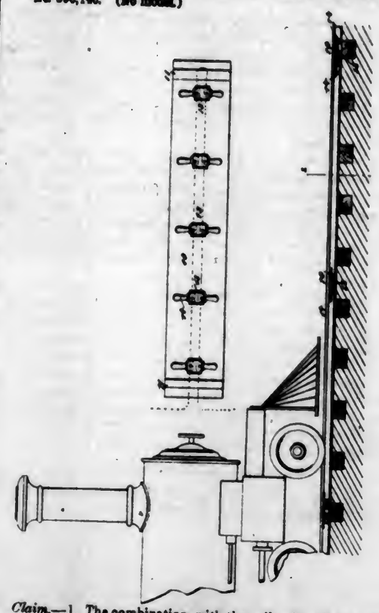
481,014. TENT. GEORGE N. DUNCAN, Greenwich, Mass. Filed Jan. 16, 1892. Serial No. 418,246. (No model.)



Claim.—1. In a tent, the tripod-frame composed of the three bars A B C, joined together at the apex, spread triangularly and secured to the earth at the foot, in combination with the canopy-top, the ribs or stretchers radiating from the apex of the frame-bars, and the braces extending from the foot of the spread frame-bars to the outer ends of the stretchers or ribs, substantially as set forth.

2. In a tent, the tripod-frame bars A B C, united at top by the socket-plate G, in combination with the ribs or stretchers F, connected to and radiating from said plate, and with the supporting and stiffening braces H secured to said ribs and to the foot of the frame-bars, substantially as set forth.

3. In a tent, the radiating ribs and marginal braces described, in combination with the tripod-frame bars A B C, connected at top to said ribs and at bottom to said braces and each made in two connected parts, deflected upwardly and secured firmly at the joint, whereby increased height is insured beneath the central portion of said bars, substantially as set forth.

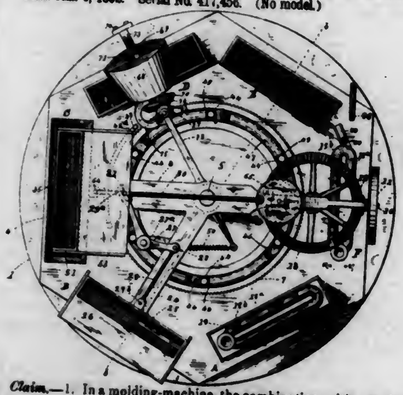


481,015. BOOK-COVER PROTECTOR. HELEN M. ENOS, Millersburg, Ohio. Filed Oct. 31, 1891. Serial No. 410,516. (No model.)

Claim.—1. An improved book-cover protector consisting of two plies of fibrous material, as paper, and a lining of flexible sheet metal, said cover being arranged to inclose the book and fold over the edges of the covers, substantially as shown and described.

2. In a book-cover protector, the combination, with a cover of fibrous material adapted to inclose the back and covers of the book, of a reinforcing ply of flexible sheet metal, connected with said cover by cement, and arranged to be bent over and inclose the edges of the book-covers, substantially as shown and described.

481,016. DEVICE FOR ILLUMINATING RAILROAD-TRACKS. WILLIAM E. FERGUSON, Montclair, N. J. Filed June 18, 1891. Serial No. 396,146. (No model.)



Claim.—1. The combination, with the rails of a railroad-track, of lights located adjacent thereto and below the treads of the rails, as and for the purpose specified.

2. The combination, with the rails of a railroad-track, of a light located between the rails and below the plane of the treads of the rails, as and for the purpose specified.

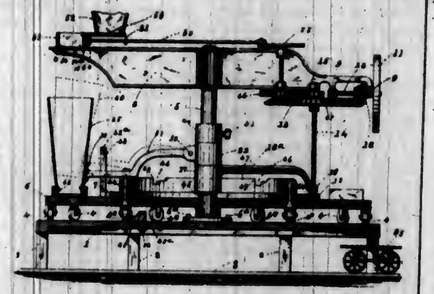
3. In a railroad, one or more lights placed between the rails and arranged to admit of trains passing over them, as and for the purpose specified.

4. The combination, with a railway-track, of lights located between the rails in a manner to admit of trains passing over them, and a shield located above the lights and also below the treads of the rails, as and for the purpose set forth.

481,017. MOLDING-MACHINE. JESSE A. FIELD, Buffalo, N. Y. Filed Jan. 9, 1892. Serial No. 417,456. (No model.)

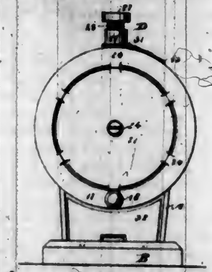
Claim.—1. In a molding-machine, the combination, with a stationary supporting-table provided with a vertical central shaft, of a movable table carrying the patterns mounted thereon and resting on friction-rollers, so as to turn easily on the stationary table, a combined sand receptacle and peening device for guiding the sand into the flask and peening it around the inner edges of the flask near the pattern as the rotating table brings it in the proper position, mechanism, substantially as above described, for giving it its peening movement, and a means consisting of a roller under which the flask passes for compressing the sand in the flask after the peening device has done its work, substantially as described.

2. In a molding-machine, the combination, with a stationary table provided with a series of supporting-rollers, of a rotating table mounted on said rollers, a series of patterns secured to said rotating table at a substantially equal distance apart, a vertical shaft rigidly secured to the stationary table and around which the movable table rotates, a combined sand and peening device, mechanism, substantially as above described, for giving it its intermittent swinging and up-and-down movements for peening the sand around the edge of the pattern, a roller for smoothing down the sand after it has been fed into the mold, pins passing down through the rotating table and provided with rollers at their lower ends, inclined upward projections located on the stationary table over which said rollers pass and lift the mold and flask up from the pattern, and mechanism, substantially as above described, for giving the moving table its required rotating movements, as herein set forth.



3. In a molding-machine, the combination of a stationary table provided with wheels, upon which is mounted a movable table, a vertical shaft rigidly secured to the stationary table, so as to pass up through the center of the rotating table, a riddle secured to an arm attached to a collar on the stationary shaft at an incline to receive the facing material and sift it on the pattern when it comes around to that point, a combined sand receiving and peening device, mechanism, substantially as hereinbefore set forth, for giving the required peening movements, a smoothing-roller and gearing operated by a horizontal gear on the rotating table for giving it its proper rotating movements as the molds pass under it, a means consisting of pins passing through the rotating table and having friction-rollers at their lower ends adapted to roll up the inclines on the projections on the lower table for lifting the mold from the pattern, and gearing, substantially as described, for giving the movable table its rotating movements.

4. In a molding-machine, a stationary supporting-table provided with rollers 4 and stationary inclined projections 83 83ª, in combination with an adjustable inclined projecting portion 84, and a continuously-rotating table mounted on a central pivotal shaft so as to rest on the stationary-table rollers and provided with pins mounted in vertical bearings in said movable table, having friction-rollers at their lower ends, so as to be moved easily by the inclined projecting portions, and a means, substantially as above described, for giving the rotating platform a continuously-rotating movement, whereby the flask or mold may be lifted up from the pattern during the continuous rotation of the table, substantially as described.

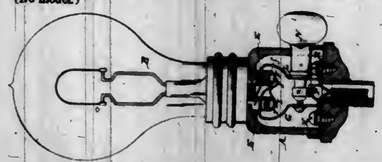


5. In a molding-machine, the combination, with a stationary supporting-table provided with a series of rollers and a vertical central shaft, of a movable table mounted thereon, a combined sand receptacle and peening device secured to an arm 37, pivoted to a collar adapted to be moved laterally one way on the stationary vertical shaft, a spring for bringing it back to its normal position an upwardly-projecting rim on the rotating table, provided with a series of depressions, each having a vertical pin fitted loosely therein and provided with a friction-roller at the bottom, and inclined projections on the lower stationary table for lifting said pins as they successively pass over them, whereby the peening device is lifted and dropped every time a flask comes below it, substantially as described.

6. In a molding-machine, the combination, with the sliding box for feeding sand, of two doors 54 54ª, pivoted at the bottom and geared so that both move together, a weighted arm projecting out from the gear 55ª, a weighted holding and releasing arm pivoted to an arm connected with the sliding box, and a stationary pin 62 for releasing the arm and pivoted doors, for the purposes described.

481,017.

481,018. PENCIL-POINTER. FRANK H. FLAGG, New York, N. Y., assignor of one-half to Andrew Dow, same place. Filed May 10, 1892. Serial No. 432,409. (No model.)



Claim.—1. In a pencil-pointer, the combination, with a casing provided with a socket-plate having a conical bore to receive a pencil, which bore extends through one face of the plate, that face being beveled, of a disk having a beveled inner face and provided with an attached abrading material, the beveled abrading-face of the disk being held to revolve in close proximity to the beveled face of the socket-plate, a clamp adapted to hold a pencil and loosely mounted in the casing above the socket-plate, and a driving mechanism connected with the disk and with the clamp, whereby both are revolved in unison, as and for the purpose specified.

2. In a pencil-pointer, the combination, with a casing provided with an opening in its top, a socket-plate attached to the casing below the opening and having a beveled outer face, and a central vertical tapering opening extending through its beveled face, of a drive-wheel journaled in the casing, a disk connected with the drive-wheel and having a beveled inner face, the beveled surface of the disk being provided with an abrading material and the beveled face of the disk practically engaging with the beveled surface of the socket-plate, a clamp capable of holding a pencil and loosely fitted in the casing, and a driving connection, substantially as shown and described, between the drive-wheel and the clamp, whereby the latter is revolved, as and for the purpose set forth.

3. In a pencil-pointer, the combination, with a casing provided with an opening in its upper end, a pinion adjacent to the opening, and a socket-plate attached within the casing beneath its upper opening, the forward face of the socket-plate being beveled and provided with a vertical tapering bore extending through the beveled surface, and clearance-channels leading from the bore, of a drive-wheel held to revolve in the casing, a disk connected with the drive-wheel, the inner face of which is beveled and provided with an abrading material, the said inner face of the disk revolving in close proximity to the beveled surface of the socket-plate, a clamp comprising a tubular section, provided with a head at its upper end and provided with jaws at its lower end and a thread between the jaws and the head, a sleeve screwed upon the tube-section and capable of closing the jaws of the latter and provided with an exterior gear, the lower end of the sleeve being adapted to enter the upper opening in the casing and its gear to mesh with the pinion of the casing, and a driving connection between the drive-wheel and pinion, as and for the purpose specified.

481,019. INCANDESCENT ELECTRIC LAMP AND LAMP-SOCKET. BRUCE FORD, Gloucester, N. J. Filed Nov. 27, 1891. Serial No. 413,201. (No model.)

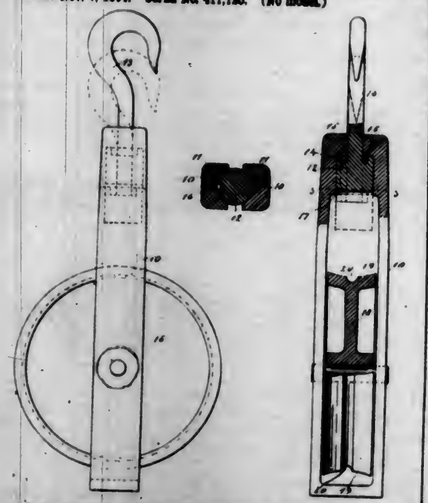
Claim.—1. An electric lamp having two terminals, one of which is provided with a high-resistance substance capable of destruction upon the passage of an excessive current, in combination with a lamp-socket provided with a spring-contact adapted to electrical contact with one of the terminals of the electric lamp and pressing upon the high-resistance substance of the other terminal.

2. As an article of manufacture, an incandescent lamp having its base part provided with two terminals and a high-resistance substance in electrical connection with one of said terminals and capable of destruction upon the passage of an excessive current through it, in combination with a lamp-socket provided with a spring-contact adapted to electrical contact with one of the terminals of the electric lamp and

pressing upon the high-resistance substance of the other terminal.

3. An incandescent lamp having its base provided with two terminals, one of which projects downward, is adapted to extend within the socket-piece, is recessed upon its end, and contains a high-resistance fusible or destructible substance.

4. As an article of manufacture, an incandescent lamp having its base part provided with two terminals and a high-resistance substance mechanically supported by and in electrical connection with one of said terminals, capable of destruction upon the passage of an excessive current through it, in combination with a socket-piece having contacts for connection with the contacts of the lamp when fitted to the socket-piece and in which one of said contacts is provided with a spring-extension or lip adapted to press upon the high-resistance material for the purpose of forming metallic contact about the lamp upon the destruction of the said high-resistance material.



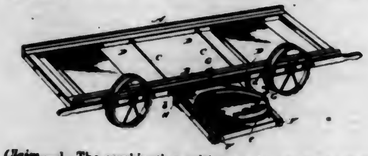
5. The combination of an incandescent lamp having two terminals, high-resistance substance capable of destruction or fusion, mechanically supported by and electrically connected with one terminal of the lamp, and a socket-piece adapted to receive the lamp and provided with contacts connecting, respectively, with the terminals of the line-circuit and the terminals of the lamp and in which one of said contacts has a spring-extension on one of the contacts of the socket-piece, resting normally against the high-resistance substance of the lamp.

6. The combination of an incandescent lamp having two terminals, a high-resistance substance capable of destruction or fusion, mechanically supported by and electrically connected with one terminal of the lamp, a socket-piece adapted to receive the lamp and provided with contacts connecting, respectively, with the terminals of the line-circuit and the terminals of the lamp, one of said contacts having a spring-extension resting normally against the high-resistance substance of the lamp, and a cut-out switch arranged within the socket-piece for shunting the lamp without the destruction of its filament.

7. An electric lamp having terminals C and D, formed with grooves E, combined with a support, spring-contacts G and L, connecting with the terminals of the line, the former being provided with the edge K, the finger I, and lip J and the latter with the curved edge M, and a high-resistance destructible substance arranged between the lip J and the terminal C of the lamp.

8. An electric lamp having terminals C and D, formed with grooves E, combined with a socket-casing, spring-contacts G and L, connecting with the terminals of the line, the former being provided with the edge K, finger I, and lip J and the latter with the curved edge M, a high-resistance destructible substance arranged between the lip J and the terminal C of the lamp, and means for adjusting the pressure of the contacts G and L against the contacts C and D of the lamp.

481,020. SNATCH-BLOCK. ADAMS C. FRENCH, Seattle, Wash. Filed Nov. 7, 1891. Serial No. 411,195. (No model.)



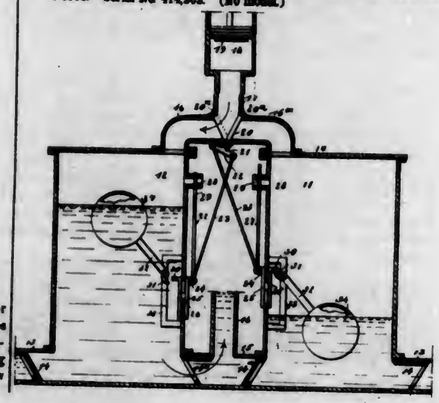
Claim.—1. A scatch-block comprising a frame having its sides or arms separated at their upper ends and concaved on their inner faces to form an enlarged socket and a removable hook having a head fitting within said socket of greater diameter than the space separating the sides or arms above it and of less diameter than the space below the same, the hook being thus adapted to be removed or inserted by passing its shank laterally between the separated or spaced upper ends of the frame when its head is in the space below its socket, substantially as set forth.

2. A snatch-block comprising a frame having its sides or arms separated at their upper ends and concaved on their inner faces to form an enlarged socket, and a removable hook having a head turning freely within said socket of greater diameter than the space above the socket and of less diameter than the space below it, the hook being thus adapted to be removed or inserted by passing its shank laterally between the spaced or separated upper ends of the frame when the head is within the space below its socket, and a fastening device securing the head against accidental displacement from its socket, substantially as described.

3. The combination, with the block-frame having its side arms separated and concaved at the top, one of said side arms having a projecting lug at the bottom of the concaved portion, of a hook having a cylindrical head to fit the concaved portions of the arm and having a keyway in the head adapted to pass over the lug on the frame, substantially as described.

4. The combination, with the frame having separated concaved upper ends, said ends having depending spurs near the top and one of them having a projecting lug at the bottom of the concaved portion, of a detachable hook having a cylindrical head to fit the concaved portions of the arms, said head having an annular groove at the top to receive the spurs of the frame, and a longitudinal keyway adapted to register with the lug on the frame, substantially as described.

481,021. CARRYING ATTACHMENT FOR HAND-CARS. JAMES W. GREENE, White City, Kans. Filed July 22, 1891. Serial No. 400,326. (No model.)



Claim.—1. The combination, with a car having hook-ended rods projecting therefrom, of a frame or support adapted to receive a keg or like receptacle and having means for the proper retention of said keg or receptacle in position thereon, said frame or support having straps adapted to engage said hook-ended rods, substantially as set forth.

2. The combination, with a car having hook-ended rods projecting therefrom, of a frame or support having a circular base thereon and hooks to secure a keg or like receptacle in proper position upon said base, and upturned eye-ended straps adapted to engage said rods, and angle-irons having said rods passing therefrom, substantially as set forth.

3. The combination, with a railway hand-car, of a frame for holding a water-keg, detachably secured to the hand-car by bars that extend through the sill of the car-frame, and to which bars the keg-carrier is secured, for the purposes specified.

481,022. PUMP. MELCHI M. GROVE, Garfield, Wash. Filed Dec. 7, 1891. Serial No. 414,962. (No model.)

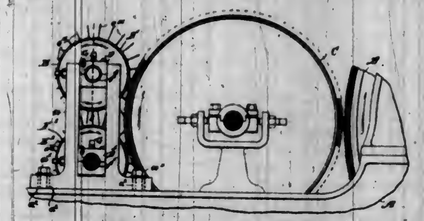
Claim.—1. A pump comprising chambers having valved inlets and outlets at their lower ends and an air-pipe having branches connected with the upper ends of the chambers, of an air-inlet valve at the juncture of the two branches to divert the air into either chamber, floats pivoted within the said chambers, slide-blocks connected with the valve for operating it and in turn operated by said floats, and air exhaust-valves in the upper parts of said chambers and also connected with the slide-blocks, substantially as set forth.

2. A pump comprising similar chambers, each having a valve-controlled inlet-pipe at its lower end and each having a common valve-controlled outlet, a pipe having two branches connecting it with the upper ends of the chambers and said pipe connecting, also, with an air-pump, a valve arranged in the air-pipe at the juncture of its two branches and adapted to divert the water to either chamber, a walking-beam connected with the crank of the valve, slide-blocks held to move vertically in the walls of the chambers, connections between the slide-blocks and the ends of the walking-beam, and floats suspended in the chambers and adapted to operate the slide-blocks, substantially as described.

3. The combination, with the two chambers having suitable water inlets and outlets, as described, and having air-pipes opening from their upper portions, of a pipe connecting the upper ends of the chambers and connected, also, with an air-pump, a valve mounted in the air-pipe and adapted to divert the air to either chamber, slide-blocks held to move vertically in the chamber-walls, said slide-blocks being connected by rods with opposite ends of a walking-beam secured to the air-valve, plates connected with the slide-blocks and extending through the air-outlet pipes, said plates having suitable openings therein, and floats suspended in the chambers and adapted to operate the slide-blocks, substantially as described.

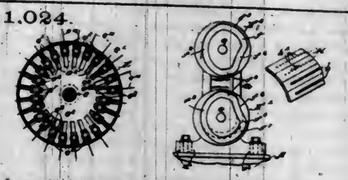
4. The combination, with the chambers having suitable water inlets and outlets and having air inlets and outlets at their upper ends, an air-pipe having two branches leading to said inlets, and a pivoted valve at the juncture of said branches, of the slide-blocks held to move vertically in the walls of the chambers and having operative connection with valves controlling the air-outlets and with the single pivoted air-inlet valve, and levers pivoted within the chambers and having at their inner ends toes to strike the flanges on the slide-blocks and at their outer ends floats, substantially as described.

481,023. TRANSPARENT TOY OR PUZZLE-PICTURE AND MODE OF PRODUCING THE SAME. WILHELM GRÜNE, Sr., Berlin, Germany. Filed Mar 14, 1892. Serial No. 424,882. (No specimens.)



Claim.—1. The method of making transparent toys or puzzle-pictures, which consists in producing the picture upon the article by means of a protecting substance or material, as varnish, then etching the unprotected parts of the article by means of powdered silicate of magnesium, and then removing the protecting material from the article by means of a solvent, as benzine, substantially as and for the purposes set forth

2. A transparent toy or puzzle-picture consisting of two similar glass-plates adapted to be maintained in contact with each other and provided upon their adjacent faces with different vapor-controlled apparition and occultation pictures, the construction being such that by the application of heat to one plate and consequent deposition on the other the second picture is rendered visible, substantially as set forth.



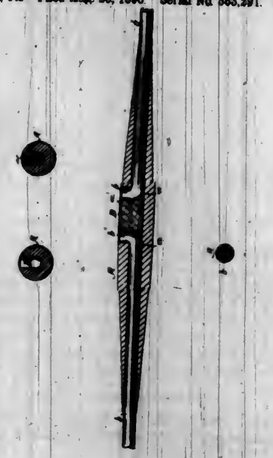
481,024. FEED-ROLL FOR CARDING-MACHINES, &c. AARON B. HARRISON, North Andover, Mass. Filed Apr. 8, 1891. Serial No. 388,165. (No model.)

Brief.—The feed-rolls are armed with teeth that are caused at different times to project to varying distances from the surface of the feed-rolls.

Claim.—1. The combination of a cylindrical feed-roll having longitudinally-movable teeth, another roll adapted to receive fibers from said teeth, and means of causing the points of said teeth at the side of said feed-roll adjacent to said receiving-roll to lie in a curved surface concentric with the axis of said receiving-roll, as and for the purpose specified.

481,024.

2. In combination with a receiving-roll, as a licker-in or burr-cylinder, of two rotary feed-rolls parallel with said receiving-roll, each of said feed-rolls having bars arranged to move radially therein, outwardly-projecting teeth carried by said bars, and stationary cams engaging said bars to vary the distance of said bars from the centers of said feed-rolls and to move said bars during a portion of each revolution of said feed-rolls in a curved path concentric with said receiving-roll and in proximity thereto, as and for the purpose specified.



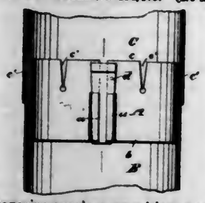
3. The combination of two parallel rotary feed-rolls, each having bars arranged to move radially therein, outwardly-projecting teeth carried by said bars, stationary cams having cam-grooves to engage said bars, to vary the distance of said bars from the centers of said feed-rolls, portions of said cam-grooves on the receiving sides of said rolls having an increasing radius to cause the teeth of each feed-roll in approaching the teeth of the other to enter the stock gradually and to attain their greatest projection when opposite the shaft of the other feed-roll, as and for the purpose specified.

4. The combination of a shaft, radially slotted disks fast on said shaft, bars movable in the slots of said disks toward and from said shaft and projecting through said slots, lags secured to the peripheries of said disks, teeth carried by said bars and projecting outwardly through openings with which said lags are provided, and stationary cams engaging the ends of said bars to vary the distance of said bars from said shaft when said shaft is rotated, as and for the purpose specified.

5. The combination of a shaft, radially-slotted disks fast on said shaft, bars movable in the slots of said disks toward and from said shaft and projecting through said slots, outwardly-projecting teeth carried by said bars, journal-boxes and cams having hollow cylindrical stems arranged in said journal-boxes and surrounding the journals of said shaft, and having cam-grooves to enable said cam-grooves to be brought into parallelism with each other by the rotation of said cams, as and for the purpose specified.

6. The combination of a shaft, radially-slotted disks fast on said shaft, bars movable in the slots of said disks toward and from said shaft and projecting through said slots, outwardly-projecting teeth carried by said bars, journal-boxes, cams having cam-grooves and having hollow cylindrical stems arranged to turn in said journal-boxes and surrounding the journals of said shaft to enable said cam-grooves to be brought into parallelism with each other by the rotation of said cams, and set-screws turning in said journal-boxes and thrusting against said stems to prevent the rotation of said cams, as and for the purpose specified.

481,025. JOINT FOR ELECTRIC WIRES. WALTER E. HARRINGTON, Atlantic City, N. J., assignor of one-half to Leonard Atwood, Philadelphia, Pa. Filed Aug. 28, 1890. Serial No. 363,291. (No model.)

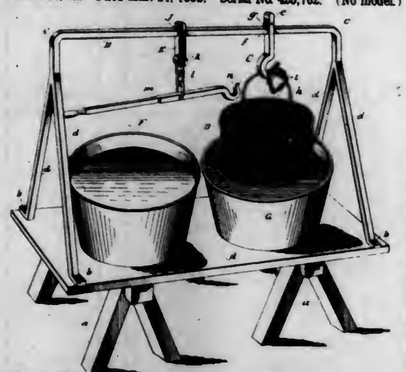


Claim.—1. The improvement in the art of connecting wires, which consists in forming a sleeve with a longitudinal passage and a transverse opening communicating therewith, inserting the ends of the wires into the passage, bending the ends of the wires, and introducing a material which afterward hardens around the bent ends of the wires, substantially as described.

2. A joint for wires, consisting of a sleeve having a longitudinal passage and a transverse opening communicating therewith, wires in the longitudinal passage, the ends of the wires being bent in the transverse opening, and a filling of cast material embedding the ends of the wires substantially as described.

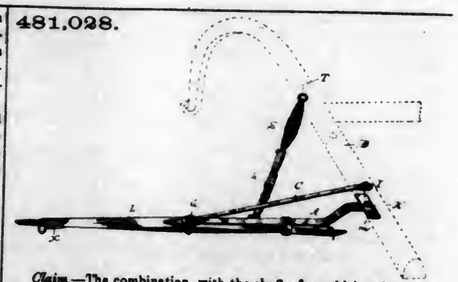
3. A coupling for electric trolley-wires, consisting of a shell made from a single piece of metal having an orifice extending throughout its length and a transverse slot at the center, opening into said orifice, said shell being tapered to a feather-edge at both ends, wires passed through the orifice and having their ends turned up into the slot, and solder filling the slot and embedding the ends of the wires, substantially as set forth.

481,026. STOVEPIPE-COUPLING. FRANCIS P. HART, Strasburg, Pa. Filed Dec. 9, 1891. Serial No. 414,473. (No model.)



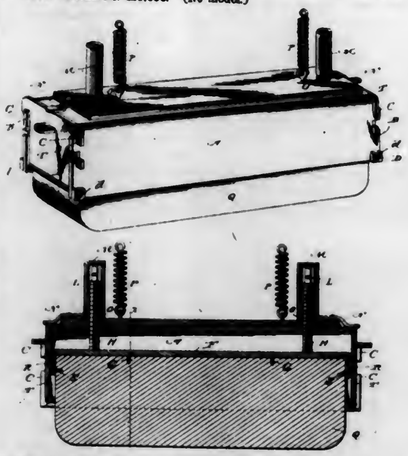
Claim.—1. A stovepipe-coupling comprising an open sleeve having one end notched to permit the said end to be contracted or expanded and provided with means for bodily expanding the sleeve, substantially as described.

2. A stovepipe-coupling comprising an open sleeve having one end notched and provided along its inner longitudinal edges with hooks and a wedge or key fitting in and between said hooks, substantially as described.



3. A stovepipe-coupling comprising a sleeve-piece having one end portion folded to double its thickness and longitudinally notched V-shaped, and at intervals the unjoined longitudinal edges of said sleeves being provided with hooks folded internally, and a thin wedge or key insertible between and within said hooks, substantially as described.

481,027. DISH-WASHING MACHINE. ANDERSON W. HEINLY, Danville, Ill. Filed Mar. 21, 1892. Serial No. 425,762. (No model.)



Claim.—The combination, in a dish-washing machine, of a frame consisting of a horizontal bar bent downwardly at right angles at a suitable distance from its ends and said ends being divided longitudinally and extending divergingly downward, a hook having a slot in its shank, a roller mounted in said slot, a wire basket, a chain connecting said basket and said hook, and means adjustably mounted on said horizontal rod for moving said basket, substantially as described.

481,028. WHIFFLETREE. WILLIAM F. HENRY, WILLIAM P. BOLLES, and ALFRED MCKEE, Bloomington, Ill. Filed Apr. 1, 1892. Serial No. 427,490. (No model.)

Claim.—The combination, with the shaft of a vehicle, of an arm A, pivoted at one end to the shaft and having pivoted to its other end a whiffletree L, a brace C, pivotally connected at one end to the free end of said arm and its other end pivotally connected to the shaft, and an elastic connection between the shaft and the said arm, substantially as and for the purpose described.

481,029. RAIL-BRAKE. CHARLES W. HOWLETT, Kansas City, Mo., assignor of one-third to Daniel S. Gerber, same place. Filed Feb. 27, 1892. Serial No. 423,038. (No model.)

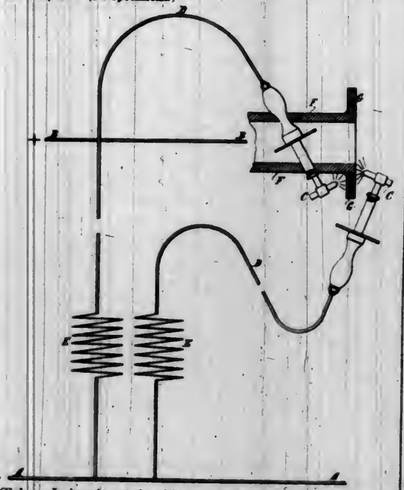
Claim.—1. A rail-brake shoe consisting of an inclosing case or shell, a movable plate arranged in said shell, a brake-sole connected to said plate, and means for moving said plate and sole vertically within the inclosing shell, substantially as described.

2. A rail-brake shoe consisting of an inclosing case or shell, a horizontal movable plate arranged within the shell, a brake-sole connected to said plate, and adjusting-screws supported in the shell and adapted to move the plate and sole vertically therein, substantially as described.

3. A rail-brake shoe consisting of an inclosing case or shell, a horizontal movable plate arranged within the shell, a brake-sole fitted in the inclosing shell, the dogs pivotally connected to the movable plate and engaging with the ends of the sole, and means for adjusting the plate and sole vertically within the shell, substantially as described.

4. In a rail-brake shoe, the combination of the inclosing shell open at its lower end, a brake-sole fitted within and extending below said shell, a horizontal plate fitted in the shell above the sole and provided on its under surface with a series of spurs, which engage with the brake-sole, the dogs pivoted to the plate and engaging with the ends of the brake-sole, and the operating-screws connected to the movable plate and extending through the inclosing shell, substantially as and for the purpose described.

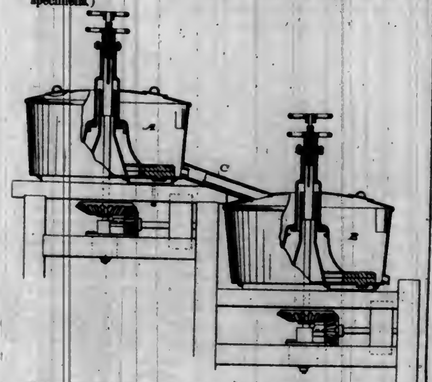
5. The combination of an inclosing shell open at its lower side and at its ends, bolts connecting the sides and extending across the open ends, the end plates arranged to close the ends of the shell, the coiled springs connected to said shell and adapted to be connected to the trucks of the car, a brake-sole fitted within the shell, and means for adjusting said sole vertically within the shell, substantially as described.



6. The combination of the inclosing shell open at its ends and lower side, the bolts connecting the sides and extending across the open ends,

the removable plates adapted to close the ends, a brake-sole fitted within and extending below the inclosing shell, a plate arranged within the shell and detachably connected to the sole, adjusting-screws connected to said plate and extending above the inclosing shell, removable caps fitted over the exposed portions of the adjusting-screws, and the levers or catches pivoted on the inclosing shell and operating to confine the removable caps and the detachable end plates in place, substantially as described.

7. The combination, with a shell or case and a brake-sole, of an adjustable plate within the shell and engaging the sole along its upper side and at its ends, and means for adjusting the plate, substantially as described.

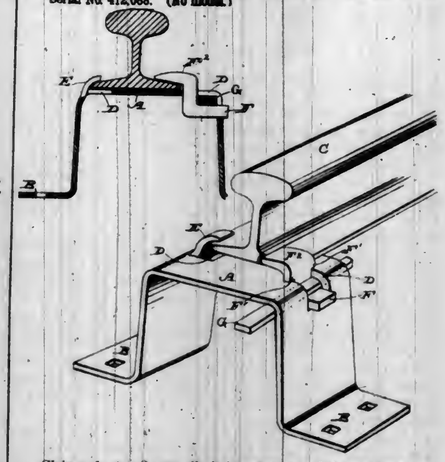


8. The combination, with a shell, a sole, and an adjusting-screw of a protection-case fitted on the screw, an end plate fitted to the open end of the case, and a latch arranged to engage both the protection-case and the end plate, substantially as described.

481,030. METHOD OF ELECTRIC WELDING. HENRY HOWARD, Halesowen, near Birmingham, England. Filed May 31, 1892. Serial No. 434,948. (No specimens.)

Claim.—In heating and welding with the electric arc, the combination of a main connected to one pole of the source of electricity, two or more pencils connected to the said main, two or more resistances each interposed between one of the pencils and the said main, and a second main connected at one end to the work to be heated or welded and at the other end to the other pole of the source of electricity.

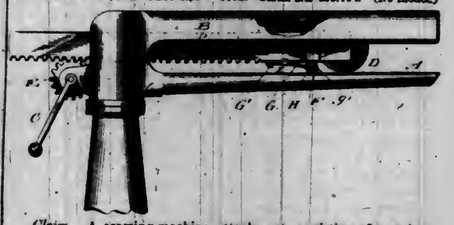
481,031. ART OF AMALGAMATING SILVER ORE. ALEXIS JANIN, San Francisco, Cal. Filed May 6, 1892. Serial No. 432,042. (No specimens.)



Claim.—1. The improvement in the art of amalgamating silver ores, which consists in adding to the ore precipitated metallic copper and an acid salt, heating and stirring the pulp until the silver minerals are desulphurized, then adding mercury, and concluding the amalgamation in the usual manner.

2. The improvement in the art of amalgamating silver ores, which consists in subjecting the ore in a preparatory pan or mixing-tub to the action of precipitated metallic copper and an acid salt, heating and stirring the pulp until the silver minerals are desulphurized, then discharging the pulp into an amalgamating-pan, adding mercury, and concluding the amalgamation in the usual manner.

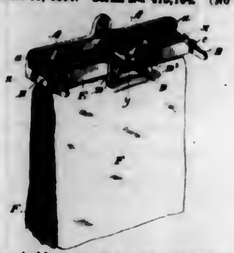
3. The improvement in the art of amalgamating silver ores, which consists in adding to the ore in a preparatory or mixing tub sulphate of copper and salt, together with finely-divided metallic iron or zinc, heating and stirring the pulp until the silver minerals are desulphurized, then discharging the pulp into an amalgamating-pan, adding mercury, and concluding the amalgamation in the usual way.



481,032. RAILWAY-RAIL CHAIR. BYRON JENNINGS, San José, assignor of one-half to James Bruce, Oakland, Cal. Filed Nov. 16, 1891. Serial No. 412,068. (No model.)

Claim.—1. A railway-rail chair consisting of the angular metal plate adapted to be secured to the tie, having a slot extending part way across the top and down upon one side, a fixed tongue projecting upward from one side of the chair, adapted to clasp and hold one flange of the rail, a bent yoke having a hook-shaped head, which presses upon the opposite flange of the rail, and a key introduced between the angle of the yoke and the inner angle of the chair, substantially as herein described.

2. A railway-chair consisting of the bent angular plate having a means by which it is secured to the tie, a slot extending part way across the top and part way down one side of the chair, a fixed hook-shaped clamp upon one side, beneath which one flange of the rail is secured, an angular piece F, bent to fit into the open slot and against the web upon the opposite side, having the hook shaped head extending over the flange of the rail, the shoulders F', resting upon the top of the chair at each side of the slot, and a locking-key passing inside of the angle of the chair and exterior to the angle of the locking-piece F, whereby the latter is locked securely to the chair, substantially as herein described.



481,033. SEAMING-MACHINE. GOTTHILF F. E. KAESLEITER, Terre Haute, Ind. Filed Apr. 7, 1892. Serial No. 428,194. (No model.)

Claim.—A seaming-machine attachment consisting of a spring-

arm having one end cut away with the side portions turned up and curved to form upper bearings for the pintles of a roller, a roller having pintles held in said bearings, springs secured to the under face of the spring-arm and receiving the pintles, and a plate with ribs upon the upper face of the said arm to prevent lateral movement thereof, in combination with the co-operating parts, as set forth.

481,084. TOILET-PAPER HOLDER. JAMES M. KEEP, New York, N. Y. Filed Dec. 18, 1891. Serial No. 415,164. (No model.)

Claim.—1. In a holder for toilet and other paper in sheets, in combination with the main or back plate having guiding posts or arms at its ends, the longitudinal movable bar having its ends close to the inner sides of the guiding posts or arms, provided with projecting guide-lugs overlapping the latter, and means for forcing the same toward the main plate, substantially as and for the purpose specified.

2. In a holder for toilet and other paper in sheets, in combination with the main plate having a groove in its front face, the bar having a rib opposite such groove and means for forcing such rib toward the plate, substantially as and for the purpose specified.

3. In a holder for toilet and other paper in sheets, in combination with the main plate having a groove, the bar having a rib opposite such groove, provided with teeth, and means for forcing and holding such bar as forced toward the plate, substantially as and for the purpose shown.

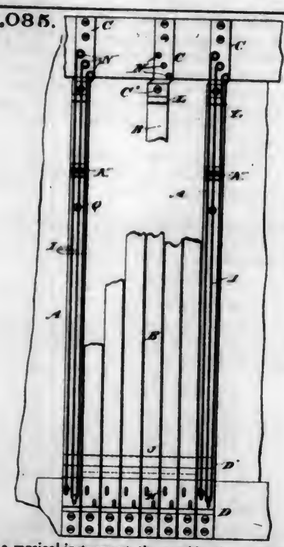
4. In a holder for toilet and other paper in sheets, in combination with the main plate having its front face provided with two projecting ribs arranged to leave a groove or channel between them, the bar carrying a longitudinal series of teeth opposite such groove and means for forcing the bar toward the plate, substantially as and for the purpose set forth.

5. In a holder for toilet and other paper in sheets, in combination with the main plate provided with the two longitudinal ribs on its front face and the two arms, the movable bar having the serrated rib and provided with suitable guide-lugs to engage the arms on the main plate and a screw device to force the bar toward the plate, so as to clamp a bundle or mass of sheets of paper between the toothed rib on the bar and the ribs on the plate, substantially as and for the purpose described.

481,085. MUSICAL INSTRUMENT. DWIGHT KEMPTON, Summerland, Cal. Filed Feb. 3, 1892. Serial No. 420,160. (No model.)

Claim.—1. A musical instrument provided with a series of harmonic sections, each comprising a bar, pins held on the said bar and carrying the strings, and a bridge held on the said bar and over which pass the strings, substantially as shown and described.

2. In a musical instrument, a harmonic section having an independent bridge over which pass the strings, substantially as shown and described.

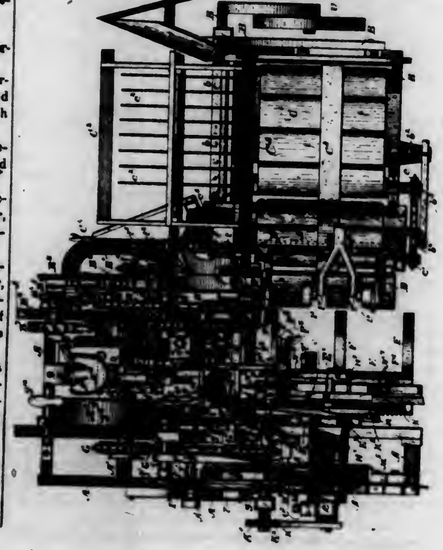


3. A musical instrument provided with a series of harmonic sections arranged alongside each other, but independent one of the other, each section supporting its strings or group of strings for the respective note, substantially as shown and described.

4. A musical instrument provided with a series of harmonic sections arranged alongside each other, but independent one of the other, each section supporting its strings or group of strings for the respective note, and a bridge held on each of the said sections to permit of giving the string or group of strings the desired tones, substantially as shown and described.

5. In a musical instrument, the combination, with a frame and a sounding-board secured thereto, of a series of harmonic sections secured to the said frame in front of the sounding-board, the said sections being arranged alongside each other, but independent one from the other, substantially as shown and described.

6. In a musical instrument, the combination, with a frame and a sounding-board secured to the back thereof, of a series of harmonic sections secured to the front of the said frame, each section supporting a string or group of strings forming one tone, the said sections being arranged alongside each other, but independent one from the other, substantially as described.



481,085.

7. In a musical instrument, the combination, with a frame and a sounding-board secured to the back thereof, of a series of harmonic sections secured to the front of the said frame, each section supporting a string or group of strings forming one tone, the said sections being arranged alongside each other, but independent one from the other, and a post extending from each section to the said sounding-board, substantially as shown and described.

8. In a musical instrument, the combination, with a frame and a sounding-board secured to the back thereof, of a series of harmonic sections secured to the front of the said frame, each section supporting a string or group of strings forming one tone, the said sections being arranged alongside each other, but independent one from the other, a post extending from each section to the said sounding-board, and means, substantially as described, for adjusting the said post, as set forth.

481,086. CORN HARVESTER AND SHOCKER. GRANGER G. KINNELL, Farmer, assignor of one-fourth to Wilber W. Kinnell, Bryan, Ohio. Filed Oct. 30, 1890. Serial No. 369,835. (No model.)

Claim.—1. In a corn-harvester, the combination, with the bundling or shocking mechanism, substantially as described, and the cutter, of the conveyer for transferring the corn from the cutter to the bundling mechanism and a flexible band of sheet metal overlying said conveyer, resting thereon and forming a smooth way along which the corn travels, substantially as described.

2. In a corn-harvester, the combination, with the pivoted bundling and shocking mechanism, substantially as described, the intermittingly-operated wheel co-operating with the arms when in a horizontal position to open or close the barrel, and the cutter and conveyer for transferring the corn from the cutter to the bundling and shocking mechanism, of the feed-table over which the corn passes, the movable arms adapted to project above the feed-table to interrupt the feed, and connections between said arms and the intermittingly-operated wheel, whereby the feed is arrested when the barrel is closed, substantially as described.

3. In a corn-harvester, the combination, with the main drive-shaft, bundling or shocking mechanism, cutter, conveyer, and feed-table, of the feed-fingers connected to a crank-shaft carrying a cam and pawl, a constantly-moving ratchet-wheel driven from the main drive-shaft and with which the pawl engages, and the pivoted arm carrying the anti-friction roller riding on the cam for releasing the pawl, said arm being released by the bundling or shocking mechanism, whereby the movements of the feed-fingers may be arrested when the bundling and shocking mechanism is not in position, substantially as described.

4. In a corn-harvester, the combination, with the main drive-shaft, bundling or shocking mechanism, cutter, conveyer, feed-table, feed-fingers, crank-shaft to which the fingers are connected, and pawl and cam on said shaft, of the constantly-moving ratchet-wheel with which the pawl engages driven from the main shaft, the spring pressed arm for throwing the pawl out of engagement, the spring for holding said arm in operative position, and the catch controlled by the bundling or shocking mechanism for maintaining the tension on said spring, substantially as described.

5. In a corn-harvester, the combination, with the main drive-shaft, bundling or shocking mechanism, cutter, conveyer, feed-table, feed-fingers, crank-shaft to which the fingers are connected, and pawl and cam on said shaft, of the constantly-moving ratchet-wheel driven from the main drive-shaft, with which the pawl engages, the pivoted spring-pressed arm carrying the anti-friction roller for throwing the pawl out of engagement, the spring for holding the said arm in operative position, the pivoted block on which said spring is mounted, and the catch controlled by the bundling and shocking mechanism for holding said block in with the tension on the spring, substantially as described.

6. In a corn-harvester, the combination, with the main drive-shaft, bundling or shocking mechanism, cutter, conveyer, feed-table, feed-fingers, pivoted links on which the fingers are mounted and crank-shaft to which said fingers are connected, and pawl, of the constantly-moving ratchet-wheel driven from the main drive-shaft, with which the pawl engages, the pivoted spring-pressed arm carrying the anti-friction roller for throwing the pawl out of engagement, the spring for holding the arm in operative position, the pivoted block on which the spring is mounted, the catch engaging said block moved by the bundling and shocking mechanism, and the cam on the crank-shaft having the recess and depressed portions, as described, and forming the track for the anti-friction roller, substantially as described.

7. In a corn-harvester, the combination, with the main drive-shaft and bundling or shocking mechanism, of the main operating-wheel for said mechanism, having connections with the drive-shaft, a clutch interposed in said connections, an arm for disengaging the clutch and then holding it disengaged, said arm adapted to be released by the driver, a second arm or lever for disengaging said clutch at a different point in the revolution of said operating-wheel and holding it disengaged, and a lever interposed in the path of the discharged shock at the rear of the machine for releasing said second arm or lever, substantially as set forth.

8. In a corn-harvester, the combination, with the main drive-shaft and bundling and shocking mechanism, of the main operating-wheel for said mechanism, having connections with the drive-shaft, a clutch interposed in said connections, a yoke rigidly secured to the main frame, having a shaft to which is pivoted an arm for disengaging said clutch and then holding it disengaged, a depending bracket secured to said shaft and provided with a lug through which passes a rod having a spring connection with the bracket and connected to said clutch-releasing arm, and a catch whereby said bracket is locked, said catch being released by the driver, substantially as described.

9. In a corn-harvester, the combination, with the main drive-shaft and the bundling or shocking mechanism, of the main operating-wheel for said mechanism, carrying a cam having a recess, a clutch interposed between the drive-shaft and said main operating-wheel, and an arm for disengaging said clutch, having an anti friction roller running on the cam, a spring for pressing the roller into the recess for releasing the clutch, and a latch under the control of the driver for holding the spring compressed, substantially as described.

10. In a corn-harvester, the combination, with the cutting and conveying mechanism and drive-shaft, of the barrel formed by the oppositely-arranged clamping-arms mounted on a common base pivoted at the center on a horizontal pivot at one side of the plane of movement of the barrel, and connections, substantially as described, between said barrel and drive-shaft for turning the same on its center, substantially as described.

11. In a corn-harvester, the combination, with the cutting and conveying mechanism and drive-shaft, of the barrel formed by the oppositely-arranged clamping-arms mounted on a common base pivoted at the center, a vertically-movable bar carrying said pivot, and connections, substantially as described, between the barrel and drive-shaft for turning the same on its center, as and for the purpose set forth.

12. In a corn-harvester, the combination, with the cutting and conveying mechanism and drive-shaft, of the barrel formed by the oppositely-arranged clamping-arms mounted on a common base pivoted at the center, connections between said barrel and drive-shaft for turning the same on its center, a vertically-movable bar or frame carrying the pivot for the barrel, a lock for holding the bar elevated, and connections, substantially as described, between the bar and drive-shaft for elevating the same, as and for the purpose set forth.

13. In a corn-harvester, the combination, with the cutting and conveying mechanism, drive-shaft, and centrally-pivoted barrel, of the vertically-movable bar or frame carrying the pivot for the barrel, the lock for holding the bar or frame elevated, the shaft driven from the main drive-shaft, having the crank-pin thereon, the link on the bar engaging the pin to elevate the bar during one part of the revolution of the shaft, and a lever tripped by an arm on the shaft to release the lock during another part of the revolution, substantially as described.

14. In a corn-harvester, the combination, with the cutting and conveying mechanism, drive-shaft, and centrally-pivoted barrel, of the shaft driven from the main drive-shaft and the crank-arm and link moved thereby to rotate the barrel on its center, substantially as described.

15. In a corn-harvester, the combination, with the cutting and conveying mechanism, drive-shaft, and centrally-pivoted barrel, of the shaft driven from the main drive-shaft, the rock-shaft connected to said shaft by the double crank and link $K K^1 K'$, respectively, whereby the rock-shaft is oscillated, a crank-arm on said rock-shaft, and a link connecting said arm and barrel, whereby the latter is moved from a horizontal to a vertical position and back again, substantially as described.

16. In a corn-harvesting machine, the combination, with the cutting and conveying mechanism, drive-shaft, centrally-pivoted barrel, and main drive-wheel for the bundling mechanism of the shaft, having a gear thereon meshing with said drive-wheel, of the vertically-movable bar or frame carrying the pivot of the barrel, the link connected to said bar and engaging a crank-pin moved by the shaft, an oscillating shaft and double-crank and link connection between said shafts, and a crank-arm and link connecting the rock-shaft and barrel, substantially as and for the purpose set forth.

17. In a corn-harvester, the combination, with the centrally-pivoted barrel, main operating-wheel for turning the same on its pivot, main drive-shaft from which said wheel is driven, a clutch for transmitting motion from the drive-shaft to the operating-wheel, an arm g^2 for releasing said clutch and holding it disengaged while the barrel is in a horizontal position, a catch g^3 for said arm, a lever M' for automatically releasing the clutch and then holding it disengaged when the barrel has turned to vertical position, and an arm M^3, projecting into the path of the discharged bundle for withdrawing said clutch-releasing lever, substantially as described.

18. In a corn-harvester, the combination, with the drive-shaft, cutter, and conveyer, of the barrel for receiving the corn, having the oppositely-arranged clamping-arms pivotally mounted on their base, the lock for the lower arm, and the spring for holding the upper arm down, substantially as described.

19. In a corn-harvester, the combination, with the drive shaft, cutter, and conveyer, of the barrel for receiving the corn, having the oppositely-arranged clamping-arms pivotally mounted on their frame, the lock for the lower arm, the spring for holding the upper arm down, and the latch for holding said spring compressed, substantially as described.

20. In a corn-harvester, the combination, with the drive-shaft, cutter, and conveyer, of the barrel for receiving the corn, having the oppositely-arranged clamping-arms, the lower arms being pivotally mounted on the supporting-frame, a shaft interposed between the upper arms and said frame, a spring between said shaft and arms for holding the arms down, and a latch for holding the shaft in said last-named position, substantially as described.

21. In a corn-harvester, the combination, with the drive-shaft, cutter, conveyer, and pivoted barrel for receiving and standing the corn on end, of the shaft controlling the upper arms of said barrel, the stud having the slot therein, with which said shaft engages, and the cam on the said operating-wheel for turning said stud, substantially as described.

22. In a corn-harvester, the combination, with the drive-shaft, cutter, conveyer, and pivoted barrel having the oppositely-arranged pivoted arms, of the gear on the lower arms, the bell-crank lever connected to the main frame for closing the arms when in horizontal position, and the gear N⁵ and link N⁶, connecting said lever and gear, substantially as described.

23. In a corn-harvester, the combination, with the drive-shaft, cutter, conveyer, and pivoted barrel having the oppositely-arranged pivoted arms, of the gear on the lower arms, gear N⁴, meshing therewith, the bell-crank lever N⁷, connected to said gear N⁶, link N⁸, connected thereto, lever pivoted on the main frame and connected to the link, and the lever driven from the main shaft for opening the arms when in vertical position, substantially as described.

24. In a corn-harvester, the combination, with the drive-shaft, cutter, conveyer, and pivoted barrel having oppositely-arranged pivoted arms, of the catch for holding the upper arms depressed, and the lever controlling said catch lying within the barrel, whereby the corn within the barrel throws the catch into operative position, substantially as described.

481,037. CASH INDICATOR AND REGISTER. GARDNER KNAPP, Somerville, and CHARLES H. LITTLE, Chelsea, Mass., assignors, by mesne assignments, to the Boston Cash Register Company, Portland, Me. Filed Nov. 20, 1888. Serial No. 291,412. (No model.)

Claim.—1. In a register, the combination, with two adjacent movable parts, as keys, of an arrester consisting of a rolling piece or body of a diameter greater than the space in the parts between the keys and a channel or holder for receiving and guiding such rolling arrester-body, substantially as described.

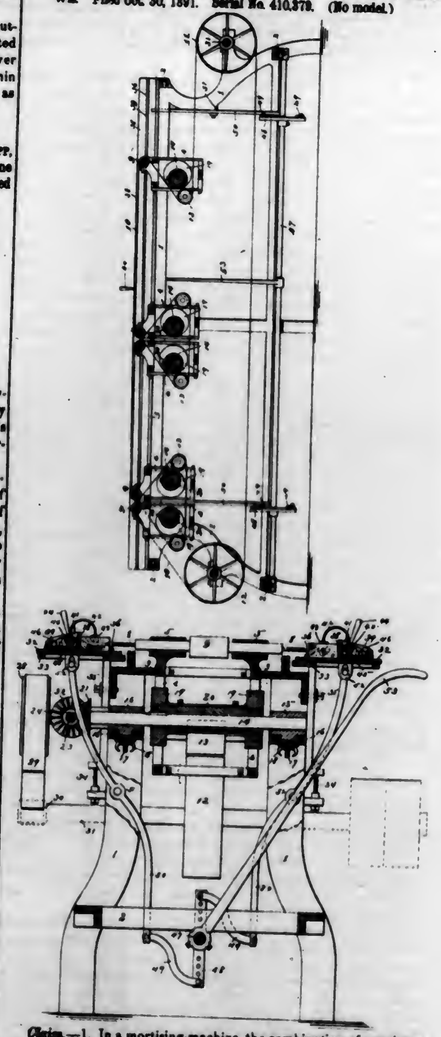
2. The combination of a series of keys, a tube or stop-case arranged at right angles with said keys and provided with a number of slots equal to the number of said keys, and a series of stops capable of rolling in said stop-case and arranged side by side within the same, the length of the combined diameters of said stops being less than the interior length of said case by the transverse thickness of said key when the same in being depressed strikes said stops, substantially as described.

3. The combination of a series of keys, each provided with a stop-separator having a uniform thickness laterally, a tube or stop-case arranged at right angles with said keys and provided with a number of slots equal to the number of said keys, each of said slots being adapted to admit one of said keys, and a series of stops capable of rolling in said stop-case and arranged side by side within the same, the length of the combined diameters of said stops being less than the interior length of said case by an amount as great as the transverse thickness of a stop-separator, substantially as described.

4. In a cash register and indicator, the combination of the operating-keys and the stops made in the form of balls and arranged to operate substantially as described.

5. In a cash register and indicator, the combination of the operating-keys provided with extensions and the stops made in the form of balls, substantially as described.

481,038. BICYCLE-TIRE. ARTHUR A. KUPPER and HERMAN C. KUPPER, Providence, R. I. Filed Mar. 8, 1892. Serial No. 424,196. (No model.)



Claim.—1. In a pneumatic tire, the combination therewith of an endless expansible tube secured to the upper inner portion thereof and collapsed against this portion of the tire when not in use and independent means for expanding the same, as described.

2. In a pneumatic tire having an inner expansible tube secured to and normally collapsed against the upper inner portion thereof, the combination therewith of a narrow reinforce-strip formed of crossed wires secured between layers of cloth or rubber and located in the tread of the tire, as described.

3. The combination, with a pneumatic tire provided with a valve and an inner expansible tube 13, secured to and normally collapsed against the upper inner portion of the tire, of the reinforce-strip 9, consisting of the layers 11 11 of cloth or rubber, and the crossed wires 10, secured between said layers, secured in the tread of the tire and extending for but a portion of its circumference, as and for the purpose described.

481,039. MORTISING-MACHINE. WILBUR F. LARISH, Oshkosh, Wis. Filed Oct. 30, 1891. Serial No. 410,378. (No model.)

Claim.—1. In a mortising-machine, the combination of a series or gang of mortising-tools, independent reciprocating carriages for the same, transverse shafts movable with and having adjustable means for reciprocating the carriages, a power mechanism and adjustable connections between the same and said shafts for actuating the latter, and means for rotating said tools, substantially as set forth.

2. In a mortising-machine, the combination of guides 3, a series of frames adjustable on and adapted to be reciprocated on said guides, a shaft and mortising-tool mounted on each frame, means for rotating said shafts, a common power mechanism for reciprocating the said frames, and power devices for reciprocating the frames movable with said frames and having adjustable connections with said common power mechanism, substantially as set forth.

3. In a mortising-machine, the combination, with suitable guides, of a series of frames adjustable on and adapted to be reciprocated on said guides, a shaft and mortising-tool mounted on each frame, means for rotating said shafts, transverse adjustable shafts connected and movable with said frames and having devices for reciprocating the latter, and means for actuating the latter shafts, substantially as set forth.

4. In a mortising-machine, the combination, with a main frame having suitable guides, of a series of frames adjustable on and adapted to be reciprocated on said guides, a shaft and mortising-tool mounted on each frame, means for rotating said shafts, transverse shafts 14, connected with and adapted to reciprocate the said frames, bearings 15 for the latter shafts adjustable on the main frame, and a power mechanism having adjustable connections with the latter shafts, substantially as set forth.

5. In a mortising-machine, the combination of a series or gang of mortising-tools, independent reciprocating carriages for the same, actuating mechanism for the tools, comprising a series of transverse shafts and eccentrics and a longitudinal driving-shaft connected therewith, and means for regulating the length of reciprocation of the carriages independently from each other, substantially as set forth.

6. The combination of a series of frames or carriages adapted to support the mortising-tools, shafts connected with and adapted by suitable means to reciprocate said carriages and having gear-wheels, adjustable bearings for said shafts, whereby said tools may be located at any desired point in the length of the work, a longitudinal shaft having gear-wheels adjustable thereon and adapted to engage said first-mentioned wheels, substantially as set forth.

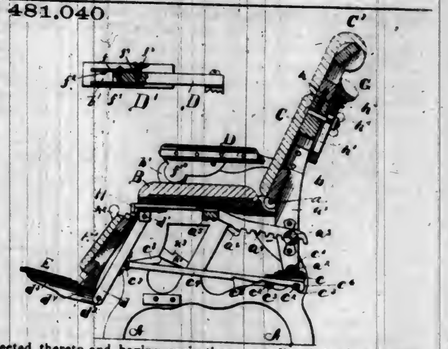
7. The combination of a series of carriages 4, adapted to support the mortising-tools, transverse shafts 14, having means for reciprocating said carriages and provided with miter-wheels 21, adjustable bearings for said shafts, the longitudinal shaft 23, adjustable miter-wheels 22 on the latter shaft, and means for rotating the longitudinal shaft and the mortising-tools, substantially as set forth.

8. The combination of a series of reciprocating frames or carriages, transverse shafts mounted thereon and adapted to carry a mortising-tool, a single belt connected with said shafts for rotating them, transverse shafts having eccentrics adapted to reciprocate said frames or carriages, and means for actuating the latter shafts and said belt, substantially as set forth.

9. The combination, with the frames or carriages 4, having tool holding and actuating devices, of the shafts 14, having the internal eccentrics 20 and external eccentrics 19, adjustable upon the eccentrics 20 and adapted to reciprocate said carriages, substantially as set forth.

10. The combination, with the mortising-augers and reciprocating holders therefor and the rail 59, of the stationary chisels 56 and clamps for holding the same longitudinally adjustable upon said rail, substantially as set forth.

11. The combination, with the reciprocating frames or carriages 4 and the shafts 6, adapted to carry a mortising-tool, of the slotting-chisels 56, mounted on said carriages and extending in the direction of movement of the latter, substantially as set forth.



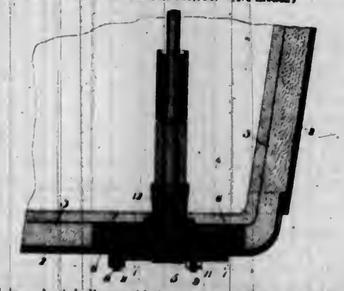
12. The combination, with the duplicate oppositely-directed reciprocating mortising devices, of the work-carriages 32 32, situated upon opposite sides of said devices, and an actuating mechanism connected with both of said carriages and adapted to move them toward and from the mortising-tools, substantially as set forth.

13. The combination, with the mortising devices, of the carriage 32, the levers 50, the links 49, the rock-shaft 47, connected with said links, and means for operating said shaft, substantially as set forth.

14. The combination, with the carriage 32 and the mortising devices, of the vertically-adjustable table 33, the levers 50, having a slotted connection with the carriage, and means for oscillating said levers and reciprocating said carriage thereon toward and from the mortising devices, substantially as described.

15. The combination, with the mortising devices, of the work-holding clamps comprising the rock-shaft 40, spring-clamps 42, mounted thereon, the ratchet-wheel 45 on the shaft, the pawl 46, engaging said ratchet, and means for turning said shaft, substantially as set forth.

481,040. PHYSICIAN'S OPERATING-CHAIR. SAMUEL LOSEBECKER, Troy, Ohio. Filed Oct. 19, 1891. Serial No. 409,182. (No model.)



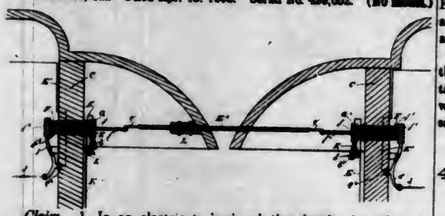
Claim.—1. In a chair, a base or frame surmounted by a seat, a back pivoted to the rear of said base and having projections which extend below the pivotal point, a trough-shaped connecting-piece *c*, pivotally connected to the lower extremities of said projections, a leg-rest pivoted to the front of said base, and a foot-rest pivoted to said leg-rest and through the medium of bars *d* to said base, and a connecting-bar c^4, hinged to the rear of the bars *d* and provided with notches c^5, adapted to engage with rods c^3 on said trough-shaped connecting-piece *c*, substantially as and for the purpose specified.

2. In a chair, a base surmounted by a seat, a back pivotally connected thereto and having projections extending below the pivotal point and connected to a cross-bar, a connecting-piece *c*, pivoted to said cross-bar, a locking-lever pivoted to said frame and provided with notches adapted to engage with a stud on one of said projections, a handle connected to said locking-lever, leg and foot rests pivoted to the front of said frame, and a connecting-bar c^4, pivoted at one end to the bars *d* and at the other adapted to engage with the connecting-piece *c*, said connecting-bar being provided with a handle c^6 for adjusting the same, substantially as specified.

3. In a chair, the combination, with the base and pivoted back, of the arms pivoted to said back and the arm-supports pivoted to said base, a detachable pivot connection between the front ends of said arms and the top of the pivoted arm-supports, and stop projections to limit the movement of said arms with relation to said back, substantially as and for the purpose specified.

4. In an adjustable chair having a base and seat and a pivoted back connected to said base, hinged arms and arm-supports, each pivoted at one end to the back and base, respectively, and at their opposite ends connected together by a detachable pivot connection, stop-projections on said arms and back to limit the movement of said arms with relation to said back, and a side support or table on said base adjacent to said seat and normally divided therefrom by said arm and arm-support, said table being adapted to form substantially a continuation of said seat when the arm and arm-support are detached and adjusted about their pivotal connection, substantially as specified.

481,041. LADLE-NOZZLE. CAMILLE MERCADER, Braddock, Pa. Filed Feb. 10, 1892. Serial No. 420,950. (No model.)



Claim.—1. A ladle provided with a hole for the insertion of a nozzle, a nozzle arranged to be removed outwardly through said hole, and means for holding said nozzle in place, in combination with an interior vertically-movable stopper, substantially as and for the purposes described.

2. A ladle provided with an inwardly-tapering nozzle set in a hole, from which it is removable outwardly, and means for removably holding said nozzle in place, in combination with an interior vertically-movable stopper, substantially as and for the purposes described.

3. A ladle provided with an annular ring and having interior inwardly-tapering sides, a nozzle having corresponding inwardly-tapering sides set in said ring, from which it is removable outwardly, and means for holding the nozzle in said ring, in combination with an interior vertically-movable stopper, substantially as and for the purposes described.

4. A ladle having a nozzle with inwardly-tapering sides and an external apertured plate bearing upon said nozzle and removably held in place, in combination with an interior vertically-movable stopper, substantially as and for the purposes described.

481,042. ELECTRIC TRAIN-SIGNAL. GEORGE MERRITT, San Francisco, Cal. Filed Apr. 13, 1892. Serial No. 429,052. (No model.)

Claim.—1. In an electric train-signal, the circuit-wires thereof extending throughout the train, in combination with a metallic rod passing through the car end and forming part of the circuit, a contact-piece also led into the circuit, and a pivoted lever electrically connected with the metallic rod and adapted to be moved into and out of electric connection with said contact-piece to close and open the circuit, substantially as herein described.

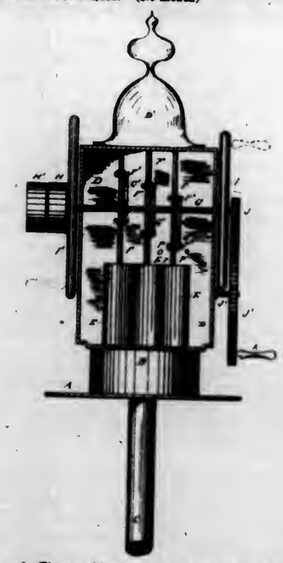
2. In an electric train-signal, the circuit-wires thereof extending throughout the train, in combination with a metallic rod passing through the car end and forming part of the circuit, a contact-piece within the car and also let into the circuit, a pivoted lever electrically connected with the metallic rod and adapted to make and break electrical connection with the contact-piece, and a cord extending within the car and connected with said lever, whereby it is operated, substantially as herein described.

3. In an electric train-signal, the circuit-wires thereof extending throughout the train, in combination with the sliding spring-controlled metallic rod passing through the end of the car and forming part of the circuit, the contact-piece within the car also let into the circuit, the pivoted lever electrically connected with the metallic rod and adapted to be thrown into and out of connection with the contact-piece, and connections between the cars for pulling the metallic rod outwardly to operate the lever, substantially as herein described.

4. In an electric train-signal, the circuit-wires thereof extending throughout the train, in combination with the sliding spring-controlled metallic rod passing through the end of the car and forming part of the circuit, the contact piece within the car also let into the circuit, the pivoted lever electrically connected with the metallic rod and normally in contact with the contact-piece, the cord within the car for operating said lever to break connection with the contact-piece, and connections between the cars for pulling the metallic rod outwardly to throw its lever out of contact with said contact-piece, substantially as herein described.

5. In an electric train-signal, the combination of the circuit-wires, the sliding rods passing through the ends of the cars and having contact levers, and the contact-pieces within the cars, with which the levers make and break electrical contact, and the flexible cables for carrying the circuit between the cars and electrically connecting one of the circuit-wires with the sliding rods, substantially as herein described

6. In an electric train-signal, the spring-controlled sliding rods in the ends of the cars, said rods having on their outer ends the bands G, insulated therefrom, and on their inner ends the swinging contact-levers, the contact-pieces within the cars, the arms carried at the outer end of the rods, one in electrical connection with the rods and the other with the bands G, the circuit-wire E, connected with bands G, the circuit-wire E', connected with the contact-pieces within the cars, and the flexible cables between the cars, having hooks electrically connecting the bands and the rods of adjacent cars, respectively, substantially as herein described.

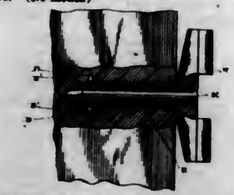


7. In an electric train-signal, the combination of circuit-wires, the sliding spring-controlled rods F in the car ends, provided with contact-levers on their inner ends for making and breaking the circuit, and the contact-pieces within the cars, upon which the levers operate, the swinging arm f'', pivoted to the outer end of said rod, the swinging arm g' on the outer end of said rod and insulated therefrom, the cams on the rod for separating the ends of said arms and permitting their contact, and the flexible cables with hooks connecting the circuit-wires between the cars with the arms f' and g', respectively, substantially as herein described.

8. In an electric train-signal, the combination of the circuit-wires E and E', the sliding spring-controlled metallic rods F in the end walls of the cars, the pivoted arm f' on the outer end of the rod, the band G on said outer end and insulated therefrom, the pivoted arm g' of said band, the cams for throwing said arms into and out of contact, the flexible cable E^3, with hooks e and e', connecting the circuit-wires E and E' with the arms g' and f', respectively, the contact-pieces e^2, with which the wires E' within the cars connect, the contact-levers I, carried by the sliding rods and adapted to make and break contact with the pieces e^2, and the bell-cords J within the cars and connected with said levers, substantially as herein described.

9. In an electric train-signal, the combination of the sliding rod F of the circuit-breaker, having the arm f' and the insulated arm g' and the chain K, with its cord-coupling k and hooks k', substantially as herein described.

10. In an electric train-signal, the flexible cables E^3, connecting the circuit-wires between the cars, in combination with the means for taking up the slack of said cables, consisting of the guides through which the bight of the cable passes, and the spring connected with said bight, substantially as herein described.



481,043. PUMP. ELLSWORTH D. MIDDLEKAUFF, Stockton, assignor of one-half to John M. McKiernan, Portersville, Cal. Filed Mar. 10, 1892. Serial No. 424,412. (No model.)

Claim.—1. The combination, in a force-pump, of the three cylinders E within the casing D, the piston-rods F, the stationary grooved collars P upon such rods, engaging with the hooks O of the revolving collars F', the cam-wheels G', their faces impinging on the faces of the collars F', the shaft G of the cam-wheels G', suitable means for turning the shaft G, and the discharge-pipes L and L', with the air-chamber M M' at the end of the pipe L, all substantially as described.

2. The herein-described force-pump, consisting of the well-pipe C, the chamber B, the casing D, the cylinders E, supplied with the discharge-pipes L, the piston-rods F, supplied with the stationary collars P and with the turning-collars F', the cam-wheels G', the shaft G of such cam-wheels, the piston J on the end of the shaft G, engaging with the gear-wheel J', supplied with the turning-handle K and having its center bearing upon the pin J^3, secured to the side of the casing D, and the cap D' above the casing D, all arranged and operating substantially as described.

481,044. HINGE. NOAH W. MOTTINGER, Akron, Ohio, assignor of one-half to Simon Mottinger, Suffolk, Va. Filed Dec. 19, 1891. Serial No. 415,593. (No model.)

Claim.—The hinge leaf having a strong extended non-slitted tubular shank B integral with said leaf and provided at its inner extremity with the short pliable projecting arms B' B', extending inwardly and longitudinally, as described, and having the spurs on their outer sides,

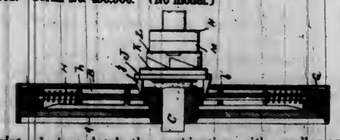
and means, substantially as shown, to bend said arms out straight when the shank has been inserted and to close the outer end of the shank, substantially as shown and described.

481,045. EASEL ATTACHMENT FOR CHAIRS AND OTHER SUPPORTS. HENRY J. MUHLFELD and FRANK J. SPILLANE, New York, N. Y. Filed Nov. 3, 1891. Serial No. 410,740. (Model.)

Claim.—1. An easel attachment for chairs or other supports, comprising two vertical sections, each section comprising a vertical rod or bar, and a reversible supporting portion for the picture or other article, mounted on said vertical rods or bars, substantially as set forth.

2. An easel attachment for chairs or other supports, comprising two vertical sections, each section comprising a vertical rod or bar, and a vertically-adjustable reversible supporting portion for the picture or other article, substantially as set forth.

3. An easel attachment for chairs or other supports, consisting of two sections, each section comprising a body portion and a supporting portion, the supporting portion being adjustable upon the body portion, and shaped when in use as a figure 4, comprising a vertical bar, a horizontal bar having a sliding and adjustable connection with the vertical bar, and a connecting-bar pivotally connecting the horizontal with the vertical bar, as and for the purpose specified.



4. The combination, with a chair-back and sockets carried thereby, of an easel consisting of two sections, each section comprising a body portion adjustably supported by the sockets and a supporting portion vertically adjustable upon the body portion, the supporting portion of each section consisting of a horizontal rod or bar capable of vertical movement at one end, and a connecting-rod pivotally connecting the horizontal rod or bar with a vertical support, as and for the purpose specified, whereby the supporting-section may be made to assume the shape of a figure 4 either in front or at the rear of the chair-back.

5. An easel attachment for chairs or other supports, comprising vertical supporting-rods adjustable toward and from each other, supports with which said rods are connected for said adjustment, and picture or other supports mounted on the upper portions of the said rods or bars, substantially as set forth.

6. An easel attachment for chairs or other supports, comprising vertical rods adjustable toward and from each other and provided with suitable supporting devices, and picture or other supports reversibly secured to the upper ends of said bars or rods to face in either direction, substantially as set forth.

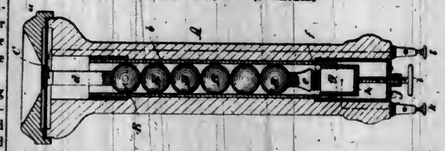
7. An easel attachment for chairs or other supports, consisting in two separate and independent vertically and laterally adjustable sections provided with suitable supporting devices, substantially as set forth.

481,046. CLUTCH. ALVIE MYERS, Melmore, Ohio. Filed Apr. 23, 1892. Serial No. 430,306. (No model.)

Claim.—1. In a clutch, the combination, with a pulley and arms concentrically mounted with the pulley, of rods carrying shoes at their outer ends, supported by the said arms, a collar having wedge-shaped projections to engage with the said rods, and two collars concentric with the pulley and having cam-faces on their meeting sides, and means for rotating the said cam-faced collars relatively to each other to separate them and force the wedge-shaped projections against the rods to press the shoes outward against the band of the pulley, substantially as described.

2. In a clutch, the combination, with a pulley and arms B, having cross-heads b at their outer ends, of rods carried by the said arms, seats F, adapted to be supported by the said cross-heads and having mutually-interlocking tongues and grooves between the end portions of the said seats and cross-heads, and shoes carried by the said seats, substantially as described.

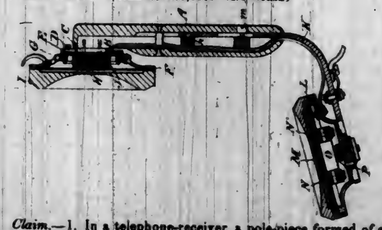
3. The combination, with a pulley and arms B, having sleeve D, of rods E, carried by the arms and provided with shoes at their outer ends to bear against the inner side of the band of the pulley, springs for holding the shoes out of engagement with the pulley, collar J, having wedge-shaped projections j to engage with the rods E, collars K and L, having their meeting sides provided with cam-faces, means for actuating the said collars to separate them, and a spring to press collar J away from the pulley, substantially as described, for the purpose specified.



481,047. INCANDESCENT ELECTRIC LIGHT. EUGENE MCQUAT, Boston, Mass. Filed July 9, 1891. Serial No. 398,940. (No model.)

Claim.—1. The above-described method of making an incandescent electric lamp, consisting of the following steps: first, uniting to the interior of an adhesively hot glass tube two platinum wires; second, causing the said tube to collapse by heat, so that the edges of the tube shall seam together and form a globular mass around the wires; third, drawing the wires away from each other and outwardly, dragging the adhering glass with them, so as to insure better contact and to leave the glass in better form for resisting fracture, substantially as described.

2. In an incandescent electric lamp, the method of manufacture, consisting of the following steps: first, placing the prepared tubular mount with attached filament loosely into the open-neck lamp-bulb; second, drawing down the neck of the bulb while the mount is within it and cutting off the former at a point where it is at least as small as the end of the mount-tube; third, melting together the unexpanded open end of the mount-tube and the drawn-out neck of the lamp-bulb; fourth, pushing the mount and adjacent parts inward until the filament is properly located and the end of the neck of the bulb assumes the form of an inwardly-projecting cone, substantially as described.

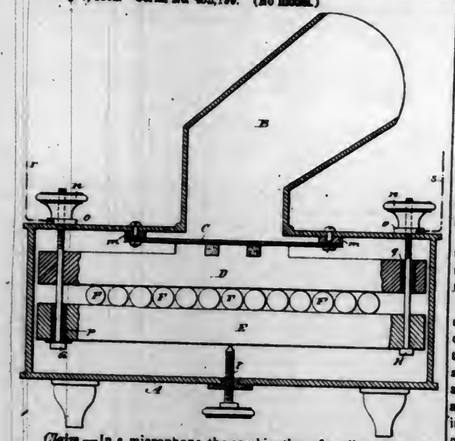


481,048. MICROPHONE. ELOY NORIEGA, Mexico, Mexico. Filed June 11, 1891. Serial No. 396,887. (No model.)

Claim.—1. A carbon for microphones, formed of charcoal, graphite, boric acid, and water in about the proportions stated.

2. A carbon for microphones, formed of charcoal, boric acid, and water in about the proportions stated.

481,049. TELEPHONE. ELOY NORIEGA, Mexico, Mexico. Filed June 11, 1891. Serial No. 396,888. (No model.)



Claim.—1. In a telephone-receiver, a pole-piece formed of series of round rods or wires of different diameters attached to the pole of a permanent magnet and forming an oblong core adapted to receive the bobbins, substantially as specified.

2. In a combined telephone transmitter and receiver, the combination of the tubular insulating-handle A, the U-magnet B, having the lateral pole-pieces C, the bobbins J, placed on the pole-pieces, the

diaphragm-cell F, the diaphragm H, and adjustable curved arm K, the diaphragm-cell L, the diaphragm M, the perforated carbon bars N N', the carbon-rods O, and the cushion P, substantially as specified.

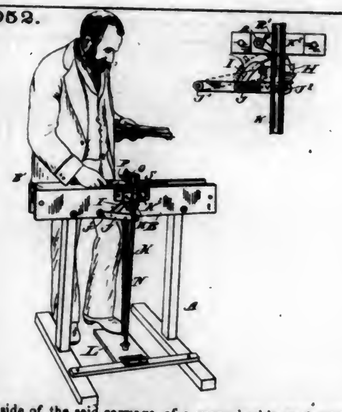
3. In a combined telephone transmitter and receiver, the combination of the tubular insulating-handle A, the U-magnet B, having the lateral pole-pieces C, the screw-threaded ring D, the screw-threaded collar E, fitted to the ring D, the diaphragm-cell F, hinged to the collar E, the diaphragm H, and curved arm K, the bobbins J, placed on the pole-pieces C, the diaphragm-cell L, the diaphragm M, the perforated carbon bars N N', the carbon-rods O, and the cushion P, substantially as specified.

481,050. MICROPHONE. ELOY NORIEGA, Mexico, Mexico. Filed May 7, 1892. Serial No. 432,199. (No model.)

Claim.—In a microphone, the combination of a vibratory carbon plate, a fixed carbon plate, and a mass of carbon filaments placed between the fixed and vibratory carbon plates, substantially as specified.

481,051. TELEPHONE. ELOY NORIEGA, Mexico, Mexico. Filed May 7, 1892. Serial No. 432,200. (No model.)

Claim.—In a microphone, the combination of the diaphragm A, formed of wood or analogous material, the perforated carbon blocks C C, attached to the diaphragm, the carbon cylinders D, having their ends inserted in the perforated carbon blocks, the adjustable spring *g*, the cup *h*, attached to the spring, and a body *i*, of fibrous material, inserted in the cup *h* and bearing against the carbon cylinders D, substantially as specified.



481,052. ADDRESSING-MACHINE. JOHN P. O'MALLEY, Manistee, Mich. Filed Nov. 7, 1891. Serial No. 411,152. (No model.)

Claim.—1. An addressing-machine comprising a carriage mounted to slide, a type-galley held on the said carriage, a rack arranged on the under side of the said carriage, an impression-block mounted to slide toward and from the face of the said galley, a rod carrying the said impression-block, a spring-pressed treadle connected with the said rod, and a gear-wheel in mesh with the said rack and operated from the said rod to impart a sliding motion to the said carriage on the upward motion of the said rod, substantially as shown and described.

2. In an addressing-machine, the combination, with a carriage mounted to slide and adapted to support a type-galley and a rack held on the under side of the said carriage, of a gear-wheel in mesh with the said rack, a rod mounted to slide vertically, an intermediate mechanism, substantially as described, to connect the said rod with the said gear-wheel to rotate the latter on the upward movement of the rod, and an impression-block held on the upper end of the said rod and adapted to be moved toward the type-galley on the downward stroke of the rod, as set forth.

3. In an addressing-machine, the combination, with a carriage mounted to slide and adapted to support a type-galley and a rack held

481,052.

on the under side of the said carriage, of a gear-wheel in mesh with the said rack, a rod mounted to slide vertically, an intermediate mechanism, substantially as described, to connect the said rod with the said gear-wheel to rotate the latter on the upward movement of the rod, an impression-block held on the upper end of the said rod and adapted to be moved toward the type-galley on the downward stroke of the rod, and a spring-pressed treadle connected with the said rod, as set forth.

4. In an addressing-machine, the combination, with a carriage mounted to slide and adapted to support a type-galley and a rack held on the under side of the said carriage, of a gear-wheel in mesh with the said rack, a ratchet-wheel held on the shaft of the said gear-wheel, a pawl engaging the said ratchet-wheel, a lever carrying the said pawl and having an upward and downward swinging motion, a rod having a pin engaging a slotted free end of the said lever to impart a swinging motion to the same, and a spring-pressed treadle pivotally connected with the said rod, substantially as shown and described.

5. In an addressing-machine, the combination, with a carriage mounted to slide and adapted to support a type-galley and a rack held on the under side of the said carriage, of a gear-wheel in mesh with the said rack, a ratchet-wheel held on the shaft of the said gear-wheel, a pawl engaging the said ratchet-wheel, a lever carrying the said pawl and having an upward and downward swinging motion, a rod having a pin engaging a slotted free end of the said lever to impart a swinging motion to the same, a spring-pressed treadle pivotally connected with the said rod, and a dog engaging the said ratchet-wheel to prevent a return movement, substantially as shown and described.

6. In an addressing-machine, the combination, with a carriage mounted to slide and adapted to support a type-galley and a rack held on the under side of the said carriage, of a gear wheel in mesh with the said rack, a ratchet wheel held on the shaft of the said gear-wheel, a pawl engaging the said ratchet-wheel, a lever carrying the said pawl and having an upward and downward swinging motion, a rod having a pin engaging a slotted free end of the said lever to impart a swinging motion to the same, a spring-pressed treadle pivotally connected with the said rod, and an impression-block held on the upper end of the said rod and adapted to move toward and from the face of the galley supported on the carriage, substantially as shown and described.

7. In an addressing-machine, the combination, with a guideway having part of its top covered by a cover-plate, of a carriage mounted to slide longitudinally in the said guideway, a type-galley supported on the said carriage, a rack secured to the under side of the said carriage, a gear-wheel in mesh with the said rack, a rod mounted to slide vertically and connected with the said gear-wheel to impart a rotary motion to the latter on the upward movement of the said rod, a spring-pressed treadle connected with the said rod, and an impression-block held on the upper end of the said rod and adapted to move toward the said galley at the front end of the said cover-plate, substantially as shown and described.

8. In an addressing-machine, the combination, with a guideway having part of its top covered by a cover-plate, of a carriage mounted to slide longitudinally in the said guideway, a type-galley supported on the said carriage, a rack secured to the under side of the said carriage, a gear-wheel in mesh with the said rack, a rod mounted to slide vertically and connected with the said gear-wheel to impart a rotary motion to the latter on the upward movement of the said rod, a spring-pressed treadle connected with the said rod, and an impression-block held on the upper end of the said rod and adapted to move toward the said galley at the front end of the said cover-plate, and a stop-block for limiting the downward motion of the said rod and impression-block, substantially as shown and described.

481,053. VELOCIPEDE. HERBERT S. OWEN, Washington, D. C. Filed Feb. 3, 1892. Serial No. 420,185. (No model.)

Claim.—1. A frame for bicycles and other vehicles, constructed wholly of sheet material bent to form and disposed, substantially as shown and described, to receive the strains from edge to edge or in the directions of the length and width of the material throughout all portions of said frame.

2. A frame for bicycles, tricycles, and other vehicles, consisting of sheet material fashioned to the required form and folded along the lines of special strain, substantially as set forth.

3. The herein-described main frame for a bicycle, consisting of sides *a b*, of sheet material, fashioned to the required form and joined along the upper side to form a backbone or reach, substantially as set forth.

4. The herein-described main frame A, consisting of side sheets or plates *a b*, extending from the head of the machine to a point over the back wheel and joined along its upper side, substantially as shown, whereby it is adapted to form a connection between the front fork or frame and the rear wheel and to cover and inclose the latter.

5. The frame A, consisting of sides *a b*, of sheet material, joined at their forward ends and provided at such point with a neck or head for connection with the forward fork or frame.

6. A main frame for bicycles and like vehicles, composed of sides *a b*, of sheet material, formed from one piece, connected by intermediate braces, substantially as shown and described, whereby the sheets are maintained in proper position to receive the strains edgewise or in the directions of their length and width.

7. A main frame for bicycles and the like, consisting of side plates *a b*, of thin material, rolled at their forward ends to form a tubular head.

8. A main frame for bicycles and the like, consisting of side plates *a b*, united at their edges through a portion of their length, and an intermediate partition or brace *h*, extending from a point near the saddle-post neck downward toward the lower side of the frame to distribute the strain throughout the latter.

9. In combination with a frame composed of side sheets or plates *a b*, united throughout a portion of their length, a transverse partition *h*, closing the space between the sheets, and an opening in one of the sheets *a b*.

10. A frame for bicycles and other vehicles, composed of sheet material fashioned to the required form and provided with reinforces at the points where the shafts are required to pass through the same.

11. In combination with frame A, brace or yoke C to receive the crank-shaft bearings.

12. In combination with a frame consisting of sheet material fashioned to form and provided with slots or openings *c*, an axle D, having its ends seated in said slots, substantially as and for the purpose set forth.

13. In combination with frame A, provided with slots or openings *c*, reinforces or strengthening-plates *f*, surrounding said openings, substantially as and for the purpose set forth.

14. In a frame for bicycles and the like, formed of sheet material, a step consisting of a prong or ear of the sheet material cut from the body and bent outward, substantially as set forth.

15. In combination with frame A, having tubular neck or saddle-post support E, a reinforce-tube applied to said neck, substantially as shown.

16. A frame for bicycles and the like, composed of sheets *a b* of thin material and a brace cut from and integral with one of said sheets, extending to the other of said sheets and secured thereto.

17. In a frame composed of sheet material, a brace or stiffening-rib formed of an integral portion of the sheet, rolled, bent, or folded laterally.

18. A main frame for bicycles and the like, formed of a single piece of sheet material cut to proper form and bent to the required shape, the meeting edges being joined together, substantially as and for the purpose set forth.

19. A front fork or shell for bicycles, tricycles, and the like, consisting of sheet material cut to the required form and rolled upon itself to produce a tubular brace or post.

20. A bicycle fork or shell composed of sheet material, having its forward edge rolled upon itself to form a tubular post or brace, one portion of the tube having a larger number of convolutions than another, substantially as and for the purpose set forth.

21. The blank for the production of a side plate of a bicycle fork or shell, provided with the widened portion *m*, adapted to be rolled upon itself previous to the rolling of the entire forward edge of the blank, whereby the tubular front edge is formed of greater thickness in its upper than in its lower part.

22. A bicycle fork or shell composed of sheet material folded or bent through its middle on a curved line, whereby it is adapted to constitute a combined fork and guard, each serving to brace and stiffen the other.

23. In combination with shell or fork J, reinforce or neck M, applied thereto.

24. A bicycle fork or shell J, provided with "boasters" or foot-rests O, cut from the body of the shell and turned outward, substantially as described.

25. In combination with a frame for bicycles and like vehicles formed of sheet material, an adjustable sleeve or block applied thereto and adapted to support a shaft or axle.

26. A bicycle-frame constructed of sheet material and having an opening through its side for the passage of the driving-chain, the material removed from the opening being bent laterally to form a guard for the driving-chain.

27. The herein-described fork or shell J, consisting of side plates *l*, joined at their rear edges and provided at their forward edges with integral tubular posts *n*.

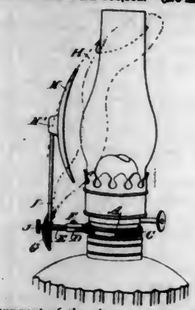
28. In combination with shell J, having tubular posts *n*, slotted cross-heads L, applied to said tubes, and clamping bolts *o*, applied to the slotted ends of the cross-heads, whereby said cross-heads are secured in place upon the tubes.

29. In combination with coiled tubes *n* and with handle-rods K inserted in said tubes, clamping devices applied to the exterior of the tubes and adapted to compress them upon the rods, substantially as and for the purpose set forth.

30. In combination with a front fork or shell of sheet material, a tubular neck or reinforce applied thereto, substantially as and for the purpose set forth.

31. A frame for bicycles, tricycles, and like vehicles, composed of sheet material and having within its walls a luggage-chamber, substantially as set forth.

481,054. STREET-SWEEPER. HENRY P. PALMER, Norwich, Conn. Filed Feb. 1, 1892. Serial No. 419,908. (No model.)

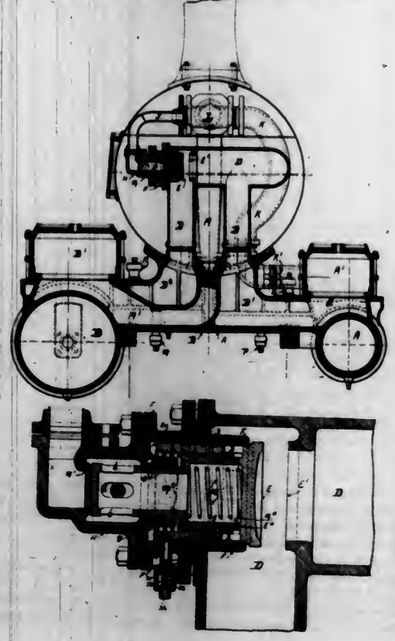


Claim.—1. In combination with a dirt receptacle of box form, a brush journaled in a shield hinged to said receptacle, bars *o*, secured to said receptacle, as set forth, and springs connecting the ends of said bars with said shield, as and for the purpose specified.

2. In a street-sweeper, in combination with a box-shaped receptacle on wheels, a brush journaled in a shield hinged to said receptacle, said shield being supported by springs *p* and bars *o*, as set forth, sprocket-wheels mounted upon the brush-shaft, and mechanism consisting of chains, sprocket-wheels, and gearing, as herein described,

connecting the sprocket-wheel of the brush-shaft with the rear wheels of the sweeper, for the purposes specified.

481,055. SIDE REFLECTOR. CHARLES H. PLOUTHER, Spokane Falls, Wash., assignor of one-half to Alfred W. Crittenden, same place. Filed June 17, 1891. Serial No. 396,552. (No model.)



Claim.—1. A support of the character described, comprising an exteriorly-grooved collar provided with a set-screw exteeding through it at the base of the groove, and the ring turning in the said groove, provided with a transverse aperture to give access to said screw and with a socket or holder to receive a reflector-support, substantially as set forth.

2. In a reflector-support, the combination, with a collar adapted to be secured to a lamp and formed with an annular groove in its periphery, of a ring fitted in the said groove to revolve on the said collar, a socket formed on the said ring, a bar adapted to be secured in the said socket, and a grooved segmental bar secured on the said socket-bar, substantially as shown and described.

3. A reflector support comprising a socketed ring, a bar adjustable in said socket and provided at its outer end with a transverse bar grooved along its upper face, a vertical transverse aperture at the juncture of said two bars, and a set-screw intersecting said aperture, substantially as set forth.

481,056. COMPOUND ENGINE. JOHN PLAYER, Dunkirk, N. Y., assignor to the Brooks Locomotive Works, same place. Filed Feb. 24, 1892. Serial No. 422,630. (No model.)

Claim.—1. In a combined admission and intercepting valve for compound engines, the combination of a receiver-casing forming a communication between the high and the low pressure cylinders, an intercepting-valve therefor, a live-steam passage communicating with the low-pressure end of the receiver, and an admission-valve therefor capable of movement independently of the intercepting-valve, but arranged in such relation to the intercepting-valve that said admission-valve will be opened and the intercepting-valve will be closed by the live steam and the admission-valve will be acted upon and closed by the intercepting-valve when the pressure against the latter has reached the proper point, substantially as described.

2. In a combined intercepting and reducing valve for compound engines, the combination of the two valves movable independently of each other as regards the closing of the intercepting-valve and the governing movement of the reducing-valve, but so combined that as the intercepting-valve is opened by the high-pressure exhaust-steam it will act upon and close the reducing-valve, substantially as specified.

3. The combination, with the receiver pipe or passages of a compound locomotive or other engine, of the intercepting-valve having an annular balancing device and steam-passages, and the intercepting-valve casing having its chamber connected to the atmosphere, and the pressure-regulating valve having an enlarged end and working within the annular part of the intercepting-valve and its small or high-pressure end working within its own casing, to which is attached the live-steam-pressure pipe, substantially as set forth.

4. In a combined intercepting and reducing valve for compound engines, the combination of the two valves movable independently of each other as regards the closing of the intercepting-valve and the governing movement of the reducing-valve, but so combined that the opening of the intercepting-valve causes the reducing-valve to close, and a stop for limiting the opening movement of the reducing-valve, substantially as specified.

5. The combination, in a compound engine, of the intercepting-valve and the reducing-valve working within said intercepting-valve, said intercepting-valve being of a greater area and having a greater stroke than the reducing-valve, whereby it allows the reducing-valve to have free movement when it (the intercepting-valve) is closed, but will close the reducing-valve when it opens, substantially as set forth.

6. The combination of the high and low pressure cylinders, the passage from the high-pressure cylinder to the low-pressure cylinder, an intercepting-valve for closing said passage, a live-steam inlet to said passage, and a reducing-valve for controlling the flow of steam from said live-steam inlet, said reducing-valve being on a line with and acted upon by the intercepting-valve, the said reducing-valve having a limited movement from its seat independent of the intercepting-valve, substantially as described.

7. The combination, in a compound engine, of the passage from the high to the low pressure cylinder, a live-steam inlet, and a reducing-valve adapted to close said inlet, the back of said valve being greater in area than the face of the valve, with an intercepting-valve for closing the passage between the high and low pressure cylinders, said intercepting-valve acting upon the reducing-valve and having a greater area than said valve, whereby the reducing-valve is held closed by the reduced pressure in the passage, substantially as described.

8. The combination of the passages between the high and low pressure cylinders, the live-steam-inlet pipe to said passage, a reducing-valve adapted to close said pipe, the back of said valve being of greater area than its face, a stop to limit the outward movement of said valve, and an intercepting-valve adapted to close the passage between the high and low pressure cylinders and adapted to a projection on the reducing-valve, the movement of the intercepting-valve being greater than that of the reducing-valve, so that steam can pass around and through the reducing-valve and between it and the intercepting-valve, substantially as described.

9. The combination of the valve-casing, the reducing-valve adapted thereto, a spring acting to keep the reducing-valve off its seat, and an intercepting-valve also guided in the valve-casing, with a spring of less strength than the reducing-valve spring, said spring being situated between the back of the reducing-valve and the intercepting-valve, so that when the engine is at rest the intercepting-valve will close the passage between the high and low-pressure cylinders and the reducing-valve will be opened to allow the live steam to act upon the low-pressure piston, substantially as described.

10. The combination, in a compound engine, of the high and low pressure cylinders, a passage between the two, an intercepting-valve for closing said passage, a live-steam inlet to the low-pressure valve-chest, a valve regulating the flow of steam through said inlet, and valves situated in the passage, one valve on each side of the intercepting-valve, with mechanism for operating said valves, substantially as described.

11. The combination of the high and low pressure cylinders, a passage between the two cylinders, an intercepting valve in said passage, a controlled live-steam inlet to the low-pressure valve-chest, and valves in the passage, one on each side of the intercepting-valve, with mechanism for operating said valves, said mechanism being so arranged as to first open the valve on the high-pressure side and then open the valve on the low-pressure side, substantially as described.

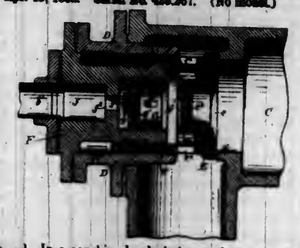
12. The combination, with the receiver pipe or passages of a compound locomotive or other engine, of the pressure-regulating valve, the regulating-valve casing having its chamber connected to the atmosphere, the connecting-pipe, the regulating-valve stop limiting the travel of the valve, the steam-passages in said valve connecting with its hollow chamber, and the annular balancing device of the intercepting-valve working upon said pressure-regulating valve and equalized to the atmosphere, as and for the purpose set forth.

13. The combination, with the receiver-pipe of a compound locomotive or other engine, of the pressure-regulating valve working within its chamber, regulated in travel by its stop, and working within the annular balancing device attached to the intercepting-valve, said pressure-regulating valve having a seat on its small end closing against the live-steam pressure, and another seat at its large end closing against the intercepting-valve, as and for the purpose set forth.

14. The combination, with the receiver pipe or passages of a compound locomotive or other engine, of the live-steam pipe connecting with the pressure-regulating-valve casing, the regulating-valve casing, the regulating-valve, its seat, its stop, its hollow steam-passages, the intercepting-valve casing having its balancing-chamber connected to the atmosphere, and the intercepting-valve with its annular balancing device and steam-passages working outside the pressure-regulating valve and within its own casing and having one seat to close the opening in the receiver-pipe and another seat to close against the regulating-valve, with the spring for holding the regulating-valve off its seat and a spring of lighter capacity for closing the intercepting-valve against its seat, as and for the purpose set forth.

15. The combination, with the receiver pipe or passages of a compound locomotive or other engine, of the live-steam pipe connecting with the pressure-regulating-valve casing, the regulating-valve casing, the regulating-valve, its seat, its stop, its hollow steam-passages, the intercepting-valve casing having its balancing-chamber connected to the atmosphere, and the intercepting-valve with its annular balancing device and steam-passages working outside the pressure regulating valve and within its own casing and having one seat to close the opening in the receiver-pipe and another seat to close against the regulating-valve, with the cut-off plunger attached to the intercepting-valve, working within the cut-off chamber in the regulating-valve, as and for the purpose set forth.

16. The combination, with the receiver pipe or passages of a compound locomotive or other engine, of the intercepting-valve having an annular balancing device and steam-passages and interior seat, with a pressure-regulating valve working within and seating itself against said valve at its larger extremity and having its smaller extremity seating itself in its casing against the high-pressure steam and its travel regulated by a stop, said high-pressure end of this valve working within a dash-pot, as and for the purpose set forth.



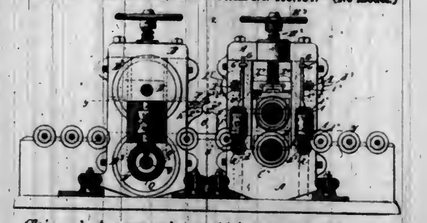
17. The combination, in a compound engine, of the valve-casing, a chamber for exhaust-steam from the high-pressure cylinder, a passage communicating with the said chamber and with the low-pressure steam-chest, a live-steam passage communicating with the valve-casing, and a reducing-valve and an intercepting-valve movable independently of each other as regards the closing of the intercepting-valve and governing the movement of the reducing-valve, the valves being automatically operated on starting by steam acting directly upon the reducing-valve, the said steam holding the intercepting-valve to its seat until the time when steam in the high-pressure chamber overcomes the pressure of the reduced steam in the low-pressure passage, when the intercepting-valve automatically opens and closes the live-steam passage, substantially as specified.

18. The combination, with the receiver pipe or passages of a compound locomotive or other engine, of the controlling-valves attached to the receiver and operated by a suitable lever and so arranged that the steam collected in both the high and low pressure ends of the receiver may be permitted to escape independently or simultaneously when desired, as and for the purpose set forth.

19. The combination of an intercepting-valve and the casing forming an intercepting-valve balancing-chamber with a check-valve arranged to prevent or retard the admission of air to said chamber and at the same time allow it to exhaust freely and also permit any leakage to escape to the atmosphere, as and for the purpose set forth.

20. The combination, in a compound engine, of a valve-casing, a chamber for exhaust-steam from the high-pressure cylinder, a passage communicating with the said chamber and with the low-pressure steam-chest, a live-steam passage communicating with the valve-casing, and a reducing-valve and an intercepting-valve movable independently of each other as regards the closing of the intercepting-valve and governing the movement of the reducing-valve, the valves being automatically operated on starting by steam acting directly upon the reducing-valve, the said steam holding the intercepting-valve to its seat until the time when steam in the high-pressure chamber overcomes the pressure of the reduced steam in the low-pressure passage, when the intercepting-valve automatically opens and closes the live-steam passage, substantially as specified.

481,057. VALVE FOR COMPOUND ENGINES. JOHN PLAYER, Dunkirk, N. Y., assignor to the Brooks Locomotive Works, same place. Filed Apr. 15, 1892. Serial No. 429,267. (No model.)



Claim.—1. In a combined admission and intercepting valve for compound engines, the combination of the receiver-casing forming a communication between the high and the low pressure cylinders, an intercepting-valve therefor, a live-steam passage communicating with the low-pressure end of the receiver, and admission-valve therefor, capable of movement independently of the intercepting-valve, but arranged in such relation to the intercepting-valve that the said admission-valve will be opened and the intercepting-valve will be closed by the live steam, said admission-valve having openings through which the steam is wire-drawn, substantially as described.

2. The combination, with the receiver pipe or passages of a compound locomotive or other engine, of the intercepting-valve having an annular balancing device working within its casing and having one seat to cut off the high-pressure steam from the receiver and having a projection on its back, with the admission-valve working within its casing and being caused to close by the operation of the projection or stop on the back of the intercepting-valve, said admission-valve casing forming the interior of the balancing-chamber for the intercepting-valve, said balancing-chamber being connected to the atmosphere, as and for the purpose set forth.

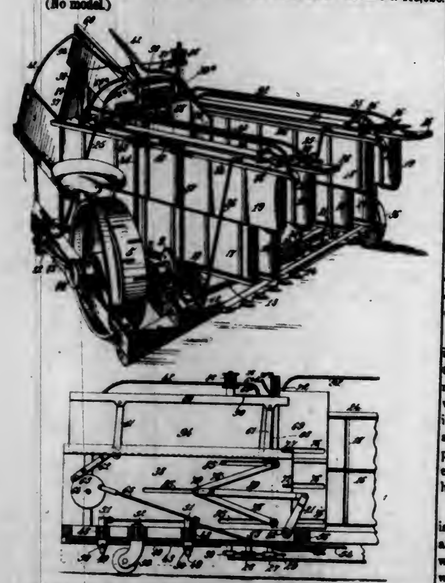
3. The combination, with the receiver pipe or passages of a compound locomotive or other engine, of the live-steam pipe connecting with the admission-valve chamber, the admission-valve chamber, the admission-valve, its seat, its stop, its steam passages and extension, with the projection on the back of the intercepting-valve, having the annular balancing device and steam-passages, said intercepting-valve working within its casing externally and outside of the projection on the admission-valve chamber, said projection forming the balancing-chamber for said intercepting-valve, which is connected to the atmosphere, as and for the purpose set forth.

4. The combination, with the receiver pipe or passages of a compound locomotive or other engine, of the intercepting-valve chamber formed externally by its own casing and internally by the admission-valve chamber and being connected to the atmosphere, the intercepting-valve having the annular balancing device working within said chamber, its steam-passages, its seat closing against the receiver, with the projection on the back end of the intercepting-valve, arranged to close the admission-valve against its seat and the admission-valve closing against its seat, working within its chamber and regulated in travel by its stop, as and for the purpose set forth.

481,058. UNIVERSAL ROLLING-MILL. ABRAM REESE, Pittsburg, Pa. Filed Nov. 20, 1891. Serial No. 413,151. (No model.)

Claim.—1. A compound or multiple universal rolling-mill comprising two sets of universal rolls, one set consisting of a pair of horizontal rolls and a pair of vertical rolls arranged out of alignment with the axis of the horizontal rolls, being constructed and adapted to roll and reduce the web and flanges of an L-beam or channel-bar in a vertical direction only, and the other set consisting of a pair of horizontal rolls and a pair of vertical rolls in alignment with the axis of the horizontal rolls, being constructed and adapted to roll the bar or beam in a lateral direction only, the vertical rolls of both sets being combined with mechanism for positively driving them, substantially as described.

2. In a compound universal rolling-mill, the combination of two distinct sets of universal rolls arranged in proximity to each other and with their respective passes in horizontal alignment, one set comprising horizontal rolls and laterally-adjustable vertical rolls out of axial alignment with the horizontal rolls and the other set comprising horizontal rolls and laterally-adjustable vertical rolls in axial alignment therewith, substantially as described.



3. The method of rolling I-beams or channel-bars, which consists in first reducing the web and flanges by pressure normal to the plane of the web, and, second, in simultaneously supporting the web and inner faces of the flanges and rolling the parallel outer faces of the flanges, substantially as described.

4. In universal mills for rolling I-beams or channel-bars, the combination, with horizontal rolls one of which has a central enlargement or collar to roll and reduce the web of a beam, of horizontally-adjustable vertical rolls mounted in sliding boxes, slotted guide bars supporting said boxes and provided each with two wedges, one at the top and the other at the bottom of the vertical roll, wedge-slides bearing upon said boxes, and means for moving all said wedge-slides and thereby adjusting said vertical rolls simultaneously, substantially as described.

5. In universal mills for rolling I-beams or channel-bars, the combination, with the horizontal rolls constructed and adapted to roll the web and flanges of an I-beam or channel-bar, of the laterally-adjustable vertical rolls arranged out of alignment with the horizontal rolls, the journal-boxes and supporting-bars of said vertical rolls, the wedge-slides impinging against said boxes, the pinions engaging with racks on said wedge-slides, the pinion-shafts supporting said pinions, and the gearing coupled to said shafts, through which the slides are moved and the vertical rolls thereby adjusted, substantially as described.

6. In rolls for rolling I-beams or channel-bars, the combination, of the horizontal rolls, a sliding pinion on the shaft of one of said horizontal rolls, a pair of vertical rolls located between the shafts of the horizontal rolls, pinions on the shafts of the vertical rolls engaging with said sliding pinions, sliding bearings in which said vertical rolls are mounted, having beveled rear faces, frames mounted on the housings in which said bearing-pieces slide, and wedge-slides passing through the housings in the rear of the bearing-slides, with racks formed on their upper edges and pinions engaging with said racks, substantially as described.

481,059. CORN-HARVESTER. ROBERT S. RINKER, Rinkerton, Va., assignor of two-thirds to Philip S. Riddelle, Washington, D. C., and Munroe Funkhouser, Rinkerton, Va. Filed Jan. 22, 1892. Serial No. 418,926. (No model.)

Claim.—1. In a corn-harvester, the combination of a main frame having stalk-cutters, shock-forming chambers separated by a partition comprising a pair of separated walls, a rising and falling ridge-pole, movable supports for the ridge-pole located between the separated walls, movable doors or platforms for supporting the stalks, devices for operating the movable supports between the separated walls to raise and lower the ridge-pole, and means for opening and closing the doors or platforms, substantially as described.

2. In a corn-harvester, the combination, with shock-forming chambers and endless carrying-aprons for delivering stalks thereinto, of a ridge-pole interposed between the shock-forming chamber and against the opposite sides of which the cornstalks rest in reverse inclined planes while a shock is being formed, mechanism for moving the ridge-pole lengthwise from its stalk-supporting position to permit the shock to drop vertically, and movable doors or platforms for sustaining the stalks while a shock is being formed, substantially as described.

3. In a corn-harvester, the combination of shock-forming chambers, mechanism for delivering the stalks thereinto, movable doors which support the butt-ends of the stalks, a ridge-pole movable to different heights and against opposite sides of which the stalks rest in reverse inclined planes while a shock is being formed and tied above the ridge-pole, and means for opening the doors and simultaneously therewith moving the ridge-pole downward, substantially as described.

4. In a corn-harvester, the combination, with suitable cutting devices, shock-forming chambers, and stalk-carrying mechanism for delivering the stalks into the shock-forming chambers, of movable doors which support the butt-ends of the stalks in the shock-forming chambers, a movable ridge-pole, against opposite sides of which the stalks rest while a shock is being formed and tied above the ridge-pole, mechanism for moving the ridge pole downward from its stalk-sustaining position, and means for opening the doors to drop the tied shock in an upright position on the surface traversed, substantially as described.

5. In a corn-harvester, the combination, with stalk-cutting mechanism and stalk-carriers, of shock-forming chambers into which the severed stalks are delivered from the stalk-carriers, a partition which separates the said chambers one from the other, a movable ridge-pole pivotally connected with the partition, doors which sustain the stalks while a shock is being formed, levers for opening and closing the doors, connections between the levers and the pivotal supports of the ridge-pole whereby the latter is moved downward as the doors are opened, and means for operating the said door opening and closing levers, substantially as described.

6. In a corn-harvester, the combination, with suitable cutting mechanism and stalk-carriers, of shock-forming chambers separated from each other by a partition, a ridge-pole pivotally supported from the partition, a crank-wheel connected with the ridge-pole supports, doors which support the stalks while a shock is being formed, spindles or shafts having door opening and closing levers, connections between the spindles and the crank-wheel, and means for operating the spindles to open and close the doors and simultaneously therewith lower and raise the ridge-pole, substantially as described.

7. In a corn-harvester, the combination, with stalk-collecting or shock-forming chambers and opening and closing doors for sustaining the stalks while a shock is being formed, of a ridge-pole movable rearward and downward and provided with a head for acting on the shock to counteract the forward motion of the machine on the shock, substantially as described.

8. The combination, with the shock-forming chambers of a corn-harvester, separated by a partition, of a rising and falling ridge-pole provided with attached aprons for covering the space between the upper edge of the partition and the ridge-pole when the latter is elevated, substantially as described.

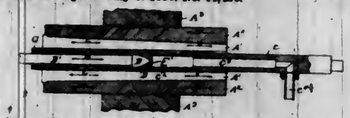
9. In a corn-harvester, the combination, with a cutting mechanism and stalk-carriers, of shock-forming chambers, movable doors which support the stalks while a shock is being formed, and platforms elevated above the doors and arranged at the rear end portions of the carriers so that the stalks drop vertically from the platform upon the doors, substantially as described.

10. In a corn-harvester, the combination, with a main frame having a cutting mechanism for severing the stalks, means for moving the severed stalks rearward, and shock-forming chambers having movable doors or platforms and separated by a partition composed of walls which converge toward their upper portions, of a rising and falling ridge-pole located above the inclined walls composing the partition and against opposite sides of which the stalks rest in reverse inclined positions while a shock is being formed and tied, and means for lowering the ridge-pole from its stalk-supporting position after the shock has been tied, substantially as described.

11. In a corn-harvester, the combination, with a cutting mechanism, endless carrying aprons, and shock-forming chambers, of a movable packer having a vertical rear wall and a movable side wall or wing provided with an attached segmental rod and a guide through which the rod passes for swinging the wall or wing laterally toward the longitudinal center of the machine on the back-stroke of the packer, substantially as described.

12. In a corn-harvester, the combination, with a cutting mechanism, stalk-carriers, and shock-forming chambers, of a reciprocating packer having side walls provided with slots and laterally-projecting teeth, and stationary arms protruding through the slots of the side walls for holding the stalks against following the motion of the back-stroke of the packer, substantially as described.

13. In a corn-harvester, the combination, with a cutting mechanism, of a pair of co-operating endless carrier-aprons having their adjacent traveling portions acting to move the stalks rearward, a shock-forming chamber, and a rotating vertical cylinder located in a space between the rear ends of the two carrier-aprons and the shock-forming chamber and provided with projections or teeth, and a reciprocating packer having a part co-operating with the toothed cylinder to force the stalks from the rear ends of the two carrier-aprons toward the shock-forming chamber, substantially as described.



14. In a corn-harvester, the combination, with cutting devices and stalk-carriers, of a shock-forming chamber having opening and closing bottom doors and a divergent rear exit to facilitate the discharge of an upright shock as the machine advances, substantially as described.

15. In a corn-harvester, the combination, with cutting devices and stalk-carriers, of shock-forming chambers separated by a partition comprising inclined walls which converge toward their rear extremities to provide widened or divergent exits, substantially as described.

16. In a corn-harvester, the combination, with cutting devices and stalk-carriers, of shock-forming chambers having widened or divergent rear extremities and opening and closing doors constituting the bottoms of the shock-forming chambers for dropping a shock on the surface traversed, substantially as described.

17. In a corn-harvester, the combination, with stalk-carriers, and the shock-forming chambers separated by a partition, comprising inclined walls, of the guard-rails 64^a and the guard rails 42, secured at their rear ends to the outer walls of the shock-forming chambers and having their forward ends extended substantially parallel with the guard-rails 64^a, said guard-rails 42 acting to force the stalks toward each other and cause them to assume inclined positions at opposite sides of the partition which separates the shock-forming chambers, substantially as described.

481,060. SHAPING METAL TUBES. JAMES ROBERTSON, Birmingham, England. Filed Mar. 18, 1892. Serial No. 425,429. (No model.) Patented in England July 6, 1891. No. 11,436.

Claim.—1. That improvement in the art of making metal articles which consists in giving a blank piece of metal softened by heat the desired form in a die by pressure and then introducing a relatively-cold fluid, such as water, under pressure into the die, said fluid operating to cool and contract the formed article as well as to eject it from the die, as set forth.

2. That improvement in the art of making seamless metal tubes and tubular articles which consists in placing a blank or billet softened by heat in a die, forcing a piercing-mandrel lengthwise into and through the billet, thus converting it into a tube, and then introducing a fluid, such as water, under pressure into the die, and thereby ejecting both the tube and mandrel from the die, as set forth.

3. The combination of a hollow die, a mandrel or pressure device movable lengthwise within the die, and means for introducing water under pressure into the interior of the die, whereby the formed article and the mandrel or pressure device may be ejected from the die, as set forth.

4. The combination of a fixed guide, a die adapted to slide lengthwise therein, a pressure device movable lengthwise within the die, and a fixed stem-rod entering the rear end of the die and provided with a conduit adapted to deliver a fluid, such as water, under pressure to the interior of the die, as set forth.

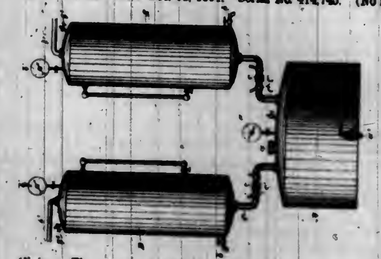
5. The combination of a fixed guide, a die adapted to slide lengthwise therein, a mandrel adapted to move lengthwise into the die, and a fixed stem-rod entering the rear end of the die as a means for supporting a billet or blank of metal therein against the piercing pressure of the mandrel, said stem-rod having a water channel or conduit adapted to introduce a fluid, such as water, under pressure into the rear portion of the die, as set forth.

6. That improvement in the art of making seamless metal tubes and hollow articles which consists in placing a blank or billet softened by heat in a die, forcing a piercing-mandrel lengthwise into and through the billet, and thereby causing the metal of the billet to exude in tube form between the die and mandrel in a direction opposite the movement of the mandrel, rigidly holding the rear end of the billet against the piercing pressure of the mandrel by a rigid support while the mandrel is piercing the billet, and thereby preventing the mandrel from breaking the billet during the piercing operation, and displacing or removing the rigid support by the direct or unrelieved pressure of the mandrel at the end of the piercing operation, whereby injury to the mandrel is prevented, as set forth.

7. That improvement in the art of making seamless metal tubes and hollow articles which consists in placing a blank or billet softened by heat in a die, rigidly supporting the rear end of the billet, forcing a piercing-mandrel lengthwise into and through the rigidly-supported billet, and thereby causing the metal of the billet to exude in tube form between the die and mandrel in a direction opposite the movement of the mandrel, and displacing the support at the rear end of the billet after the mandrel has passed substantially through the billet, whereby the mandrel is permitted to emerge unobstructed from the rear end of the tube without injury.

8. That improvement in the art of making seamless metal tubes and hollow articles which consists in placing a blank or billet softened by heat in a die, rigidly supporting the rear end of the billet, forcing a piercing-mandrel lengthwise into and through the rigidly-supported billet, displacing the support from its operative position at the rear end of the billet after the mandrel has passed substantially through the billet, and thereby permitting said support to slide in the die, and finally introducing a fluid, such as water, under pressure into the rear end of the die, and thereby ejecting the mandrel, the billet, and the displacing billet-support, as set forth.

9. As a fixed improvement in apparatus for making seamless metal tubes and hollow articles, the combination of a die, a piercing-mandrel movable lengthwise in the die, and an abutment for the rear end of the billet, adapted to sustain the billet rigidly against the relieved pressure of the mandrel and to give way to the direct or unrelieved pressure of the mandrel, whereby the mandrel is permitted to emerge from the rear end of the tube without injury, as set forth.

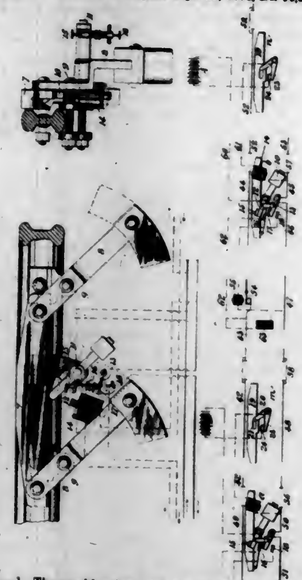


10. As an improvement in apparatus for making seamless metal tubes and hollow articles, the combination of a die, a piercing-mandrel movable lengthwise in the die, a recessed support at the rear portion of the die, adapted to resist the pressure of the mandrel against the billet, and a fixed abutment for the rear end of the billet, adapted to sustain the billet rigidly against the relieved pressure of the mandrel and to give way to the direct or unrelieved pressure of the mandrel and retreat before the mandrel into the recessed support, as set forth.

11. As an improvement in apparatus for making seamless metal tubes and hollow articles, the combination of a die, a piercing-mandrel movable lengthwise in the die, a recessed support at the rear portion of the die, adapted to resist the pressure of the mandrel against the billet, an abutment for the rear end of the billet, and a locking device or key securing the abutment to the support and adapted to resist the relieved pressure of the mandrel through the billet against the abutment and to be ruptured or shorn by the direct or unrelieved pressure of the mandrel, as set forth.

12. As an improvement in apparatus for making seamless metal tubes and hollow articles, the combination of a die, a piercing-mandrel movable lengthwise in the die, a recessed support at the rear portion of the die, adapted to resist the pressure of the mandrel against the billet, and a service-plate of rupturable metal covering the forward end of the recessed support, said plate serving as an abutment for the rear end of the billet, while its margin constitutes a locking device or key engaging the abutment with the recessed support and adapted to be ruptured or shorn by the direct pressure of the mandrel, as set forth.

13. The combination of a hollow die, a mandrel or pressure device movable lengthwise within the die, a support or abutment for the rear end of the billet, adapted to sustain the billet rigidly against the pressure of the mandrel when said pressure is relieved by the exudation of the metal between the die and mandrel and to give way or become loosened by the direct pressure of the mandrel, and means for introducing a fluid under pressure, such as water, into the rear end of the die to eject the mandrel, the formed tube, and the loosened support from the die, as set forth.

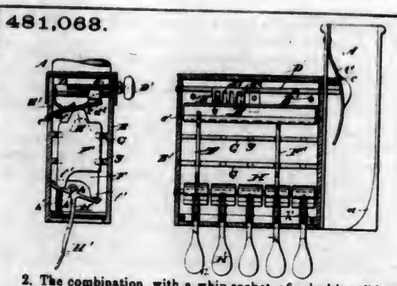


481,061. FERMENTING PROCESS. FREDERICK W. RUEFF, San Francisco, Cal. Filed Dec. 11, 1891. Serial No. 414,745. (No model.)

Claim.—The process herein described, which consists in first ex-

posing the liquid to the action of fermenting germs contained in a separate vessel, whereby fermentation sets in; second, stopping the fermentation short of completeness by cutting off the liquid from exposure to the fermenting germs and cooling the same, whereby it still contains sugar and is clarified, and, finally, subjecting the liquid during cooling and bottling to a pressure of carbonic-acid gas, substantially as herein described.

481,062. ELECTRIC CONTROL OF RAILWAY-TRAINS. ROBERT C. DAVIS, Bristol, England. Filed Mar. 10, 1892. Serial No. 424,382. (No model.) Patented in Belgium Sept. 23, 1891, No. 96,506.



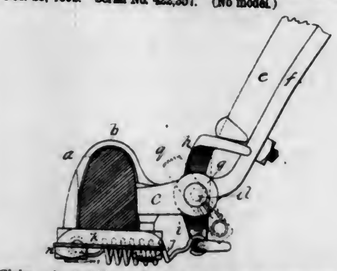
Claim.—1. The combination, with two conductors arranged in sections parallel with the rails and a separate current-generator connected to each section, of a blocking-switch provided with a magnet and arranged at the rear end of each section, an unblocking-switch arranged in advance of each blocking switch, an electric switch provided with a magnet and arranged between each said blocking and unblocking switch, an automatic lever for controlling the motor on the train, a magnet carried by the train and normally arranged in circuit with the said conductors and adapted to hold the said lever in a position to permit the said motor to work, and intermediate conductors arranged substantially as set forth, whereby the front train actuates each said blocking-switch and shunts the current through the said electric switch of the same section and subsequently restores the original circuit by actuating the unblocking-switch of the next section over which it passes, substantially as set forth.

2. The combination, with the two main-line conductors 28 and 29 and the two branch-line conductors 39 and 40, connected to them, of the blocks of insulating material 30, 31, and 32, inserted in the conductors 29 and 40 substantially as shown, the switches 26 and 27, operatively connected with the points, the intermediate conductors 34 and 35, connecting the switch 26 with the conductor 29 on opposite sides of the block 30, the intermediate conductor connecting the switch 27 with the conductor 40, the intermediate conductor connecting the switch 27 with the conductor 29 between the blocks 30 and 32, and the intermediate conductor 38, connecting the switch 27 with that part of the conductor 40 between the block 31 and the conductor 29, substantially as described and shown.

481,063. WHIP-SOCKET. HENRY E. SCHRADER, Manteno, Ill. Filed Jan. 23, 1892. Serial No. 418,900. (No model.)

Claim.—1. A whip-socket having a lock-case at one side, a transverse slide-rack therein provided with an external operating-handle, a whip-retainer in the socket at the inner end of the slide-rack, a toothed latch in the case for engaging the said rack, a series of sliding tumblers engaging the said latch, and keys pivoted in the case in engagement with the tumblers and having finger-pieces projecting through the casing, substantially as described.

481,068.



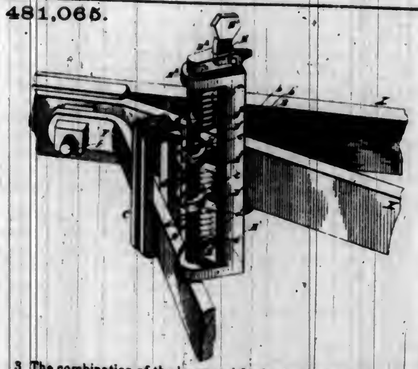
2. The combination, with a whip-socket, of a locking-slide movable into said socket, a latch-bar adapted to engage said slide, a series of tumblers movable toward and from said latch-bar, and separate keys for actuating said tumblers to throw them against the latch-bar and cause it to move into engagement with the said slide, substantially as described.

3. The combination, with a whip-socket, of a lock in which is comprised a slide movable into the socket and formed with a rack, a whip-retainer at the inner end of the slide, a rocking latch-bar having a bit adapted to engage said rack, a series of reversible tumblers below said latch-bar, and separate trips for each of said tumblers, the trips being provided with operating-keys, substantially as described.

4. The combination, with a whip-socket, of a whip-retaining plate therein and a lock comprising a slide movable against said retainer-plate and formed with a rack, a latch-plate for the slide, pivoted to rock toward and from the same and having a bit adapted to engage the rack thereon, a series of tumblers below the latch-bar, said tumblers being loosely held by recessed guide-flanges on the interior of the case, actuating-trips for the tumblers, having T-heads extending at both sides of the pivot thereof and provided with keys, and the tumblers having each at one end a ward for contacting with the latch-bar and at the opposite end a toe resting on the T-head of the trip, substantially as described.

481,064. THILL-COUPLING. HENRY A. SEVIGNE, Boston, Mass., assignor to the Sevigne Manufacturing Company, same place. Filed Feb. 23, 1892. Serial No. 422,357. (No model.)

Claim.—1. A thill-coupling comprising in its construction the thill and thill-iron, the clip, the coupling bolt or pin provided with arms, one of which extends upward and over the thill upon which it bears and the other extending downward, and an adjustable spring connected with the latter arm, as set forth.

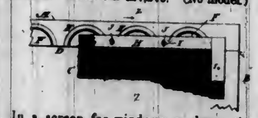


2. A thill-coupling comprising in its construction the thill and thill-iron, the clip, the coupling bolt or pin provided with arms, one of which extends upward and over the thill upon which it bears and the other extending downward, the adjustable plate *k* and the spring connected at one end to the last mentioned arm, and at the other end to the said plate, substantially as set forth.

481,065. FENDER. CORNELIUS C. SHANBROK, Pettit, Ind. Filed Mar. 21, 1892. Serial No. 425,750. (No model.)

Claim.—1. The combination of the beam and fender-bar and the supporter adjustably attached to the beam, with the lugged shaft attached to said supporter and the fender-regulator adjustably mounted on said shaft, all constructed and arranged to operate substantially as and for the purpose set forth.

2. The combination of the supporter having parallel toothed side bars with the securing-bolts having toothed heads adapted to engage the teeth of said bars, substantially as described, and a fender-regulator attached to said supporter, substantially as and for the purpose described.



481,065.

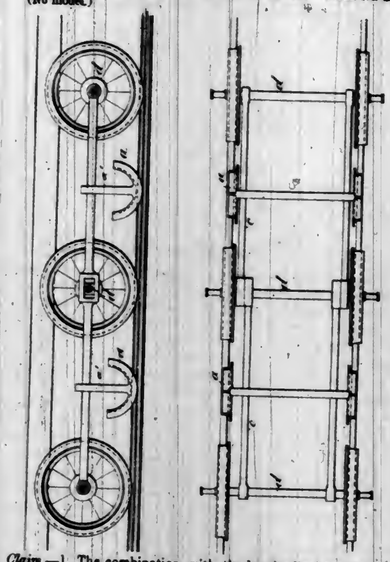
3. The combination of the beam and fender-bar and the supporter having parallel side bars provided with oppositely-pointing ratchet-teeth above and below their centers, respectively, on their inner opposed faces, with the wedge-headed bolts having notches or teeth in their heads to engage the teeth of the said bars, the clip-plate, and securing-nuts, and the fender-regulator attached to said supporter, substantially as described.

4. The combination of the beam and fender-bar, the supporter attached to beam, and the lugged shaft removably journaled in said supporter, and its locking-dog, with the slotted fender-regulator plate having lateral perforated and slotted ears engaging said shaft and adjustable thereon, substantially as and for the purpose described.

481,066. WINDOW OR DOOR SCREEN. CHARLES J. SHIBREFF, Brockville, Canada, assignor to himself and John Macleod Gill, same place. Filed Mar. 31, 1892. Serial No. 427,270. (No model.)

Claim.—1. In a screen for windows or doors, the combination, with the netting or wire-cloth and a frame the top rail of which is formed with a series of separated channels opening above the said netting or wire-cloth, of a ribbon located in front of the said channels, concealing the edge of the netting or wire-cloth and adjustable to enlarge or diminish the openings above said netting or wire-cloth, substantially as described.

2. In a screen for windows or doors, the combination, with the netting or wire-cloth and a frame the top rail of which is formed with a series of separated channels E, each of which is provided with a sunken channel F, of a ribbon located in front of the said channels, concealing the edge of the netting or wire-cloth and adjustable to enlarge or diminish the openings above said netting or wire-cloth, substantially as described.

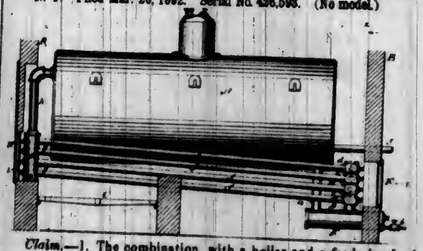


3. In screens for windows or doors, the combination, with a frame B, having its top rail A formed with a series of piers D, connected by arched channels E and sunken channels F, a screen C, secured to the frame and having its upper edge terminating below the crowns of the arched channels, the ribbon H, applied to the upper edge of the screen and provided with a series of vertical slots J, and screws I, extending through the slots and engaging the frame for the purpose of vertically adjusting the ribbon on the screen, substantially as described.

481,067. MANUFACTURE OF SCREEN-DOORS. CHARLES J. SHIBREFF, Brockville, Canada, assignor to himself and John Macleod Gill, same place. Filed Mar. 31, 1892. Serial No. 427,271. (No model.)

Claim.—The improvement in the art of constructing screen-doors, which consists in providing the door-frame with incisions extending from its inner edges in a direction approximately parallel with its face and with other incisions at a distance from its inner edges and approximately at right angles to the first incisions, then removing the strips bordered by the two sets of incisions, so as to form recesses in the frame, then adjusting the screen in said recesses, and, finally, securing the strips over the edges of the screen, substantially as described.

481,068. GUARD-SHOE FOR RAILWAY-VEHICLES. HENRY L. SIMMONS, St. Day, England. Filed Feb. 20, 1892. Serial No. 422,337. (No model.)

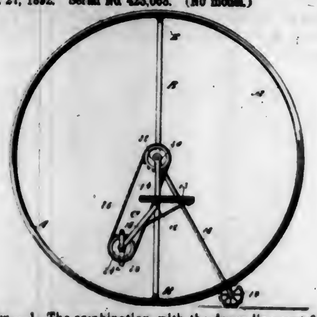


Claim.—1. The combination, with the longitudinal bars carried by the axles, of the rail-guard shoes provided with central stems connected to the said bars and depending from them, substantially as set forth.

2. The combination, with a longitudinal bar carried by the axles, of a rail-guard shoe provided with a central stem and a spring connecting the said stem with the said bar, substantially as set forth.

3. The combination, with the stationary tube *c*, carried by the car and provided with a guide at its lower end, of a rail-guard shoe provided with a central stem sliding in the said guide and a spring inclosed within the said tube and adapted to support the said shoe and permit it to rise, substantially as set forth.

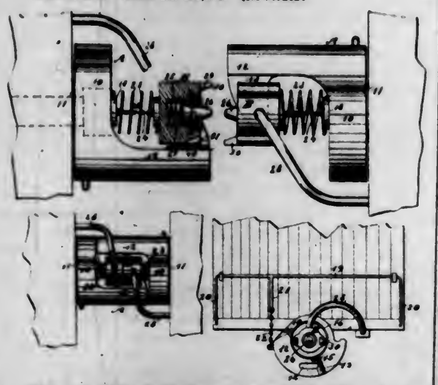
481,069. STEAM-GENERATOR. GEORGE W. SLOANE, Brooklyn, N. Y. Filed Mar. 26, 1892. Serial No. 426,093. (No model.)



Claim.—1. The combination, with a boiler and a feed-pipe leading directly thereinto, of a mud-drum E, having a pipe *e* extending into the boiler, a drum D, rising from the mud-drum, and pipe connections between the drum and the steam-space of the boiler, substantially as described.

2. A steam-generator consisting of a furnace structure, a boiler A, a mud-drum E, situated beneath the boiler and connected to the same by a pipe *a*, a drum D, connected to the mud-drum and extending up between the boiler and the rear wall of the furnace structure, pipes

c c', extending from the drum D in opposite directions, heads *d d'*, connected to the ends of the pipes *c c'* and provided with hand-holes *e e'*, doors F F' opposite said hand-holes, drums G G' between the front end of the boiler and the front wall of the furnace structure, pipes *f f'*, extending from the heads *d d'* into the drums G G', hand-holes *g g'* in the drums G G', doors H H' opposite said hand-holes, and pipes *h h'*, leading from the drums G G' into the boiler, substantially as described.



481,070. VELOCIPEDE. MARTHA E. SLOCUM, Meadville, Pa. Filed Feb. 27, 1892. Serial No. 423,063. (No model.)

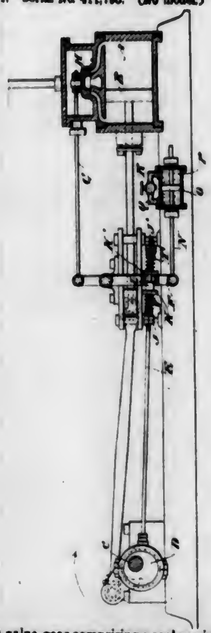
Claim.—1. The combination, with the depending seat-frame having outwardly-projecting arms at its upper end, on which the wheel-hubs are journaled, and the operating mechanism, of the arm or arms 18, rigidly mounted at their upper ends on said outwardly-projecting arms and inclined rearward and downward to a point adjacent to the ground-line, substantially as set forth.

2. The combination, in a velocipede, with the seat-frame having a horizontal seat, vertical arms at the ends thereof, horizontal arms projecting outward from the upper ends of said vertical arms through wheel-hubs, sprocket-wheels on the wheel-hubs, arms 15, projecting downward and forward from the seat-frame and carrying the treadles provided with sprocket-wheels, and chains connecting the wheel and treadle sprockets, of the rods or bars rigidly secured to the said horizontal arms and extending downward and rearward therefrom and provided with wheels at the ground-line, substantially as set forth.

481,071. CAR-COUPLING. HAMPTON K. SMITH, Union, S. C. Filed Oct. 17, 1891. Serial No. 409,078. (No model.)

Claim.—1. The combination, with a car-coupler, of a valve-head containing a chamber having a conical outer end and an aperture leading into said chamber and adapted to receive a steam or air pipe, a spring-controlled conical valve located in the chamber, a cushion or washer surrounding the chamber and extending beyond its forward end, and guide devices attached to the outer faces of the valve-heads as and for the purpose specified.

2. In a car-coupling, the combination, with a draw-bar and a coupling-hook mounted to rock thereon, of a valve-head yieldingly connected to the draw-bar and adapted for connection with a steam or air pipe and a valve in said head, substantially as described.



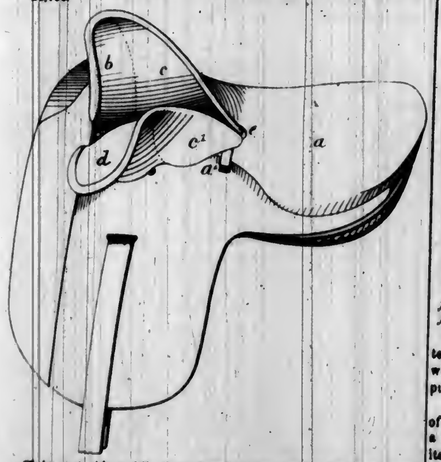
3. In a car-coupling, the combination, with a draw-bar and a coupling-hook mounted to rock thereon, of a valve-head, a valve in said head, a flexible connection connecting the valve-head to the draw-bar, and a spring interposed between the valve-head and the draw-bar, substantially as described.

4. In a car-coupling, the combination, with a draw-bar and a coupling-hook mounted to rock thereon, of a valve-head provided with a guide-lug, a flexible connection between the valve-head and draw-bar, and a conical and spring-pressed valve in the valve-head and projecting beyond the outer face of the same, substantially as described.

5. In a car-coupler, the combination, with a draw-bar, of a draw-head consisting of a body-section having a hub, the said body-section being provided with an eccentrically-located bore extending through the hub, and a wing extending from one side of the body, terminating in a hook the direction of which is diametrically across the front face of the body, substantially as shown and described.

6. In a car-coupler, the combination, with a draw-bar having a head at its outer end, of a draw-head provided with a hub at one end and an eccentrically-located bore extending in reduced form through the hub, the said head through the medium of the said bore being loosely mounted upon the draw-bar, and a wing extending horizontally over the outer face of the body at one side, terminating in a hook the direction of which is diametrically of the body of the draw-head and the outer end of which wing and hook is beveled or inclined, as and for the purpose specified.

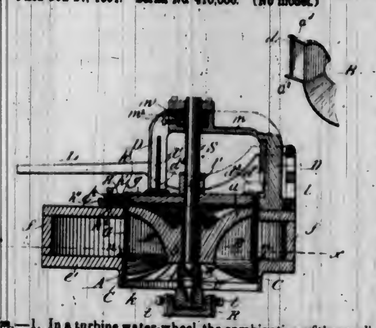
481,072. VALVE-GEAR. FRED. E. SMITH, Boston, Mass. Filed Nov. 13, 1891. Serial No. 411,780. (No model.)



Claim.—1. A valve-gear comprising a rocker yieldingly connected with its eccentric-rod, and a stationary auxiliary fluid-cylinder having connected ends, and a piston operating in said cylinder and connected with the valve-stem, substantially as set forth.

2. In a valve-gear, the combination, with an eccentric and its rod, of a fixed collar held on the said rod, springs coiled on the said rod and pressing against washers adapted to be engaged by the said collar, and a rocker connected with the main valve and adapted to be engaged at opposite sides by the said washers, substantially as shown and described.

3. In a valve-gear, the combination, with a valve-stem, of a cylinder containing a piston connected with the said valve-stem, a fluid contained in the said cylinder, a pipe connecting the ends of the cylinder with each other, and a regulating-valve in the said pipe, substantially as shown and described.

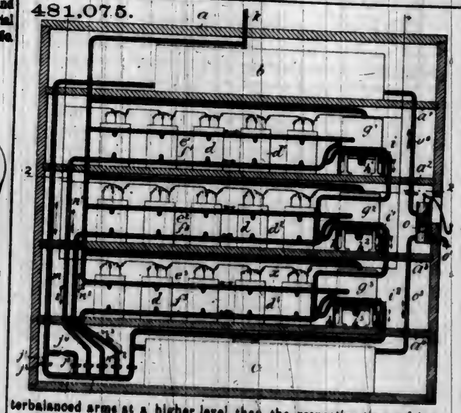


4. In a valve-gear, the combination, with an eccentric and a rocker yieldingly connected with the said eccentric, of a cylinder having connected ends and filled with a fluid, a piston mounted to travel in the said cylinder and connected with the said rocker, and a valve arranged in the pipe for connecting the ends of the cylinder, substantially as shown and described.

481,073. SIDE SADDLE. THOMAS G. SMITH, Malmesbury, and FREDERICK W. MATHEW, London, England. Filed May 11, 1892. Serial No. 432,589. (No model.) Patented in England Dec. 12, 1891, No. 21,796.

Claim.—A side saddle for a female rider, having its upper pommel *b* provided with an extension *c*, which is curved backward, and its lower pommel *d* provided with an extension *c'*, which is curved upward and backward, said curved extensions constituting an extended bearing approximately from the knee to the groin of the rider for the purpose of obtaining steadiness and firmness of seat, substantially as described.

481,074. WATER-WHEEL. WILLIAM G. SPENCER, Dahlonega, Ga. Filed Oct. 27, 1891. Serial No. 410,006. (No model.)

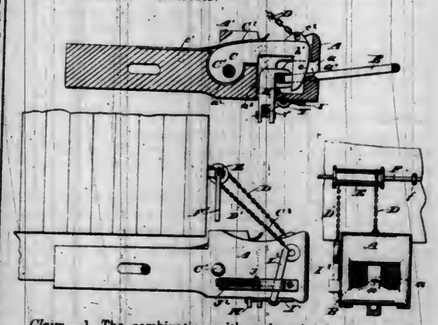


Claim.—1. In a turbine water-wheel, the combination of the scroll, the wheel proper consisting of the crown-plate having an inwardly-projecting hub, the buckets secured thereto, the band surrounding the lower outer edges of the buckets, and the supplementary sides secured to the outer edges of the buckets between the crown-plate and the said band, the lower end of each side being turned to form a guide, substantially as described.

2. In a turbine water-wheel, the combination of the scroll, the wheel, the gate, the casing secured to the top of the scroll and surrounding the gate, the band and packing carried within the said casing, and the adjusting-screws passing through the casing and impinging upon the said band, substantially as described.

481,075. ELECTRIC BATTERY. PETER STIEBS, Charlottenburg, Germany. Filed Apr. 20, 1892. Serial No. 429,846. (No model.)

Claim.—1. The combination, in an electric battery, of one or more tiers of closed battery-cells, a supply-tank located above the battery-cells, a receiving-tank located beneath the battery-cells, a feed-pipe communicating with the supply-tank and with the upper tier of cells, air-pipes communicating with all the cells of the respective tiers and serving as overflow-pipes, connecting-tubes between the respective tiers of cells and the receiving-tank, counterbalanced arms normally closing said connecting-tubes, and regulating-vessels supported by said counterbalanced arms at a higher level than the respective tiers of jars with which they are in communication, substantially as and for the purposes set forth.



2. The combination, in an electric battery, of one or more tiers of closed battery-cells, a supply-tank located above the battery-cells, a receiving-tank located beneath the battery-cells, a force-pump and its complemental connections for emptying the contents of the receiving-tank into the supply-tank, a feed-pipe communicating with the supply-tank and with the upper tier of cells, air-pipes communicating with all the cells of the respective tiers and serving as overflow-pipes, connecting-tubes between the respective tiers of cells and the receiving-tank, counterbalanced arms normally closing said connecting-tubes, and regulating-vessels supported by said counterbalanced arms at a higher level than the respective tiers of jars with which they are in communication, substantially as and for the purposes set forth.

3. The combination, in an electric battery, of one or more tiers of closed battery-cells and their complemental regulating devices and overflow connections, an elevated supply-tank, a feed-pipe communicating with the supply-tank and the upper tier of cells and bifurcated to form branch tubes, whereof one is restricted in cross-section, and pinch-cocks or valves for opening and closing said branch tubes, substantially as and for the purposes set forth.

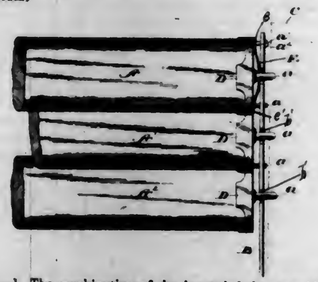
4. In an electric battery, a tier of closed battery-cells, a pipe for supplying electrolyte thereto, a connecting or overflow tube, a counterbalanced pivotal arm normally closing said connecting-tube, a covered regulating-vessel supported by said arm at a higher level than the cells, and tubes communicating with said cells and regulating-vessel, substantially as and for the purposes set forth.

5. The combination, in an electric battery, of one or more tiers of closed cells and their complemental filling and discharging apparatus and a series of air-tubes discharging into the atmosphere and communicating with said cells and with the tanks and vessels of the filling and discharging apparatus, substantially as and for the purposes set forth.

481,076. CAR-COUPLING. CHARLES W. STILLIANS, Pueblo, Colo., assignor of one-half to Isaac Freund, same place. Filed Nov. 11, 1891. Serial No. 411,538. (No model.)

Claim.—1. The combination, with a draw-head, of a coupling hook or arm, a normally-elevated vertically-sliding link-tilter in rear of the link-engaging portion of the hook or arm, and mechanism for

raising the coupling hook or arm and depressing the link-tilter, substantially as set forth.



2. In a car-coupling, the combination, with a draw-head, of a vertically-movable hook extending therein from the under side, its hook proper projecting forwardly over the position occupied by the ordinary coupling-link, a cranked rock-shaft held to said hook at its lower end, and an arm for rocking said shaft, substantially as described.

3. In a car-coupling, the combination, with the draw-head, of link-controlling devices comprising a hook fitted to slide vertically in said draw-head, its hook proper lying normally within the draw-head over the position occupied by the usual link, a cranked rock-shaft for operating said hook, an arm for rocking said shaft, and a spring for returning the said arm and connected devices to the normal position, substantially as described.

4. In a car-coupling, the combination, with the draw-head, of link-controlling devices consisting of a hook held to a cranked rock-shaft and fitted to slide vertically in the draw-head, its hook proper lying therein and extending forwardly over the position occupied by the usual coupling-link, an operating-arm on the rock-shaft, a sliding rod bearing at one end against said arm, a spring on said rod for holding it against the said arm, and a chain and winding-drum for throwing the arm, substantially as shown and described.

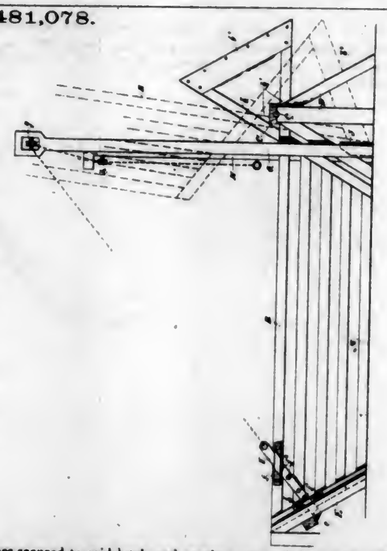
5. In a car-coupling, the combination, with the draw-head, of link-controlling devices comprising a vertically-sliding hook in the draw-head, a rock-shaft to which said hook is connected, said shaft having an operating-arm, and a chain and winding-drum therefor, the chain being connected with the arm of the rock-shaft for throwing the same, substantially as described.

481,077. WINDOW-BLIND. EDWARD STOEPPELWERTH and CHARLES H. KNEFELKAMP, St. Louis, Mo. Filed Nov. 27, 1891. Serial No. 413,271. (No model.)

Claim.—1. The combination of the journaled slats provided, respectively, with the pins, the slat-rod jointed to said pins, and the friction-plate E, attached to the pins of adjoining slats and bearing against said slat-rod, substantially as described.

2. The combination of the slats, the caps attached, respectively, to said slats, and each provided with a journal and pin, the slat-rod jointed to said slat-pins, and the friction-plate attached to the pins of the slats and bearing against the slat-rod, substantially as described.

481,078. GATE. COLEMAN TALBOT, Santa Rosa, Cal., assignor of one-half to Joseph M. Talbot, same place. Filed Apr. 6, 1892. Serial No. 428,093. (No model.)

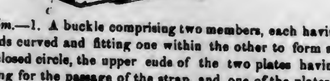


Claim.—1. The vertically-swinging gate pivoted horizontally at its inner end and having the inclined end bar, with an extension, a top rail or bar with an extension, and a weight-box connecting the ends of said extensions beyond the line of pivot of the gate, substantially as herein described.

2. The gate having the upwardly-diverging end bars, the inner one of which has an extension, the top rail or bar, with an extension, the weight-box connecting the ends of said extensions, and a horizontal pivot-bar at the inner end of the gate-top, in combination with the standards upon which said bar is pivoted, the inclined guides for the outer end of the gate, and the fixed stop for its weight-frame at the inner end, substantially as herein described.

3. The vertically-swinging gate pivoted horizontally at its inner end and having the inclined bar at its outer end, in combination with the corresponding inclined guide E, with latch-stop *e*, and the inclined gravity-latch on the gate, adapted to pass its lower end under said stop, substantially as herein described.

4. The vertically-swinging gate pivoted horizontally at its inner end and having the inclined bar at its outer end, in combination with the corresponding inclined guide E, with latch-stop *e*, the inclined gravity-latch on the gate, adapted to pass its lower end under said stop, said latch having a stop for limiting its movement, and the operating-



481,078.

ropes secured to said latch and passing over suitable guide-pulleys, substantially as herein described.

5. The vertically-swinging gate pivoted horizontally at its inner end, said gate having the upwardly-divergent end bars, the inner one of which has an extension, a top rail or bar with an extension, and a weight-box connecting the ends of said extension beyond the line of pivot of the gate, in combination with the inclined guide E for the outer end of the gate, the latch-stop *e* thereon, the sliding inclined gravity-latch on the gate, having suitable stops, and the operating-ropes I, secured to the latch and passing over suitable guide-pulleys, substantially as herein described.

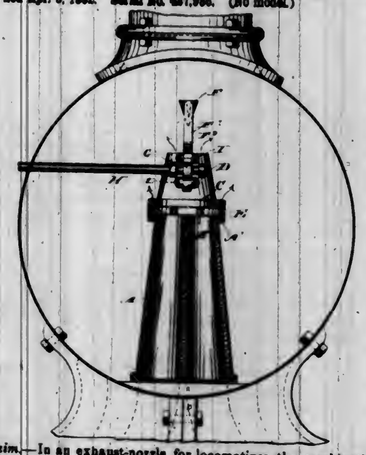
481,079. BUCKLE. JOHN G. TAYLOR, Keene, Tex. Filed Mar. 28, 1892. Serial No. 426,811. (No model.)

Claim.—1. A buckle comprising two members, each having their lower ends curved and fitting one within the other to form substantially a closed circle, the upper ends of the two plates having each an opening for the passage of the strap, and one of the plates having a tongue which passes through the strap, substantially as set forth.

2. A buckle comprising two members, each having curved lower ends, the curved portion of one having a tongue or projection and a curved portion of the other having an opening to receive the said tongue, substantially as described.

481,080. GRAIN CUT-OFF. PHILANDER D. THOMPSON, Neligh, Nebr. Filed Mar. 12, 1892. Serial No. 424,730. (No model.)

Claim.—The combination, with an outer stationary cylinder having a series of discharge-openings in its sides, a centrally-apertured conical bottom, and a delivery-spout at each opening, of an inner revoluble cylinder having a centrally-apertured conical bottom and a single discharge opening in its side, a funnel-shaped hopper rigidly secured within the inner cylinder, the overlapping flanges secured to the



outer cylinder and adapted to overlap the upper edge of the inner cylinder, the tube passed through the outer bottom and secured in the aperture of the inner bottom, the operating-shaft passed through the tube, and the nuts secured upon the shaft above and below the tube and adapted to bear upon the ends of tube, substantially as shown and described.

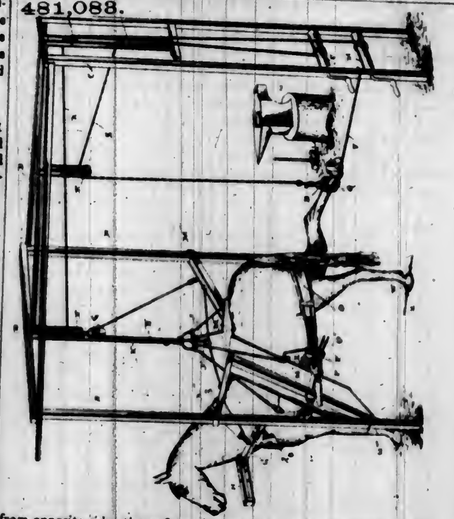
481,081. COMPOUND PROJECTILE FOR SMALL ARMS. MICHAEL TWOMEY, Billingshurst, assignor to Edgar Ray, London, England. Filed Feb. 23, 1892. Serial No. 422,574. (No model.) Patented in England Dec. 18, 1891, No. 22,173; in France Feb. 5, 1892, No. 219,181; in Belgium Feb. 6, 1892, No. 96,343, and in Italy Mar. 2, 1892, LXI, 359.

Claim.—As an improved article of manufacture, a compound projectile constructed to flatten out at the front end when striking the object aimed at and composed of a hard-metal case closed at the rear end and open at the front end and a soft-metal core introduced at the front end of the case, substantially as described.

481,082. EXHAUST-NOZZLE. CHARLES W. UMBOLTS, Bristol, Va. Filed Apr. 6, 1892. Serial No. 427,996. (No model.)

Claim.—In an exhaust-nozzle for locomotives, the combination, with the stand-pipe A, having the lateral top flange A', provided with the pins B, and a vertical flange E, secured to the top flange, of the detachable nozzle D, having a flanged base C, which is supported in fixed position upon said pins and surrounded by the said vertical flange, between which latter and said nozzle is an annular space serving as a supplemental steam-passage, and the inverted cone F, the rack-bar, and toothed segment for adjusting it, as shown and described.

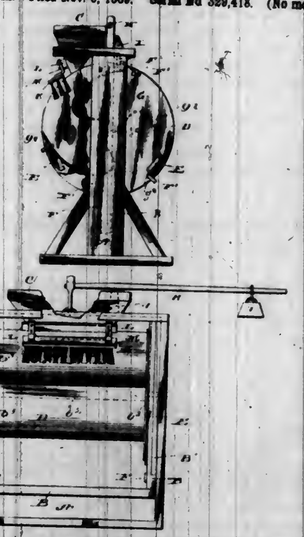
481,083. HORSESHOEING-RACK. JOHN WAGNER and GEORGE B. SUNDERLAND, Marietta, Ohio. Filed Feb. 12, 1892. Serial No. 421,325. (No model.)



Claim.—1. The combination, with a frame in which the animal is placed and a band for preventing him from moving rearward therein, of loops through which the ends of the said band pass and dogs which are pivoted in the said loops and which bear against the said band ends, the outer ends of the dogs being secured to the frame, substantially as shown and described.

2. In a device of the character described, the combination, with a boxing provided with an opening in its upper side and a post within the box below the opening, of rods arranged around the post, and diverging downward from the upper end thereof and a rope which is looped around the said rods, for the purpose substantially as shown and described.

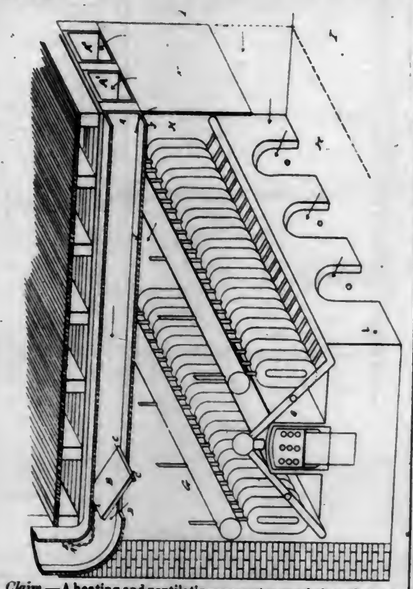
3. The combination, with the uprights A and upwardly-converging braces M', of loops at the lower end of said braces and loop-arms M'', projecting from the upper ends of the braces, all of said loops encircling the uprights and adapted to move vertically thereon, substantially as shown and described.



4. The combination of a frame, movable braces projecting inward

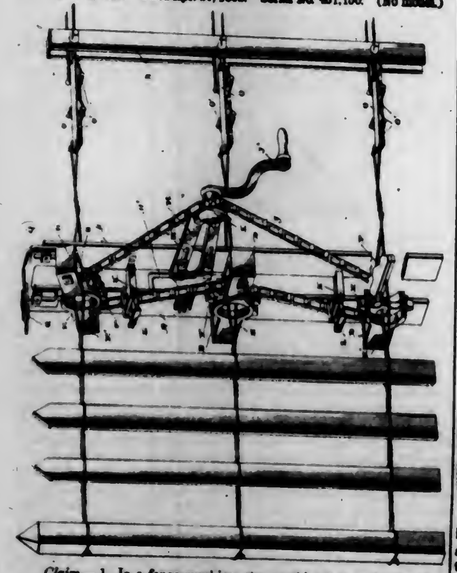
481,088.

from opposite sides thereof, an elevating-line, diverging ropes at the lower end of said line, which are secured at their respective outer ends to the adjustable braces, and means for elevating the line, substantially as shown and described.



481,084. GRAIN-WEIGHING MACHINE. GEORGE W. WAKEFIELD, Waterman, Ill. Filed Nov. 6, 1889. Serial No. 329,418. (No model.)

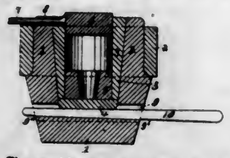
Claim.—1. In an automatic grain-weighing machine having a revoluble bucket-cylinder on a horizontal axis and operated by the weight of the grain falling into the buckets, a flexible brush projecting downward into the bucket and serving to brush from a portion of its bed or bottom the excess of grain, if any, beyond the predetermined weight and to carry it over into the next bucket, all as set forth.



2. In a grain-weigher adapted to be supplied by a continuous stream of grain, the combination, with a revoluble cylinder having a series of buckets whose shallower portion has substantially the curved form shown, of an adjustable flexible brush projecting into the inside of the buckets, as shown and described, and serving when the cylinder commences to revolve to hold back and sweep over the excess of grain, if any, from the shallower part of the bed of the bucket into the next adjacent bucket, all as set forth.

481,085. HEATING AND VENTILATING APPARATUS. SAMUEL W. WATSON, Detroit, Mich., assignor to the Detroit Plumbers' Supply Company, same place. Filed Sept. 10, 1891. Serial No. 405,296. (No model.)

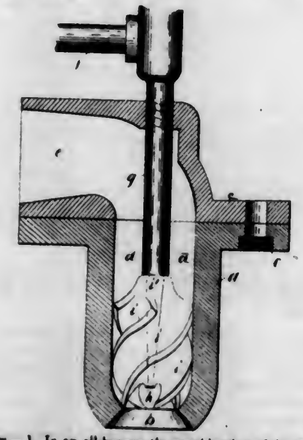
Claim.—A heating and ventilating apparatus consisting of a heater inclosed in a heating-chamber, a cold-air room or supply, an air-flue A, extending over the heater, having communication with the heating-chamber and with the cold-air room or supply and comprising a heat-radiating surface which constitutes the top wall of the heating-chamber above the heater, and a damper controlling said air-flue, substantially as described.



481,086. PICKET-WIRING FENCE-MACHINE. ALMOND R. WELTY, Shreve, Ohio. Filed Apr. 29, 1892. Serial No. 431,160. (No model.)

Claim.—1. In a fence-machine, the combination, with a vertical support, frames secured thereto, sprocket-wheels journaled in said frames, and a means for operating said wheels, of brackets projecting from said support and which are recessed on one of their sides, and stops which are adapted to be inserted in the said recesses, and laterally-projecting shoulders on the sides thereof, which are engaged by the ends of the brackets, substantially as shown and described.

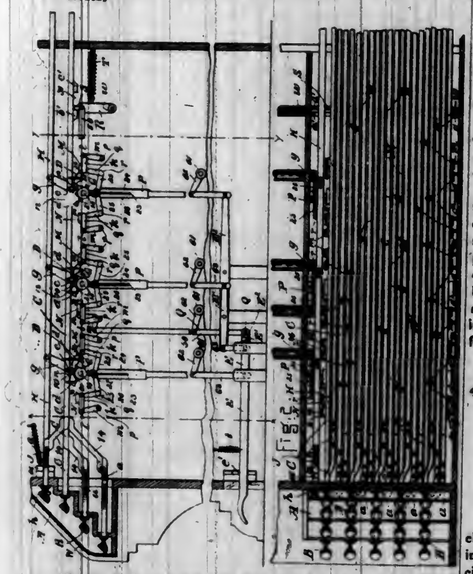
2. In a fence-machine, in combination, a vertical support consisting of two members, castings secured across them, having central openings and flanges around the openings, lugs projecting from the castings, plates having central openings and which are secured against the said lugs, flanges on the inner sides of the plates around their openings, sprocket-wheels between the said plates and castings, which revolve on the flanges of the said members, a laterally-adjustable arm secured to the vertical support, a sprocket-wheel journaled thereto, a drive-chain which moves around said sprocket-wheels, a spreader on the wires which pass through the machine and which is adjacent thereto, a post, and a tension device secured thereto, consisting of a center bar and laterally-projecting arms thereon, over which the wires pass, substantially as shown and described.



481,087. DIE-HOLDER AND DIE FOR MAKING STAMP-SHOES. JOHN WILSON, Sr., East St. Louis, Ill. Filed Oct. 22, 1891. Serial No. 409,526. (No model.)

Claim.—1. The combination of a sectional tapering die, a slotted holder for the die, a wedge fitting in the slot of the holder for removing the die, a plate resting against the under side of the die, a block within the die, and a follower adapted to fit in the upper end of the die, substantially as and for the purpose set forth.

2. The combination of a sectional tapering die, a slotted holder for the die, a wedge for removing the die from the holder, a block within the die, and a follower adapted to fit in the die, substantially as and for the purpose set forth.



481,088. HYDROCARBON-BURNER. AMBROSE CHANEY and EDWARD T. WIRBE, Terre Haute, Ind. Filed Jan. 12, 1892. Serial No. 417,864. (No model.)

Claim.—1. In an oil-burner, the combination of the shell, the oil-passage in the shell having its open discharge end in rear of the open end of the shell, and the series of separate spiral webs extending completely across the open space in the shell around said passage and projecting beyond the open end of the passage, so as to direct the air across said open end, as described.

2. In an oil-burner, the combination of the shell having an end opening, a core centrally in the shell having a longitudinal oil-passage with an oil-discharge end in rear of said end opening, an oil-supply pipe entering the opposite end of said core, and the spiral ribs integral with said core and extending across the space within the shell around the core and projecting forwardly beyond said oil-discharge end, and thereby forming spiral passages discharging in different directions across said oil-discharge end, substantially as described.

481,089. COMBINATION ORGAN STOP-ACTION. JESSE WOODBERRY, Boston, Mass. Filed May 31, 1892. Serial No. 435,054. (No model.)

Claim.—1. In an organ stop-action, the combination, with the adjustable register or stop-rods C, each provided on its under side with a series of centrally-pivoted rocker-levers D, of a setting mechanism consisting of the rocker-bars G, located beneath the levers D and adapted to depress or raise the same at either end by the contact of their edges therewith, said bars being provided with arms or levers *g*, and the sliding rod H, located above the register-rods and connected with and adapted to actuate the arms *g* and bars G to rock the levers D and set the same in different positions to be acted upon by pushing devices connected with the combination pedals, substantially as and for the purpose set forth.

2. In an organ stop-action, the combination, with the register-rods provided on the under side with rocker-levers D, of the pusher-bars M N, mounted upon horizontal rods *k*, the rollers or rocker-shafts *r*, provided with lateral arms 25 and with arms *q*, connected with said rods *k* and adapted to move the same simultaneously in opposite directions to contact with the ends of the levers D, the vertical rod P, connected with a pedal and having the outer ends of the arms 25 of the rocker-shafts *r* pivoted thereto, and the links *m*, pivoted at their upper ends to the rods *k*, whereby the pusher-bars are kept in parallelism with the register-rods as they are moved back and forth in opposite directions by the mechanism connected therewith, substantially as set forth.

3. In an organ stop-action, the combination, with the adjustable register-rods C, each provided on its under side with a series of centrally-pivoted rocker-levers D, of the pivoted rocker-bars G, located beneath the levers D and adapted to depress or raise the same at either end, said bars being provided with arms *g*, the sliding setting-rod H, located above the register-rods and connected with and adapted to actuate the arms *g* and bars G to rock the levers D, the pusher-bars M N, mounted upon the horizontal rods *k*, the rocker-shafts *r*, with their arms *q* 25, said arms *q* connected with the rods *k*, the vertical rod P, connected with a pedal and having the arms 25 of the rocker-shafts *r* pivoted to its upper end, and the pivoted links *m*, connected at their upper ends to the rods *k*, whereby the bars M N are kept in parallelism with the register-rods C as they are moved back and forth in opposite directions by the mechanism connected therewith, all operating substantially as set forth.

4. In an organ stop-action, the combination, with the register-rods C, provided on the under side with the rocker-levers D, of the pusher-bars M N, mounted upon horizontal rods *k*, the rocker-shafts *r*, with their arms *q* 25, and the vertical connecting-rod P, split or divided at its upper end to form two separate portions, and having one of said arms 25 pivoted to each portion, substantially as and for the purpose set forth.

5. In an organ stop-action, the combination, with the register-rods provided with the rocker-levers D, the pusher-bars M N, mounted upon the rods *k*, and the mechanism for actuating the same, of the full-organ-lever mechanism consisting of the arm R, roller or rocker shaft *w*, arms *d'*, bars S S, extending beneath the register-rods, said rods being each provided on the under side with blocks *b' c'*, having a suitable space between them, the pedal Q and suitable connections between said pedal and the arm R, and the spring T, connected with said lever mechanism and adapted to retract the same on the release of the pedal to simultaneously draw in the entire series of stops, substantially as set forth.

6. In an organ stop-action, the register-rods C, having their front ends provided with portions *a* 14, curved or inclined in horizontal and vertical planes to connect them in groups or series, with their knobs or handles arranged in a vertical plane, substantially as set forth.

7. In an organ stop-action, the combination, with the adjustable register or stop rods C, each provided on its under side with a series of centrally-pivoted rocker-levers D, of the rocker-bars G, located beneath the levers D and each provided at each end with two fulcrum-pins 16 17, the supporting-blocks 19, having slots 18 for the reception of the said fulcrum-pins 16 17, the arms or levers *g*, secured to the bars G, and the sliding-rod H, connected with said arms *g*, whereby said bars G are rocked in one direction upon the fulcrum-pins 16 and in the opposite direction upon the fulcrum-pins 17, substantially as and for the purpose set forth.

481,090. FOUNTAIN-PEN. LOUIS B. WOOLFOLK, Cincinnati, Ohio. Filed May 6, 1892. Serial No. 432,064. (No model.)

Claim.—1. In a fountain-pen, the combination, with an ink-holder closed at the upper end, of a stopper in the open lower end of the ink-holder, provided with a transverse slot constructed entirely within a circumference thereof and extending entirely through said stopper, a pen held in said transverse slot, a feed-tongue below the pen, and ducts and passages for permitting an outflow of ink from the ink-holder to the point of the pen and an inflow of air into the ink-holder.

2. In a fountain-pen, the combination, with an ink-holder closed at the upper end, of a stopper in the open lower end of the ink-holder, adapted to hold a pen and provided with a rigid lip integral therewith, located back of the pen, extending beyond the end of the stopper and a portion thereof in contact with the inner wall of the ink-holder, and ducts and passages whereby air may enter the ink-holder and ink may flow out of the ink-holder to the point of the pen.

3. In a fountain-pen, the combination, with an ink-holder closed at the upper end, of a stopper in the open lower end of the ink-holder, provided with a transverse slot constructed entirely within the circumference thereof and extending entirely through said stopper, a pen held in said slot, a feed-tongue below the pen and a longitudinal groove back of the pen, and means whereby air may enter the ink-holder and ink may flow out of the ink-holder to the point of the pen.

4. In a fountain-pen, the combination, with an ink-holder closed at the upper end, of a stopper in the open lower end of the ink-holder, a pen held in the stopper, said stopper provided with an ink-hole, a wide groove or passage extending from the ink-holder to the ink-hole, and a narrow ink duct or passage from the ink-hole to conduct ink to the pen, all substantially as described.

5. In a fountain-pen, the combination, with an ink-holder closed at the upper end, of a stopper in the open lower end of the ink-holder, adapted to hold a pen and provided with a rigid lip integral therewith, located back of the pen, and an ink way constructed in the lip, substantially as and for the purpose set forth.

6. In a fountain-pen, the combination, with an ink-holder closed at the upper end, of a stopper in the open lower end of the ink-holder, a pen held in the stopper, said stopper provided with a lip integral therewith, located back of the pen, and an air-inlet back of the pen, constructed partly in the periphery of the stopper and partly in the periphery of the lip, substantially as described.

7. In a fountain-pen, the combination of an ink-holder closed at the upper end, with a stopper in the open lower end of the ink-holder, a pen held in the stopper, said stopper provided with a longitudinal hole, located entirely beneath the pen, a feed-rod held in said longitudinal hole, provided with a feed-tongue integral therewith adjacent to the pen, and a projection extending downward below the pen, substantially as described.

8. In a fountain-pen, the combination of an ink-holder closed at the upper end, a stopper in the open lower end of the ink-holder, adapted to hold a pen and provided with a longitudinal hole therein, located entirely beneath the pen, a feed-rod held in said longitudinal hole, having a feed-tongue integral therewith, a projection integral with the stopper below the pen, and an ink-cup below the normal lower end of the stopper and located between the pen, the feed-tongue, the inner wall of the ink-holder, and said projection, substantially as described.

9. In a fountain-pen, a stopper adapted to hold a pen and provided with a rigid lip located back of the pen, said lip having a stop-per-check, substantially as and for the purpose set forth.

10. In a fountain-pen, the combination, with an ink-holder closed at the upper end, of a stopper in the open lower end of the ink-holder, provided with a longitudinal hole below the pen, a feed-rod held in the longitudinal hole, having the under side of its lower end cut away to form a feed-tongue, said cut-away portion of the feed-rod extending up into the longitudinal hole, thereby lengthening the feed-tongue, and ducts and passages whereby air may enter the ink-holder and ink may flow from the ink-holder to the point of the pen.

11. In a fountain-pen, the combination, with an ink-holder, of a stopper in the lower end of the ink-holder and a pen held in the stop-per, said stopper provided with a longitudinal hole located entirely beneath the pen, a feed-rod held in said longitudinal hole and having the under side of its lower end cut away to form a feed-tongue, and ducts and passages for the inflow of air into the ink-holder and the outflow of ink to the point of the pen.

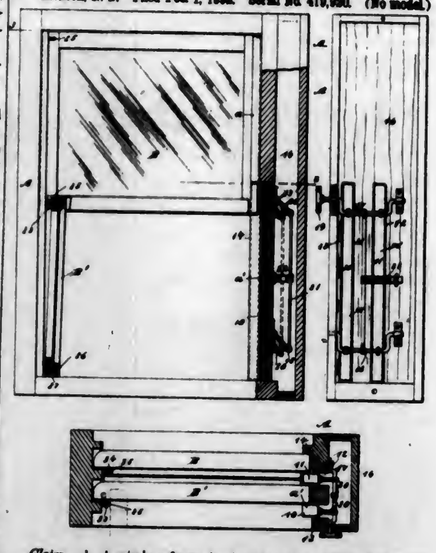
12. In a fountain-pen, the combination, with a stopper having a pen-holding slot and provided with a longitudinal hole below the pen-slot, of a feed-rod adapted to be held in the longitudinal hole, said feed-rod having the under side of its lower end cut away to form a feed-tongue, the cut-away portion of the rod extending up into the longitudinal hole, whereby the feed-tongue is lengthened and a cavity is formed in the stopper beneath the feed-tongue, substantially as de-scribed.

13. In a fountain-pen, a feed-rod having a portion cut away from the under side of its lower end to form a feed-tongue, a finger below said feed-tongue integral with the under portion of said feed-rod, and a slot between the feed-tongue and finger, substantially as described.

14. In a fountain-pen, the combination of a stopper having a slot to hold a pen and provided with a longitudinal hole beneath the pen-slot, with a feed-rod held in said longitudinal hole, provided with a feed-tongue integral therewith, the under side of the lower end of said feed-rod being cut away to form an elongated feed-tongue and to form a cavity in the stopper beneath the feed-tongue, and a finger integral with the under side of the feed-rod, extending down into the cavity beneath the feed-tongue, substantially as and for the purpose set forth.

15. In a fountain-pen, the combination, with an ink-holder closed at the upper end, of a stopper in the open lower end of the ink-holder, holding a pen and provided with a longitudinal hole below the pen, a feed-rod held in the longitudinal hole, a feed-tongue, and an ink-pas-sage communicating between the ink-holder and the longitudinal hole beneath the feed-tongue, substantially as and for the purpose set forth.

16. In a fountain-pen, the combination, with a stopper holding a pen and provided with a longitudinal hole beneath the pen, of a feed-rod adapted to be held in said longitudinal hole, having the under side of its lower end cut away to form a feed-tongue, said feed-tongue cut away on each side to form ink-spaces between the feed-tongue and the wall of the longitudinal hole, substantially as described.



17. In a fountain-pen, the combination of an ink-holder closed at the upper end, with a stopper in the open lower end of the ink-holder, a pen held in the stopper, said stopper provided with a lip integral therewith, located back of the pen, and an air-inlet in the periphery of the stopper and lip, the inlet having its mouth open to the air on the upper side of the lip below the lower end of the ink-holder, and ducts and passages for conducting air from the air-inlet into the ink-holder and ink from the ink-holder to the point of the pen.

18. In a fountain-pen, the combination of a stopper provided with a transverse slot constructed entirely within the circumference thereof, a pen held in the transverse slot, an ink-duct back of the pen, and a feed-tongue below the pen, substantially as described.

19. In a fountain-pen, the combination, with an ink-holder closed at the upper end, of a stopper in the open lower end of the ink-holder, provided with a pen having an ink-aperture in the heel thereof, a feed-tongue below the pen, and ducts and passages whereby air may enter the ink-holder and ink may flow from the ink-holder to the top side of the ink-aperture in the pen and passing thence through said aper-ture to the feed-tongue below the pen flow onto the point of the pen.

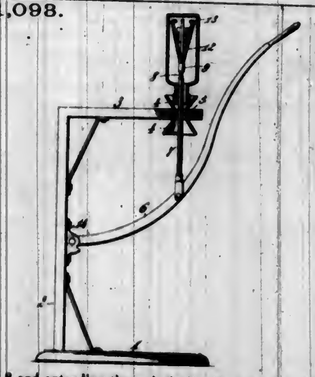
20. In a fountain-pen, the combination of an ink-holder closed at the upper end, with a stopper in the open lower end of the ink-holder, having a prolongation extending within said ink-holder and provided with a transverse slot constructed entirely within the circumference of the stopper and traversing said prolongation, a pen having the heel thereof held in said transverse slot in said prolongation, and ink and air ducts for permitting the inflow of air into the ink-holder and the outflow of ink from the ink-holder to the point of the pen.

481,091. WINDOW FRAME AND SASH. JOHN ANDERSON, Hickson, N. D. Filed Feb. 1, 1892. Serial No. 419,930. (No model.)

Claim.—1. A window-frame having one of its parting beads and one of its inner beads provided with a movable section, connected crank-shafts mounted in the frame and connected with the said mov-able beads to move them to and from the sashes to permit the sashes to swing outward, and means for operating said crank-shafts, substan-tially as set forth.

2. A window-frame provided with vertical slots in one face and having one of its parting-beads and one of its inner beads provided with a movable section mounted in said slots to move toward and from the sashes, connected spring-pressed crank-shafts connected with said movable sections, and means for operating said shafts, substan-tially as shown and described.

481,092. SHAFT-COUPLING. CHARLES W. BARNABY, St. Louis, Mo. Filed Jan. 4, 1890. Serial No. 336,983. (No model.)



Claim.—1. The combination, in a shaft-coupling, of a longitudi-nally-divided clamping-sleeve provided with a flange on each side of the dividing-slot and one or more clamping-blocks dovetailed onto said flanges, each block provided with one or more screws, by which the clamping-blocks may be forced radially from the center of the coup-ling to close the clamping-sleeve upon the shafts, substantially as set forth.

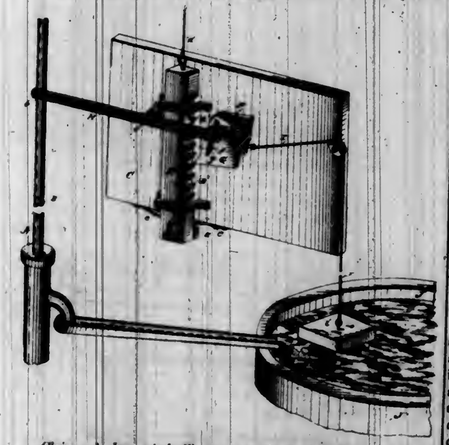
2. The combination, in a shaft-coupling, of a clamping-sleeve di-vided longitudinally by one or more slots and provided with a flange on each side of each slot, and a clamping-block dovetailed or hooked over each pair of flanges, and device for operating said block so that the flanges will be forced toward each other when the clamping-block is forced or sprung radially from the center of the coupling, substan-tially as set forth.

481,098. CORK-EXTRACTOR. JOHN M. BARNES, North Adams, Mass. Filed Apr. 9, 1892. Serial No. 428,496. (No model.)

Claim.—The combination, with a base 1, standard 2, overhang-ing arm 3, double conoidal guide 4, and lever 6, pivoted to the stand-ard, of a rigid rod 7, pivoted to the lever, having a screw-threaded

481,098.

upper end S and extending through the double conoidal guide into a bottle when the lever is raised, a series of diverging elastic hooked arms 12, rigidly secured to the rigid rod, and a screw-threaded sleeve 9, adjustable on the threaded part of the rod and circling and mov-able on the exterior of the elastic arms to press them toward each other when the sleeve is adjusted upward, substantially as described.

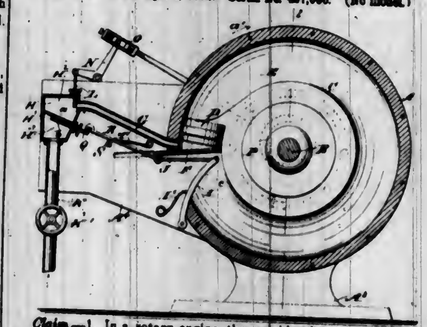


481,094. BILLIARD-CUSHION. MOSES BEMINGER, Chicago, Ill., assignor to the Brunswick-Balke-Collender Company, same place. Filed Apr. 27, 1892. Serial No. 430,867. (No model.)

Claim.—1. In a billiard-cushion strip, the combination, with the usual rubber body portion A, of a face-hardening strip composed of the material or substance known as "vulcanized fiber," the said strip being arranged substantially as hereinbefore set forth.

2. In a cushion-strip provided with a face-hardening strip of vul-canized fiber, the combination of the body portion A, the strip of vulcanized fiber *f*, and a strip of canvas or other suitable textile fabric, which envelops the strip *f*, all substantially as and for the purposes set forth.

481,095. AUTOMATIC GOVERNOR FOR WIND-WHEELS. JACOB H. BERRY, Mishawaka, Ind. Filed Aug. 18, 1891. Renewed June 24, 1892. Serial No. 437,842. (No model.)



Claim.—1. In a windmill-governor, the combination of the mov-able toothed bar and the locking-pawl pivoted on a fixed support be-side and engaging said bar, a float and connections between the same and said locking-pawl, an oscillating lever connected by one end to and reciprocated by the pitman-rod, a working pawl suspended from the free end of said lever and lying beside said locking-pawl, and a pin or stud on one pawl loosely engaging the other, whereby the work-ing pawl is thrown into or out of engagement with the bar by and with the locking-pawl, substantially as described.

2. The combination of the movable toothed bar, the locking-pawl engaging the same, the reciprocating pawl beside the locking-pawl, the float and connections for disengaging said pawl from the bar and the oscillating lever connected to the pitman-rod at one end and car-rying said reciprocating pawl at the other end, and the buffer adjust-ably secured to said bar for limiting its upward movement, substan-tially as and for the purpose described.

3. The combination of the pump and reciprocating pitman, the vertically-movable toothed bar adapted to be connected to the vane-operating chain of a windmill, the pivoted pawl engaging said bar, the float and cord for controlling said pawl, the oscillating lever actuated by the pitman, and the pawl suspended from the inner end of said lever beside the aforesaid pawl, and having a slot engaged by a pin on said pawl, so that the suspended pawl can reciprocate independ-ently of the other and both be disengaged simultaneously from the bar when the float drops, and the buffer on said toothed bar, all sub-stantially as and for the purposes specified.

481,096. ROTARY ENGINE. HERMANN BETTEN, Hagenendorf, Germany. Filed Apr. 4, 1892. Serial No. 427,686. (No model.)

Claim.—1. In a rotary engine, the combination, with a cylinder having an annular steam-space and a piston mounted to turn in the cylinder and provided with a head traveling in the steam-space of the cylinder, of a gate fitted to slide in and out of the steam-space of the cylinder and actuated by the piston, a steam-chest provided with an apertured partition, a valve for opening and closing the aperture of the partition and operated by the sliding gate, an inlet leading from the steam-chest to the steam-space of the cylinder above the gate, and a valve for opening and closing said inlet and operated from the shaft of the piston, substantially as described.

2. In a rotary engine, the combination, with a cylinder having an annular steam-space, of a piston mounted to turn in the said cylinder and having a head fitting the said steam-space, a gate fitted to slide in the said cylinder to and from the said steam-space, and a spring-pressed arm pivotally connected with the said gate and projecting into the said steam-space to be actuated by the head of the said piston, substantially as shown and described.

3. In a rotary engine, the combination, with a cylinder having an annular steam-space, of a piston mounted to turn in the said cylinder and having a head fitting the said steam-space, a gate fitted to slide in the said cylinder to and from the said steam-space, a spring-pressed arm pivotally connected with the said gate and projecting into the said steam-space to be actuated by the head of the said piston, a steam-chest provided with a partition having a port, said steam-chest being connected with the said steam-space of the cylinder, and a valve con-trolling the connection between the said steam-chest and steam-space of the cylinder, substantially as shown and described.

4. In a rotary engine, the combination, with a cylinder having an annular steam-space, of a piston mounted to turn in the said cylinder and having a head fitting the said steam-space, a gate fitted to slide in the said cylinder to and from the said steam-space, a spring-pressed arm pivotally connected with the said gate and projecting into the said steam-space to be actuated by the head of the said piston, a steam-chest provided with a partition having a port, said steam-chest being connected with the said steam-space of the cylinder, a valve control-ling the connection between the said steam-chest and steam-space of the cylinder, and a second valve adapted to open and close the aper-tured partition of the steam-chest and actuated from the said gate, substantially as shown and described.

5. In a rotary engine, the combination, with a cylinder having an annular steam-space, a piston-head in said steam-space, and a gate fit-ted to slide in and out of the steam-space and operated by the piston, of a steam-chest provided with an apertured partition dividing the steam-chest into two compartments, one of which is connected with the steam-space of the cylinder and the other with the steam-supply, a valve for opening and closing the aperture of the partition, and a connection between the valve and gate, substantially as described.

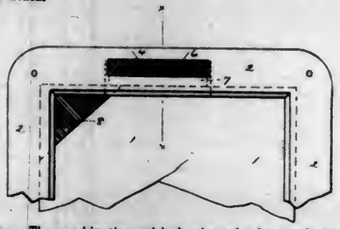
481,097. PENCIL-SHARPENER FOR SCHOOL-SLATES. WILLIAM D. BLACK, Port Perry, Pa. Filed Sept. 10, 1891. Serial No. 405,337. (No model.)

481,099.

Claim.—1. In an ore-concentrator, the concentrating-table hav-ing a flexible bottom and a flexible beam to which the bottom is se-cured, arranged between the sides of the table, means for vibrating the table, and a bumper-block against which the said beam strikes as the table is vibrated, substantially as described.

2. In an ore-concentrator, a table having a bumper-beam formed with one of its ends gradually diminishing in thickness as the center is approached, substantially as set forth.

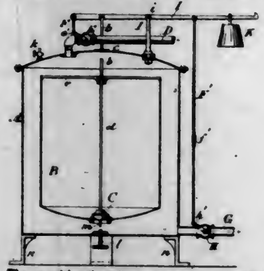
3. In an ore-concentrator, the combination of a table having a central bumper beam composed of two longitudinal parts, the lower part gradually decreasing in thickness as the center is approached and the upper part gradually increasing in thickness as the center is ap-proached, substantially as set forth.



17. In an ore-concentrator, the concentrating-table consisting of the flexible bottom and the side pieces to which the bottom is secured, in combination with packing-strips O² placed between the bottom and the side pieces and rigid strips secured to the edges of the side pieces below the bottom, substantially as set forth.

18. In an ore-concentrator, the concentrating-table consisting of the flexible bottom, the side pieces, and the central flexible bumper-beam, in combination with the rigid strips O', secured to the edges of the side pieces below the bottom, substantially as described.

19. In an ore-concentrator, a table having a bumper-beam with a rigid fore end, a flexible intermediate part, and a rear end of less flexi-bility, substantially as shown, and for the purposes set forth.

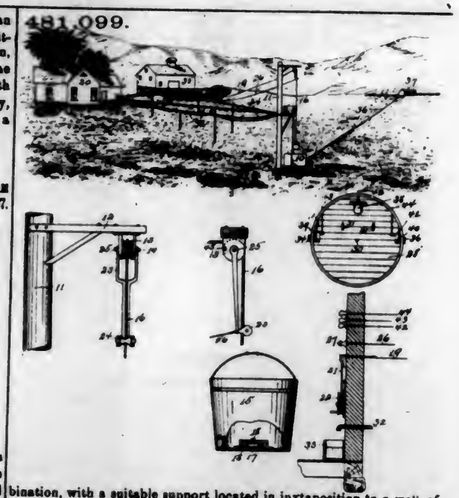


5. In a rotary engine, the combination, with a cylinder having an annular steam-space, a piston-head in said steam-space, and a gate fitted to slide in and out of the steam-space and operated by the piston, of a steam-chest provided with an apertured partition dividing the steam-chest into two compartments, one of which is connected with the steam-space of the cylinder and the other with the steam-supply, a valve for opening and closing the aperture of the partition, and a connection between the valve and gate, substantially as described.

481,097. PENCIL-SHARPENER FOR SCHOOL-SLATES. WILLIAM D. BLACK, Port Perry, Pa. Filed Sept. 10, 1891. Serial No. 405,337. (No model.)

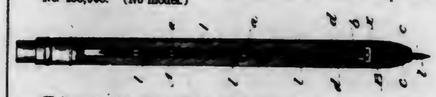
Claim.—The combination, with the slate, the frame of which has a deep groove in line with the groove receiving the edge of the slate proper, said frame also having an opening leading from its face to said groove, of a file set in said deep groove and having its upper roughened surface exposed through said opening, said file being of greater length and width than said groove, and a sound-deadening substance interposed between said file and slate proper, substantially as shown and described.

481,098. STEAM-TRAP. WILLIAM C. BAKER, Baltimore, Md. Filed Apr. 11, 1892. Serial No. 428,636. (No model.)



Claim.—1. The combination, in a steam-trap, of the cylinder A, containing a central bucket B, provided with a valve C and connected by guide-rods *b* to a weighted lever I, fulcrumed at *i*, and operating rotating valves E and H positively and alternately, in the manner shown and set forth.

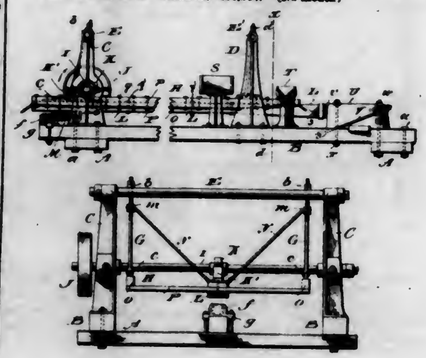
2. The combination of the cylinder A, containing the bucket B, provided with the valve C, acted on by the adjusting-screw *l*, in combination with the guide-rod *b*, connected to the fulcrumed lever I, operating the rotating valves E and H by means of the rods F and the rod F', provided with the turnbuckle *f*, all arranged as and for the purpose set forth.



481,099. APPARATUS FOR ELEVATING AND CONVEYING WATER. VALENTINE BOATWRIGHT, Adel, Iowa. Filed Jan. 14, 1892. Serial No. 418,032. (No model.)

Claim.—1. In an apparatus for elevating and conveying water, the combination, with a suitable support located in juxtaposition to a well and a tank mounted on said support, of a clip secured to and pending from said support at a point above the tank, a sheave mounted in said clip, a bifurcated hanger pivoted on said clip and depending therefrom, the lower portion of which hanger is bifurcated and bent at right angles to the main portion thereof, an anti-friction pulley mounted in said lower portion of the hanger, a rope extending over the sheave and downward through the bifurcated lower end of said hanger, and a pail secured to the end of said rope below said hanger, together with means for moving said hanger out of the normal position, whereby the said pail is brought into the vertical plane of the said tank.

2. In an apparatus for elevating and conveying water, the combination, with a suitable support located in juxtaposition to a well, of a tank mounted upon said support and provided with valves and conduits leading therefrom, wires leading from said valves to a common point outside of said tank, vertical stops or guides fixed within said tank, a bifurcated hanger pivoted to a clip mounted on said support, a rope run over a sheave pivoted in said clip, a pail suspended by said rope, a valve in the bottom of said pail, and an anti-friction roller in the bifurcated lower end of said hanger, together with means for moving said hanger out of its normal position, whereby said pail is brought into the vertical plane of said tank and caused to engage the said stops.



481,100. PENCIL. CLARK W. BOMAR, New York, N. Y., assignor to the Eagle Pencil Company, same place. Filed June 6, 1892. Serial No. 435,695. (No model.)

Claim.—1. A lead-pencil provided with a lead receptacle or magazine having a self-closing mouth and a tip adapted to open the magazine and to receive therefrom one of the lead-points contained therein, substantially as hereinbefore set forth.

2. A lead-pencil provided with a self-closing lead receptacle or magazine, in combination with a removable and reversible tip adapted to open with its lead-holding end the self-closing mouth of the magazine and to take and withdraw therefrom one of the lead-points contained therein, substantially as and for the purposes hereinbefore set forth.

481,101. ORE-CONCENTRATOR. WILLIAM H. H. BOWERS, Denver, Colo., assignor of one-half to the Colorado Iron Works, same place. Filed Feb. 12, 1892. Serial No. 421,287. (No model.)

Claim.—1. In an ore-concentrator, the concentrating-table having a flexible bottom and a flexible beam to which the bottom is secured, arranged between the sides of the table, means for vibrating the table, and a bumper-block against which the said beam strikes as the table is vibrated, substantially as described.

2. In an ore-concentrator, a table having a bumper-beam formed with one of its ends gradually diminishing in thickness as the center is approached, substantially as set forth.

3. In an ore-concentrator, the combination of a table having a central bumper beam composed of two longitudinal parts, the lower part gradually decreasing in thickness as the center is approached and the upper part gradually increasing in thickness as the center is approached, substantially as set forth.

4. In an ore-concentrator, the combination of a table having a central beam composed of two parts, the lower part gradually decreasing in thickness as it nears the center, the upper part gradually increasing in thickness as it nears the center, a bottom of suitable thin metal secured between the said two parts forming the bumper-beam, and side pieces which correspond to the incline of the said bumper-beam, substantially as set forth.

5. In an ore-concentrator, the combination of a longitudinally-reciprocating table or concentrator, a retracting-spring therefor adapted to accelerate the forward movement of the table by its expansive force and to assist the return thereof by its retractive force, an ore-supply trough, and a washing-water-supply trough, substantially as described.

6. In an ore-concentrator, a table having a central beam composed of two parts between which the bottom is secured, one or more of the said parts being cut away at the center, whereby increased flexibility is secured, as set forth.

7. In an ore-concentrator, the combination of a longitudinally-reciprocating table having a central bumper-beam gradually decreasing in thickness as its center is approached, side pieces curved to correspond with said bumper-beam, a bottom secured to said beam and side pieces, means for reciprocating said table, and a spring secured to said table, substantially as described.

8. In an ore-concentrator, the combination of a longitudinally-reciprocating table having a bumper-beam composed of two parts, substantially as described, side pieces curved underneath to correspond with the cut in the bumper-beam, a bottom secured between the parts of the said beam and to the sides of the table, means for reciprocating said table, and a retracting-spring secured at one end to the said beam, substantially as described.

9. In an ore-concentrator, the combination of a longitudinally-reciprocating table or concentrator having a bottom of thin sheet metal, a flexible central beam, a bumper against which said table comes into contact, and an ore and water supply trough, substantially as described.

10. In an ore-concentrator, the combination of a longitudinally-reciprocating table or concentrator having a bottom of thin sheet metal, a retracting-spring therefor at one end adapted to accelerate the forward movement of the table by its expansive force and to assist the return thereof by its retractive force, a bumper at the other end, and an ore and water supply trough, substantially as described.

11. In an ore-concentrator, the combination of the two sets of vertical supports, a longitudinally-reciprocating table or concentrator suspended between said supports, a retracting-spring located at one end beneath the table, a bumper located at the other end, and an ore and water supply trough, substantially as described.

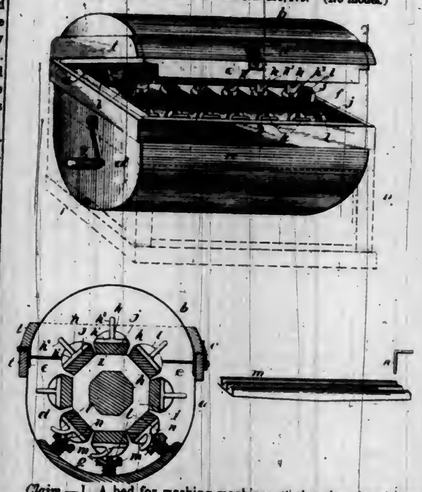
12. In an ore-concentrator, the combination of the longitudinally-reciprocating table having the central flexible beam, a tappet arranged on one end of said beam, and the drive-shaft provided with the cam for striking said tappet, substantially as described.

13. In an ore-concentrator, the combination, with a longitudinally-reciprocating table or concentrator having a central beam thinner at its intermediate portion than at its ends, of the vertical supports, the rock-shafts held by said supports, and the vertically-adjustable hangers or rods passing through said rock-shafts and secured to the sides of the table, substantially as described.

14. In an ore-concentrator, the combination of a longitudinally-reciprocating table or concentrator, the vertical supports, the rock-shafts, the vertical hangers, and the diagonal hangers adjustable with respect to said vertical hangers, connected with the bottom of the table between its sides, substantially as described.

15. In an ore-concentrator, the combination of a longitudinally-reciprocating table or concentrator, the rock-shafts, the vertical supports, the vertical hangers adjustable vertically in said rock-shafts, and the diagonal hangers independently adjustable with respect to said vertical hangers, connected with the table or concentrator between its sides, substantially as described.

16. In an ore-concentrator, the concentrating-table consisting of a flexible bottom, a flexible central beam, and side pieces to which the bottom is secured, in combination with rigid stripe secured to the said side pieces outside of or below the bottom, substantially as set forth.



17. In an ore-concentrator, the concentrating-table consisting of the flexible bottom and the side pieces to which the bottom is secured, in combination with packing-stripe O[a] placed between the bottom and the side pieces and rigid stripe secured to the edges of the side pieces below the bottom, substantially as set forth.

18. In an ore-concentrator, the concentrating-table consisting of the flexible bottom, the side pieces, and the central flexible bumper-beam, in combination with the rigid stripe O', secured to the edges of the side pieces below the bottom, substantially as described.

19. In an ore-concentrator, a table having a bumper-beam with a rigid fore end, a flexible intermediate part, and a rear end of less flexibility, substantially as shown, and for the purposes set forth.

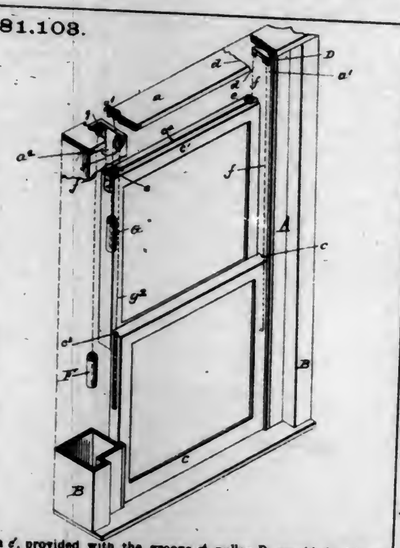
20. In an ore-concentrator, the concentrating-table having a flexible bottom, a flexible beam decreasing in thickness inwardly from its end or ends and arranged between the sides of the table, means for vibrating the table, and a bumper-block against which the said beam strikes as the table is vibrated, as described.

481,102. WASHING-MACHINE. MELANCTHON BURGESS, St. George, Utah. Filed Mar. 2, 1892. Serial No. 423,479. (No model.)

Claim.—1. A bed for washing-machines of the class herein described, consisting of a series of independent slats, L-shaped guides passing through their ends, secured to circular base-pieces in the bottom of the body, and coil-springs interposed between the slats and the said circular base-pieces and embracing the guides, in the manner substantially as described.

2. A washing-machine having a bed and a roller, in combination with flexible scrubbers secured to the roller, said scrubbers consisting of a circular base-piece having a fan-shaped arm formed integral therewith, in the manner substantially as set forth.

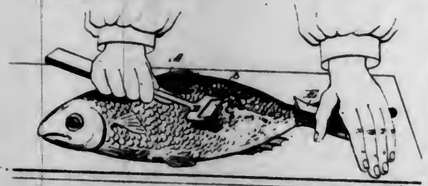
3. In a washing-machine, the combination of a series of independent spring-actuated slats secured to the bottom of the body portion and forming the bed of the machine, a revoluble roller having a number of flexible scrubbers secured to its periphery and operating in conjunction with the said bed, and a series of semicircular cams secured to the roller and adapted to engage the seats of the bed, whereby said slats are given an intermediate reciprocating or jumping motion, substantially as described.



4. A washing-machine having a bed consisting of two or more circular base-pieces, a number of corrugated slats, L-shaped guides passing through the ends of said slats and secured to the base-pieces, and springs interposed between the said base-pieces and slats, in combination with a revoluble roller having a series of flexible scrubbers and cams secured thereto and adapted to engage the slats, substantially as described.

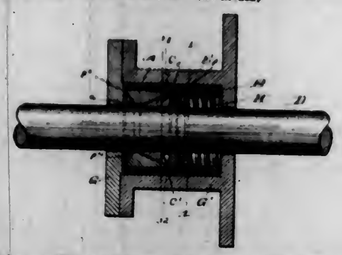
5. In a washing-machine, the combination of a bed composed of a number of independent spring-actuated slats, a revoluble roller operating with the bed, and a series of cams secured to the roller and adapted to actuate the slats, substantially as described.

481,108. SASH-BALANCE. HENRY P. CATCH, McGregor, Tex. Filed Nov. 24, 1891. Serial No. 412,930. (No model.)



Claim.—The combination of the frame A, sash c, having the grooves

481,103.

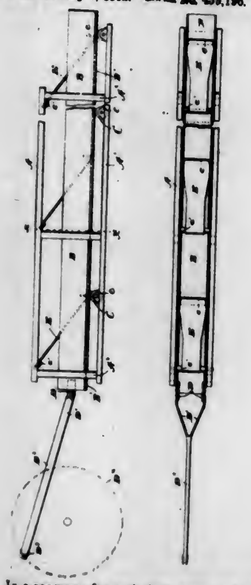


d^3, sash d', provided with the groove d^4, pulley D, provided with the vertical pulley d and horizontal pulley d', secured in the upper end of lintel a', pulleys e e, one attached to each end of the sash d', pulley g, secured in lintel a^3, cord f, one end attached to the sash c, the other traversing the pulleys D and e e and g, and weight F, running in the weight-box B and secured to the free end of said cord, substantially as shown and described.

481,104. FISH-SCALER. WILLIAM CLOW, Toronto, Canada, assignor of three-fourths to Wesley George Reed, George Clow, and James Munroe Sinclair, same place. Filed Apr. 27, 1891. Serial No. 390,621. (No model.)

Claim.—A scraper comprising a handle, a bar B at the forward end carrying an inclined scraper-blade, the shank of the handle and the said bar B inclining downwardly and meeting in a rounded bearing-point x in the rear of the scraper-blade, substantially as described.

481,105. ROD-PACKING. CHARLES L. COOK, Louisville, Ky. Filed Feb. 16, 1892. Serial No. 421,743. (No model.)

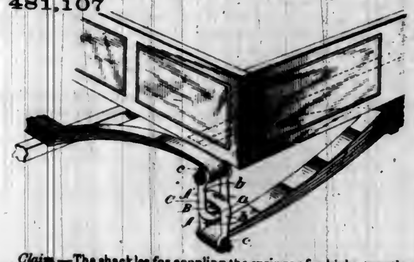


Claim.—1. The combination, with the casing having the ball-and-socket bearing connection with the gland and formed with an interior conically-beveled chamber, of the conical ring in said chamber, said ring being formed in segments, the ring closing the joints formed by said segments, and also formed in segments held in place by a lug or projection on the conical ring, said lap-jointed ring having a rounded or convex face, a concaved follower bearing against said ring, and a spring pressing said follower, substantially as specified.

2. In a rod-packing, the combination, with the shell or casing having its inner end spherically concaved and formed with an interior chamber having its side walls conically tapered inwardly, said taper commencing a short distance inward from the outer end of said chamber, of the ring having a spherically-beveled surface fitting the spherical concavity of the inner end of the shell or casing, the segmental conical ring seating in the inner end of said chamber around the rod, the lap-joint segmental ring seating in said conical ring and having a convex outer surface, the follower having a concave inner face fitting said convex surface, and the spring pressing said follower, substantially as specified.

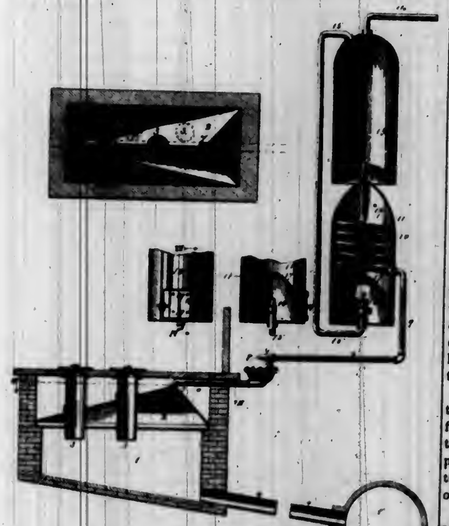
3. The combination, with the stuffing-box and its gland, of the floating packing therein, said packing comprising the cylindric shell or casing of a less diameter than the interior chamber of the stuffing-box, said shell having a spherically-concaved socket in its inner end, and an interior conical and straight-walled chamber, the ring having the spherical surface fitting said socket and seating against said gland, the inner segmental conical packing-ring seating in the conical portion of said chamber, the outer lap-joint packing-ring arranged to seat partially in the concaved portion of said chamber and partially in the straight-walled portion thereof, said outer ring having a convex outer face, a follower concaved on its inner face to fit said ring, said follower being arranged to enter said casing to take up the wear of the rings, and a spring pressing said follower, substantially as specified.

481,106. CONVEYER. ROXLEY B. COXE, Drifton, Pa. Filed Mar. 7, 1891. Renewed July 7, 1892. Serial No. 439,196. (No model.)



Claim.—1. In a conveyer for coal, slate, stone, and other material, in combination with the two principal parts, consisting of a trough and a longitudinal series of pushers hinged to a suitable support and extending downward and forward from the same into the trough and having their lower ends adapted to rest upon the trough-bottom, so that the latter forms the stop to limit the swing of the pushers upon their pivots, and means for reciprocating one of said parts with reference to the other, substantially as and for the purpose specified.

2. In a conveyer for coal, slate, stone, and other material, in combination with the movable trough and means for reciprocating it, a series of pushers hinged to a suitable support extending at an angle forward and downward into the trough and having their lower ends adapted to rest upon the trough-bottom, so that the latter acts as a stop to limit their swing upon their pivots, said ends being provided with upturned portions presenting abrupt faces toward the discharge end of the trough, substantially as and for the purpose described.



481,107. SHACKLE FOR COUPLING SPRINGS. CHARLES H. DOBBINS, Chicago, Ill. Filed Apr. 28, 1892. Serial No. 431,028. (No model.)

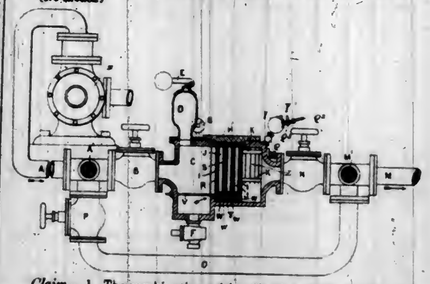
481,107

Claim.—The shackles for coupling the springs of vehicles together, consisting of two clips made in U form and one of which having walls forming free open spaces with a socket formed in the bend of its walls, and a clip with corresponding shaped walls having a ball formed in the bend of its walls to engage in the socket of the first-named clip, whereby both of said clips are adapted to have vertical play within each other without obstruction, substantially as and for the purposes specified.

481,108. APPARATUS FOR CONSUMPTION OF SEWER-GAS. JACOB EICHARDT, St. Louis, Mo. Filed Mar. 9, 1892. Serial No. 424,315. (No model.)

Claim.—1. The combination, with the vault having receiving-ducts and gas discharging duct, of a cover closing the top of the vault, excepting the space occupied by the ducts, a coil in the gas-discharging duct, a burner beneath the coil and fed by escaping gases, and a discharge-duct communicating with said coil, all substantially as set forth.

2. The combination of the vault having a cover, a tank, a pipe communicating between the vault and the tank, a coil in the pipe between said vault and tank, a burner located near the coil, and a pipe communicating between the burner and tank, all substantially as set forth.



3. The combination, with the vault, of the tank, the heating-chamber, the gas-discharging pipe communicating between the vault and the tank and having formed in it a coil located in the heating-chamber, a burner located in the heating-chamber beneath the coil, and a pipe feeding the burner from the tank, all substantially as set forth.

4. The combination of the vault having a cover, the tank, the heating-chamber, the pipe leading from the vault through the heating-chamber and to the tank, the burner in the heating-chamber fed from the tank, and the condensing-chamber in the pipe between the vault and the heating-chamber, all substantially as set forth.

5. The combination, with the vault having the cover, of a tank, a gas-outlet pipe communicating between the cover and the tank, the heating-chamber surrounding a portion of said gas-outlet pipe and having a hood therein, and a burner located beneath said hood and fed from the tank, all substantially as set forth.

6. In an apparatus for the consumption of sewer-gas, the combination of the vault having the arched cover in the upper part thereof, the gas-tank connected by a pipe with the upper portion of said cover, the condenser and heating-coil interposed in the pipe between the vault and the tank, a heating-chamber surrounding the coil and having a hood beneath said coil, a burner located beneath the hood, a pipe leading from the tank to the burner, and an outlet-pipe for permitting the discharge of the gas from the tank to any desired point, all substantially as and for the purposes herein specified.

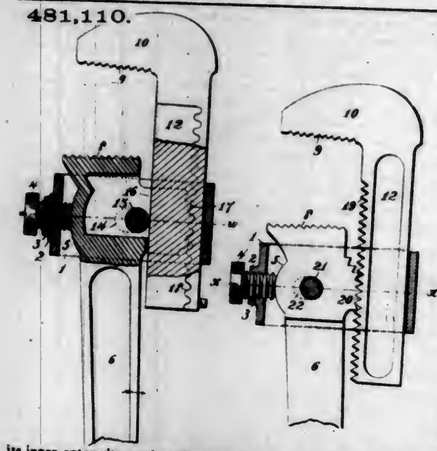
481,109. FILTERING OR PURIFYING FEED-WATER. JAMES B EDMISTON, Liverpool, England. Filed May 20, 1891. Serial No. 393,455. (No model.)

Claim.—1. The combination, with a filtering-chamber and a pump passing liquid through the chamber, of a series of flexible filtering-diaphragms placed across the water-way in said chamber at suitable distances apart and supported in such manner as to be free to pulsate with the strokes of the said pump, which passes the liquid successively through them, and means whereby the impurities may be discharged from the spaces between the diaphragms from time to time, as required, substantially as described.

2. The combination of the filtering-chamber C, the filter-cloths S, placed across the chamber between the inlet and outlet thereof, perforated partitions I, supporting the cloths, frames J, alternating with the partitions I, steam-cock Q on the outlet end of the chamber, blow-off cock F on the inlet end thereof, passage T, running through the entire series of partitions and frames and communicating with the latter, and the valve or valves W, controlling said passage, substantially as and for the purpose described.

3. The combination of the filtering-chamber C, perforated partitions I, supporting filter-cloths S within said chamber, as described, frames J, alternating with said partitions, passage T, running through the entire series of partitions and frames, passages U, leading from passage T to the interior of the frames, valve or valves W, controlling the passage T, and a device for regulating the valve from the exterior of the chamber, substantially as described.

4. The combination of the chamber C, filtering-diaphragms S, placed across the water-way through the chamber, cock Q on the discharge end of said chamber, cup Y, opening into cock Q, steam-cock Q^2, leading to cup Y, and blow-off cock F on the supply end of the chamber, substantially as and for the purpose described.



481,110. WRENCH. RICHARD S. GILLESPIE and HARRY JAMES, New York, N. Y. Filed Nov. 12, 1891. Renewed July 16, 1892. Serial No. 440,221. (No model.)

Claim.—1. The combination of a slotted box or frame, a screw or set bolt adjustable in a part of the box or frame, a sliding bar or shank having a jaw, and an oscillatory handle or lever arranged in toothed engagement with the bar or shank and having a pin which is capable of working back and forth in the slotted portion of the box or frame, substantially as described.

2. The combination of a box or frame having slotted side walls, a screw or set bolt adjustable in a part of the box or frame between the slotted side walls, a sliding bar or shank having a jaw, and an oscillatory handle or lever arranged in toothed engagement with the bar or shank and provided with a transverse pivot-pin, the end portions of which are capable of working back and forth in the slotted side walls of the box or frame, substantially as described.

3. The combination of a slotted box or frame, an oscillating handle or lever having a convex projection and a pin which is adapted to work back and forth in the slotted portion of the box or frame, a screw or set bolt adjustable in a part of the box or frame and bearing at

481,110.

its inner extremity against the convex projection of the handle or lever, and a sliding bar or shank having a jaw and arranged in toothed engagement with the handle or lever, substantially as described.

481,111. SHUTTER-FASTENER. GORGE H. GLAD, Boston, Mass. Filed Sept. 16, 1891. Serial No. 405,918. (No model.)

Claim.—1. In combination with the clamping-bar of a shutter-bower, a shutter-locking device attached thereto, consisting of a plate with two spring-actuated latches pivoted thereon, substantially as and for the purpose specified.

2. In combination with the clamping-bar of a shutter-bower, a shutter-locking device attached thereto in a space or cavity, so as to be inclosed, substantially as and for the purpose shown.

3. In combination with the hollow clamping-bar of a shutter-bower having provision for engagement of two clamping devices, a shutter-lock secured in said bar between the latter, substantially as and for the purpose described.

4. In combination with the clamping-bar of a shutter-bower having a cavity with converging sides, a plate carrying shutter-locking means in said cavity and conforming in shape thereto, substantially as and for the purpose set forth.

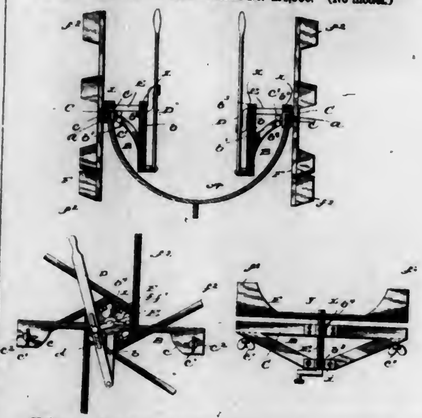
5. In combination, two oppositely-rocking pivoted latches rocking on a common horizontal pivot and having adjoining edges vertically to one side of said pivot, and a key adapted to rock said latches by engagement with said edges, substantially as and for the purpose specified.

6. In combination, two oppositely-rocking pivoted latches rocking on a common horizontal pivot and having adjoining edges above said pivot, between which is a space narrower than long, formed by notching each latch edge, and a key conforming in shape to said space to rock the latches, substantially as and for the purpose shown.

7. In combination, a supporting-plate, a latch pivoted thereon having a cavity, a spring in the latter engaging a wall thereof, and a projection or lug on said plate also engaged by said spring and fitting and closing the end of said cavity, substantially as and for the purpose set forth.

8. In combination, a supporting-plate, a hollow boss projecting therefrom, a latch extending into said boss, adapted to be engaged by a projection on a shutter, and a spring in said boss, substantially as and for the purpose shown and described.

9. In combination with the clamping-bar of a shutter-bower, the arm or bar for connection with a shutter, and the device to clamp the latter to the former, consisting of a bolt and a nut thereon, said bolt passing entirely through the nut and having a screw with a portion projecting beyond its periphery to limit the movement of said nut along it by engagement with the upper side of the nut, substantially as and for the purpose shown.



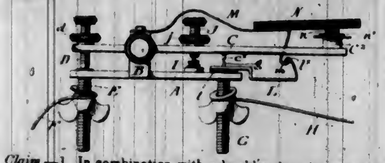
481,112. JAR-CLOSURE. FRANZ GUILLEAUME and EWALD GOLTSTEIN, Bonn, Germany. Filed May 21, 1892. Serial No. 433,672. (No model.)

Claim.—1. A jar-closure consisting in the combination, with a jar having inside a peripheral shoulder and above the same a number of superposed grooves, of a lid resting on said shoulder and a resilient cross-bar longer than the inner diameter of the jar and which on being bent down in the middle and forced into the jar engages with its ends in the said grooves and ultimately presses upon the lid, substantially as described.

2. A jar-closure consisting in the combination, with a jar having inside a peripheral shoulder and above the same a number of superposed grooves, of a lid resting on said shoulder and provided with a perforation, a resilient cross-bar longer than the inner diameter of the jar and which on being bent down in the middle and forced into the jar engages with its ends in the said grooves and ultimately presses upon the lid, the said cross-bar carrying a resilient tongue adapted to press on the perforation of the lid, and an india-rubber washer placed between the tongue and the perforation, substantially as specified.

481,113. MEANS FOR PROPELLING BOATS. ALANSON M. HASWELL, Springfield, Mo., assignor of one-half to Joseph C. Plumb, same place. Filed Feb. 12, 1892. Serial No. 421,306. (No model.)

Claim.—1. In a boat-propelling apparatus, the combination, with the paddle-shaft and means for operating it, of the frame B, consisting of the vertical part b, the inclined part b', and angle parts b^3, connected to and combined with the gunwale-strip C, having means for horizontally adjusting it upon the boat, substantially as set forth.



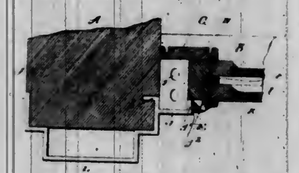
2. In combination with the frame B, made as described, and the gunwale strip C, bearing said frame, the lever D, pivoted to part b of the frame and slotted at d, the crank-arm E, passed through the slot d', and paddle-wheel connected to said arm, substantially as and for the purpose set forth.

3. The frame B, bearing the gunwale-strip C and having oppositely-inclined portions secured to the ends of said gunwale-strip at their divergent ends, and the aligned bearings or boxes, one secured upon said strip and the other secured to the converging ends of said inclined portions, in combination with the crank-shaft E, bearing the paddle-wheel, and means for operating said shaft, said frame with the shaft and wheel all being horizontally adjustable upon the boat, substantially as and for the purpose set forth.

4. The combination of the gunwale-strip having means for its horizontal adjustment upon the vessel and the frame carried by said gunwale-strip and adapted to bear the paddle-wheel shaft and comprising a central pendent bar having an outward and upward inclined bar or arm connected to said gunwale-strip, substantially as set forth.

5. The gunwale-strip having pendent screw-clamps for adjustably connecting it to the vessel, and the frame having its inclined portions connecting with said gunwale-strip, and a central pendent bar at the converging ends of said inclined portions, provided with an upward and outward inclined bar or arm connecting with said gunwale, in combination with the paddle-wheel shaft and means for operating said shaft, substantially as set forth.

481,114. COMBINED TELEGRAPH-KEY AND CIRCUIT-CLOSER. WILLIAM F. LOTT, Philadelphia, Pa., assignor of one-half to Romuald T. McDonnel, same place. Filed Apr. 26, 1892. Serial No. 430,772. (No model.)



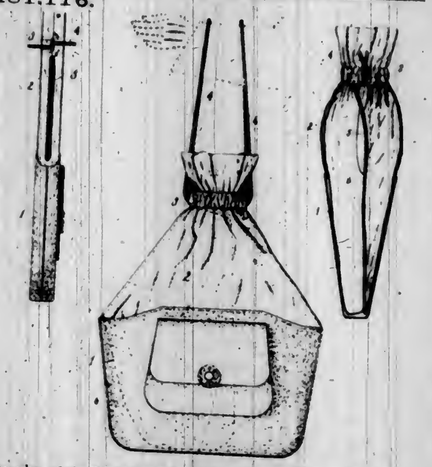
Claim.—1. In combination with a knobless key, its supports, the binding-posts, and the contact-posts, a switch-finger in circuit with one binding-post, a switch-band in circuit with the other binding-post and extending into such relation with the switch-finger as to be normally held in contact therewith by its own resilience, and an operating-knob, independent of the key, mounted on said band, depression of which knob brings it into contact with the key and carries the switch-band out of contact with the switch-finger, substantially as set forth.

2. In combination with a key, its supports, the binding-posts, and the contacts, a switch-finger, a switch-band provided with a hook engaged behind said finger and normally retained in such position by the resilience of the band, and an operating-knob mounted on said band, substantially as set forth.

3. In combination with a knobless key, its supports, the binding-posts and the contacts, a switch-finger, a switch-band secured to the rear part of the instrument, extending to the front part thereof and provided with a lateral extension engaged behind said finger, and an operating-knob, independent of the key, mounted on said band and provided with a depending stud working in an opening in the key, substantially as set forth.

4. In combination with a key, its supports, the binding-posts and the contacts, a hooked switch-finger, a switch-band secured to the rear part of the instrument, extending to the front thereof and provided with a depending hooked extension which passes through an opening in the key and engages with the hook of the finger, and an operating-knob mounted on said band, substantially as set forth.

481,115. BUILDING-FRONT. FRANK MESKER and THOMAS O. ARBOGAST, St. Louis, Mo., assignors to Mesker & Bro., same place. Filed July 15, 1890. Serial No. 358,831. (No model.)



Claim.—The building-front having the wall A and the window-frame provided with the stiles having set therein the parting-strips and the metal sheets, each having an outwardly-extended offset terminating in flanges, one secured to the stile and the other entering the wall, said metal sheets also having series of offsets integral therewith and forming columns, substantially as set forth.

481,116. LADY'S SHOPPING-BAG. HENRY C. MILLIGAN, South Orange, N. J., assignor to Rudolph Wolff & Co., New York, N. Y. Filed Feb. 25, 1892. Serial No. 422,806. (No model.)

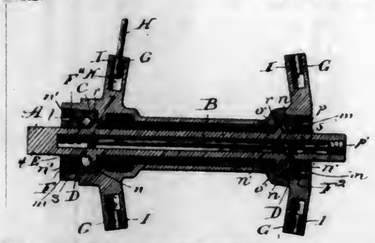
Claim.—1. A lady's shopping-bag having the lower leather part 1, the upper fabric part 2, the drawing and carrying cords or handles 4, and an independent side opening in the edge of the fabric part of the bag above the leather and below the drawing-cords, substantially as and for the purpose set forth.

2. A lady's shopping-bag having the lower leather part 1, the upper fabric part 2, the drawing and carrying cords or handles 4, a side pocket, and an independent side opening 5 to the side pocket, located in the edge of the fabric part of the bag above the leather part and below the drawing and carrying cords, substantially as described.

481,116.

481,117. FASTENER FOR PICTURE-FRAMES. CHARLES F. NABERLE, New York, N. Y. Filed Apr. 6, 1891. Serial No. 387,733. (No model.)

Claim.—1. A fastener for use in picture-frames and the like, composed of elastic material and having a holding or fastening end adapted to penetrate or partly penetrate and be secured in the frame, inside, or stretcher and a loop adapted to bear with a spring pressure on the other of the parts to be held together, substantially as set forth.



2. The combination of two parts comprising a picture-frame or inside and the inside or stretcher with a fastener composed of elastic material and having a holding or fastening end penetrating or partly penetrating and secured in one of said parts and a loop adapted to bear with a spring pressure upon another of said parts and a holding-point arranged to slightly penetrate such other part and in connection with said loop to hold the said parts together and prevent displacement thereof, substantially as set forth.

3. A fastener for use in picture-frames and the like, composed of elastic material and having a holding or fastening end adapted to penetrate or partly penetrate and be secured in the frame, inside, or stretcher, a holding-point adapted to slightly penetrate another of such parts, and a loop connecting such end and point and adapted to bear with a spring pressure on the other of the parts to be held together, substantially as set forth.

4. The combination of a picture-frame, a suitable inside, and a stretcher bearing the canvas with two or more fasteners, each composed of elastic material and having a holding or fastening end penetrating or partly penetrating and secured in one of said parts, a holding-point slightly penetrating another of such parts, and a loop connecting such end and point and adapted to bear with a spring pressure on the other of the parts to be held together, substantially as set forth.

5. A fastening for use in picture-frames and the like, composed of elastic material and having a fastening end *a*, a pressure or holding end *c*, having an eye and holding-point thereon, and a loop *b*, connecting such end and point, substantially a set forth.

481,118. VELOCIPEDE. MICHAEL J. O'DONNELL, Chicago, Ill., assignor of three-fourths to George G. Brandenburg and George R. Walker, same place. Filed Dec. 1, 1891. Serial No. 413,693. (No model.)

Claim.—1. The lubricating mechanism for bicycle-bearings and similar purposes, comprising a hollow shaft perforated to produce the oil-expelling passage leading to the bearing, and a valve-stem having a piston-valve adapted to open and close said passage, said valve-stem being secured in the hollow shaft, substantially as described.

2. A lubricating device for bicycle and other bearings, comprising, in combination, a hollow shaft provided with two or more passages extending from the inside of the shaft to the bearings, a piston-valve stem carrying piston-heads and introduced into said shaft so as to adapt the piston-head to open and close the passages at will, and a recessed screw-threaded plug at the end of said stem, engaging internal screw-threads on the shaft, whereby turning of the stem manipulates the piston-valves to open and close the passages, substantially as described.

3. In a bicycle or similar vehicle, the ball-bearing-retaining device comprising, in combination, a hub having an internal shoulder, a shaft within the hub provided with an external shoulder having a concave outer face, and a ring introduced into the hub around the shaft and presenting on its inner face an annular surface affording a bearing for the balls opposite to that afforded by the shoulder on the shaft, substantially as described.

4. In a bicycle or similar vehicle, the ball-bearing-retaining device comprising a hub having an internal shoulder, rings introduced into said hub, each having a concave annular recess, and means, substantially as described, for holding said rings in place, as and for the purpose set forth.

5. In a bicycle or similar device, the ball-bearing-retaining mechanism comprising a shaft having a shoulder concaved on its outer side, a hub having an internal annular shoulder presenting an internal diameter to permit it to pass over the shoulder on the shaft, separable rings fitting closely in said hub and out of contact with the axle and shoulder thereon, each ring presenting in its face a concavity approximating the arc of a circle, and a locking device adapted to enter said hub and retain the rings against displacement, substantially as described.

6. In combination with a hub provided with an internal shoulder and an axle within the hub, the ball-bearing-retaining rings C and D, having on their contiguous faces annular concavities approximating the arc of a circle, a locking-nut having peripheral screw-threads to engage internal screw-threads on the hub and provided with apertures for the reception of wrench-prongs, the parts being arranged to operate substantially as described.

7. In a ball-bearing device, the combination, with the ball-retaining rings presenting concavities to embrace the balls, a locking device comprising two rings, one of which is provided with perforations *l* and the other of which is provided with recesses *m*, extending part way through the body, and a yielding material, such as paper, introduced between the rings and provided with perforations to coincide with the apertures *l*, and recesses *m*, said parts being peripherally screw-threaded to engage internal screw-threads on the hub, the whole being arranged to operate substantially as described.

8. In a ball-bearing device, the combination, with the hub, of a ball retaining and locking device comprising, in combination, rings C D, introduced into the hub and embracing the ball, the outer of said rings having recesses to receive the point of wrench-prongs and peripherally screw-threaded to engage screw-threads on the interior of the hub, a ring F, constituting a nut and provided with perforations *l* to receive the prongs of a wrench and peripherally screw-threaded to engage the screw-threads on the interior of the hub, and a disk of yielding material, such as paper, provided with perforations, as shown, to coincide with the perforations *l*, the parts being arranged to operate substantially as described.

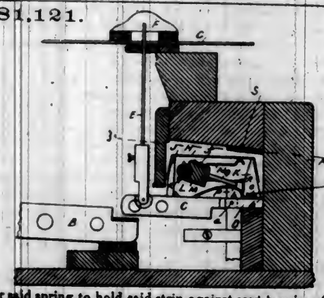
9. In a bicycle or similar vehicle provided with annular ball-bearings, the means for preventing the access of dust to the bearings, comprising, in combination with the outer ring holding the ball-bearing in place, provided with an annular notch or groove at a point adjacent to the shaft, a shaft provided with an annular flange E, entering and moving freely in said notch or groove, substantially as described.

481,119. STEAMER, LAWN, OR INVALID CHAIR. DANA PARKS, Boston, Mass., assignor of four-fifths to Mark Stone, Charles H. Schofield, Harris Goldberg, and Brainard A. Andrews, same place. Filed Sept. 19, 1891. Serial No. 406,238. (No model.)

Claim.—In the herein-described chair, the combination of the supporting-frame E, the swinging hangers pivoted thereto, seat A, suspended by said hangers, back B, hinged to the seat, arms C, hinged to the frame E independently of the hangers and seat and each having a groove *c*, provided with a toothed rack, a pivoted pawl in the back B, adapted to engage said rack, and a spring arranged between the frame E and arms C, whereby the seat and arms will be held in substantially a horizontal position when the chair is unoccupied, substantially as shown and described.

481,120. ELECTRIC ANNUNCIATOR. FRANK A. PICKERNELL, Newark, N. J., assignor to the American Telephone and Telegraph Company, of New York. Filed Apr. 16, 1892. Serial No. 429,459. (No model.)

Claim.—1. A self-setting annunciator having an electro-magnet organized when excited to release the single drop or shutter and an auxiliary electro-magnet organized to reset or restore the said shutter by shortening or reducing the resistance of a magnetic circuit, including the core and armature of said electro-magnet, substantially as described.



2. The combination of an electro-maguet, an armature therefor, a latch controlled thereby, and a signal-shutter engaged by said latch, of a second electro-magnet provided with an iron base extending from its heel-piece, and a core having a curved projection, the said signal-shutter constituting the armature of the said second electro magnet and the magnetic circuit of said second electro-magnet being through the said core, shutter, iron base, and heel-piece, substantially as described.

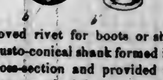
481,121. DAMPER-ACTION FOR PIANOFORTES. JOHN P. RICHARDSON and GEORGE F. DYER, Cambridge, assignors to the Mason & Hamlin Organ and Piano Company, Boston, Mass. Filed Oct. 13, 1890. Serial No. 367,992. (No model.)

Claim.—1. In combination, a damper-lever, a flexible or yielding strip attached thereto by one end, a spring-arm having the strip secured thereto by its other end, a bearing or stop, and mechanism for holding said flexible or yielding strip against said bearing.

2. In combination, a damper-lever, a flexible or yielding strip attached thereto by one end, a spring-arm having the strip secured thereto by its other end, a bearing or stop above said strip, and a spring attached to a suitable support adapted to be moved into position for said spring to hold said strip against said bearing, for the purpose specified.

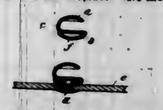
481,121.

3. In combination, a damper-lever, a flexible or yielding strip attached thereto by one end, a spring-arm having the strip secured by its other end, a bearing or stop above said strip, and a spring attached to an arm pivoted to a suitable support, for the purpose specified.



4. In combination, a damper-lever, a flexible or yielding strip attached thereto by one end, a spring-arm having the strip secured by its other end, a bearing or stop above said strip, and a spring attached to an arm pivoted to a suitable support, and mechanism for operating said pivoted arm.

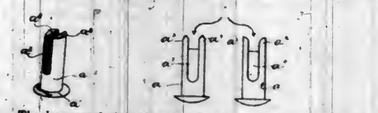
481,122. RAILWAY JOINT-CHAIR. TOM SAYERS, Bombay, India. Filed Aug. 25, 1891. Serial No. 403,740. (No model.)



Claim.—The combination, in a railway, of a joint-chair having the usual flanges and provided with a longitudinal groove or channel corresponding to the cross-section of the feet and webs of the rails, a rail located in said groove or channel having its base resting upon the bottom of the chair, and wedges for insertion from each end thereof between said chair and web of the rail, substantially as described.

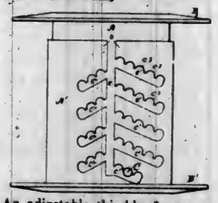
481,123. RIVET. JUDSON L. THOMSON, Waltham, Mass., assignor to the Judson L. Thomson Manufacturing Company, same place. Filed Jan. 18, 1892. Serial No. 418,385. (No model.)

Claim.—The improved rivet for boots or shoes, composed of a head and a tapered or frusto-conical shank formed in one piece with the head and circular in cross-section and provided with a tapered slot which is widest at the outer end of the shank and has a flat surface at its inner end, each prong formed by the slot having a curved or substantially semicircular outer surface and a flat inner surface, the inner and outer tapered surfaces of the rivet being substantially equal in angle, whereby the points of the prongs are located centrally above the bases thereof, as and for the purposes set forth.



481,124. LACING-STUD. JUDSON L. THOMSON, Waltham, Mass., assignor to the Judson L. Thomson Manufacturing Company, same place. Filed Mar. 17, 1892. Serial No. 425,229. (No model.)

Claim.—1. A sheet-metal lacing hook or stud comprising a head, a foot, and a neck uniting the head and foot, the said foot having an upper and a lower plate, the lower plate having an orifice for engagement with an attaching-rivet and the upper plate covering said orifice.

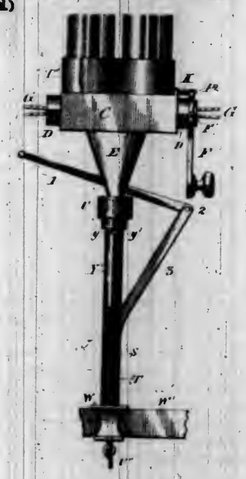


2. The combination, with a sheet-metal lacing-hook comprising a foot bent or doubled upon itself, a head, and a neck, of a rivet having a head adapted to bear on the under side of the article to which the hook is applied and a shank adapted to be engaged with the said foot, the end of said shank entering the space between the two parts of the foot, as set forth.

481,125. RIVET. JACOB J. UNBEHEND, Waltham, Mass., assignor to the Judson L. Thomson Manufacturing Company, same place. Filed Jan. 18, 1892. Serial No. 418,437. (No model.)

Claim.—The improved rivet hereinbefore described, composed of the shank and the head, the shank being slotted entirely across its outer end to form clinching-prongs and cut away lengthwise at opposite points on its periphery to form a wedge, with an elongated cutting-edge connecting the bases of the prongs and adapted to penetrate and cut the material into which the rivet is inserted, the sides of said wedge being of uniform width, as set forth.

481,126. PROTECTING-THIMBLE FOR STEAM OR HEATING PIPES. SAMUEL VANSTONE, Providence, R. I. Filed Aug. 25, 1890. Serial No. 363,031. (No model.)



Claim.—1. An adjustable thimble for steam or heating pipes, comprising the flanged inner and outer telescoping portions, one of said portions being provided with the longitudinal slot and the lateral engaging recesses arranged alternately at opposite sides of the same, and the other with an engaging lug adapted to enter the longitudinal slot and the lateral engaging recesses, substantially as described.

2. An adjustable thimble for steam or heating pipes, comprising the flanged inner and outer telescoping portions, one of said portions being provided with the longitudinal slot and the inclined engaging recesses extending laterally from the same, and the other with a lug adapted to enter the longitudinal slot and the lateral inclined recesses, whereby the said portions may be readily and closely adjusted in position, substantially as described.

3. An adjustable thimble for steam or heating pipes, comprising the flanged inner and outer telescoping portions, one of said portions being provided with the longitudinal slot, and the inclined engaging recesses provided with the notches, and the other with a lug adapted to enter the longitudinal slot and the lateral inclined recesses and the notches, substantially as described.

481,127. APPARATUS FOR LOADING CARTRIDGES. WILLIAM WAGNER, Washington, D. C. Filed June 2, 1892. Serial No. 435,298. (No model.)

Claim.—1. A cartridge-loading machine having magazines mounted thereon, an oscillating cylinder having horizontal chambers connected therewith, provided with horizontal adjustable heads therein, and a hopper with which said chambers communicate.

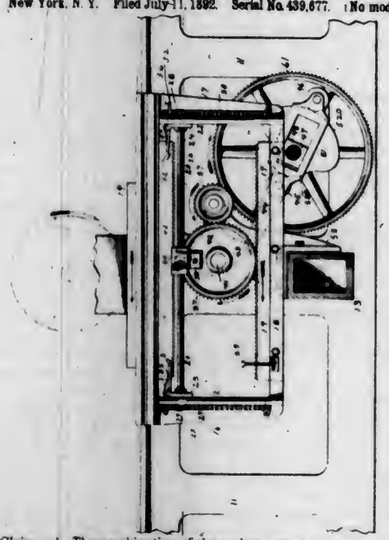
2. A cartridge-loading machine having magazines thereon, an oscillating cylinder having adjustable horizontal chambers communicating therewith, and a hopper with which said chambers also communicate.

3. A cartridge-loading machine having magazines thereon, an oscillating cylinder provided with horizontal chambers connected therewith, horizontal adjustable blocks in said chambers, having stems projecting through the heads of said cylinders, and means thereon for indicating the capacity of the charge chambers.

4. A cartridge-loader provided with ammunition-magazines, an oscillating cylinder having horizontal chambers communicating therewith, blocks horizontally adjustable in said chambers, provided with bifurcated stems projecting from each head, and means thereon for locking the respective tines to the cylinder-heads.

5. A cartridge-loader provided with ammunition-magazines, a rotary cylinder beneath the same provided with chambers communicating with the hopper, adjustable heads or blocks therein, bifurcated stems projecting from each head, and notches thereon for engagement with lugs on the cylinder-heads.

6. A cartridge-loader magazine having a spring-actuated reciprocating agitator therein and having a stem protruding therefrom and projected in the path of a cam or projection and acting in a direction transversely to the line of feed of the ammunition, and means for actuating the same.



7. A cartridge-loader magazine having a reciprocating agitator transverse to the bottom thereof and a projection on the operating-crank of said loader for imparting a reciprocating motion to said agitator.

8. A cartridge-loader magazine having a reciprocating agitator within the same, the protruding end of said agitator being beveled to afford sliding contact with a projection for the operating-crank.

9. A cartridge-loader having a standard, a magazine thereon, a sliding collar on said standard having an orifice which serves as a conveyer from the hopper to the plunger, a plunger thereon, and mechanism for imparting a reciprocating motion to said plunger

---

481,128. MECHANICAL MOVEMENT. HENRY A. W. WOOD, New York, N. Y. Filed July 11, 1892. Serial No. 439,677. (No model.)

Claim.—1. The combination of the reciprocating member or bed with mechanism for reciprocating the same, and a reversing mechanism comprising a crank element, and a vertically-moving guide for said element mounted on the bed, substantially as described.

2. The combination of the reciprocating member or bed with mechanism for reciprocating the same, and a reversing mechanism comprising a crank element, and a guide in constant engagement with said element, said guide being mounted on the bed, substantially as described.

3. The combination of the reciprocating member or bed with mechanism for reciprocating the same, and a reversing mechanism comprising a crank pin or block, a vertically-moving guide for said crank pin or block mounted on the bed, and means for bringing said crank pin or block into operative connection with the bed to reverse its movement, substantially as described.

4. The combination, with the reciprocating member or bed and mechanism for reciprocating the same, of a reversing mechanism comprising a crank pin or block, a guide mounted on the bed in constant engagement with said crank pin or block, and means for bringing said crank pin or block into operative connection with the bed to reverse its movement, substantially as described.

5. The combination, with the reciprocating bed or member and mechanism for reciprocating the same, of a reversing mechanism comprising a crank pin or block, a moving guide for said crank pin or block mounted on the bed, and means for locking said crank pin or block to said bed, so that said crank pin or block will reverse the movement of said bed, substantially as described.

6. The combination, with the reciprocating bed or member and mechanism for reciprocating the same, of a reversing mechanism comprising a revolving crank-arm, a block mounted so as to revolve in said crank-arm, and a moving guide mounted on the bed in constant engagement with said block, whereby said block will be kept from turning on its axis, substantially as described.

7. The combination, with the reciprocating bed or member and mechanism for reciprocating the same, of a reversing mechanism comprising a revolving crank-arm or member, a block mounted so as to revolve or turn in said crank-arm, a moving guide mounted on the bed in constant engagement with said crank-block, whereby said crank-block will be kept from turning on its own axis, and means for bringing said crank-block into operative connection with the bed to reverse its movement, substantially as described.

8. The combination, with the reciprocating bed or member and mechanism for reciprocating the same, of a reversing mechanism comprising a crank pin or block, a guide mounted on the bed so as to be vertically movable thereon, said crank pin or block being in constant engagement with said guide, and abutments against which said pin or block is adapted to bear to reverse the movement of the bed, substantially as described.

9. The combination, with the reciprocating bed or member and mechanism for reciprocating the same, of a reversing mechanism comprising a crank-pin, a vertically-movable guide in constant engagement with said pin, and abutments in said guide for said crank-pin, said guide being connected to move vertically on the bed, but so that any horizontal movement transmitted to said guide or to its abutments will be transmitted to said bed, substantially as described.

10. The combination, with the reciprocating bed or member and mechanism for reciprocating the same, of a reversing mechanism comprising a crank pin or block, a guide for said crank pin or block mounted so as to be vertically movable on the bed, and means whereby the vertical movement transmitted from the crank pin or block to said guide will be transmitted to a plurality of points, so that the guide will always be kept in a substantially horizontal line, substantially as described.

11. The combination, with the reciprocating bed or member and mechanism for reciprocating the same, of a reversing mechanism comprising a crank-pin and a guide for said crank-pin, said guide being mounted in boxes or journals which are mounted on the bed so as to be capable of vertical motion, said bearings thereby forming abutments for the crank-pin, whereby said crank-pin will reverse the movement of the bed, substantially as described.

12. The combination, with the reciprocating member or bed and mechanism for reciprocating the same, of a reversing mechanism comprising a crank pin or block, a shaft which said crank pin or block constantly engages, which shaft thereby forms a guide for the crank-block, and bearings carrying said shaft and mounted so as to be vertically movable on the bed, said bearings also forming abutments against which the crank-block is adapted to bear to reverse the movement of the bed, substantially as described.

13. The combination, with the reciprocating bed or member and mechanism for reciprocating the same, of a reversing mechanism comprising a crank pin or block, a guide mounted on said bed so as to be capable of vertical movement thereon, said guide having abutments against which the crank-block is adapted to bear, and also means for locking the crank-block in engagement with the abutment-block, substantially as described.

14. The combination, with the reciprocating bed or member and mechanism for reciprocating the same, of a reversing mechanism consisting of a crank pin or block, and a shaft 20, with which said crank pin or block is in constant engagement and which forms a guide for said crank-pin, and abutment-blocks or bearings mounted on the bed so as to have a vertical movement thereon, said abutment-blocks carrying means whereby the crank-block may be locked in engagement with the same, substantially as described.

15. The combination, with the reciprocating bed or member and mechanism for reciprocating the same, of a reversing mechanism comprising a guide mounted so as to be vertically movable on the bed, a crank-pin in engagement with said guide, and abutments against which the crank-pin is adapted to bear to reverse the movement of the bed, and latches for holding the crank-pin in engagement with the abutment-blocks, and means whereby the vertical movement of said guide will release said latches at the proper time, substantially as described.

16. The combination, with the reciprocating bed or member and a mechanism for reciprocating the same, of a reversing mechanism comprising a crank pin or block, a shaft 20, which said crank pin or block constantly engages, abutment-blocks mounted vertically movable on the bed, against which the crank-block is adapted to bear, latches carried by said abutment-blocks, and pins or projections mounted on the bed, adapted to release said latches, substantially as described.

17. The combination, with the reciprocating bed or member and mechanism for reciprocating the same, of a reversing mechanism comprising the crank-block 39 and shaft 20, which said crank-block engages, the abutment-blocks in which said shaft 20 is journaled, said blocks being mounted vertically movable on the bed, the racks 29 and 30, also mounted on the bed, and pinions 27 and 28, mounted on said shaft and engaging said racks, substantially as described.

18. The combination, with the reciprocating bed or member and mechanism for reciprocating the same, of a reversing mechanism consisting of the crank-block 39, the shaft 20 in constant engagement with said crank-block, the abutment-blocks in which said shaft 20 is journaled, said blocks being mounted vertically movable on the bed, the racks 29 and 30, also mounted on the bed, pinions 27 and 28 on said shaft, engaging said racks, and latches 31 and 32, also carried by said blocks 23 and 24, substantially as described.

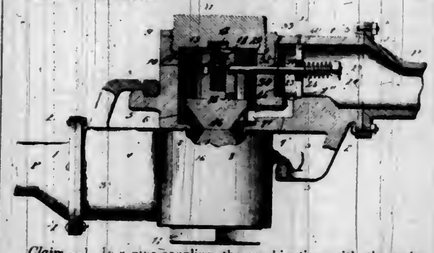
19. The combination, with the reciprocating bed or member, of the main driving mechanism consisting of two racks, a pinion arranged so as to alternately engage said racks, a reversing mechanism comprising a crank-block mounted on said pinion, a moving guide mounted on the bed, which said crank-block constantly engages, and abutments formed with said guide against which said crank-block is adapted to bear to reverse the movement of the reciprocating member, substantially as described.

20. The combination, with the reciprocating bed or member and mechanism for reciprocating the same, of a reversing mechanism comprising a crank element, and an abutment-block mounted in bearings on the bed so as to be capable of a vertical movement, and means for raising and lowering the abutment-block, so that the crank element may properly connect to the same to reverse the movement of the bed, substantially as described.

21. The combination, with the reciprocating bed or member and mechanism for reciprocating the same, of a reversing mechanism comprising a crank element, and abutment-blocks mounted in bearings on the bed so as to be capable of a vertical movement, and means operated from the reversing mechanism acting to raise and lower said abutment-blocks, substantially as described.

22. The combination, with the reciprocating bed or member and mechanism for reciprocating the same, of a reversing mechanism comprising a crank element, and abutment-blocks mounted in bearings on the bed so as to be capable of a vertical movement, and connections from the crank-pin adapted to raise and lower said abutment-blocks, whereby the crank-block will properly engage the abutment-blocks to reverse the movement of the bed, substantially as described.

481,129. CULTIVATOR-TOOTH. JAMES S. WORCESTER, Hackensack, N. J. Filed June 9, 1892. Serial No. 436,123. (No model.)



Claim.—1. The combination, with a frame or support, of a tooth movably secured to said support, said tooth being made to consist of a share or runner provided with plates or tongues having an upward inclination toward the rear, substantially as described.

2. The combination, with a frame or support, of a tooth movably secured to said support, said tooth being made to consist of a share or runner provided with plates or tongues having an upward inclination toward the rear, said share being constructed with an upper shield or guard to prevent excessive penetration of the share, substantially as described.

3. The combination, with a frame or support, of a swinging tooth swiveled to said support, so as to have a vertical and lateral motion, said tooth being provided with laterally-projecting plates or tongues, substantially as described.

4. The combination, with a frame or support, of a tooth movably connected to said support and provided with lateral plates or tongues and with an upper guard and an elastic rest for the tooth when in its elevated position, substantially as described.

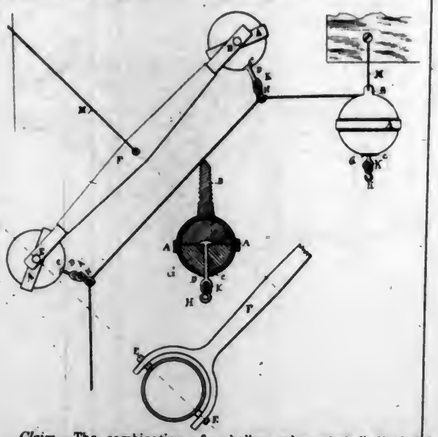
481,130. VALVED PIPE-COUPLING. ELLIS BARTHOLOMEW, Lima, Ohio, assignor of four-fifths to Oscar W. Bell, same place, and Oliver Jay and Daniel W. Jay, St. Mary's, Ohio. Filed Apr. 18, 1892. Serial No. 429,614. (No model.)

Claim.—1. In a pipe-coupling, the combination, with the casing provided with a bore having a valve-seat, a passage connecting this bore with the train-pipe, a valve in the bore, and a spring holding its head normally against said seat, of a pressure-actuated catch adapted to hold the valve open and a spring normally disconnecting this catch from the valve, as and for the purpose set forth.

2. In a pipe-coupling, the combination, with the casing provided with a transverse bore reduced at one end to form a valve-seat and enlarged at its other end, a rubber gasket on said seat, a sleeve in said bore bearing on the gasket, a nut in said larger end bearing on the sleeve, a valve whose head moves within the sleeve and is adapted to close against said seat and whose stem is reduced, a passage leading from above the seat to the train-pipe, a collar detachably secured within the sleeve and through which collar said stem slides, and a spring between the valve and nut, of a pressure-actuated pin passing through the side of the sleeve under the collar and into the valve-stem and adapted to hold the valve open, and a spring normally disconnecting this catch from the valve, as and for the purpose set forth.

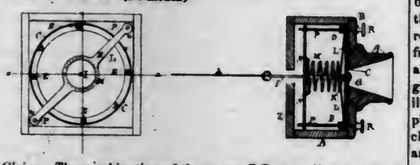
3. In a pipe-coupling, the combination, with the casing provided with a transverse bore having a reduced seat at one end, a sleeve in said bore, a nut holding the sleeve in place, a valve whose head moves within the sleeve and is adapted to close against said seat, the stem of the valve being reduced and socketed, a passage leading from above said seat to the train-pipe, a collar screwed into the sleeve and through which said stem slides, and an expansive spring within said socketed stem bearing against the nut, of a pressure-actuated catch adapted to hold the valve open and a spring normally disconnecting this catch from the valve, as and for the purpose set forth.

4. In a pipe-coupling, the combination, with the casing having a transverse bore provided with a seat at one end and closed at its opposite end and a spring-actuated valve in said bore having a groove in its stem, of a passage leading over above said seat to the longitudinal opening in said casing, a disk closely fitting this opening, a pin secured to said disk and adapted to engage said groove under pressure, and a spring for disengaging the pin and groove, as and for the purpose set forth.



5. In a pipe-coupling, the combination, with the casing having a transverse bore provided with a seat at one end and closed at its opposite end and a spring-actuated valve in said bore having a groove in its stem, of a passage leading from above said seat to the longitudinal opening in said casing, a spider secured in this opening, a pin sliding through the spider and having a head at its inner end, its outer end being adapted to engage said groove, a spring between the spider and head for disengaging said outer end and groove, and a disk secured to the pin, moving over the transverse opening from said passage and adapted by pressure to engage said outer end of the pin with said groove in the stem, as and for the purpose hereinbefore described.

481,131. RING-TRAVELER. ALBERT F. BENTLEY, New Bedford, Mass., assignor to the American Ring Traveler Company, Providence, R. I. Filed Mar. 23, 1892. Serial No. 426,058. (No model.)



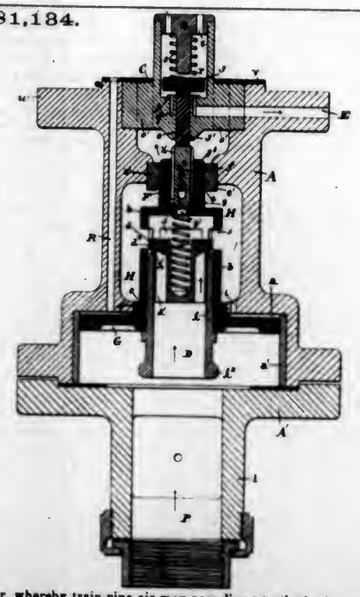
Claim.—A ring-traveler having hooks *a b c* and *d e f*, and the connecting-piece bent inward to form a single bearing-piece 6, which contacts with the ring to reduce the friction, as and for the purpose described.

481,132. INSULATOR. WILLIAM J. BOWEN, Norwalk, Ohio, assignor to William Hubbard, Elgin, Ill. Filed May 2, 1891. Serial No. 391,437. (No model.)

Claim.—The combination of a hollow spherical shell divided through the middle, having screw-threads on each half for attaching them together, the top half provided with means for fastening the same to any support, an insulating material within the shell, having embedded within it a headed pin passing through the same and provided at its outer end with an eye to which the conductor is connected and supported, substantially as described.

481,133. MECHANICAL TELEPHONE. WILLIAM J. BOWEN, Norwalk, Ohio, assignor to William Hubbard, Elgin, Ill. Filed May 2, 1891. Serial No. 391,438. (No model.)

Claim.—The combination of the screws P P, extending outside of the case B, bar N, spiral spring M, disk L, air-tube K, diaphragm G, case B, and mouthpiece A.



481,134. VALVE FOR AIR-BRAKES. GEORGE A. BOYDEN, Baltimore, Md., assignor to the Boyden Brake Company of Baltimore City, of Maryland. Filed Sept. 30, 1889. Serial No. 325,474. (No model.)

Claim.—1. In triple-valve mechanism for automatic air-brakes, the combination of a passage from the train-pipe, a passage from the auxiliary reservoir, which is smaller or more restricted than said train-pipe passage, and a single valve coacting with both of said passages and controlling communication between them and the brake-cylinder, whereby when an emergency application of the brakes is desired the train-pipe air and auxiliary-reservoir air, the former at lower pressure than the latter, will both pass to the brake-cylinder through the triple valve.

2. In valve mechanism for automatic air-brakes, the combination of a communication with the brake-cylinder from both the auxiliary reservoir and train-pipe, a single valve controlling said communication, and means to retard or restrict the flow thereto of the auxiliary-reservoir air when applying the brakes in comparison with the flow of train-pipe air, whereby train-pipe air at lower pressure than said auxiliary-reservoir air will pass said valve when making an emergency application of the brakes.

3. In a triple valve, the combination, with a suitable chamber, of a port therefrom to the brake-cylinder, a valve controlling said port, and passages to the said chamber from the train-pipe and from the auxiliary reservoir, the latter passage being of less capacity than the

481,134.

former, whereby train-pipe air may pass direct to the brake-cylinder through the triple valve to effect a quick action of the brakes for emergency stops.

4. In a valve for automatic air-brakes, the combination of a communication with the brake-cylinder, a suitable valve controlling said communication, two air-passages coacting with said valve and relatively proportioned as to their capacity to allow the flow of both train-pipe air and auxiliary-reservoir air each at a different pressure to pass said valve when open, and a check-valve to prevent the return of air to the train-pipe.

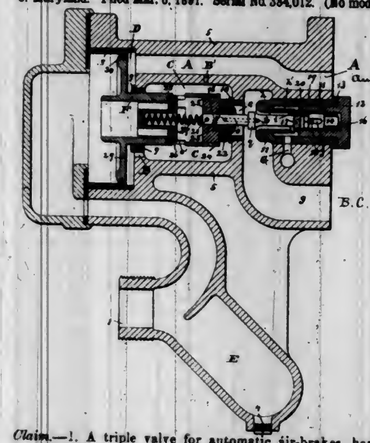
5. A valve for controlling automatic air-brakes, having, in combination, a piston which is moved in one direction by pressure from the train-pipe and in the other direction by pressure from the auxiliary reservoir, a valve-chamber which has a check-valved communication from the train-pipe, a communication with the auxiliary reservoir, and a port communicating with the brake-cylinder, said port being of greater area or capacity than the said communication with the auxiliary reservoir, and a valve controlling said port and moved by the piston, whereby when the said port is opened the pressure in the valve-chamber will be reduced momentarily below that in the train-pipe, and air from the latter will thereupon pass to the brake-cylinder.

6. In a triple valve for automatic air-brakes, the combination of a chamber having a port leading to a brake-cylinder, a passage opening into said chamber and which supplies auxiliary-reservoir air thereto, a piston-chamber and piston, a valve controlling said port and operated by the piston, and a passage from the auxiliary reservoir direct to said piston-chamber and avoiding the chamber first mentioned and which is larger or of greater capacity than the said passage which supplies auxiliary-reservoir air.

7. In valve mechanism for automatic air-brakes, the combination of a piston-chamber, a piston, a valve-chamber having a brake-cylinder port, a passage for supplying auxiliary-reservoir air when applying the brakes, which passage is smaller or of less capacity than said port, a passage to supply train-pipe air when applying the brakes, a valve in the valve-chamber coacting with said port and controlling the flow of air to a brake-cylinder from both a train-pipe and an auxiliary reservoir, and a passage from the auxiliary reservoir to the said piston-chamber and which in its course avoids the said valve chamber.

8. In a triple valve for automatic air-brakes, the combination of a valve-chamber having a port leading to the brake-cylinder, a piston-chamber and piston, a passage from the auxiliary reservoir direct to the piston-chamber and which avoids the said valve-chamber, a passage which is smaller or more restricted than either the said port or the said direct passage to the piston-chamber, this small passage opening into the valve-chamber, and a valve controlling said port and operated by the piston.

9. In a triple valve for automatic air-brakes, the combination of a chamber having a port communicating with the brake-cylinder, a piston-chamber and piston, a passage from the train-pipe to the ported chamber, a partition provided with a passage which is smaller or more



restricted than either the said port or the train pipe passage, said partition serving to partially separate the ported chamber from the said piston-chamber, and a valve moved by said piston and controlling said port, whereby both train-pipe air and auxiliary-reservoir air may pass the same valve-port for an emergency stop.

10. The combination, in valve mechanism for air-brakes, of a piston, a valve-chamber having a communication with a brake-cylinder, one from the train-pipe and another through a throttled or more restricted passage from the auxiliary reservoir, a valve to govern the communication leading to the brake-cylinder, a tubular extension of the piston entering the valve chamber and moving the valve and containing a passage which forms the said communication between the train-pipe and valve-chamber, and a check-valve controlling said last-named passage.

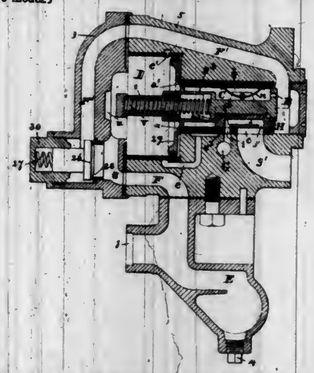
11. In valve mechanism for automatic air-brakes, the combination of a main port communicating with a brake-cylinder from both the train-pipe and the auxiliary reservoir, a suitable valve controlling said main port, a graduating-valve which admits air-pressure in small volume to the brake-cylinder, and air-passages coacting with said main port and relatively proportioned as to their capacity to allow both train-pipe air and auxiliary-reservoir air, each at a different pressure, to pass to said main port when the latter is open.

12. In valve mechanism for automatic air-brakes, the combination of a chamber having a main port leading to the brake-cylinder, a reciprocating valve of plug form coacting with said main port and capable of a certain extent of movement without opening the said port, a graduating-valve A, fitting loosely in said plug-valve, and a release-valve unconnected with the said main valve and controlling an air-escape port.

481,135. FLUID-PRESSURE BRAKE. GEORGE A. BOYDEN, Baltimore, Md., assignor to the Boyden Brake Company of Baltimore City, of Maryland. Filed Mar. 6, 1891. Serial No. 384,012. (No model.)

Claim.—1. A triple valve for automatic air-brakes, having, in combination, a port c, leading to the brake-cylinder, a main valve 22, which closes and opens said port, a valve to release the air from the brake-cylinder, a piston actuated by air-pressure, and a stem having one end suitably connected with the piston and which passes loosely through the main valve and also through the said port leading to the brake-cylinder and imparts movement to the said release-valve.

2. A triple valve for automatic air-brakes, having, in combination, a port c, leading to the brake-cylinder, a main valve 22, which closes and opens said port, a valve to release the air from the brake-cylinder, a piston actuated by air-pressure, a stem having one end suitably connected with the piston and which passes loosely through the main valve and also through the said port leading to the brake-cylinder and imparts movement to the said release-valve, and a stop-shoulder on the said stem between the main valve and release-valve.



3. A triple valve for automatic air-brakes, having, in combination, a port c, leading to the brake-cylinder, a piston actuated by air-pressure, a stem having one end suitably connected with the piston constructed to act as a graduating-valve, a main valve 22, loose on said stem and which rides or floats lengthwise thereof and is wholly supported thereby and opens and closes the said port leading to the brake-cylinder, and a stop-shoulder on the stem to come in contact with the said main valve, whereby when the brakes are being applied by the graduating-valve the main valve remains immovable and the stop-shoulder coming in contact with it arrests the movement of the said piston.

4. A triple valve for automatic air-brakes, having, in combination, a passage from the train-pipe, a passage from the auxiliary reservoir, which is smaller or more restricted than said train-pipe passage, a main port coacting with both of said passages and communicating between them and the brake-cylinder, a piston actuated by air-pressure, a stem having one end suitably connected with the piston, and a valve loose on said stem and which rides or floats lengthwise thereof and is wholly supported thereby and opens and closes the said main port communicating to the brake-cylinder.

5. A triple valve for automatic air-brakes, having, in combination, a valve to release the air from the brake-cylinder, a piston actuated by air-pressure, a main port c, leading to the brake-cylinder and located between the said release-valve and piston, a stem having one end suitably connected with the piston and which passes through said port and imparts movement to the said release-valve, and said stem provided with a passage having a lateral port for the flow of a small volume of air to apply the brakes by graduation, and a main valve 22, which is free to ride or float lengthwise on said stem and opens and closes the said lateral graduation-port and which also opens and closes the main port leading to the brake-cylinder.

6. A triple valve for automatic air-brakes, having, in combination, a port communicating with the brake-cylinder from both the auxiliary reservoir and the train-pipe, means for restricting the flow to the said port of auxiliary-reservoir air when applying the brakes for an emergency stop as compared with the flow of train-pipe air, a piston actuated by air-pressure, a stem having one end suitably connected with the piston and which is provided with a small passage for the flow of auxiliary-reservoir air to apply the brakes by graduation, and a main valve 22, which rides or floats loosely on said stem and is wholly supported thereby and opens and closes the said port communicating with the brake-cylinder and also controls the said small graduation-passage.

481,136. VALVE FOR AUTOMATIC AIR-BRAKES. GEORGE A. BOYDEN, Baltimore, Md., assignor to the Boyden Brake Company of Baltimore City, of Maryland. Filed Feb. 12, 1892. Serial No. 421,237. (No model.)

Claim.—1. The combination, in valve mechanism for automatic air-brakes, of a port through which air passes to the brake-cylinder from both the train-pipe and auxiliary reservoir to produce quick action, a port leading to the atmosphere to exhaust the air from the brake-cylinder, a single slide-valve to control the said ports, and a piston which actuates the slide-valve and is moved in one direction by auxiliary-reservoir pressure and in the opposite direction by train-pipe pressure.

2. The combination, in valve mechanism for automatic air-brakes, of a piston actuated in one direction by auxiliary-reservoir pressure and in the opposite direction by train-pipe pressure, and a single slide-valve controlling the passage of air to the brake-cylinder from both the train-pipe and auxiliary reservoir for an emergency application of the brake.

3. The combination, in valve mechanism for automatic air-brakes, of a piston-chamber, a piston, a valve-chamber having a port through which air passes to the brake-cylinder from both the auxiliary reservoir and train-pipe, a slide-valve controlling said port, and a partition which at the time of applying the brakes separates the auxiliary-reservoir-air pressure that is on the said piston from the pressure in that part of the valve chamber that is adjacent to the said port.

4. The combination, in valve mechanism for automatic air-brakes, of a valve chamber, a slide-valve therein controlling the exhaust of air from the brake-cylinder to the atmosphere, and also the passage of air to the brake-cylinder from both the train-pipe and the auxiliary

reservoir, a piston-chamber, and a piston to actuate the said slide-valve and carrying a partition arranged to retard or restrict the auxiliary-reservoir air in its transmission to the port of the said slide-valve.

5. The combination, in valve mechanism for automatic air-brakes, of a port through which air passes from both the auxiliary reservoir and train-pipe to the brake-cylinder, a port leading to the atmosphere, a passage for auxiliary-reservoir air to pass to said brake-cylinder port, a passage having a greater area than the first-mentioned passage to admit train-pipe air to said brake-cylinder port, a slide-valve to control said ports, and a check-valve located in the said train-pipe passage.

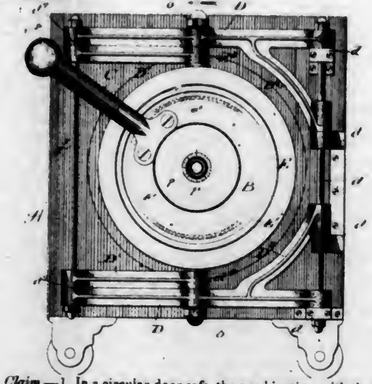
6. The combination, in valve mechanism for automatic air-brakes, of a piston-chamber, a piston, a valve-chamber having a port leading to the atmosphere and also a port leading to the brake-cylinder, a slide-valve controlling the said ports, a communication for auxiliary-reservoir air direct to one side of the said piston without passing through the valve-chamber, and a restricted communication for auxiliary-reservoir air to pass to said brake-cylinder port.

7. The combination, in valve mechanism for automatic air-brakes, of a valve-port through which air passes to the brake-cylinder from both the auxiliary reservoir and direct from the train-pipe, an exhaust-port, a slide-valve to control the said port, a piston, and communications relatively proportioned to produce on the auxiliary-reservoir side of the piston a greater pressure than that of the said air passing through the brake-cylinder port.

8. The combination in valve mechanism for automatic air-brakes, of a slide-valve seat having a port which is in communication with the brake-cylinder, a passage through which train-pipe pressure is transmitted to the said brake-cylinder port when applying the brakes for emergency stops, a passage of more restricted capacity than said train-pipe passage and through which auxiliary-reservoir pressure also is transmitted to the said brake-cylinder port when applying the brakes for emergency stops, and a slide-valve resting on said seat and coacting with said port and controlling the passage to the brake-cylinder of both the train-pipe and auxiliary-reservoir pressure, as set forth.

9. The combination, in valve mechanism for automatic air-brakes, of a slide-valve, a piston which actuates the said slide-valve, and a graduating-passage for auxiliary-reservoir pressure to preliminarily apply the brakes, the exit from which passage is controlled by the said slide-valve and the inlet thereto by the said piston and which passage admits auxiliary-reservoir pressure to the brake-cylinder when open at both of said controlled places.

10. The combination, in valve mechanism for automatic air-brakes, of a slide-valve seat having a port which is in communication with the brake-cylinder, a passage leading to the said slide-valve seat and through which auxiliary-reservoir pressure is transmitted for graduating the brakes, a passage through which train-pipe pressure is transmitted to the said brake-cylinder port when applying the brakes for emergency stops, a passage of more restricted capacity than said train-pipe passage and through which auxiliary-reservoir pressure also is transmitted to the said brake-cylinder port when applying the brakes for emergency stops, and a slide valve traversing said seat and controlling the air passing through all three of said passages.



11. The combination, in valve mechanism for automatic air-brakes, of a slide valve seat having a port which is in communication with the brake-cylinder, a passage leading to the said slide-valve seat and through which auxiliary-reservoir pressure is transmitted for graduating the brakes, a passage through which train-pipe pressure is transmitted to the said brake-cylinder port when applying the brakes for emergency stops, and a single slide-valve traversing the said valve-seat and controlling the said passages, for the purpose set forth.

12. The combination, in valve mechanism for automatic air-brakes, of a slide-valve seat having three ports, the first of which is in communication with the brake-cylinder and the second with the atmosphere, a graduating-passage leading to the third valve-seat port and through which auxiliary-reservoir air is transmitted to preliminarily apply the brakes, a single slide-valve traversing the said seat and controlling the graduating or preliminary application of the brakes and the release of the same, and a piston to actuate the said slide-valve and having a limited movement independent thereof.

481,137. SAFE. THOMAS M. BRINTNALL, Chicago, Ill. Filed Feb. 16, 1891. Renewed Jan. 16, 1892. Serial No. 418,327. (No model.)

481,137.

Claim.—1. In a circular-door safe, the combination, with the door, its locking-bolts carried by the door, and the adjacent frame or jamb, of mechanism permanently connecting the door and bolts, whereby the revolution of the door after it is closed will always operate to shoot the bolts, substantially as described.

2. In a circular-door safe, the combination, with the door, the adjacent frame or jamb, the locking-bolts, and permanent intermediate connecting mechanism, of a stationary stop carried by the frame, which engages and holds a stop carried by the door when the latter is closed, whereby the revolution of the door acts to shoot the bolts, substantially as described.

3. In a circular-door safe, the combination, with the door and the adjacent frame or jamb, of the locking-bolts carried by the door, intermediate mechanism connecting the door and bolts, and a stationary stop on the frame for engaging a stop carried by the door when the latter is closed, whereby the revolution of the door always operates to shoot the bolts, substantially as described.

4. In a circular-door safe, the combination, with the door, its locking-bolts carried by the door and the frame or jamb, of cam mechanism permanently connected with the door for operating the bolts, whereby the revolution of the door causes the cam mechanism to positively operate the bolts, substantially as described.

5. In a circular-door safe, the combination, with the door and the adjacent frame or jamb, of the locking-bolts carried by the door, cam mechanism engaging the bolts, and stop mechanism permanently connecting the frame or jamb and the cam mechanism when the door is closed, whereby the revolution of the door when it is closed causes the cam mechanism to operate the bolts, substantially as described.

6. In a circular-door safe, the combination, with the door and the adjacent frame or jamb, of the locking-bolts carried by a ring or plate portion of said door movable with respect thereto, mechanism rigidly connected with the door which engages the bolts, and a stop on the frame for engaging the movable ring, substantially as described.

7. In a circular-door safe, the combination, with the door and the adjacent frame or jamb, of the locking-bolts carried by a ring or plate on the door and movable with respect thereto, cam mechanism rigidly connected with the door which engages the bolts, and a stop on the frame for engaging the movable ring, substantially as described.

8. In a circular-door safe, the combination, with the door and the adjacent frame or jamb, of the locking-bolts carried by a ring or plate on the door, said ring or plate engaged to the door by a threaded engagement, cam mechanism rigidly engaged to the door for operating the bolts, and a stop on the frame which engages the bolt-ring, substantially as described.

9. In a circular-door safe, the combination, with the door and the adjacent frame or jamb, of the locking-bolts carried by a ring or plate on the door and movable with respect thereto, a plate rigidly engaged to the door having cam slots which engage the bolts, and a stop on the frame which engages the movable ring, substantially as described.

10. In a circular-door safe, the combination, with the door and the adjacent frame or jamb, of the locking-bolts carried by a ring or plate which is engaged to the door by a screw-threaded engagement, a plate rigidly engaged to the door having cam-slots which engage and operate the bolts, and a stop on the frame which engages the bolt-ring, substantially as described.

11. In a circular-door safe, the combination, with the door, the adjacent frame or jamb, the locking-bolts carried by said circular door, and mechanism for invariably locking the bolts by the revolution of the door when the latter is closed, of time-lock mechanism for dogging the door in its locked position until intentionally released, substantially as described.

12. In a circular-door safe, the combination, with the door, its frame or jamb, locking-bolts carried by said circular door, and mechanism for invariably operating the bolts by the revolution of the door when the latter is closed, of a combination-lock located on the exterior of the door for dogging the same in its locked position, substantially as described.

13. In a circular-door safe, the combination, with the door, its frame or jamb, and the locking-bolts carried by a ring or plate on the door and movable with respect thereto, of mechanism for dogging the door and the movable ring together until intentionally released, substantially as described.

14. In a circular-door safe, the combination, with the door, of a lever for operating the same, one end of said lever being permanently engaged to the door, while the body of the lever is made extensible substantially as described.

15. In a circular-door safe, the combination, with the door, of a lever for operating the same, said lever consisting of two parts, one telescoping within the other, thus making it extensible, one of said parts being permanently engaged to the door, substantially as described.

16. In a safe, the combination, with the door, of mechanism for supporting same, consisting of a pair of long arms pivoted to the body of the safe and extending beyond the center of the door and a pair of returning short arms pivoted to the long arms and to the door, substantially as described.

17. In a safe, the combination, with the door, of mechanism for supporting the same, consisting of the arms D D', pivoted to each other, and the pins *b*, extending through the ends of the arms D' and entering slots in the arms D, substantially as described.

18. In a circular-door safe, the combination, with the door and its supporting hinge-ring, of set-screws between the hinge-ring and adjacent stationary door-ring and bearing upon the latter, whereby the door may be adjusted in any direction to center it, substantially as described.

19. In a circular-door safe, the combination, with the door and its supporting hinge-ring, of set-screws journaled in said hinge-ring and having a ball-and-socket bearing in the door-ring, substantially as described.

20. In a circular door safe, the combination, with the stationary ring E and adjacent door, of anti-friction rollers between the ring and door, substantially as described.

21. In a safe, the combination, with the door and its locking-bolts, of the frame or jamb having a ring or bearing against which the bolts shoot, said bearing being adjustable toward or from the frame, substantially as described.

22. In a circular-door safe, the combination, with the door and its locking-bolts, of the frame or jamb having a ring or bearing against which the bolts shoot, said ring made adjustable by the bolts *i* and set-screws *i'*, substantially as described.

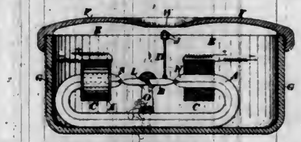
23. In a circular-door safe, a time-lock mechanism for dogging the door in its locked position, consisting of a latch or dog on a movable part of the door, an adjacent stationary portion provided with a notch or recess into which the dog rides, and a spring for forcing the dog into the recess, said spring held normally out of contact with the dog but arranged to be brought into contact with it when it is desired to lock the door, substantially as described.

24. In a circular-door safe, a time-lock mechanism for dogging the door, consisting of a latch or dog adapted to enter a recess in a stationary part, a movable plate adjacent to the dog, carrying a spring adapted to force the dog into the said recess, and a stop adapted to force the dog out of the recess, the construction being such that a revolution of the plate in one direction will bring the spring to bear on the dog, and a revolution in the opposite direction will bring the stop to bear on the dog, substantially as described.

25. In a circular-door safe, a time-lock mechanism for dogging the door, consisting of the latch or dog, the adjacent stationary portion provided with a notch or recess, the spring for throwing the latch or dog into the notch, the stop for forcing it out, means for holding the latch-spring abnormally in contact with the latch, and a supplemental spring for carrying the latch-spring out of contact with the latch when released, substantially as described.

26. In a circular-door safe, a time-lock mechanism for dogging the door, consisting of a latch or dog, an adjacent stationary portion provided with a notch or recess, a movable plate carrying a spring for throwing the latch or dog into the notch, and a stop for throwing it out, a spring for holding the plate normally in such a position that the latch-spring exerts no pressure on the latch, and means for holding the plate so that the latch-spring bears on the latch until released, substantially as described.

27. In a circular-door safe, the combination, with the dogging-latch and latch-spring mounted on a movable plate held normally so that the latch-spring exerts no pressure on the latch, of means for holding the latch-spring in contact with the latch, consisting of the supplemental latch H', adapted to engage and hold a pin on the movable plate, substantially as described.

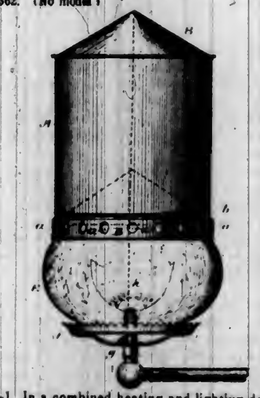


28. In a circular-door safe, the combination, with the dogging-latch and latch-spring mounted on a movable plate, of the latch H' for holding the latch-spring in contact with the dogging latch, said latch H' having the lip or toat H^4, adapted to engage and hold a pin on the movable plate, substantially as described.

29. In a circular-door safe, the combination, with the door, of a combination-lock for dogging the same in its locked position, said combination-lock housed within a cap or cup screwed into the outer face of the door, substantially as described.

30. In a circular-door safe, the combination, with the door, of a bolt housed therein adjacent to the edge and adapted to enter a notch or recess in the adjacent frame, a spring for holding said bolt normally within the confines of the door, and a combination-lock upon the exterior of the door, adapted to force the dogging-bolt out into the frame, substantially as described.

31. In a circular-door safe, the combination, with the door, of the rings upon the exterior thereof, said rings rabbeted into each other, and the bolts or screws which secure the inner plate or ring to the door being covered by a screw-cap, the latter being dogged against revolution when the door is closed, substantially as described.



481,138. TELEPHONE. FREDERICK H. BROWN, Chicago, Ill., assignor of one-half to Sidney F. Andrews. Filed Mar. 23, 1891. Serial No. 386,094. (No model.)

Claim.—1. In an apparatus for transmitting articulate sounds telephonically, the combination of a permanent magnet, one pole of which is movable in close proximity to the other pole, a diaphragm, and a connection between the diaphragm and the movable pole of the magnet, substantially as set forth.

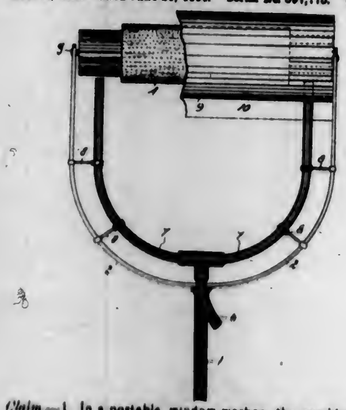
2. In an apparatus for transmitting articulate sounds telephonically, the combination, with one or more permanent magnets with magnetic fields of dissimilar polarity, of an inductive body within the said field and movable transversely thereto, a diaphragm, and a connection between the diaphragm and the inductive body, substantially as set forth.

481,139. COMBINED GAS HEATING AND LIGHTING DEVICE. OLIVER H. P. CORNELL, Albany, assignor, by mesne assignments, to the Caloric Cone Company, New York, N. Y. Filed Dec. 20, 1890. Serial No. 375,362. (No model.)

Claim.—1. In a combined heating and lighting device, the combination, with a globe, of a closed drum containing a volume of atmospheric air and having an upwardly-depressed conical bottom and means for supporting the same centrally, so as to extend laterally all around beyond the upper edge of the globe and leave a radially-inclined space between them, substantially as and for the purposes shown and described.

2. In a combined heating and lighting device, the combination, with a closed drum containing a volume of atmospheric air, of a globe having an inwardly-curved upper edge and means of supporting the

former, so that the periphery of its lower end will extend beyond and overhang the sloping outer surface of the latter and leave a space between them, substantially as and for the purposes shown and described.



3. In a combined heating and lighting device, the combination, with a hollow globe, of a closed drum containing atmospheric air, having an upwardly-depressed or conical bottom with its apex above and its periphery about on or slightly below the level of the upper edge of the globe, the former so located above the latter as to leave a space between them, substantially as and for the purposes shown and described.

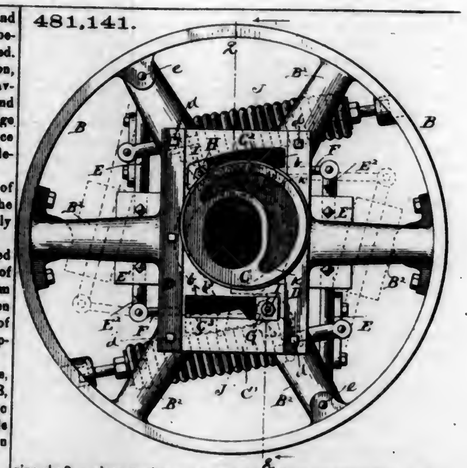
4. In a combined heating and lighting device, the combination of a hollow globe, with a drum or chamber above provided with the herein-described conical or upwardly-depressed bottom, substantially as and for the purposes shown and described.

5. In a combined heating and lighting device, the herein-described combustion-chamber, consisting of the inwardly-curved upper edge of a hollow globe, an apex of the conical or upwardly-depressed bottom of a closed drum arranged to leave a radially-sloping space between the said conical bottom near its periphery and the said upper edge of the globe, in combination with a closed drum and a globe, and to operate substantially as and for the purposes shown and described.

6. As a new article of manufacture, the herein-described device, consisting of a drum with cylindrical sides A, closed upper end B, conical bottom C, with inwardly-depressed apex *i*, flexible metallic strips *d*, downwardly-extending rim D, and perforations *a*, the whole constructed and to operate substantially as and for the purposes shown and described.

481,140. ROTATING WINDOW-WASHER. HIRAM B. DAVIS, Denver, Colo. Filed June 20, 1891. Serial No. 397,773. (No model.)

Claim.—1. In a portable window-washer, the combination of a cylindrical brush carrying cups or paddles adapted to utilize the force of the water carried to the brush, causing the same to rotate, a bifurcated frame having the brush journaled in its arms, and a rigid tubular handle attached to said frame and adapted to carry the water to the brush through the medium of suitable attachments or extensions, substantially as described.



2. In a window-washer, the combination, with a cylindrical brush adapted to be rotated by water carried thereto under pressure, of a bifurcated frame having the brush journaled in the extremities of its arms, a rigid tubular handle attached to said frame and adapted to carry the water to the brush through the medium of suitable attachments or connections, and a shield mounted upon the frame and partially surrounding the brush, substantially as described.

481,141. GOVERNOR FOR STEAM-ENGINES. FREDERICK C. DIETZ, Zanesville, Ohio, assignor to the Blandy Machine Company, same place. Filed May 3, 1892. Serial No. 431,717. (No model.)

Claim.—1. In a governor for steam-engines, the combination, with the engine-shaft, a plate stationary upon said shaft, an eccentric for the purpose indicated loose upon said shaft, and a sliding plate rigid with said eccentric, said plates being slotted at diametrically-opposite sides of the engine-shaft, of blocks or suitable devices adapted to operate in said slots, the arrangement of the latter relative to each other being such that upon the movement of said blocks or other devices endwise of said slots the sliding plate aforesaid is moved upon the stationary plate and the eccentric is thrown across the engine-shaft, as required, substantially as and for the purpose set forth.

2. In a governor for steam engines, the combination, with the engine-shaft, a plate stationary upon said shaft, an eccentric for the purpose indicated loose upon said shaft, and a sliding plate rigid with said eccentric, said plates being slotted at diametrically-opposite sides of the engine-shaft, of blocks or suitable devices adapted to operate in said slots, the arrangement of the latter relative to each other being such that upon the movement of said blocks or other devices endwise of said slots the sliding plate aforesaid shall be moved upon the stationary plate and the eccentric thrown across the engine-shaft, as required, substantially as and for the purpose set forth.

481,141.

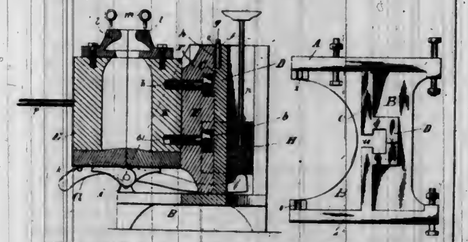
3. In a governor for steam-engines, the combination, with the engine-shaft, a plate stationary upon said shaft, an eccentric for the purpose indicated loose upon said shaft, and a sliding plate rigid with said eccentric, the stationary plate being provided with guides for the sliding plates and both plates being slotted at diametrically-opposite sides of the engine-shaft, of blocks or suitable device adapted to operate in said slots, the arrangement of the latter relative to each other being such that upon the movement of said blocks or other devices endwise of said slots the sliding plate aforesaid shall be moved upon the stationary plate and the eccentric thrown across the engine-shaft, as required, substantially as and for the purpose set forth.

4. In a governor for steam-engines, the combination, with the engine-shaft, a plate stationary upon said shaft, an eccentric for the purpose indicated loose upon said shaft, and a sliding plate rigid with said eccentric, the stationary plate being provided with guides for the sliding plate, both plates being slotted at diametrically-opposite sides of the engine-shaft, of blocks or suitable devices adapted to operate in said slots, the arrangement of the latter relative to each other being such that upon the movement of said blocks or other devices endwise of said slots the sliding plate aforesaid shall be moved upon the stationary plate and the eccentric thrown across the engine-shaft, as required, substantially as and for the purpose set forth.

5. In a governor for steam-engines, the combination, with the engine-shaft, a plate stationary upon said shaft, an eccentric for the purpose indicated loose upon said shaft, and a sliding plate rigid with said eccentric, the stationary plate being provided with guides for the sliding plate, both plates being slotted at diametrically-opposite sides of the engine-shaft, of blocks or suitable devices adapted to operate in said slots, the arrangement of the latter relative to each other being such that upon the movement of said blocks or other devices endwise of said slots the sliding plate aforesaid shall be moved upon the stationary plate and the eccentric thrown across the engine-shaft, as required, one of said plates upon the side opposing the other plate being cut away to reduce the friction between the plates, substantially as set forth.

6. In a governor for steam-engines, the combination, with the engine-shaft, a plate stationary upon said shaft, an eccentric for the purpose indicated loose upon said shaft, and a sliding plate rigid with said eccentric, the stationary plate being provided with guides for the sliding plate, both plates being slotted at diametrically-opposite sides of the engine-shaft, of blocks or suitable devices adapted to operate in said slots, the arrangement of the latter relative to each other being

such that upon the movement of said blocks or other devices endwise of said slots the sliding plate aforesaid shall be moved upon the stationary plate and the eccentric thrown across the engine-shaft, as required, and a yoke adapted to insure the simultaneous operation of the sliding blocks or their equivalent in the slots of the plates aforesaid, substantially as set forth.

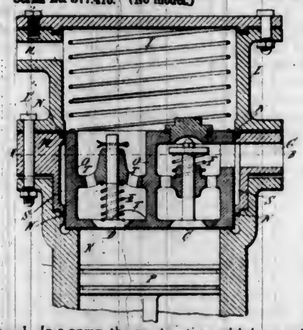


7. In a governor for steam-engines, the combination, with the engine-shaft and an eccentric for the purpose indicated loose upon the shaft, of weighted levers, as at E, mechanism operatively connecting said levers with said eccentric and adapted to throw the latter across the engine-shaft, as required, and a yoke mounted on the engine-shaft, said yoke loosely connected with and adapted to insure the simultaneous action of said weighted levers, substantially as and for the purpose set forth.

8. The combination, with the main or driving shaft of a steam-engine, of governing mechanism comprising a wheel, as at B, fast upon said shaft, a plate, as at *b*, rigid with the hub of said wheel, an eccentric for the purpose indicated loose upon said shaft, a sliding plate rigid with said eccentric, both of said plates being slotted at diametrically-opposite sides of the engine-shaft, blocks or suitable devices adapted to operate endwise of said slots, substantially as indicated, weighted levers, as at E, and links or rods operatively connected with said blocks or their equivalents and with said weighted levers, the arrangement of the slots in the plates aforesaid being such that upon the movement of said blocks or their equivalents endwise of said slots the sliding plate aforesaid is moved upon the stationary plate and the eccentric thrown across the engine-shaft, as required, and a yoke adapted to insure the simultaneous action of said weighted levers, substantially as and for the purpose set forth.

9. The combination, with the main or driving-shaft of a steam-engine, of governing mechanism comprising a wheel B, fast upon said shaft, a plate *b*, rigid with said wheel, an eccentric for the purpose indicated loose upon said shaft, sliding plate C, rigid with said eccentric, both of said plates being slotted, substantially as shown and described, pins or bolts I, weighted levers E, links or rods operatively connecting pins or bolts I with said weighted levers, blocks or suitable devices loosely mounted upon said pins or bolts and adapted to operate endwise of the slots in the plates aforesaid, a yoke adapted to insure simultaneous action of said weighted levers, and springs J, the sliding plate and eccentric being located at one side of the arms of wheel B, and weighted levers E, connecting-rods F, and springs J being located at the opposite side of said arms, all substantially as and for the purpose set forth.

10. The combination, with the main or driving shaft of a steam-engine, of governing mechanism comprising a wheel B, fast upon said shaft, a plate *b*, rigid with said wheel, an eccentric for the purpose indicated loose upon said shaft, sliding plate C, rigid with said eccentric, both of said plates being slotted, substantially as shown and described, pins or bolts I, weighted levers E, links or rods operatively connecting pins or bolts I with said weighted levers, blocks or suitable devices loosely mounted upon said pins or bolts and adapted to operate endwise of the slots in the plates aforesaid, the arrangement and construction of weighted levers E relative to pins or bolts I and connecting-rods F being such as to bring the draft or pull upon pins or bolts I centrally of the latter, substantially as set forth.

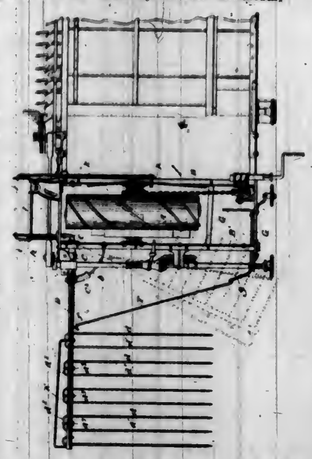


481,142. SUPPORTING-HOLDER FOR GLASS-MOLDS. ULYSSES S. HUGGINS, Washington, Pa., assignor to Charles N. Brady and Blancher D. Northrop, same place. Filed Sept. 10, 1890. Renewed May 16, 1892. Serial No. 433,214. (No model.)

Claim.—1. The combination of a supporting frame having a number of mortises therein, one or more molds each provided with a tenon F, engaging with each mortise, and a cam-bolt *g* for locking said tenon in place in said mortise, substantially as set forth.

2. The combination of a supporting-frame having a number of mortises therein, one or more molds each provided with a tenon F, engaging with each mortise, a cam-bolt *g* for locking said tenon in place in said mortise, a counterbalancing-weight H for each mold, and a lever G, upon which bear the said counterbalancing-weight and the moving part of each mold.

481,143. AIR-COMPRESSOR. ARTHUR H. HUTCHINSON, Kansas City, Mo., assignor to Laura M. Hutchinson, same place. Filed Jan. 12, 1891. Serial No. 377,413. (No model.)



Claim.—1. In a pump, the combination, with loose valve-case O, carrying an inlet-valve C and an outlet-valve D, of the packings N, substantially as set forth.

2. In a pump, the combination of the cylinder and piston, the movable valve-case arranged in the cylinder and having an inlet and outlet, the spring for holding the valve-case, the spring-controlled valves in the case, and the guide surrounding the valve-case, substantially as described.

3. In a pump, the combination of the cylinder and piston therein, the guide above the cylinder, the movable valve-case having the chambers, the inlet and outlet valves in said chambers, the chamber above the valve-case having an outlet, and the by-pass pipe leading from the valve-case to the cylinder, as described.

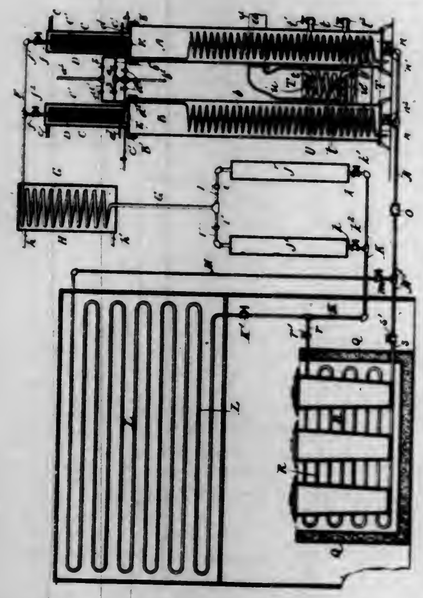
4. In a pump, the combination of the cylinder and piston therein, the guide above the cylinder having an inlet, the movable valve-case fitting the guide and having an inlet, the by-pass pipe, the chamber around the valve-case, the inlet and outlet valves in the case, and the case or chamber above the cylinder having the outlet, all arranged as described.

481,144. SHEAF-CARRIER. WILLIAM A. KIRBY, Auburn, N. Y. Filed Sept. 30, 1891. Serial No. 407,310. (No model.)

Claim.—1. In a sheaf-carrier for harvesters, the carrier-head or rock-shaft pivoted to the machine-frame and provided with the rearwardly-extending arm or shoe rigid thereon, in combination with a suitable support for said shoe, whereby an angular tilt is given to the carrier in discharging its load, substantially as described.

2. The carrier rock-shaft pivoted to the machine-frame and provided with the rearwardly-extending arm or shoe rigid thereon, in combination with the curved track or way for said shoe and the tilting fingers rigidly secured to said head, substantially as described.

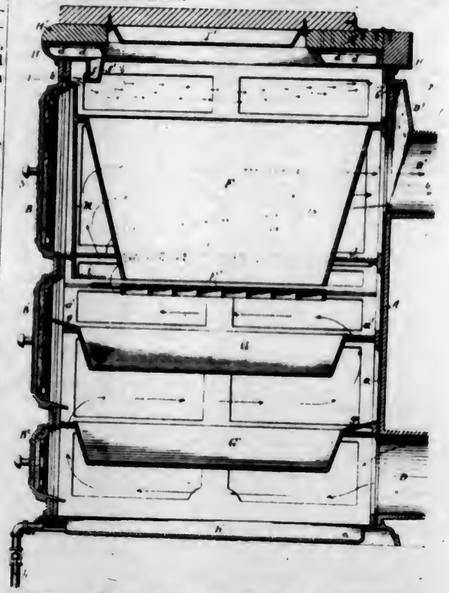
3. In a sheaf-carrier, the carrier-head or rock-shaft pivoted to the machine-frame and having rigid fingers, in combination with a rock-shaft G, connected to said carrier by means of link F for swinging it to and from its folded position, substantially as described.



4. In a sheaf-carrier, the carrier rock-shaft or head-casting provided with the socket for the carrier rock-shaft, the rearwardly-projecting shoe rigid thereon, and the crank-arm for actuating said head, in combination with the universal joint connection between said head or casting and the machine-frame, and the track or support on which said shoe travels, substantially as described.

481,145. SASH-BALANCE. JOSEPH P. MAGNEY, Oakland, assignor to the Magney Sash Balance Company, San Francisco, Cal. Filed Aug. 28, 1891. Serial No. 403,976. (No model.)

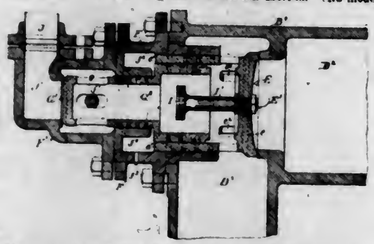
Claim.—In a sash-lock, and in combination with the rack and pinion, the box in which the pinion is held, having in its corner and at one side of the pinion a guiding-block, a triangular locking-piece having a stem projecting from its side into the guiding-block and having its right-angular edges fitting in the corner of the box to be guided by the walls thereof and the spur on its free side, the spring for forcing the locking-piece into engagement with the pinion, and the stem projecting through the casing, substantially as described.



481,146. REFRIGERATING-MACHINE. CHARLES F. MILLER, Lancaster, Pa. Filed Jan. 9, 1892. Serial No. 417,520. (No model.)

Claim.—1. In combination with a generator of volatile refrigerant, a cooling-coil and a cooling-jacket exterior to said coil, the two cooling devices being arranged to allow the gas to flow out between them, while the steam accompanying it will be condensed and precipitated, substantially as set forth.

2. In a refrigerating-machine, a generator provided with an extension C of lesser diameter, in combination with a cooling-jacket C', applied to this extension only, an inlet and outlet for water to circulate through the said jacket, and a coil for cooling-water arranged within the said extension only, this extension communicating at bottom with the interior of the said generator and having in its top an outlet for gas, substantially as set forth.

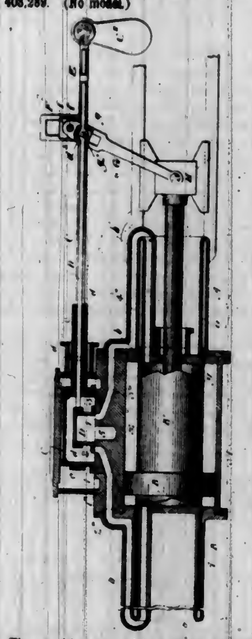


481,147. APPARATUS FOR DRYING OR CREMATING GARBAGE AND FECAL MATTER. JOHN H. PARKE, Philadelphia, Pa., assignor of one-half to Oscar D. McClellan, same place. Filed Sept. 29, 1891. Serial No. 407,135. (No model.)

Claim.—1. The within-described apparatus for cremating or drying garbage or fecal matter, the same consisting of a casing having an inlet and outlet for hot air or products of combustion, a grated hopper for receiving the garbage or fecal matter, and one or more trays or pans beneath said hopper, said hopper and trays being interposed in the path of the hot air or products of combustion in its passage through the casing, substantially as specified.

2. The within-described dry closet, the same consisting of a casing having inlet and outlet for hot air or products of combustion, a grated hopper contained within said casing, means for causing the hot air or products of combustion to circulate around said hopper, and a seat containing a chamber for disinfecting material, substantially as specified.

481,148. COMBINED INTERCEPTING AND REDUCING VALVE. JOHN PLAYER, Dunkirk, N. Y., assignor to the Brooks Locomotive Works, same place. Filed Apr. 14, 1892. Serial No. 429,145. (No model.)



Claim.—1. A combined intercepting and reducing valve structure having a passage from the high to the low pressure cylinder, and a live-steam inlet to the low-pressure cylinder, in combination with a reducing-valve having a passage therethrough, and an intercepting-valve in line with the reducing-valve and having on its back a plunger adapted to the passage in the intercepting-valve, substantially as set forth.

2. The combination, with the receiver pipe or passages of a compound locomotive or other engine, of the live-steam pipe connecting with the pressure-regulating-valve casing, the regulating-valve casing, the regulating-valve, its seat, its stop, its hollow steam-passages, the intercepting-valve casing having its balancing-chamber connected to the atmosphere, the intercepting-valve with its annular balancing device, and steam-passages working outside the pressure-regulating

valve and within its own casing and having one seat close to the opening in the receiver-pipe, with another seat closing against the regulating-valve and working within a cut-off chamber in said valve, as and for the purpose set forth.

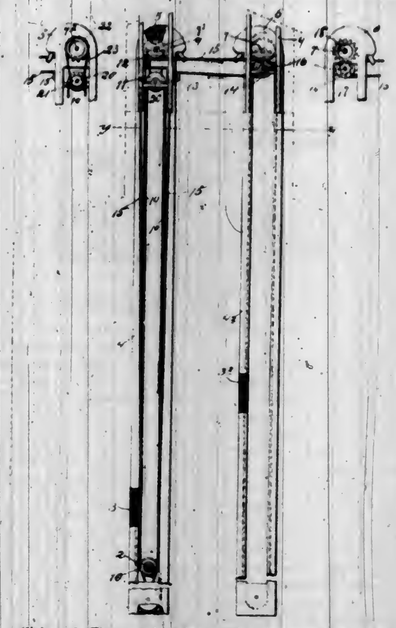
3. The combination, with the receiver pipe or passages of a compound locomotive or other engine, of the intercepting-valve having an annular balancing device, steam-passages, and interior seat, with a pressure-regulating valve working within and seating itself against said valve at its larger extremity and having its smaller extremity seating itself in its casing against the high-pressure steam and its travel regulated by a stop, said high-pressure end of this stop being connected to a piston working in a suitable dash-pot attached to the exterior of its casing, substantially as and for the purpose set forth.

481,149. COMPOUND LOCOMOTIVE. HARRY C. REAGAN, Jr., Philadelphia, Pa., assignor of two-thirds to Edward F. Peacock, same place, and Thomas Pray, Jr., New York, N. Y. Filed Aug. 21, 1891. Serial No. 403,289. (No model.)

Claim.—1. The combination, with a main admission-valve controlled by the eccentric, of an auxiliary exhaust-valve actuated by a varying connection between the cross-head and the valve-rod, whereby the movement of the auxiliary valve is delayed during the first part of the stroke of the eccentric in order to hold open the exhaust, substantially as described.

2. The combination, with a main admission-valve controlled by the eccentric, of an auxiliary exhaust-valve actuated by a lever connected with the cross-head and having a varying leverage on the auxiliary-valve rod, substantially as described.

3. The combination, with an engine-cylinder having a main valve controlling the admission of live steam and an auxiliary valve controlling the exhaust, of a rocker-arm, a rod connecting said arm with the main valve, a rod attached to the auxiliary valve, and a lever having a vertically-movable fulcrum connected with the main-valve rod, said lever being also connected with the auxiliary-valve rod and actuated by the cross-head, substantially as described.



4. The combination, with a main admission-valve and an auxiliary exhaust-valve, of a main-valve rod connected with the eccentric and having a slotted lug F, an auxiliary valve rod, a slotted lever fulcrumed on a block sliding in the lug F and connected with the cross-head, and a block sliding in the slot in the lever and coupled to the auxiliary-valve rod, substantially as described.

5. The combination, with two independent valves, one of which has a valve-rod driven by the eccentric, of a lever pivoted to the cross-head at one end and having its other end connected with the valve-rod by a vertically-movable fulcrum and a second valve-rod attached to the other valve and connected with the lever by a sliding joint maintained at a constant level, whereby the distance of said joint from the fulcrum of the lever is constantly changing throughout the stroke, substantially as described.

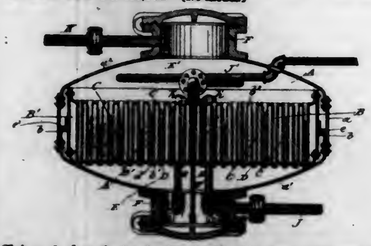
6. The combination, with the main valve, of the rod C, having the slotted leg F, containing the sliding block *f*, the slotted lever G, carrying the sliding block *g*, one end of the lever being fulcrumed on the block *f* and the other end jointed to the cross-head H, the auxiliary valve, and the valve-rod D', connected with the block *g*, substantially as described.

7. The combination, with the cylinder A, having high-pressure steam-passages 1 3 and low-pressure steam-passages 2 4, of pipes I, joining said passages, stop-valves *i* in said pipes, a rod I', adapted to operate both valves simultaneously, substantially as described.

481,150. ELEVATOR-BELT DRIVE. DIGHTON A. ROBINSON, Minneapolis, Minn. Filed June 26, 1891. Serial No. 397,624. (No model.)

Claim.—1. The combination, with elevator-belts occupying transversely-opposite positions one to the other, of head and boot pulleys therefor, said boot-pulleys for said belts arranged in the lower part of the building, a main longitudinal shaft arranged in the lower part of the building, means for driving the same, short counter-shafts arranged in connection with said head-pulleys, drive-pulleys arranged on each counter-shaft, corresponding drive-pulleys arranged on said main shaft, said boot and drive pulleys being secured on separate shafts, separate drive-belts passing from the latter to each counter-shaft drive-pulley, and means for reversing the operating direction of one of said belts, whereby said elevator-belts are caused to run in opposite directions, substantially as described.

2. The combination, with elevator-belts, of head and boot pulleys therefor, counter-shafts in connection with said head-pulleys, a main shaft located in the lower part of the building and in closer proximity to one of said belts than to the other, drive-pulleys on said shafts, drive-belts passing over the same, one of said belts operating over idlers adapting the same to be carried across the building at an angle to the main portion of the belt, and means for reversing the direction of rotation of one of said belts with respect to its elevator-belt, whereby said elevator belts are operated in opposite directions, substantially as described.

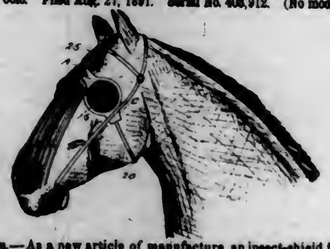


3. The combination, with two elevator-belts arranged transversely opposite one another, head and boot pulleys therefor, a main shaft passing between the legs of one of said elevator-belts, counter-shafts arranged between the same and in proximity to said head-pulleys, drive-pulleys on said counter-shafts and said main shafts, drive-belts passing over corresponding sets of said pulleys, one of said drive-belts passing up between the legs of the elevator-belt, embracing said main

shaft and connected to the head-pulley of said elevator by a sprocket-wheel and chain-belt device, and a gear-and-pinion connection with the other elevator-belt head-pulley for the other drive-pulley, substantially as described.

4. The combination, with the elevator-belts, of head and boot pulleys therefor, counter-shafts in connection with said head-pulleys, a main-line shaft arranged in the lower story of the building and embraced between the sides or legs of one of said elevator-belts, idlers arranged in the top of the building, and rope drive-belts passing over the same and grooved pulleys arranged on said main and counter shafts, substantially as and for the purpose specified.

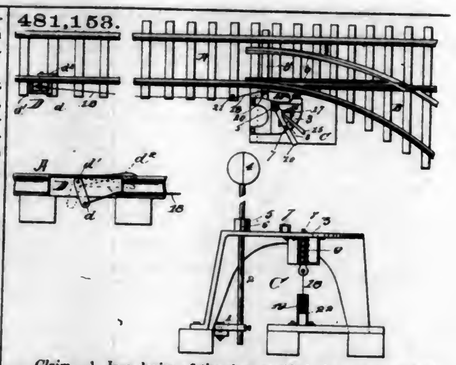
5. The combination, with the main shaft, of drive-pulleys thereon, clutches for connecting the same, elevator-belts, head and boot pulleys therefor, the pulleys 11 and 14, arranged on the shafts 20 and 16, the idlers 12 and 13, the sprockets 21 and 22, the sprocket-chain 23, passing over the same, the pinion 17 and gear-wheel 18, arranged as described, and the rope drive-belts 15 and 19, substantially as and for the purpose specified.



481,151. DEVICE FOR HEATING LIQUIDS. ALEXANDER SELKIRK, Albany, assignor, by mesne assignments, to Robert Whitehill and Daniel Waring, Newburg, N. Y. Filed May 31, 1889. Renewed Jan. 28, 1892. Serial No. 419,544. (No model.)

Claim.—1. In a device for heating liquids, the combination, with a receptacle or vessel for containing steam or other known heating agent, of two or more tubes or pipes contained within the chamber of said steam-receptacle and connecting with oppositely-located liquor-chambers, which are situated exterior to said receptacle and provided with inlet and outlet pipes or openings, and the plugs D, provided each with perforations *d* and secured in said tubes, substantially as and for the purposes set forth.

2. In a device for heating liquids, the combination, with the heads a' and b', having a liquor-chamber between, heads a^2 and b^2, also having between them a liquor-chamber, a cylinder which, together with heads b' and b^2, forms a steam-chamber which has provision for receiving steam, and a series of tubes contained within the said steam-chamber and having their opposite ends communicating with said liquor-chambers, of the plugs D, having in them perforations *d* and secured within said tubes, and provision for the inlet and discharge of liquor, substantially as and for the purpose set forth.

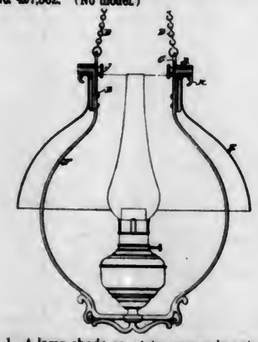


481,152. EYE-PROTECTOR FOR HORSES. JOHN STEELE, Denver, Colo. Filed Aug. 27, 1891. Serial No. 403,912. (No model.)

Claim.—As a new article of manufacture, an insect-shield for animals, consisting of a strip 10, of flexible material, provided with apertures having perforated or foraminated concavo-convex coverings, and a downwardly-extending flexible piece 30, formed integral with or attached to part 10 and consisting of strings adapted to protect the nose of the animal, and suitable means for attaching the device to the head, substantially as described.

481,153. SAFETY-SWITCH. MCDONALD M. TURNER and IRBY H. CRAFT, Atlanta, Ga. Filed Aug. 17, 1891. Serial No. 402,989. (No model.)

481,153.

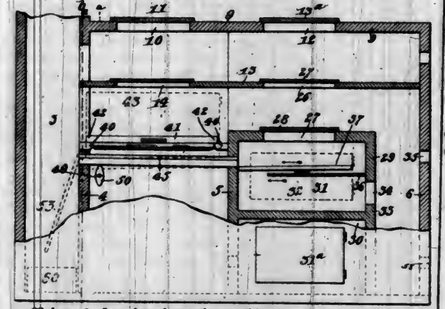


Claim.—1. In a device of the class specified, the combination of the upright crank-shaft, an operating-lever pivoted thereon and having a sliding bolt engaging said shaft on bringing it into forcible contact therewith, a lever pivoted on said operating-lever having its short arm bearing on said sliding bolt when depressed, and means for holding said lever depressed when the switch is set, for the purpose specified.

2. In a device of the class specified, the combination of the gate-rails held normally closed to the main track, the crank-shaft connected therewith, a main lever loosely pivoted upon said shaft, a pin set in said lever and adapted to forcibly contact with said shaft but held normally out of contact therewith, a lever pivoted to said main lever and connected with said pin and operating to press said pin into engagement with the shaft, a segment carried on the frame, a projection adapted to engage the main lever, and a spring-pressed latch adapted to engage and hold said lever stationary relative to the main lever and to disengage same on its depression, substantially as and for the purpose specified.

3. In a device of the class specified, the gate-rail and a tie-bar connecting same, a pulley secured to each of the two adjacent ties, a pulley on said tie-bar offset from between said pulleys on the ties, a rope passing in contact with said pulleys, and a depression-lever connected to said rope and operating to strengthen same upon its depression by increasing its tension, substantially as and for the purpose specified.

481,154. LAMP-SHADE SUPPORT. JOSEPH E. BONNER, Ansonia, Conn., assignor to Wallace & Sons, same place. Filed Apr. 2, 1892. Serial No. 427,562. (No model.)

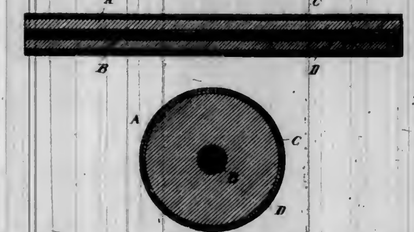


Claim.—1. A lamp shade or globe supporting clamp device consisting of a body-piece adapted in construction and provided with means for attachment to a lamp-harp and to suspension connections, as shank B and eye C, and a jaw adjustable on the body of the clamp and adapted to engage and support a lamp shade or globe, substantially as and for the purpose set forth.

2. In combination in a clamp for supporting a lamp-shade, a body-piece provided with means of attachment to a lamp-harp and to suspension connections, as by shank B and eye C, a jaw movably mounted on the head of the clamp and adapted to engage and support a lamp-shade, and a screw rotatably fixed on the clamp and engaging the said jaw and adapted to adjust the same, substantially as and for the purpose set forth.

3. In combination in a clamp for supporting a lamp-shade, the recessed head A, the adjustable shade-engaging jaw-block and jaw H L, the shank B, adapted to be secured to a lamp-harp, and a suspension attachment, as eye C, constructed and operating substantially as and for the purpose set forth.

481,155. DRY CLOSET. JOHN S. ROSS, Denver, Colo. Filed Dec. 13, 1890. Serial No. 374,642. (No model.)



Claim.—1. In a dry closet, the combination, with walls forming a vault, of an apertured cover therefor, a perforated removable pan contained in the said vault below the aperture in the said cover, a furnace contained in one end of the said vault and a stack connected with the other, a combined smoke and urine trough located below the said perforations in the pan and having its opposite ends above the base of the stack and furnace, respectively, and means whereby the elevation of one of the ends of the trough may be changed, substantially as described.

2. In a dry closet, the combination, with a stack, of a furnace connected therewith, a urine-trough having its opposite ends located above the base of the said stack and above the furnace, and means whereby either of the said ends may be caused to be the higher, as may be desired.

3. In a dry closet, the combination, with a removable perforated pan, of a combined smoke and urine trough located below the perforations in the said pan, a stack and a furnace contiguous to the opposite ends of the said trough, evaporating-pans located in the said stack and furnace below the ends of the trough, and a rod having an enlargement thereon below the said trough and adapted to alter the inclination thereof, as described.

REISSUES.

11,259. LEAD PENCIL OR OTHER ARTICLE OF FIBROUS MATERIAL. BYRON B. GOLDSMITH, New York, N. Y. Filed May 27, 1892. Serial No. 433,389. Original No. 447,310, dated Mar. 3, 1891.

Claim.—1. As an improved manufacture, an article having a wooden or other fibrous absorbent surface provided with a coat or coats of pyroxyline varnish and a superimposed coat or coats of ordinary gloss-varnish, substantially as described.

2. As an improved manufacture, an article of wood or of other fibrous absorbent material provided with a tinted coat or coats of pyroxyline varnish and a superimposed coat or coats of ordinary varnish, substantially as described.

3. As an improved manufacture, an article of wood or of other fibrous absorbent material having a polished and tinted coat or coats of pyroxyline varnish upon its exposed surface and a superimposed coat or coats of ordinary varnish upon the pyroxyline, substantially as described.

4. As an improved manufacture, an article of wood or of other fibrous absorbent material having a polished coat or coats of pyroxyline upon its exposed surface and a polished coat or coats of ordinary varnish upon the pyroxyline, substantially as described.

5. As an article of manufacture, a lead-pencil having a coat of pyroxyline upon its exposed surface and a coat of ordinary varnish upon the pyroxyline, substantially as described.

6. As an article of manufacture, a lead-pencil having a tinted coat of pyroxyline upon its exposed surface and a protective coating of ordinary varnish upon the pyroxyline, substantially as described.

7. As an article of manufacture, a lead-pencil having a polished and tinted coat of pyroxyline upon its exposed surface and a protective coating of ordinary varnish upon the pyroxyline, substantially as described.

8. As an article of manufacture, a lead-pencil having a polished coat of pyroxyline upon its exposed surface and a polished coating of ordinary varnish upon the pyroxyline, substantially as described.

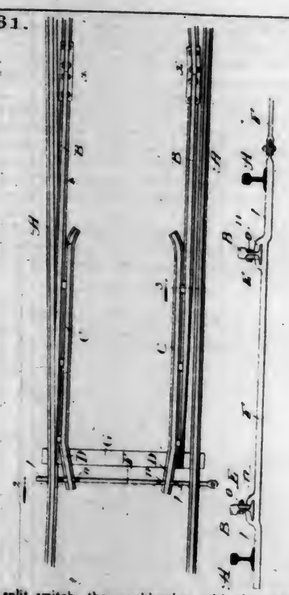
11,260. THILL-COUPLING. WILLIAM H. HANNAN, Syracuse, N. Y., assignor to William Herbert Hannan, same place. Filed Sept. 2, 1891. Serial No. 404,565. Original No. 456,117, dated July 14, 1891.

Claim.—1. The combination, with the draft-eye composed of a fixed section and a movable section, of a spring-arm secured at one end and free at the other, a cam-lever pivoted to the free end of said spring-arm, and a tie attached to the cam-lever outside of its fulcrum and connecting the cam-lever with the movable section of the draft-eye, whereby the spring-arm exerts a constant pressure upon the movable section and also holds the cam-lever yieldingly in a locked position, substantially as set forth.

2. The combination, with the axle, of a draft-eye composed of a forwardly-projecting fixed section and a movable section hinged to the front end of the fixed section, a spring-arm secured to the axle and projecting forwardly therefrom, a cam-lever hinged to the free front end of the spring-arm, and a tie attached to the cam-lever outside of its fulcrum and connecting the cam-lever with the hinged section of the draft-eye, substantially as set forth.

3. In combination with the axle-clip, coupling-pin, fixed lower draft-eye section *b*, and the upper eye-section *b'*, hinged to the front of the fixed section, the spring-arm *c*, secured at one end to the clip-tie and extending from the rear thereof forward underneath the same, the cam-lever *d*, hinged to the free end of said spring-arm, and the bail *e*, connected to the cam-lever and adapted to engage the rear end of the hinged eye-section, substantially as set forth.

4. The combination, with the front axle and thill-iron, of the clip-tie C, elongated in the direction lengthwise of the axle and formed at the center of its length with the draft-eye section *b*, axle-clips C C, secured to the two ends of said clip-tie, the draft-eye section *b'*, hinged to the eye-section *b*, the spring-arm clamped between the central portion of the clip-tie and extending from the rear of the clip-tie underneath the same and forward therefrom, the cam-lever *d*, hinged to the free end of said spring-arm, and the bail *e*, connected to said cam-lever and adapted to bear on top of the rear end of the hinged draft-eye section, substantially as described and shown.



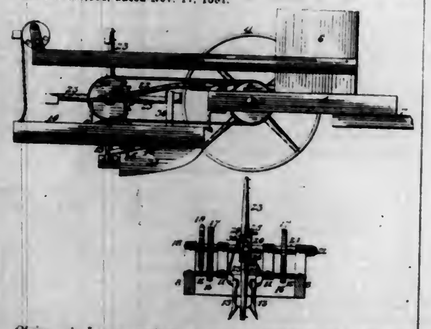
11,261. RAILWAY-SWITCH. AXEL A. STROM, Austin, assignor to the Strom Manufacturing Company, Chicago, Ill. Filed July 22, 1892. Serial No. 440,940. Original No. 457,904, dated Aug. 18, 1891.

Claim.—1. In a split-switch, the combination, with the point-rails, of reinforcing-bars secured to and extending along their inner sides and having their bearing-bases laterally beyond those of the point-rails, substantially as and for the purpose set forth.

2. In a split switch, the combination, with the point-rails, of gage-adjusting horizontally-inward-projecting sections inclining inward from the point-rails and a tie-bar connecting the point-rails at and adjustable on the said sections lengthwise thereof, substantially as and for the purpose set forth.

3. In a split switch, the combination, with the point-rails, of gage-adjusting horizontally-inward-projecting sections inclining toward each other from the point-rails and provided with bolt-holes, perforated plates fitting against the sides of the said sections and bolted thereto, and a tie-bar connecting the point-rails at the said sections and held by the said plates, substantially as and for the purpose set forth.

11,261.



4. In a split switch, the combination, with the point-rails, of guard-rail-shaped reinforcing-rails bolted to and extending along the inner sides of the point-rails and spacers interposed between the point-rails and reinforcing-rails, substantially as and for the purpose set forth.

5. In a split switch, the combination, with the point-rails, of reinforcing-bars secured to the inner sides of said rails and extending beyond the points thereof and a tie-bar connecting the point-rails at the said extensions, substantially as described.

6. In a split switch, the combination, with the point-rails B, of guard-rail-shaped reinforcing-rails C, bolted to and extending along the inner sides and beyond the points of the rails B, bent sections D at the ends of the reinforcing-rails, having holes *q*, perforated plates E, bolted to the said sections through holes *q*, and a tie-bar F, connecting the point-rails at the sections D and engaged by the adjustable plates, substantially as and for the purpose set forth.

11,262. PLANT-TRANSPLANTING MACHINE. GILBERT S. GUNDERSEN, Beloit, Wis. Filed May 21, 1892. Serial No. 433,927. Original No. 463,190, dated Nov. 17, 1891.

Claim.—1. In a transplanting-machine consisting of a rear and front section having a hinge-joint connection, the front section supported upon carrying-wheels and carrying a water-tank, the rear section carrying a furrow-opener, and the plant carrying and watering devices, and a connection between the water-tank and watering device.

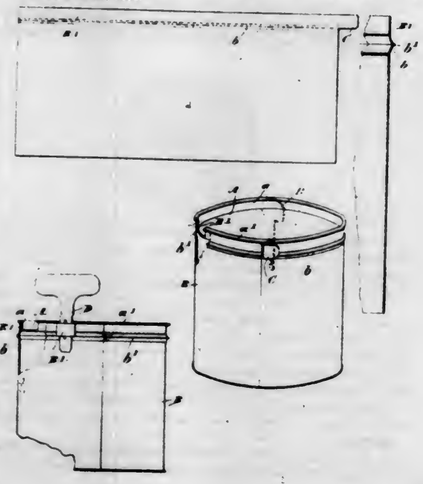
2. In a transplanting-machine, the combination of a shaft, a crank on one end thereof, an arm working on a crank-pin at the end of said crank, and an oblique packer-plate at the end of said arm, substantially as described.

3. In a transplanting-machine, the combination, with a packer-arm, of a yielding and resilient connection between said packer-arm and the frame of the machine, substantially as described.

4. In a transplanting-machine, the combination, with a packer-arm, of a two-part arm, one end whereof is pivotally connected to the packer-arm and the other to the frame of the machine, and a spring or yielding connection between the two parts of said arm, substantially as described.

5. In a transplanting-machine, the combination of a revolving tubular arm, jaws at the end of said arm adapted to hold the plant, and a spring adapted to close said jaws upon the plant, substantially as described.

6. In a transplanting-machine, the combination of a revolving tubular arm, jaws at the end of said arm adapted to hold the plant, a spring adapted to close said jaws upon the plant, and means for automatically opening said jaws at the proper position of the revolving arm, substantially as described.



7. In a transplanting machine, the combination, with the tank and hollow hub and water-pipe connection, of a revolving tubular arm adapted to convey water to the plant, a spring-operated device for closing the supply of water, and means for automatically opening said supply against said spring at the proper position of the revolving arm, substantially as described.

11,263. IRIDESCENT STONE OR BODY. JOHN JACOBSON, Boston, Mass. Filed Mar. 31, 1892. Serial No. 427,302. Original No. 467,579, dated Jan. 26, 1892.

Claim.—As a new article of manufacture, the herein-described stone or body having its surface composed of facets, and one or more of said facets being provided with lines equidistant, of uniform thickness, and of sufficient number to the inch to produce iridescence, substantially as described.

11,264. TIN CAN OR RECEPTACLE. WILLIAM PRATT, Montreal, Canada. Filed July 11, 1892. Serial No. 439,732. Original No. 471,736, dated Mar. 29, 1892.

Claim.—1. A tin can or receptacle the cover of which is formed with a peripheral rim shaped in part to fit within the body and to rest upon the edge of same, and the body having an integral detachable connecting strip, to which the inserted portion of such cover is soldered, and means for detaching said strip, as set forth.

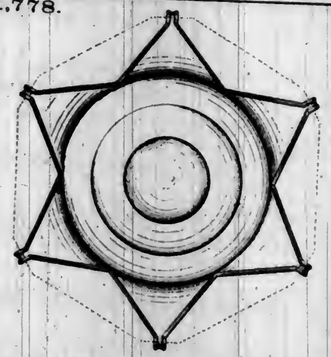
2. A tin can or receptacle the cover of which is formed with an upwardly-projecting peripheral rim shaped in part to fit within the body and to rest upon the edge of same, the body having an integral detachable connecting strip, to which the inserted portion of such cover is soldered, and said strip having an extended free end to furnish a holdfast for its removal.

3. A tin can or receptacle the cover of which is formed with a peripheral rim shaped in part to fit within the body and to rest upon the edge of same, and after being soldered to the body is removable therefrom and capable of reuse by the removal from cover and body of a detachable connecting strip provided by an outwardly-pressed V-shaped beading or depression in such body near its upper edge, adapted to be severed at its apex to allow the removal of said strip and present an outwardly-flaring edge for the easy reinsertion of said cover, as set forth.

4. A tin can or receptacle having upon its perimeter a beading, the cross-section of which is of an obtuse or wide V-shaped form in the main with an extended acute apex, for the purposes set forth.

DESIGNS.

21,777. SPOON. JAMES C. BADGER, Concord, N. H. Filed June 10, 1892. Serial No. 436,271. Term of patent 3½ years.



Claim.—The design for a spoon, substantially as shown and described.

21,778. CARRIAGE-LAMP. MARCUS L. DE VOURNEY, Newark, N. J. Filed Feb. 11, 1892. Serial No. 421,111. Term of patent 7 years.

21,778.

Claim.—The design for a carriage-lamp, substantially as shown and described.

21,779. BADGE. LOUIS REICHERT, Scranton, Pa. Filed July 2, 1892. Serial No. 438,830. Term of patent 3½ years.

Claim.—The design for a badge, substantially as described and shown.

21,780. CARRIAGE-STEP. WILLIAM R. WILSON, Columbus, Ohio. Filed June 4, 1892. Serial No. 435,581. Term of patent 3½ years.

Claim.—The design for a carriage-step, as herein shown and described.

TRADE-MARKS

REGISTERED AUGUST 16, 1892.

21,604. SNUFF. BRUTON & CONDON, Nashville, Tenn. Filed June 20, 1892.

Essential feature.—The representation of a growing plant surmounted by a sailing-vessel, a plow, and a sheaf of grain inclosed within the outline of a shield, above which is festooned a spray of vine hanging low on either side and surrounding the letters "B S S." Used since July, 1891.

21,605. FLANGE-PACKINGS. ALFRED WELLS CASE, Highland Park, Conn. Filed June 20, 1892.

ASTAFALTA

Essential feature.—The word "ASTAFALTA." Used since June 20, 1892.

21,606. CIGARS AND CIGARETTES. FOSTER HILSON COMPANY, New York, N. Y. Filed July 8, 1892.

The Hoffman House Bouquet

Essential feature.—The words "THE HOFFMAN HOUSE BOUQUET" and the representation of a satyr surrounded by nymphs. Used since June, 1885.

21,607. PREPARATION FOR SODA-WATER. WILLIAM A. HEINSEIMER, Havana, Ill. Filed June 10, 1892.

LA

Essential feature.—The word "LA." Used since May 1, 1892.

21,608. BISCUITS, CRACKERS, WAFERS, CAKES, AND SIMILAR ARTICLES. HITCHCOCK & Co., Pittston, Pa. Filed May 26, 1892.

21,608.

TID-BIT

Essential feature.—The words "TID-BIT." Used since April 14, 1891.

21,609. BITTER WINE. JOSEPH KOLIN, Chicago, Ill. Filed May 2, 1892.

HOŘKÉ VÍNO

Essential feature.—The representation of a bunch of grapes bearing the monogram of the letters "T K" and the words "HOŘKÉ VÍNO." Used since October 1, 1891.

21,610. VARNISHES AND JAPANS. THE NATIONAL VARNISH COMPANY, New Haven, Conn. Filed June 28, 1892.

National

Essential feature.—The word "NATIONAL." Used since December 16, 1891.

21,611. BATTERY COMPOUNDS. THE WRIGHT UNIVERSAL ELECTRIC COMPANY, New York, N. Y. Filed June 30, 1892.

21,611.

ELECTRIC SAND

Essential feature.—The words "ELECTRIC SAND." Used since June 1, 1892.

21,612. BLOTTING-PAPER. EATON, DIKEMAN & Co., Lee, Mass. Filed July 20, 1892.

COLUMBIAN

Essential feature.—The word "COLUMBIAN." Used since December, 1891.

21,613. BLOTTING-PAPER. EATON, DIKEMAN & Co., Lee, Mass. Filed July 20, 1892.

MAGNET

Essential feature.—The word "MAGNET." Used since December, 1891.

21,614. OIL FABRICS. LYON, HALL & Co., Baltimore, Md. Filed July 14, 1892.

LANCASTER.

Essential feature.—The word "LANCASTER" and the representation of a shield bearing the figures of three lions, a crown surmounting the shield, and a branch on each side. Used since May, 1889.

21,615. LAXATIVE. PHILIP STEINHART, Los Angeles, Cal. Filed Mar. 20, 1891.

Essential feature.—The words "CALIFORNIA FRUIT SYRUP" and the pictorial representation of a cluster or collection of fruit, consisting of dates, grapes, peaches, and prunes, together with a cactus branch and palm. Used since July 1, 1890.

21,616. REMEDY FOR RHEUMATISM. HERMAN SCOTT SEARLE, Tacoma, Wash. Filed Jan. 29, 1891.

S. I. R. C.

Essential feature.—The letters "S. I. R. C." Used since July 1, 1890.

21,617. LOTION FOR THE COMPLEXION. SYLVAN TOILET CO., Port Huron, Mich. Filed Apr. 13, 1892.

BALM OF LILYS

Essential feature.—The words "BALM OF LILYS." Used since September, 1888.

21,618. TOILET SOAP. SYLVAN TOILET CO., Port Huron, Mich. July 18, 1892.

SATIN-SKIN

Essential feature.—The compound word "SATIN-SKIN." Used since April 1, 1891.

21,619. WATERPROOF COLLARS AND CUFFS. THE CELLULOID COMPANY, Newark, N. J. Filed July 12, 1892.

WORLD'S FAIR

Essential feature.—The words "WORLD'S FAIR." Used since May 1, 1892.

21,620. LAGER-BEER. FRED KRUG BREWING COMPANY, Omaha, Nebr. Filed Mar. 15, 1892.

Essential feature.—The representation of a plain glass of beer grasped by a left hand and all inclosed in a circle. Used since November 15, 1880.

21,621. CHEESE. MCCORD, BRADY COMPANY, Omaha, Nebr. Filed July 18, 1892.

PLYMOUTH

Essential feature.—The word "PLYMOUTH" and a monogram composed of the letters "H S C." Used since June 1, 1892.

21,622. EDGE TOOLS. HARRY C. MARSHALL, New York, N. Y. Filed July 21, 1892.

RIVERSIDE TOOL CO.

Essential feature.—The words "RIVERSIDE TOOL CO." Used since November 1, 1891.

21,623. SAWS OF ALL KINDS. E. C. ATKINS & COMPANY, Indianapolis, Ind., Memphis and Chattanooga, Tenn., and Minneapolis, Minn. Filed Dec. 12, 1891.

NEEDLE

Essential feature.—The word "NEEDLE." Used since May, 1890.

21,624. ENAMELED SHEET-METAL WARE. HERMAN AICH, New York, N. Y. Filed July 21, 1892.

ONYX

Essential feature.—The word "ONYX." Used since May 1, 1892.

21,625. WATCHES AND PORTABLE CLOCKS. WEBSTER C. BALL, Cleveland, Ohio. Filed July 22, 1892.

B OF LF

Essential feature.—The letters and word "B OF L F." Used since July 1, 1892.

21,626. WATCHES AND PORTABLE CLOCKS. WEBSTER C. BALL, Cleveland, Ohio. Filed July 22, 1892.

B OF RT

Essential feature.—The letters and word "B OF R T." Used since July 1, 1892.

21,627. VEGETABLE FERMENT FOR THE MANUFACTURE OF WINES. FRANÇOIS CHAVAUTY, Paris, France. Filed June 18, 1892.

Essential feature.—The representation of an anchor. Used since June 1, 1892.

21,628. NOSE AND THROAT DOUCHE. W. C. DOWNEY & CO., Washington, D. C. Filed July 22, 1892.

FIRNOL

Essential feature.—The word "FIRNOL." Used since August 1, 1891.

21,629. MEDICATED COTTON. JAMES W. JOHNSON, New Brunswick, N. J., and New York, N. Y. Filed July 16, 1892.

21,629. LINTINE

Essential feature.—The word "LINTINE." Used since April 1, 1891.

21,630. MEDICATED COTTON. JAMES W. JOHNSON, New Brunswick, N. J., and New York, N. Y. Filed July 16, 1892.

-:-COTTONOID-:-

Essential feature.—The word "COTTONOID." Used since April 1, 1891.

21,631. COMPOUND FOR THE CURE OF RHEUMATISM AND RHEUMATIC GOUT. RICHARD T. LASHTER, New York, N. Y. Filed June 17, 1892.

Rheuma.

Essential feature.—The word "RHEUMA." Used since May 1, 1886.

21,632. PREPARED FOOD FOR ANIMALS. PRATT FOOD COMPANY, Philadelphia, Pa. Filed June 24, 1892.

Essential feature.—A seal bearing the picture in the foreground of a horse leaping a fence with cows and fowls standing about. Used since June, 1887.

21,633. PREPARED FOOD FOR POULTRY. PRATT FOOD COMPANY, Philadelphia, Pa. Filed June 24, 1892.

Essential feature.—The representation of a serrated seal bearing the words "PRATTS POULTRY FOOD." Used since June, 1887.

21,634. PREPARED POULTRY-FOOD. PRATT FOOD COMPANY, Philadelphia, Pa. Filed July 8, 1892.

Essential feature.—The representation of a rooster drawing a cart loaded with eggs upon which a hen is seated. Used since June, 1888.

21,635. DISINFECTING-PAPER. AUGUSTE PONSOT, Paris, France. Filed July 15, 1892.

A. Ponsot

Essential feature.—The fac-simile signature "ATE. PONSOT." Used since July, 1888.

21,636. BOOTS AND SHOES OF ALL KINDS. CHARLES A. RAYMOND, Boston, Mass., and New York, N. Y. Filed July 7, 1892.

21,636. Kumfurt

Essential feature.—The word "KUMFURT." Used since July 1, 1890.

21,637. BITTERS. ROBERT PICKETT BURWELL, Richmond, Va. Filed July 5, 1892.

BURGUNDY  BITTERS

Essential feature.—The representation of a square shield bearing three fleurs-de-lis associated with the words "BURGUNDY BITTERS." Used since June 15, 1892.

21,638. BEER. CONRAD SEIPP BREWING COMPANY, Chicago, Ill. Filed June 30, 1892.

Essential feature.—A circular disk bearing the device of a pair of scales placed upon and across a capital letter "S," formed of barley-heads and hop-leaves. Used since May 17, 1892.

21,639. WEARING-APPAREL, OUTER AND UNDER WEAR, BEDDING, AND THE MATERIALS OF WHICH THEY ARE MADE. DR. JAEGER'S SANITARY WOOLEN SYSTEM COMPANY, New York, N. Y. Filed July 21, 1892.

JAEGER SYSTEM

Essential feature.—The words "JAEGER SYSTEM." Used since April 19, 1887.

21,640. MEDICAL COMPOUND FOR EXTERNAL AND INTERNAL USE FOR SKIN AND BLOOD DISEASES. ELEANOR MCFARLAND, Columbus, Ohio. Filed May 27, 1892.

SAVED.

Essential feature.—The word "SAVED." Used since 1890.

21,641. LIVER-TONIC. HARVEY M. HENDERSON, Chicago, Ill. Filed June 20, 1892.

Essential feature.—The words "HENDERSON'S CALIFORNIA LIVER TONIC," with a disk bearing the words "HENDERSON'S STANDARD PREPARATIONS" and a monogram of the letters "H D H." Used since October 1, 1889.

21,642. SKIRT-FACINGS. MEYERHOF, MARX & SIMONSEN, Manchester, England. Filed July 22, 1892.

Amazon

Essential feature.—The word "AMAZON." Used since December 1, 1876.

21,643. UMBRELLAS AND PARTS THEREOF. SAMUEL FOX & COMPANY, Limited, Sheffield, England. Filed June 2, 1892.

CRUSADE

Essential feature.—The word "CRUSADE." Used since February, 1888.

21,644. TONICS. EUGENE SALBEY, Milwaukee, Wis. Filed June 30, 1892.

Essential feature.—The words "FRED MILLER'S MALTO-CREAM" and the representation of a fan like device formed of barley-heads joined at their bases by a hop-blossom. Used since May 14, 1892.

21,645. LEATHER BOOTS AND SHOES. SOLID OAK SHOE CO., Worcester, Mass. Filed Apr. 11, 1892.

Solid Oak

Essential feature.—The words "SOLID OAK" in script above an extended flourish. Used since January 10, 1892.

21,646. SHOES. CHARLES TREADWELL, St. Paul, Minneapolis, and Duluth, Minn., and West Superior and Ashland, Wis. Filed July 12, 1892.

Tread-Well

Essential feature.—The words "TREAD" and "WELL" separated by a hyphen. Used since March 27, 1885.

21,647. MEDICAL COMPOUNDS FOR THE CURE OF LUNG AND THROAT DISEASES. THE VAPO-CRESOLENE COMPANY, Stanley, N. J., and New York, N. Y. Filed July 23, 1892.

Vapo-Cresolene.

Essential feature.—The words "VAPO-CRESOLENE." Used since April 1, 1879.

21,648. LAMPS AND ACCESSORIES PERTAINING THERETO. THE CLARK BROS. LAMP, BRASS, AND COPPER COMPANY, New York, N. Y. Filed Apr. 30, 1892.

21,648.

U-TRENTON-S

Essential feature.—The word and letters "U-TRENTON-S." Used since July 24, 1891.

21,649. MEDICINAL SIRUP. WILLIAM H. WINSLOW, Pittsburg, Pa. Filed June 30, 1892.

SEMINOLE

Essential feature.—The word "SEMINOLE." Used since January 15, 1892.

THE NORRIS PETERS CO. PHOTO LITHO WASHINGTON D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE CHAMPNEY.

Decided June 13, 1892.

PATENTABLE IMPROVEMENT—WHAT IS.

Whenever in an art, machine, manufacture, or composition of matter a change, however apparently minute, is made which is not obvious and results in marked advantages, a patentable invention has been produced; and when such a change has remained unmade for a considerable time, in spite of inducements to make it by reason of its value, that is evidence approaching the conclusive that change was not obvious.

APPEAL from Examiners-in-Chief.

ART OF MAKING DIES.

Application of George F. Champney filed December 4, 1889, No. 332,533.

Messrs. Philipp, Munson & Phelps for the applicant.

SIMONDS, *Commissioner:*

This is an appeal from the decision of the Examiners-in-Chief denying patentable novelty to the following claims:

1. The process of manufacturing dies, which consists in causing the patrix to move at a high degree of speed and while so moving to strike the die-block, substantially as described.

2. The process of manufacturing dies, which consists in causing the patrix to move at a rate of twenty-five or more feet per second and while moving at such rate to strike the die-block, substantially as described.

3. The process of manufacturing dies, which consists in heating the die-block, protecting the heated die-block from the oxygen of the air, causing the patrix to move toward the die-block at the rate of twenty-five or more feet per second, and exposing the die-block to the patrix at or about the moment of impact, substantially as described.

4. The method of manufacturing dies, which consists in heating a die-block and forming an impression in the heated die-block by the impact of a patrix moving at a high degree of speed, substantially as described.

5. The method of manufacturing dies, which consists in heating a steel or iron and steel die-block and forming an impression in the heated die-block by the impact of a patrix moving at the rate of twenty-five or more feet per second, substantially as described.

6. The method of manufacturing dies, which consists in preparing a suitable die-block, placing the same under a hammer to which the patrix is attached, and dropping the hammer upon the die from an elevation of ten or more feet, substantially as described.

7. The method of manufacturing dies, which consists in heating the die-block, placing it under a hammer to which the patrix is attached, securing it against distortion under the blow of the hammer, and dropping the hammer upon the die-block from such an elevation that when the patrix strikes the die-block it is moving at a high degree of speed, substantially as described.

8. The method of manufacturing dies, which consists in casting the patrix in a suitable mold, constructing of suitable metal, as steel, a solid die-block to receive the impression of the patrix, heating the die-block, causing the patrix to move at a high rate of speed, and while so moving to strike the die block, substantially as described.

9. The method of manufacturing dies, which consists in casting the patrix in a suitable mold, constructing of suitable metal, as steel, a solid die-block to receive the impression of the patrix, heating the die-block, causing the patrix to move at the rate of twenty-five or more feet per second, and while so moving to strike the die-block, substantially as described.

10. The method of manufacturing dies, which consists in casting the patrix in a suitable mold from iron, (including therein steel and iron mixed with steel,) constructing a solid die-block of suitable metal or steel to receive the impression of the patrix, heating the die-block, protecting the surface of the die-block from oxidation while hot, causing the patrix to move at the rate of twenty-five or more feet per second, and while so moving to strike the die-block, substantially as described.

11. The method of manufacturing dies, which consists in preparing a suitable die-block, placing the same under a hammer to which the patrix is attached, dropping the hammer upon the die from such an elevation that when the patrix strikes the die-block it is moving at a high rate of speed, and arresting the descent of the hammer after its rebound, substantially as set forth.

12. The method of manufacturing dies, which consists in preparing a die-block of suitable metal, as steel, heating it, placing it under a hammer, affixing the patrix to the hammer detachably, as by cement, causing the hammer to drive the patrix into the die-block, the connection between the patrix and the hammer being broken by the shock of impact, and permitting the patrix to remain in the die, so as to prevent access of air to the heated surface, substantially as described.

13. The method of manufacturing dies, which consists in preparing a die-block of suitable metal, as steel, heating it, placing it under a hammer, affixing the patrix to the hammer detachably, as by plaster-of-paris, causing the hammer to drive the patrix into the die-block, the connection between the patrix and the hammer being broken by the shock of impact, and permitting the patrix to remain in the die, so as to prevent access of air to the heated surface, substantially as described.

14. The method of manufacturing steel dies, which consists in heating a steel die-block, protecting the heated die-block from the oxygen of the air, causing the patrix to move toward the die-block at a high rate of speed, and exposing the die-block to the patrix at or about the moment of impact, substantially as described.

15. The method of manufacturing dies, which consists in heating a steel die-block, preparing a patrix of a metal which is comparatively soft and easily worked, and causing the patrix to move at a high rate of speed and while so moving to strike the die block, substantially as described.

Applicant has a prior patent disclosing a process much the same as this, except that the patrix has not the "high degree of speed" specified in the claims. That prior patent mentions the use of a "drop-hammer," and as a drop-hammer was used in this art the patrix lacked the high degree of speed which is material to the practice of this process. Other references show drop-hammers having the high degree of speed mentioned; but they were not used, so far as the references show, for the practice of this process. When a process is under consideration, it is not necessarily or generally material that devices may have existed in the prior art by which the process could be practiced. (*Corning* v. *Burden*, 15 How., 252; *Cochrane* v. *Deener*, 11 O. G., 687; 94 U. S , 780.)

Whenever in an art, machine, manufacture, or composition of matter a change, however apparently minute, is made which is not obvious and which results in marked advantages the rule is that a patentable invention has been produced, and when the history of the art is such that the inducement to make the change is very great, by reason of its value, and the change remains unmade for a considerable time that is evidence approaching the conclusive that the change is not obvious. Applicant's improvement answers these t sts.

The decision of the Examiners-in-Chief is reversed, subject to the substitution of the claims which applicant presents by proposed amendment at the hearing,

together with an amendment to the specification, satisfactory to the Examiner in charge, which makes the minimum speed of the patrix not less than twenty-five feet per second.

EX PARTE WOODWARD.

Decided May 12, 1892.

PRACTICE—COURSE OF APPEALS.

Where an applicant who has been in interference seeks, after a decision of priority in his favor, to amend his claims, and the Examiner rejects his amendment as covering matter which applicant has claimed too late, *Held* that the question thus raised is one which should be decided by the Examiners-in-Chief on appeal before it comes to the Commissioner.

ON petition.

LAMP.

Application of George W. Woodward filed September 7, 1889, No. 323,273.

Messrs. Gifford & Broun for the applicant.

FROTHINGHAM, *Assistant Commissioner:*

This is a petition taken from the action of the Examiner holding that—

claims 4, 5, 6, and 7 * * * cannot be entered, as they are made too late. If applicant had desired an interference on the subject-matter of these claims, he should have proceeded under Rule 109.

The petitioner requests that the Examiner be directed—

to enter said claims and pass upon them.

Upon examination of the record it appears that the above-entitled application has been involved in interference with the application of another person, which interference was decided in favor of the present applicant. In the letter declaring the interference it was stated that the issue involved the applicant's claims and—

the claims and case of Charles S. Upton, of New York.

After the decision on the question of priority applicant filed an amendment containing certain claims, numbered 3, 4, 5, 6, and 7.

It appears that claim 3 is substantially the issue of the said interference and that the other claims above mentioned are substantially the claims of Upton involved in said interference.

The Examiner refused to enter claims 4, 5, 6, and 7 for substantially the reason that applicant is estopped by reason of certain proceedings in the interference from inserting or prosecuting in this application any claim to the subject-matter as more broadly stated by Upton. The Examiner's action is therefore in effect a refusal to enter claims which were presumably considered patentable at the time the interference was instituted on the ground that applicant has now no right to make them.

Under all the facts in the case I am of the opinion that the question thus raised is one which should be decided by the Examiners-in-Chief on appeal before a decision is rendered thereon by the Commissioner. The Examiner is therefore directed to enter the claims and reject them for all reasons which in his opinion are grounds for rejection, if he is still of the opinion that Woodward is not entitled to them.

To the foregoing extent the petition is granted, and the case is remanded to the Examiner for action in conformity herewith.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—District of Massachusetts.

HEAD *v.* PORTER.

Decided December 3, 1891.

PATENT—INFRINGEMENT BY A PUBLIC OFFICER IN COURSE OF OFFICIAL DUTY.

Where an officer of the Government, having been sued for the infringement of patents in his official employment, pleads to the jurisdiction and alleges that the Government, being the real defendant, is a necessary party, *Held* that the plea must be overruled and that public employment is not a sufficient defense.

NATURE OF A PATENT RIGHT.

The rights secured to a patentee under his grant from the Government are a form of property in the enjoyment of which he is entitled to protection against all trespassers, including the Government.

Mr. William A. Hayes, 2d, for the complainant.
Mr. Frank D. Allen for the defendant.

COLT, *J.:*

The plea in this case raises the single question of jurisdiction. The suit was originally brought by William S. Smoot, the complainant's intestate, against James G. Benton, an officer of the United States Army, in command of the National Armory at Springfield, Mass., charging him with infringement of two patents, dated, respectively, January 1, 1867, and August 27, 1867, for improvements in cartridge-retractors for breech-loading firearms. Subsequently the defendant died, and thereupon the complainant moved to amend his bill by substituting the present defendant, Porter, master armorer at the Springfield Armory. The amendment was allowed, reserving the right of the defendant to object.

The defendant appeared and without objections filed an answer in the case. The United States attorney, on behalf of Porter, urges this circumstance as tending to show that this suit is in substance, though not in form, against the United States; but I fail to see the force of this argument. The complainant on the death of Benton might have proceeded against his representatives; but he chose to sue the present defendant, who consents to be substituted for Benton. The suit therefore stands as if originally brought against Porter.

The defendant admits that since the date of the patents and before the filing of the bill he has superintended and still superintends the making of breech-loading firearms at the Springfield Armory, as the master armorer; but he alleges that all his acts in relation thereto have been done in obedience to specific orders from the Secretary of War and his superior officers, directing the construction thereof, and in no other way. In other words, his defense is that he has acted only as the agent of the Government and under its authority.

The subject-matter of this suit is a patent issued by the United States, and it became important at the outset to determine the nature of this grant. It has been authoritatively declared by the Supreme Court that the right of a patentee under Letters Patent was exclusive of the United States and that it stands on the same footing as other property. (*James* v. *Campbell*, 21 O. G., 337; 104 U. S., 356; *Hollister* v. *Benedict Manufacturing Co.*, 113 U. S., 59.) Assuming the allegations of the bill to be true, this is a suit where the property rights of an individual have been invaded by an officer or agent of the United States, acting under its direction, and the question is whether this court has jurisdiction in such a suit.

In cases where this general subject has come before the Supreme Court the proposition is admitted that the United States, as the sovereign power, cannot be sued without its consent. I need only cite on this point *United States* v. *Lee*, (106 U. S., 196;) but it is not to be inferred from this that this court has not jurisdiction in an action where an officer or agent of the United States is sued for property in his possession as such officer or agent or for injury to the person or property of another where the defense is that he acted under the orders of the Government.

In *United States* v. *Peters* (5 Cranch, 115) the United States District Court of Pennsylvania in an admiralty proceeding decided that the libelants were entitled to the proceeds of the sale of a vessel condemned as prize of war, which had come into the hands of David Rittenhouse as Treasurer of Pennsylvania. The district judge declined to enforce the decree against the representatives of Rittenhouse on the ground that the funds were held as the property of that State, and that as she could not be subjected to judicial process neither could the officer who held the money in her right. An application for a writ of mandamus to compel the district judge to enfore the decree was granted.

In *Meigs et al.* v. *McClung's Lessee* (9 Cranch, 11) the suit was for land on which the United States had a garrison and had erected a fort. The defendants were military officers in possession, and they insisted that no action could be brought against them because the land was occupied by the United States for the benefit of the United States and by their direction. The court held that the title being in the plaintiff, he might sustain his action.

Wilcox v. *Jackson* (13 Pet., 498) was a suit against officers of the United States to recover possession of land which had been in the possession of the Government for over thirty years. The Court do not consider the question whether such an action could be maintained, but proceed to decide the question of the plaintiff's title.

In *Osborn et al.* v. *Bank of the United States* (9 Wheat., 738) the State of Ohio had levied a tax upon a branch of the bank located in Ohio. One hundred thousand dollars was seized by Osborn, the Auditor of the State, and delivered to the Treasurer of the State. In a suit by the bank both were made parties defendant. Objections were raised to the jurisdiction of the court on the ground that the State of Ohio was the real party in interest; that the parties defendant were her officers, and that they were sued for acts done in their official capacity and in obedience to her laws. These objections were overruled.

Chief-Justice Marshall says, on page 842:

If the State of Ohio could have been made a party defendant, it can scarcely be denied, that this would be a strong case for an injunction. The objection is, that, as the real party cannot be brought before the court, a suit cannot be sustained against the agents of that party; and cases have been cited, to show that a court of chancery will not make a decree, unless all those who are substantially interested, be made parties to the suit. This is certainly true, where it is in the power of the plaintiff to make them parties; but if the person who is the real principal, the person who is the true source of the mischief, by whose power and for whose advantage it is done, be himself above the law, be exempt from all judicial process, it would be subversive of the best established principles to say that the laws could not afford the same remedies against the agent employed in doing the wrong, which they would afford against him could his principal be joined in the suit.

Again, he says:

The process is substantially, though not in form, against the State. * * * and the direct interest of the State in the suit as brought is admitted; and had it been in the power of the bank to make it a party, perhaps no decree ought to have been pronounced in the cause, until the State was before the court. But this was not in the power of the bank. * * * A denial of jurisdiction forbids all inquiry into the nature of the case. * * * It asserts that the agents of a State, alleging the authority of a law void in itself, because repugnant to the Constitution, may arrest the execution of any law in the United States.

Grisar v. *McDowell* (6 Wall., 363) was an action to recover possession of land brought against General McDowell as an officer of the United States. The land had been reserved for military purposes by the Government. The objection that this suit was brought against a military officer of the United States for property belonging to the United States and set apart for public use, and that therefore it was substantially a suit against the Government, was not passed upon by the court; but the court proceeded to determine the question of title as between the plaintiff and the Government.

Brown et al. v. *Huger* (21 How., 305) is a similar case.

In *Davis* v. *Gray* (16 Wall., 203) the State of Texas having made a grant of alternate sections of land along which a railroad should thereafter be located and the railroad having been located through it, a suit was brought against the Governor of the State and Commissioner of the Land Office, and they were enjoined from delivering patents of the sections of land which belonged to the railroad company. The objection to the jurisdiction of the court was disposed of on the authority of *Osborn* v. *Bank of United States.*

The court says:

Where the State is concerned, the State should be made a party if it could be done. That it cannot be done is a sufficient reason for the omission to do it, and the court may proceed to decree against the officers of the State in all respects as if the State were a party to the record. In deciding who are parties to the suit the court will not look beyond the record. Making a State officer a party does not make the State a party, although her law may have prompted his action and the State may stand behind him as the real party in interest. A State can be made a party only by shaping the bill expressly with that view, as where individuals or corporations are intended to be put in that relation to the case.

While this language is cited in support of the majority opinion of the Court in *United States* v. *Lee*, Mr. Justice Miller in that case says he is not prepared to admit that—

the Court can proceed against the officer in all respects as if the State were a party.

And in *Cunningham* v. *Macon & Brunswick R. R. Co.* (109 U. S., 446) the same eminent judge, speaking for a majority of the Court, declares that while the action of the court in *Davis* v. *Gray* has not been overruled—

it is clear that in enjoining the Governor of the State in the performance of one of his executive functions the case goes to the verge of sound doctrine, if not beyond it, and that the principle should be extended no further.

In the leading case of *United States* v. *Lee* (106 U. S., 196) the action was ejectment to recover the possession of lands to which the plaintiff, Lee, claimed title.

The defendants were in possession as officers of the Government. The Attorney-General suggested to the Court, without making the United States a party, that the property in controversy, known as "Arlington Cemetery," had been for more than ten years and now is held, occupied, and possessed by the Government, through its officers and agents, who are in the actual possession thereof as public property of the United States.

To sustain this defense, the Court held that it was necessary to show that the defendants were in possession under the United States by virtue of some valid authority, and the contrary appearing judgment was awarded to the plaintiff.

After reviewing the authorities Mr. Justice Miller says:

> This examination of the cases in this Court establishes clearly this result: that the proposition that when an individual is sued in regard to property which he holds as officer or agent of the United States, his possession cannot be disturbed when that fact is brought to the attention of the Court, has been overruled and denied in every case where it has been necessary to decide it, and that in many others where the record shows that the case as tried below, actually and clearly presented that defense, it was neither urged by counsel nor considered by the Court here. though, if it had been a good defense, it would have avoided the necessity of a long inquiry into plaintiff's title and of other perplexing questions, and have quickly disposed of the case.

Mr. Justice Miller then proceeds to discuss certain expressions in the opinion of the Court in *Carr* v. *United States*, (98 U. S., 433,) and he says:

> As these remarks were not necessary to the decision of the point then in question, as the action was equally inconclusive against the United States, whether the persons sued were officers of the Government or not, these remarks, if they have the meaning which counsel attribute to them, must rest for their weight as authority on the high character of the judge who delivered them, and not on that of the court which decided the case. That the United States are not bound by a judgment to which they are not parties, and that no officer of the Government can, by defending a suit against private persons, conclude the United States by the judgment, was sufficient to decide that case, and was all that was decided.

Looking at the question upon principle, he continues:

> It seems to be opposed to all the principles upon which the rights of the citizen, when brought in collision with the acts of the Government, must be determined. In such cases there is no safety for the citizen, except in the protection of the judicial tribunals, for rights which have been invaded by the officers of the Government, professing to act in its name. * * * The position assumed here is that, however clear his rights, no remedy can be afforded to him when it is seen that his opponent is an officer of the United States, claiming to act under its authority; for, as Mr. Chief-Justice Marshall says, "to examine whether this authority is rightfully assumed is the exercise of jurisdiction, and must lead to the decision of the merits of the question." * * * The defense stands here solely upon the absolute immunity from judicial inquiry of every one who asserts authority from the executive branch of the Government, however clear it may be made that the Executive possessed no such power. Not only no such power is given, but it is absolutely prohibited, both to the executive and the legislative, to deprive any one of life, liberty, or property, without due process of law, or to take private property without just compensation.

Poindexter v. *Greenhow*, one of the Virginia coupon cases, (114 U. S., 270,) was an action of detinue for personal property distrained by the defendant, as Treasurer of the State of Virginia, for delinquent taxes, in payment of which the plaintiff had tendered coupons cut from bonds issued by the State under the funding act of March 30, 1871. By the terms of that act the coupons after maturity were receivable for all taxes and debts due the State. It was held that this created a contract between the coupon-holder and the State, and that any subsequent act of the State which forbids the receipt of these coupons is in violation of the contract and void as against coupon-holders. Upon the question now under consideration Mr. Justice Matthews, speaking for the majority of the Court, says:

> It is next objected, that the suit of the plaintiff below could not be maintained, because it is substantially an action against the State of Virginia, to which it has not assented. It is said that the tax-collector, who is sued, was an officer and agent of the State, engaged in collecting its revenue, under a valid law, and that the tax he sought to collect from the plaintiff was lawfully due; that, consequently, he was guilty of no personal wrong, but acted only in an official capacity, representing the State, and, in refusing to receive the coupons tendered, simply obeyed the commands of his principal, whom he was lawfully bound to obey; and that if any wrong has been done, it has been done by the State in refusing to perform its contract, and for that wrong the State is also reliable, but is exempted from suit by the eleventh article of amendment to the Constitution of the United States.

The opinion then proceeds to answer these objections in the light of the adjudged cases in the Supreme Court, reliance being placed especially on *United States* v. *Lee* and *Osborn* v. *Bank of United States*. In the course of this discussion it is said:

> A defendant sued as a wrong-doer, who seeks to substitute the State in his place, or to justify by the authority of the State, or to defend on the ground that the State had adopted his act and exonerated him, cannot rest on the bare assertion of his defense. He is bound to establish it. The State is a political corporate body, can act only through agents, and can command only by laws. It is necessary, therefore, for such a defendant, in order to complete his defense, to produce a law of the State which constitutes his commission as its agent, and a warrant for his act. This the defendant, in the present case, undertook to do. He relied on the act of January 26, 1882, requiring him to collect taxes in gold, silver, United States treasury notes, national-bank currency, and nothing else, and thus forbidding his receipt of coupons in lieu of money. That, it is true, is a legislative act of the government of Virginia, but it is not a law of the State of Virginia. The State has passed no such law, for it cannot; and what it cannot do, it certainly, in contemplation of law, has not done. The Constitution of the United States, and its own contract, both irrepealable by any act on its part, are the law of Virginia; and that law made it the duty of the defendant to receive the coupons tendered in payment of taxes, and declared every step to enforce the tax, thereafter taken, to be without warrant of law, and therefore a wrong. He stands, then, stripped of his official character, and, confessing a personal violation of the plaintiff's rights for which he must personally answer, he is without defense.

It was accordingly directed that judgment be rendered for the plaintiff.

In *Cunningham* v. *Macon & Brunswick R. R. Co.* (109 U. S., 446) this general question was discussed and the cases in which the court had taken jurisdiction, where the objection was interposed that the suit was substantially against the State, and that therefore the State was a necessary party, were examined and classified. The second class of cases is stated by Mr. Justice Miller as follows:

> Another class of cases is where an individual is sued in tort for some act injurious to another in regard to person or property, to which his defense is that he has acted under the orders of the Government. In these cases he is not sued as, or because he is, the officer of the Government, but as an individual, and the court is not ousted of jurisdiction because he asserts authority as such officer. To make out his defense he must show that his authority was sufficient in law to protect him. (*Mitchell* v. *Harmony*, 13 How., 115; *Bates* v. *Clark*, 95 U. S., 204; *Meigs* v. *McClung*, 9 Cranch, 11; *Wilcox* v. *Jackson*, 13 Pet., 498; *Brown* v. *Huger*, 21 How., 305; *Grisar* v. *McDowell*, 6 Wall., 363; *United States* v. *Lee*, 106 U. S., 196.)

This language is cited with approval in *Poindexter* v. *Greenhow*.

In reviewing the cases involving the general principle now under consideration the fact should not escape observation that the judges of the Supreme Court have been much divided in opinion. The leading cases of *United States* v. *Lee* and the Virginia coupon cases were decided by a bare majority of the Court, four of the judges dissenting in each case. But, notwithstanding this diversity of opinion, I think it is not going too far to say that the doctrine enunciated by Mr. Justice Miller, under the second head of his classification in *Cunningham* v. *Macon & Brunswick R. R. Co.*, has become the established law of the Supreme Court, and it is under this head the present case falls. It cannot be said that the Supreme Court have authoritatively decided the identical question raised in this case, of the

right of a patentee to maintain a suit in tort for the infringement of a patent right against an individual whose defense is that all his acts in relation thereto were done as an officer or agent of the Government and in obedience to its orders.

Cammeyer v. *Newton* (11 O. G. 287; 94 U. S., 225) was an action brought for the infringement of a patent, and one of the defenses set up was that of use, if any, which the defendant had made of the patented improvement was done under the direction of the United States and as its agent or officer. Mr. Justice Clifford, speaking for the Court, says on this point:

> Public employment is no defense to the employé for having converted the private property of another to the public use without his consent and without just compensation.

After reference to the clause in the Constitution which provides that private property shall not be taken for public use without just compensation and to the section of the patent act giving the patentee the exclusive right to make, use, and vend to others his invention or discovery for a certain term of years he then proceeds:

> Agents of the public have no more right to take such private property than other individuals under that provision, as it contains no exception warranting any such invasion of the private rights of individuals. Conclusive support to that proposition is found in a recent decision of this Court, in which it is held that the Government cannot, after the patent is issued, make use of the improvement any more than a private individual, without license of the inventor or making him compensation (*United States* v. *Burns*, 12 Wall., 246.)

The question of infringement is then considered and determined against the patentee. This opinion does not discuss the objection which has been raised in this class of cases to the jurisdiction of the Court, and in view of the subsequent expressions of the Court in *James* v. *Campbell* (21 O. G., 337; 104 U. S., 356) and *Hollister* v. *Benedict Manufacturing Co.* (113 U. S., 59) it can hardly be deemed conclusive of the question.

James v. *Campbell* was a suit brought upon a patent against James, a public officer, to respond for the use of the patented machine. The circuit court rendered a decree in favor of the complainant. (*Campbell* v. *James*, 18 O. G., 979; 17 Blatchf., 42.)

After admitting the exclusive right of the patentee in the invention, which the Government itself cannot use without just compensation, unless by consent, the opinion then proceeds:

> But the mode of obtaining compensation from the United States for the use of an invention, where such use has not been by the consent of the patentee, has never been specifically provided for by any statute. The most proper forum for such a claim is the Court of Claims, if that court has the requisite jurisdiction. As its jurisdiction does not extend to torts, there might be some difficulty, as the law now stands, in prosecuting in that court a claim for the unauthorized use of a patented invention; although where the tort is waived, and the claim is placed upon the footing of an implied contract, we understand that the court has, in several recent instances, entertained the jurisdiction. * * * If the jurisdiction of the Court of Claims should not be finally sustained, the only remedy against the United States, until Congress enlarges the jurisdiction of that court, would be to apply to Congress itself. The course adopted in the present case, of instituting an action against a public officer, who acts only for and in behalf of the Government, is open to serious objections. We doubt very much whether such an action can be sustained. It is substantially a suit against the United States itself, which cannot be maintained under the guise of a suit against its officers and agents, except in the manner provided by law. We have heretofore expressed our views on this subject in *Carr* v. *United States*, (98 U. S., 433,) where a judgment in ejectment against a Government agent was held to be no estoppel against the Government itself; but as the conclusion which we have reached in this case does not render it necessary to decide this question, we reserve our judgment upon it for a more fitting occasion.

The Court then proceeds to discuss the patent and to decide the case upon its merits against the patentee.

It is to be noticed that this case is prior to *United States* v. *Lee* and the Virginia coupon cases; also, that the foregoing remarks of Mr. Justice Bradley concerning the jurisdiction of the Court are based upon *Carr* v. *United States*. In *United States* v. *Lee* the language of the Court in *Carr* v. *United States* is commented upon, and it is said that the decision in that case did not properly extend to certain remarks of the Court. It may also be observed that Mr. Justice Bradley was among those members of the Court who dissented in *United States* v. *Lee* and that he wrote the dissenting opinion in the Virginia coupon cases.

The more recent case of *Hollister* v. *Benedict Manufacturing Co.* (113 U. S., 59) was a suit to enjoin the infringement of a patent, and one of the defenses relied upon was that all the acts of the defendant complained of in the bill were done by him in the discharge of his duties as collector of internal revenue of the United States and by direction of the Commissioner of Internal Revenue and that he had acted as collector by virtue of legal appointment by the President of the United States.

Mr. Justice Matthews, speaking for the Court, refers to the doubts expressed in *Campbell* v. *James* whether such a suit against public officers could be sustained or whether a suit upon an implied promise of indemnity might not be prosecuted against the United States in the Court of Claims, and then says:

> If the right of the patentee was acknowledged, and, without his consent, an officer of the Government, acting under legislative authority, made use of the invention in the discharge of his official duties, it would seem to be a clear case of the exercise of the right of eminent domain, upon which the law would imply a promise of compensation, an action on which would lie, within the jurisdiction of the Court of Claims such as was entertained and sanctioned in the case of *United States* v. *Great Falls Manufacturing Co.*, (112 U. S., 645.) And it may be, that, even if the exclusive right of the patentee were contested, such an action might be brought in that court, involving all questions relating to the validity of the patent; but, as we have concluded to dispose of the present appeal upon other grounds, it becomes unnecessary to decide the question arising upon this defense.

The opinion then proceeds to discuss the patent and to dispose of the case against the contention of the patentee.

It is at least doubtful whether the present action could be brought in the Court of Claims. In its present form it is an action in tort and not upon any contract, express or implied, and, as was said by Mr. Justice Bradley in *James* v. *Campbell*, the jurisdiction of that court does not extend to torts. While the Supreme Court have declined to pass upon the question of jurisdiction in these cases, they have assumed jurisdiction and disposed of each case on its merits. In other words, no case can be found where the Court has dismissed the suit for want of jurisdiction, and this would seem to be sufficient ground in this case to overrule the plea and allow the case to be heard upon bill, answer, and proofs. If, however, the principle established in the cases we have reviewed and the rule laid down by Mr. Justice Miller in *Cunningham* v. *Macon & Brunswick R. R. Co.* is sound, it is difficult to see why the court has not jurisdiction in the present case.

This is an action of tort for the infringement of a patent brought against an individual who is an officer or agent of the United States and whose defense is that he acted under orders of the Government. That this is no defense in actions of this general character has, as we have seen, been repeatedly held by

the Supreme Court, and the objection interposed that these suits are substantially against the Government, and that therefore it is a necessary party to enable the court to grant relief, has been many times urged without avail. The rights secured to a patentee under his grant from the Government are a form of property in the enjoyment of which he is entitled to protection against all trespassers, including the Government. To deprive him of the full enjoyment of these rights by using his invention without his consent is to deprive him of his property without just compensation or due process of law, and therefore in conflict with those provisions of the Constitution which secure this protection to the citizen.

I am of the opinion, therefore, that the plea in this case should be overruled.

Plea overruled.

U. S. Circuit Court—Eastern District of Missouri, Eastern Division.

MARSH *v.* QUICK MEAL STOVE COMPANY.

Decided April 25, 1892.

1. PATENT—INFRINGEMENT—ACTIONS AT LAW—JURY TRIALS.
The question of the construction of the claims of a patent is the province of the court and does not rest with the jury.
2. CONSTRUCTION OF CLAIMS.
Where a claim of a patent reads "In a gasoline-stove, etc.," and then enumerates a number of other elements, the words "In a gasoline-stove" will be understood as including the well-known essential elements of such stoves, and to enable the plaintiff to recover the other elements of the claim or their substantial equivalents must be all found in the defendant's stove.
3. SAME.
Where the claim of a patent contains as an element a commingling-chamber capable of accomplishing two purposes, which are fully set forth in the patent, (such chamber being in addition to the commingling-chambers common to all gasoline-stoves,) and the defendant's stoves have only the ordinary commingling-chambers, *Held* that the combination of the claim is not present in defendant's stove.
4. LICENSEE—COVENANT.
A licensee who covenants not to dispute the validity of a patent under which he is licensed will not be permitted to do so; but the burden is nevertheless on the licensor to show that the licensee has operated under his license, and in the absence of such proof the licensor cannot recover.

STATEMENT OF THE CASE.

Letters Patent of the United States were issued to James A. Marsh, February 22, 1887, No. 358,284. On the 10th day of March, 1887, the Quick Meal Stove Company took a license under the patent, agreeing to pay a stipulated royalty on all stoves made by the company under the Marsh patent. An action at law under the license was brought by Marsh to recover royalties upon certain stoves made by the Quick Meal Company, which Marsh maintained came under his patent, while the Quick Meal Company contended they did not.

The claim of the patent involved reads as follows:

1. In a gasoline-stove, a retort, a commingling-chamber, and a duct connecting said retort and said chamber, in combination with a side burner and a communicating pipe between the said chamber and the side burner, whereby ignited gas may be carried from one to the other, as and for the purpose set forth.

The defendant's stove contained only the ordinary commingling-chambers, with a tube between the burners, which communicated with one of the commingling-chambers and which served as an automatic lighting device between the burners.

At the close of plaintiff's evidence defendant asked the court to direct the jury to find for the defendant on the ground that the plaintiff had not made out a *prima facie* case.

Messrs. Fisk & Allen and *Mr. Edward J. O'Brien* for the complainant.

Mr. George H. Lothrop, Mr. George H. Knight, and *Messrs. Lubke & Muench* for the defendant.

THAYER, *J.*:

I have given this case such an examination as I have been able to in the short time that has elapsed since the plaintiff closed his case, and I have come to the following conclusion:

It is the province of the court to construe the claims of the patent that has been offered in evidence. That construction of course is to be made in the light of such expert testimony as has been offered. In the Marsh patent the commingling-chamber D is both described and claimed as a distinct and independent part (having special functions) of the combination covered by the first claim of the Marsh patent. The commingling-chamber is provided with a separate needle-valve (marked on the drawing C) to operate it, and both the commingling-chamber and the accompanying needle-valve seem to be necessary to enable the automatic lighting-tube F to perform one of the functions that the inventor had in view—that is to say, the function of heating the side burner K for initial lighting purposes. Now, it may be true, and and I think it is true, that the commingling-chamber in the Marsh patent, with its valve C, is a useless device; but the fact remains that it has been described with great detail and is clearly claimed as an integral part of the Marsh combination or invention. His patent must, accordingly, be limited to a combination containing that part—that is to say, to a combination containing a commingling-chamber in addition to the ordinary commingling chamber or chambers attached to the burners. In the Quick Meal stove this separate and independent commingling-chamber is wanting. It is obvious that the relighting-tube in both modes of construction acts upon the same principle and subserves the same purpose. In the Quick Meal stove the tube is continuous from one light to the other, while in the Marsh stove it is broken and passes the flame through the commingling-chamber and out through the small orifice that is marked "*b*" on the drawing; but this concession does not alter the fact that Marsh has described and claimed a part not found in the "Quick Meal" mode of construction. Having so described and claimed it, it becomes one of the necessary elements of his combination, though it is practically useless. The licensee, the defendant in this case, is not here alleging that the Marsh patent is void. That he could not do under his license. He simply says:

I have not used the patented device covered by my license;

and there is no evidence, in the opinion of the court, to show that he has used it.

The result is that you gentlemen of the jury, will be directed to return a verdict in favor of defendant.

Plaintiff thereupon took a non-suit, with leave.

World's Columbian Exposition.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., March 8, 1892.

To the Inventors and Manufacturers of the United States:

It is the intention of the Patent Office to make at the World's Columbian Exposition at Chicago in 1893 an exhibit which will show that great advance in the several arts which is due, in large measure, to the encouragement and support afforded by our patent system. This exhibit is to consist of models of patented inventions, which will be carefully selected, to show as far as is possible the inception of each art, the stages through which the art has advanced, and the final development reached at the present time. This display of typical inventions, embodied in concrete form and properly arranged, will, it is believed, constitute a grand historical exhibit of the progress of the useful arts and one which will be of great interest not only to inventors and manufacturers, but to the public generally.

The Office collection of models has been seriously impaired by fire, and is further incomplete by reason of the fact that models have not generally been required or received during the last ten years. The Office is not, therefore, in possession of the models of many valuable inventions which might properly be included in such an exhibit, and without which, indeed, the exhibit would be incomplete. The limited appropriation for this exhibit will not permit the Office to make such models. An urgent appeal is therefore made to all inventors and manufacturers to come to the assistance of the Office in this matter, either by loans of models already built or by the construction of such models not in the possession of the Office as should properly be placed in such a collection. Of course, where models are loaned to the Office all proper credit will be given both in labels and catalogues to the parties by whom the loans are made, and such disposition will be made of the models after the close of the exhibit as the owners shall direct. Many inventors and manufacturers have already indicated a willingness to co-operate with the Office in this matter, and it is confidently expected that such a response will be made to this general appeal as will assure the unparalleled success of this attempt to graphically and concretely show the development of American invention.

W. E. SIMONDS,
Commissioner.

Protection of Foreign Exhibitors.

DEPARTMENT OF STATE,
Washington, D. C., July 30, 1892.

To the Diplomatic and Consular Officers of the United States:

GENTLEMEN: I subjoin a transcript of the act of Congress approved April 6, 1892, Public No. 29, entitled "An act to protect foreign exhibitors from prosecution for exhibiting wares protected by American patents and trade-marks," which reads as follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That no citizen of any other country shall be held liable for the infringement of any patent granted by the United States, or of any trade-mark or label registered in the United States, where the act complained of is or shall be performed in connection with the exhibition of any article or thing at the World's Columbian Exposition at Chicago.

You will transmit copies of this circular to the government of the country to which you are accredited, and ask that it be given the widest possible circulation for the information of those directly concerned.

I am, gentlemen, your obedient servant,

JOHN W. FOSTER,
Secretary of State.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., August 4, 1892.

Official copy to the Commissioner of Patents for his information and guidance.

E. M. DAWSON,
Chief Clerk.

The Official Gazette.

THE OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Publishers' Catalogues.

This Office would be pleased to receive from manufacturers and publishers such catalogues, circulars, price-lists, or other advertisements relating to the sciences and mechanical arts as are published by them for gratuitous distribution; but notice is hereby given such manufacturers or dealers who feel disposed to send their publications that not less than three copies should be forwarded in order that the subjects may be properly indexed, classified, and subclassified in the Scientific Library for convenient and ready reference.

Notice.

All solicitors, agents, or attorneys who, in circulars or advertisements or otherwise, refer to the Commissioner of Patents, or to any other official of the Patent Office, for evidence of their professional standing, do so without authority.

Copies of Decisions Furnished.

Hereafter an uncertified copy of every decision or action by any tribunal in this Office will be furnished by such tribunal to the interested party or parties without charge.

This order does not include the written statements of the grounds of decisions made by Examiners to the appellate tribunal in *ex parte* cases.

Issue of August 23, 1892.

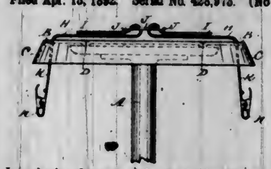
APPLICATIONS UNDER EXAMINATION.



Condition at Close of Business August 16, 1892.

Division No.	Subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. New.	Amended	No. of applications awaiting action.
	Between one and two months in arrears.			
31	Gas, Painting, Leather, Tanning, Alcohol, Oils, Fats, and Glue, etc.	June 16	Aug. 10	65
14	Metal-Bending, Wire-Working, Coin-Controlled Apparatus, Farriery, etc.	June 23	Aug. 5	126
8	Furniture, Toilet, Umbrellas and Canes, etc.	June 23	Aug. 3	214
30	Lamps, Gas-Fittings, Type-Writers, Matrix-Making Machines.	June 18	July 26	184
	Between two and three months in arrears.			
16	Telegraphy, Telephony, Electric Lighting and Signaling.	June 7	Aug. 9	185
11	Boots and Shoes, Clasps, Buckles and Buttons, Harness, Hose and Belting.	June 3	Aug. 6	296
21	Textiles, etc.	May 26	Aug. 5	179
25	Artesian and Oil Wells, Butchering, Mills and Thrashing, Stone-Working, etc.	May 23	Aug. 4	268
23	Instruments of Precision, Acoustics, Optics, etc.	May 20	Aug. 1	284
2	Farm Stock, Products, etc	May 23	July 26	303
12	Mechanical Engineering, Store-Service, etc.	May 26	July 22	206
24	Sewing-Machines and Apparel	May 21	July 19	119
22	Fire-Arms, Navigation, Signals, etc.	May 18	July 18	232
27	Brushing and Scrubbing, Grinding and Polishing, Laundry, etc.	June 1	July 13	236
32	Advertising, Baggage, Packing and Storing Vessels, etc.	May 17	July 13	332
3	Metallurgy, Metal Founding, Forging, Rolling, Coating, Annealing and Tempering, etc.	June 3	July 8	190
18	Steam-Engineering, etc	May 26	July 5	228
20	Builders' Hardware, Cutlery, Safes, Dentistry, Surgery, Undertaking, Artificial Limbs, etc.	June 2	July 2	287
5	Fine Arts, Stationery, Book-Binding, Music, etc.	May 28	July 1	223
	Between three and four months in arrears.			
10	Carriages and Wagons and Railway-Cars.	May 5	July 20	552
6	Chemistry, Medicines, Fertilizers, Preserving, Photography, Sugar and Salt, etc.	May 10	July 19	302

PATENTS

GRANTED AUGUST 23, 1892.

481,156. HAT-SUPPORTER. WILLIAM APPLEGATH, Hamilton, Canada. Filed Apr. 13, 1892. Serial No. 428,973. (No model.)

Claim.—In a device for suspending hats, the thin circular metallic plate B, with flange C and one or more circular indentations D and elongated slots E, diametrically opposite to each other, in combination with the suspension-bands H, with buckle J for lengthening or shortening purposes, and clips K to attach to the inner or sweat band of hats, substantially as specified and set forth.

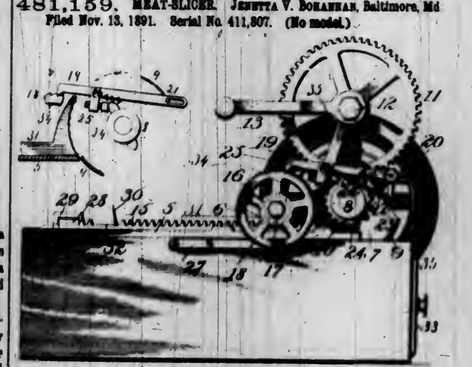
481,157. SUSPENSION DEVICE. GEORGE W. BALDWIN, Meriden, Conn., assignor to the Edward Miller & Company, same place. Filed May 6, 1892. Serial No. 432,060. (No model.)

Claim.—1. In a suspension device, in combination, an arbor, a spring-actuated drum on said arbor, a chain on said drum, a loop on said arbor and capable of vertical motion in relation thereto, and a brake-lever, one end of which engages with said loop, its other end acting upon said drum, substantially as described.

2. In a suspension device, in combination, an arbor, a spring-actuated drum on said arbor, a chain on said drum, a loop on said arbor and capable of vertical motion in relation thereto, a brake-lever, one end of which engages with said loop, its other end acting upon said drum, and means, as a nut, for regulating the motion of said brake-lever, substantially as described.

3. In a suspension device, in combination, an arbor, a spring-actuated drum on said arbor, a chain on said drum, a loop on said arbor and capable of vertical motion in relation thereto, a brake-lever, one end of which engages with said loop, its other end acting upon said drum, and a disk interposed between said brake-lever and said drum, substantially as described.

4. In a suspension device, in combination, an arbor, a spring-actuated drum upon said arbor, a chain on said drum, a loop on said arbor and capable of vertical motion in relation thereto, a brake-lever, one end of which engages with said loop, its other end acting upon said drum, a disk interposed between said brake-lever and said drum, and a washer interposed between said disk and said drum, substantially as described.



481,158. PENHOLDER. WILLIAM B. BLALOCK and JAMES A. MUIR, Huntsville, Tex. Filed Jan. 26, 1892. Serial No. 419,367. (No model.)

Claim.—The combination, in a penholder, of a staff with tenoned end, a portion of which is cut out of its upper surface with a downward bevel to its lower end, a beveled slide adapted to fit and slide upon the beveled cut in the staff, said slide being provided with a slight

shoulder upon its upper side and a hole through the same for a screw or pin, a tube longitudinally slotted inclosing said staff and slide, a tube of such inner circumference as to inclose the slotted tube end of staff and slide, said outer tube provided with a hole adapted to receive a screw or pin, said screw or pin passing through the hole in the outer tube, through the slot in the inner tube, and into the hole in the slide all substantially as set forth.

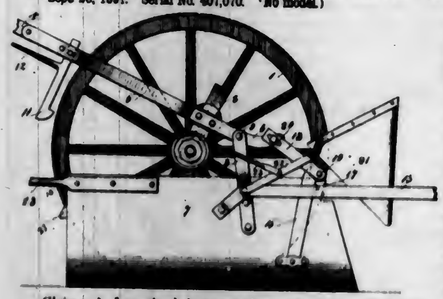
481,159. MEAT-SLICER. JENETTA V. BONAHAN, Baltimore, Md. Filed Nov. 13, 1891. Serial No. 411,807. (No model.)

Claim.—1. The combination, in meat-slicers, of one or more blades set spirally upon heads fixed to a rotary shaft and a table located with its forward end close to the cylinder of rotation of the knives and having a narrow guide rising from that side at its front end which is the base of a wedge formed between one of the said spiral knives and the table, substantially as described.

2. The combination of a table having a narrow guide standing at one side of the forward edge, one or more knives fixed spirally upon heads journaled to revolve across the said forward end of the table, and an automatically-propelled meat-carriage upon the table having a transverse arm and a spur-armed head-block fitted to slide freely upon the said arm, substantially as described, whereby meat upon the said head-block will be held from twisting on the table and yet be free to adjust itself transversely for its side irregularities to follow the said guide.

3. The combination, in meat-slicers, of a shaft provided with cutting-blades and fitted to revolve in bearings, and further provided with a number of wipers corresponding to the number of blades, a table and a meat-carriage thereon, the carriage being provided with a feed-rack, a pinion journaled upon the frame to engage the said rack and provided with a ratchet-wheel, a pawl slotted and thereby mounted upon a stud of the frame and adapted to engage the ratchet-wheel, a

tappet upon the pawl in the path of the said wipers, and a spring connecting the pawl with a fixture of the frame to act with an impulse oblique to the line of the pawl, the wipers bearing such relation to the knives as to advance the meat between the knives and not against their faces.



4. The combination, in meat-slicers, of a table, a shaft provided with spiral knives at the end of the table and with a series of wipers corresponding to the knives in number, a carriage fitted to slide upon the table and provided with a feed-rack, a pinion-wheel to engage the rack and provided with a ratchet-wheel, a pawl to engage the ratchet-wheel and mounted for longitudinal motion upon the frame, a tappet longitudinally adjustable on the pawl in the path of the said wipers, and a spring for retracting the pawl, substantially as described.

5. The combination of a table, a meat-carriage mounted to slide thereon and provided with a feed-rack, a pinion to engage the said rack, knives mounted upon a shaft at the end of the table, and mechanism communicating feed motion between the said shaft and pinion, a space being left at the end of the said rack in which the pinion revolves freely when the carriage reaches the forward end of its path, substantially as described.

6. The combination, in meat-slicers, of a table, a carriage thereon, a ratchet and pinion for feeding the carriage, a pawl to propel the ratchet, and a frictional detent acting against the ratchet, substantially as described.

7. The combination, in meat-slicers, of a table, a cutter-blade hung to move past the end of the table with its edge carried at an angle to the plane thereof, and a horn fixed to the table at the base of a wedge formed by the angle of the blade and table and curved in the form of a segmental arc nearly parallel with the cylinder of revolution of the blade and slanted inward, substantially as described.

481,160. ROAD-SCRAPER. JAMES M. BROOKS, Molena, Ga. Filed Sept. 28, 1891. Serial No. 407,070. (No model.)

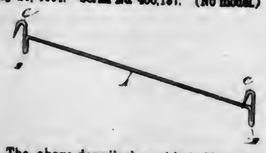
Claim.—1. In a wheeled scraper, the combination, with a carriage having an arched axle and a lever adapted to tilt said arched axle, of a scraper-pan suspended from said lever, a hood adapted to fit over the front end of the scraper-pan, hood-supports pivotally connected with the scraper-pan, and devices connecting the hood to the arched axle, whereby the hood will be operated by the tilting of the arched axle to cover or uncover the front of the scraper-pan, substantially as and for the purpose specified.

2. In a wheeled scraper, the combination, with a carriage having an arched axle and a lever adapted to tilt said arched axle, of a scraper-pan suspended from said lever, a hood adapted to fit over the front end of the scraper-pan, hood-supports pivotally connected to the scraper-pan, and devices connecting the hood to the arched axle, whereby said hood will be automatically lifted from the scraper-pan when the arched axle is tilted forward and lowered in front of the pan when the axle is moved to an approximately perpendicular position, substantially as described.

3. The combination, with a carriage having an arched axle and a lever rigidly secured to the downwardly-extending portion of the arched axle, of a scraper-pan swung from said lever and adapted to be lowered to rest upon the ground by elevating the lever and to be lifted from the ground by the depressing of the lever, a hood adapted to fit over the forward portion of the scraper-pan, straps pivotally connecting the hood to the scraper-pan, and devices connecting the hood to the arched axle, whereby said hood will be automatically lifted from the scraper-pan when the lever is elevated and to be lowered to its position over the front of the scraper-pan when the lever is depressed, substantially as and for the purpose specified.

4. The combination, with a carriage having an arched axle and a lever 4, having arms 5, rigidly secured to the downward-extending portion of said arched axle, said arms having forward extensions, of a scraper-pan pivotally swung from said extensions, a hood adapted to fit over the forward end of said scraper-pan, straps pivotally connecting said hood with the sides of the scraper-pan, and means for connecting said straps to the arched axle, whereby the hood will be lifted when the lever 4 is elevated and will be lowered when the lever 4 is depressed, substantially as described.

5. The combination, with a carriage having an arched axle and a lever rigidly secured to the downward-extending portion of said arched axle, of a scraper-pan pivotally swung from said lever, a hood adapted to fit over the forward end of said scraper-pan, straps pivotally connecting said hood with the sides of the scraper-pan, and rods connected at one end to said straps and at the other end movably connected to said arched axle, the arrangement being such that when the lever is elevated the hood will be raised and when the lever is depressed the hood will be lowered to its position over the front of the scraper-pan, substantially as described.



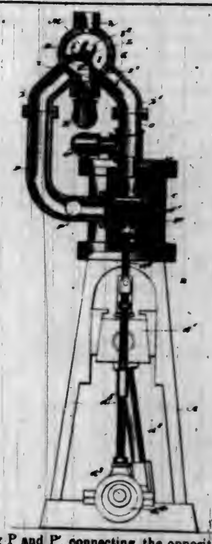
6. The combination, with a carriage having an arched axle and a lever secured to said arched axle, of a scraper-pan pivotally swung from said lever, draft-bail connected to the sides of said scraper pan, a hood adapted to fit over the front portion of the scraper-pan, straps pivotally connecting said hood with the sides of the scraper-pan, said straps being of such shape that the forward portions will rest upon the draft-bail, whereby the weight of the hood will be supported by the draft-bail, and devices for raising and lowering said hood, substantially as described.

7. The combination, with a carriage having an arched axle and a lever 4, having arms 5, rigidly secured to the downwardly-extending portion of said arched axle, said arms having forward extensions 6, of a scraper-pan 7, pivotally swung from said extensions 6, a hood 21, adapted to fit over the forward end of said scraper-pan, straps 22, pivotally connecting said hood with the sides of the scraper-pan, rods 23, connected at one end to the straps 22 and at the other end passing through holes in lugs 24 upon the arched axle, said rods being adapted to move freely in said holes, and nut 25 upon the ends of said rods to prevent the rods moving out of said holes, substantially as and for the purpose specified.

8. The combination, with a carriage having an arched axle and a lever secured to said arched axle, of a scraper-pan pivotally swung from said lever, straps 15, pivotally secured at their lower ends to the sides of the scraper-pan and having hooks 16 at their upper ends, a draft-bail having lugs 17 thereupon adapted to be engaged by the hooks 16, and straps 18, connecting the upper ends of the straps 15 with said lever and so adjusted that when the lever is raised the hooks 16 will engage the lugs 17 and when the lever is depressed the hooks will be withdrawn from engagement with the lugs, substantially as and for the purpose specified.

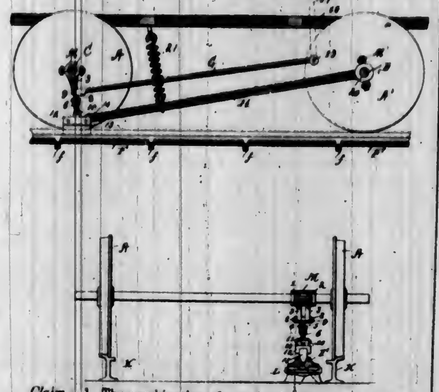
9. The combination, with a carriage having an arched axle and a lever 4, having arms 5, secured to said arched axle, each of said arms having a forward extension 6, of a scraper-pan, standards 8, secured at their lower ends to said pan and at their upper ends pivotally secured to the extensions 6, straps 15, pivotally secured at their lower ends to the sides of the scraper-pan and having hooks at their upper ends, a draft-bail 13, having lugs 17, adapted to be engaged by the hooks 16, and straps 18, connecting the upper ends of the straps 15 with the extension 6, said straps 18 being so adjusted that when the lever 4 is raised the hooks 16 will engage the lugs 17 and when said lever is depressed the hooks 16 will be withdrawn from engagement with the lugs 17, substantially as and for the purpose specified.

481,161. NAPKIN-HOLDER. ISAAC T. BROWN, Columbus, Ind. Filed July 20, 1891. Serial No. 400,187. (No model.)



Claim.—The above-described napkin-holder, consisting of the straight bar A, bent downward at each end at right angles, then doubled upon itself in parallel planes, so as to form the pair of short handles B B, and then bent in planes at right angles to the handles to form a pair of pointed hooks C C, all as shown and described.

481,162. REVERSING-VALVE. JAMES CLARK, Medina, N. Y. Filed Dec. 31, 1891. Serial No. 416,696. (No model.)



Claim.—In a reversing-valve, the combination, with opposite steam-chests having central and end steam-ports and hollow annularly-grooved valves moving in said chests, of a cylindrical valve-casing supported above and away from said steam-chests and having opposite bottom alternating exhaust and steam ports, and a central piped exhaust-port between said opposite alternating ports, piping O and O', connecting one of said alternating ports with the end ports of both

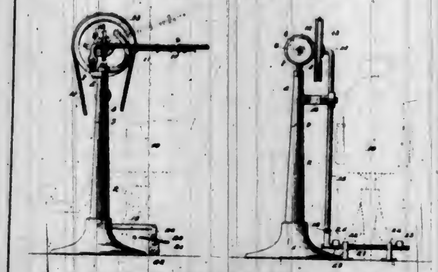
481,162.

steam-chests, piping P and P', connecting the opposite port with the central ports of said steam-chests, an oscillating two-way plug mounted within said casing and provided with concaved sides and bottom forming opposite regulating-wings moving over said alternating ports to connect either one of the same with the piped exhaust, and an upper squared seat or recess intermediate of said wings, an operating-shaft journaled in said casing and having a squared portion resting in said seat, and a lever connected to said shaft, substantially as set forth.

481,168. CAR-BRAKE. CHARLES A. DAHLSTROM, Chicago, Ill. Filed Dec. 23, 1891. Serial No. 415,965. (No model.)

Claim.—1. The combination of a car having two or more trucks, a toggle-joint the upper arm of which is pivotally connected with said car and the lower arm thereof provided with a shoe adapted to engage in a longitudinal slot or groove of a railway-rail, a rigid bar or rod pivotally attached at one end to said shoe and at the other end pivotally attached to said car, a rigid bar or rod pivotally connected at one end to said toggle-joint and at the other end to an operative lever, an operative lever pivotally attached to said car, a railway-track having rails for the wheels of said car, and a third rail provided with a longitudinal slot or groove in its upper face, adapted to engage with said shoe, whereby by means of said lever said shoe may be lowered and elevated into and from engagement with said slot or groove in said third rail, all substantially as shown.

2. The combination of a car having two or more trucks, a toggle-joint the upper arm of which is pivotally connected with said car and the lower arm thereof provided with a shoe having a truncate V-shaped face adapted to engage in a longitudinal slot or groove of a railway-rail, a rigid bar or rod pivotally attached at one end to said shoe and at the other end to said car, a second rigid bar or rod pivotally connected at one end to said toggle-joint and at the other end to an operative lever, an operative lever pivotally connected to said car and also to said second bar or rod, a railway-track having rails for the wheels of said car, and a third rail provided with a longitudinal slot or groove with inclined surfaces adapted to engage with said shoe, all substantially as shown.



3. The combination of a car having two or more trucks, a toggle-joint the upper arm of which is provided with a collar connected with and carried loosely upon one of the axles of said car and the lower arm thereof provided with a shoe adapted to engage in a longitudinal slot or groove of a railway-rail, a rigid bar or rod pivotally attached at one end to said shoe and at the other provided with a collar which connects with and is carried loosely upon an axle of said car, a second rigid bar or rod pivotally connected at one end to said toggle-joint and at the other end to an operative lever, an operative lever pivotally connected to said car and also to said second bar or rod, a railway-track having rails for the wheels of said trucks, and a third rail provided with a longitudinal slot or groove adapted to engage with said shoe, all substantially as shown.

4. In a car brake employing a shoe and a third rail with a longitudinal slot or groove adapted to engage with said shoe, a toggle joint the upper arm of which is provided with a collar M, having the depending lugs 3, and the piece 4, having a tongue connecting with the lugs 3 by a bolt 9, the shank 7 being screw-threaded to engage with the screw-threaded bore of part 6 and being provided with a screw threaded nut 5 to retain the adjustment between parts 4 and 6, 6 being provided with a tongue to engage with the lugs 10 of the clamp 12, which carries the shoe 13, all substantially as shown.

5. In a car-brake, the toggle-joint the upper arm of which is pivotally connected with the car and the lower arm provided with a shoe adapted to engage with a longitudinal slot or groove in a third rail, a rigid bar or rod connected pivotally at its respective ends with said shoe and with said car, a second bar or rod pivotally connected at its respective ends with said toggle-joint and with an operative lever attached to said car, an operative lever, a third rail provided with a longitudinal slot or groove adapted to engage with said shoe, and a spring connected with said first-mentioned bar or rod and with said car, all substantially as shown.

6. In a car-brake, a shoe supported by a toggle-joint attached to the car, in combination with a rail having a slot or groove in its upper surface capable of engaging with said shoe, and means for operating said toggle-joint and engaging and disengaging said shoe with said rail, all substantially as shown.

481,164. DENTAL ENGINE. FRANK A. DAMON, Fitchburg, Mass. Filed July 16, 1891. Serial No. 399,708. (No model.)

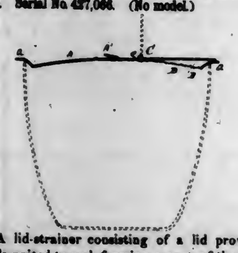
Claim.—1. A dental engine provided with a tool-shaft, a friction driven wheel thereon, a pivoted arm, and a driving friction-wheel arranged on one end of said arm and by it adjustable with relation to the driven wheel to bring the point of contact between the two wheels to opposite sides of the center of the driving-wheel to change the direction of motion and capable of having its center brought opposite the driven wheel to stop the tool-shaft, the parts being combined and operating as set forth.

2. The combination, in a dental engine, of the tool-shaft, a friction-wheel mounted thereon, a second friction-wheel having a depressed center, a pivoted arm carrying the second friction-wheel, the frictional contact being between the circumference of the first and the side surface of the second wheel, and means to vibrate said arm, as set forth.

3. The combination, in a dental engine, of a tool-shaft, a friction-wheel thereon, a second friction-wheel, with whose side surface the circumference of the first wheel engages, a pivoted arm upon which the second wheel is mounted, a treadle, and connections between the pivoted arm and the treadle, whereby the position of the second wheel

with relation to the first is controlled from the treadle, as and for the purpose set forth.

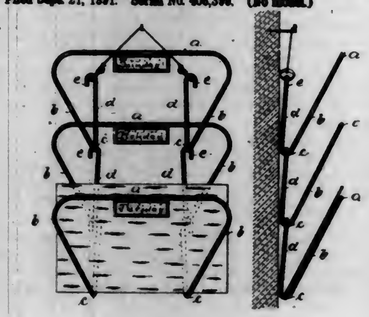
4. In combination, the column consisting of the upper and lower parts connected by a swivel-joint, the friction-wheel carrying the tool-shaft and pivotally mounted on the upper part of the column, the side friction-wheel driven from a suitable motor, the lever upon which said wheel is mounted, also pivoted to the upper part of the column, the horizontal bar connected to the pivoted arm at one end, and the treadle-shaft having crank-arm, to which said horizontal bar is connected at its opposite end, as and for the purpose set forth.



481,165. DEEP-WATER FISHING-TACKLE. SAMUEL C. DARROW, Traverse City, Mich. Filed Mar. 2, 1891. Serial No. 383,996. (No model.)

Claim.—1. In a fishing-reel, the combination of a frame, a line-spool mounted in said frame, a guide-spool rotatably mounted in vertically-movable supports, and a spring for maintaining said guide-spool in an elevated position, substantially as described.

2. In a fishing-tackle, the combination of a frame, a line-spool mounted on said frame, means for rotating said spool, a catch upon said spool, a spring adapted to engage in said catch, and a guide-spool adapted to engage in said catch, and a guide-spool adapted to engage the line rotatably mounted in vertically-movable supports, and a spring for maintaining said guide-spool in an elevated position against the strain on the line, substantially as described.



481,166. LID-STRAINER. HANNAH S. DIACK, Detroit, Mich. Filed Mar. 30, 1892. Serial No. 427,066. (No model.)

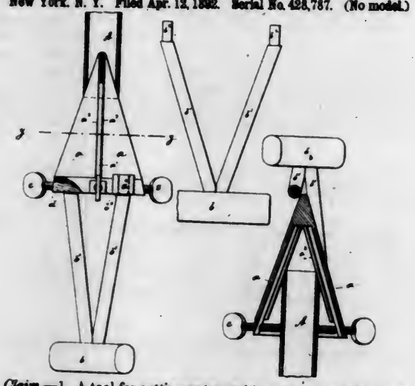
Claim.—1. A lid-strainer consisting of a lid provided with a strainer, side walls united to and forming a part of the lid, bounding the strainer laterally, and a hinged cover located over the strainer and closing down upon said side walls, substantially as set forth.

2. A lid-strainer consisting of a lid formed with a raised rim at its periphery and provided with a strainer located within said rim, walls D D', united to and forming a part of the lid, located at the sides of the strainer, and a hinged lid closing down at its sides upon said walls and at its front edge upon said rim and forming a chamber between the lid and the underlying walls, rim, and strainer, substantially as described.

481,167. PAPER-HOLDER. LEOPOLD ELIAS, Kosten, Germany. Filed Sept. 21, 1891. Serial No. 406,390. (No model.)

Claim.—1. A paper-holder consisting of single pieces which are bent to a U shape and the ends whereof are provided with hooks *e e* and which are connected one with another by means of the hooks *e e* and of the bends *e e*, for the purpose described.

2. A paper-holder consisting of single pieces of wire which are bent to a U shape and the ends whereof are provided with hooks *e e* and which are connected one with another by means of the hooks *e e* and of the bends *e e*, for the purpose described.



3. A paper-holder consisting of single pieces of wire which are bent to a U shape and the ends whereof are provided with hooks *e e* and with tablets in the middle part of the cross-bar *a* and which are connected one with another by means of the hooks *e e* and of the bends *e e*, for the purpose described.

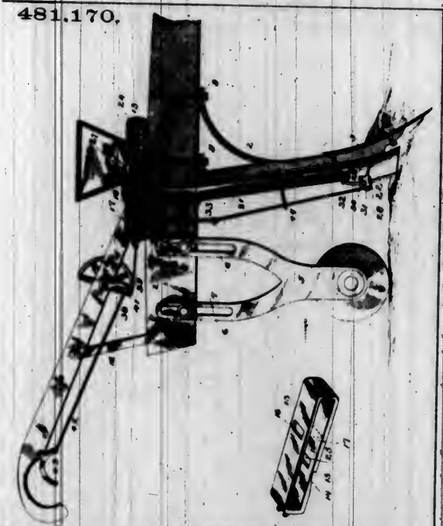
481,168. COMBINED VISE, PIPE-TONGS, AND CUTTER. JOHN ELLIS, Stockton, Cal. Filed Dec. 11, 1891. Serial No. 414,771. (No model.)

Claim.—A combined vise, pipe-tongs, and cutter consisting, essentially, of the threaded handle B, the threaded nut A^2, the serrated curved jaw E, the guide-bar A^4, secured to the nut A^2, the sliding clutch A', the convex block G, and the block H, supplied with the revolving cutter I, and with the pin *k*, substantially as specified.

481,169. TAPERING-TOOL FOR LEAD PIPES. MAX FRITSCHE, New York, N. Y. Filed Apr. 12, 1892. Serial No. 428,787. (No model.)

Claim.—1. A tool for cutting outer and inner tapers on pipes and consisting of a slotted cone having both outwardly and inwardly operating cutting-edges, substantially as specified.

2. The combination of a slotted cone *a*, having outwardly and inwardly operating cutting-edges a^3 a^4, and lugs a^4, with a reversible handle adapted to be engaged by said lugs, substantially as specified.



3. The combination of a slotted cone *a*, having outwardly and inwardly operating cutting-edges with a reversible handle and with centering-screws *c*, substantially as specified.

481,170. CORN AND SEED PLANTER. ADAM GRIESENER, Pueblo, Colo. Filed Dec. 2, 1891. Serial No. 413,792. (No model.)

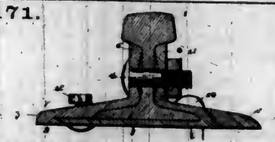
Claim.—1. In a corn and seed planter, the combination, with a suitable seed-hopper, of a seed-slide consisting of an open frame arranged longitudinally beneath the hopper and provided with a seed-opening in its upper member and an independent seed-opening in its lower and parallel member, a rigid block arranged in the frame and having a vertical seed-opening coinciding with a passage in the plow-beam, a spring arranged between the end of said block and the end of the frame and normally drawing said frame in one direction, and means for moving it in an opposite direction to cause the seed-opening in its upper member to coincide alternately with the opening in the hopper-bottom and with the vertical opening in the block and to cause the opening in the lower member to coincide with the passage in the block, and a passage in the beam at the moment the hopper or seed-opening coincides with the opening in the upper bottom, substantially as specified.

2. In a corn and seed planter, the combination, with a rigid hopper having a discharge-opening in its bottom, of a seed-slide consisting of

481,170.

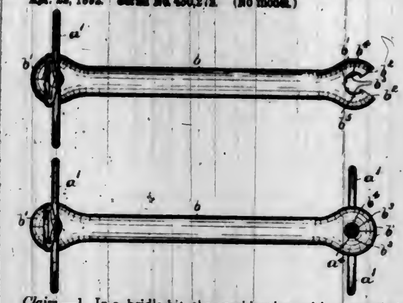
an open frame arranged to slide upon one of its sides upon the plow-beam, its lower side being provided with an under-cut and a seed-opening, and its upper side with a seed-opening, a rigid block filling a portion of said frame and having a seed-passage with which the openings in the frames alternately coincide, a seed-valve arranged in a seed-tube which communicates with a passage in the beam, a spring-actuated rod connected to the valve-lever, and having a friction-wheel riding on the frame and upon the inclined face of the under-cut therein, a spring moving the frame in one direction, and means for giving longitudinal movement thereto in an opposite direction, substantially as and for the purposes specified.

3. In a corn and seed planter, the combination, with a stationary hopper having a discharge-opening, of a seed-slide consisting of an open rectangular frame sliding upon one of its sides on the beam and directly beneath the hopper, a rigid block partly filling said open frame and having a vertical opening wherewith openings in the upper and lower members of the frame coincide alternately by the longitudinal movement of the frame, a spring arranged between the end of said block and the end of the frame, a seed-valve pivoted in a seed-tube communicating with a passage in the beam and with that in the block, a rod or bar lying in a seat in the beam and connected to the valve-lever, its head rising into a chamber in the beam beneath the frame, a friction-wheel journaled on said rod and bearing on the lower face of the frame, which is provided with an under cut, a spring raising said rod, a lever pivoted on one of the handles and connected to an arm on a shaft behind the hopper, and a segment-pulley on said shaft having a flexible connection to the frame, substantially as and for the purposes specified.



4. In a corn and seed planter, the combination, with a seed-hopper, of a seed-slide consisting of two parallel connected parts sliding between the hopper and the beam, a block lying between said parts and having a passage which is caused by the longitudinal movement of the said parts to alternately coincide with the openings in the upper and lower parallel parts, respectively, a spring arranged between the end of said block and the end of the frame and moving said parts in one direction, and a hand-lever connected to said parts for imparting movement in the opposite direction, substantially as and for the purposes specified.

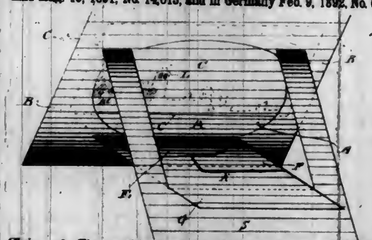
481,171. RAILROAD-JOINT. URBAN H. HANE, Lakeland, Fla. Filed Apr. 14, 1892. Serial No. 429,132. (No model.)



Claim.—In a rail-joint, the combination, with the rails, of an outer angular fish-plate provided with an integral bottom plate extending entirely across the lower faces of the rails and beyond the same and forming a solid seat and having its outer edge beveled, the inner fish-plate provided on its lower face with a beveled flange receiving the

481,171.

beveled edge of the bottom plate and securely locking the parts, horizontal bolts passing through the fish-plates and the webs of the rails, spikes passing through the fish-plates and securing the same to cross-ties, those spikes adjacent to the nuts of said bolts preventing the nuts from turning, and vertical bolts passing through the inner fish-plate and the bottom plate and securing the parts together, substantially as described.



481,172. BRIDLE-BIT. CHARLES E. HEINER, Newark, N. J. Filed Apr. 22, 1892. Serial No. 430,272. (No model.)

Claim.—1. In a bridle-bit, the combination, with a mouthpiece having jaws *b'* and ribs b^3, of a cheek-piece and a mouthpiece-bar a^3, provided with a narrower portion a^4, forming shoulders or offsets a^5, and said jaws on said mouthpiece being closed down about said narrower portion a^4, and said shoulders or offsets a^5 engaging with the flat surfaces b^4 of said ribs b^3, all of said parts being arranged and combined substantially as and for the purposes set forth.

2. In a bridle-bit, the combination, with a mouthpiece having jaws *b'* and ribs b^3, said ribs being adapted when said jaws are closed down upon each other to form an open square and a circular recessed portion b^5 on each side of said square, of a cheek-piece and a mouthpiece-bar a^3, provided with a narrower portion a^4, which is square in cross-section, forming shoulders or offsets a^5, and said jaws on said mouthpiece being closed down about said narrower portion a^4, and said shoulders or offsets a^5 engaging with the flat surfaces b^4 of said ribs b^3, and said circular recesses b^5 encircling the portions of the mouthpiece-bar a^3 adjacent to said narrower portion a^4, all of said parts being arranged and combined substantially as and for the purposes set forth.

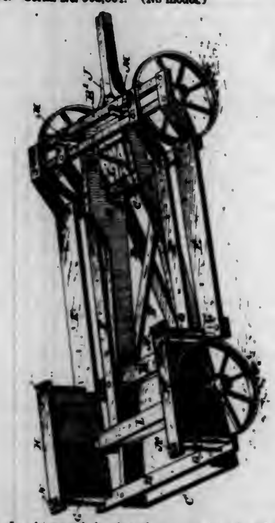
481,173. CHRISTMAS-CARD. CARL HEYMANN, Berlin, Germany. Filed Mar. 22, 1892. Serial No. 426,025. (No model.) Patented in England Aug. 19, 1891, No. 14,013, and in Germany Feb. 9, 1892, No. 61,857.

Claim.—1. The combination, in a Christmas greeting-card or the like, of a picture having different parts of different degrees of transparency with a reflecting-card hinged to reflect light on the back of said picture, the said card having on its face pieces of colored foil adapted to reflect light upon the back of said picture for the production of effects of lighting appropriate to the subject of said picture, substantially as described.

2. In a Christmas greeting-card or the like, the combination of a slightly-translucent paper A, having a picture and having part thereof cut away, a non-translucent card B, a very translucent paper C, filling the cut-away parts of the picture, certain non-covered puncture or

punctures L, permitting direct view of the reflecting-back through paper A, and a reflecting-back G, having colored foils thereon, as and for the purpose specified.

481,174. HYDRAULIC FEED FOR WOOD-PULP MACHINES.



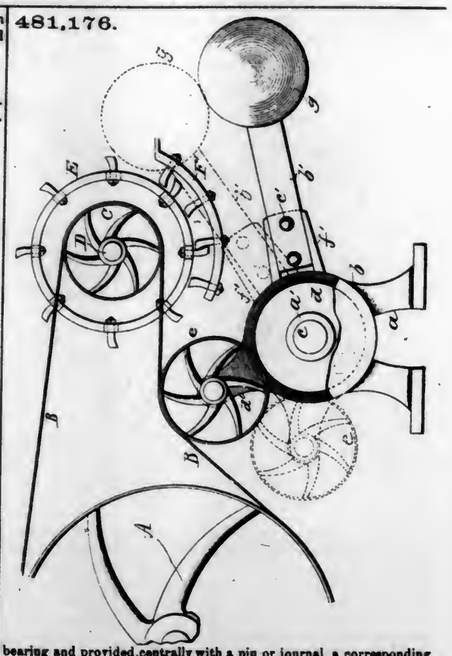
JOHN T. HORTON, Lowville, N. Y. Filed Apr. 24, 1890. Renewed Feb. 15, 1892. Serial No. 421,634. (No model.)

Claim.—In a hydraulic feed for wood-pulp grinders, the combination, with a pressure-cylinder having passages connected with the opposite ends, of two independent water-supply pipes, a single water-discharge pipe, and an interposed four-way valve adapted to connect one of the passages with the proper supply-pipe and the remaining passage with the discharge-pipe, substantially as and for the purpose set forth.

481,175. HAY-RACK.

HENRY S. HOY, Louisville, N. Y. Filed May 8, 1891. Serial No. 392,001. (No model.)

Claim.—1. In a hay-rack having the rear axles placed above the longitudinal frame-timbers of said rack and the forward end of said rack adapted to fit over and be used with the forward running-gear of an ordinary farm-wagon, the combination of converging framing-planks having a vertical offset near the forward end of each, cross-bars fastening in position said framing-planks, longitudinal boarding for supporting the load, and a short reach for attaching the framework to the axle.

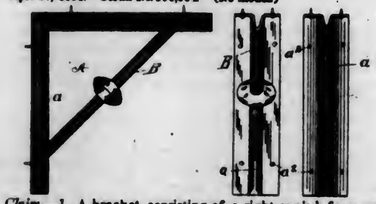


2. In a hay-rack, the combination of the converging framing-planks A A, having a vertical offset near the forward end of each, the upper cross-bars B B' B' B³ B³, and the lower cross-bars O O O, the axle-tree I, hung over the framing-planks A A, as shown, the braces D D, the longitudinal boarding E E E E, the short reach K, and the wheel-guards O O, all arranged substantially as shown and described.

481,176. BELT-TIGHTENER FOR THRASHING-MACHINES.

EDWARD HUBER, Marion, Ohio. Filed Feb. 1, 1892. Serial No. 419,961. (No model.)

Claim.—A belt-tightener consisting, essentially, of a stationary plate or disk having a flat inner face adapted to form an extended

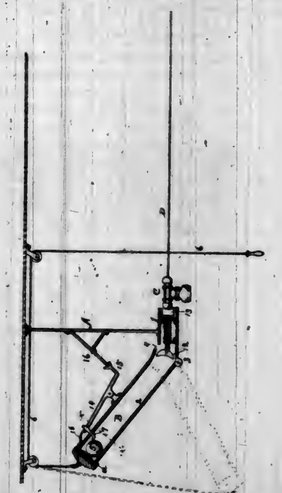


481,176.

bearing and provided centrally with a pin or journal, a corresponding movable plate or disk provided, also, with a flat inner face adapted to engage and have an extended bearing upon the inner face of the stationary plate or disk, said movable plate or disk having an opening which receives the pin or journal of the stationary plate or disk, whereby the movable plate or disk has an axial bearing and a bearing at right angles to the axis, an arm on the movable plate or disk, supporting an idle pulley or wheel adapted to bear on the belt, a weight-arm approximately at right angles to the wheel or pulley-supporting arm, and a weight having a shank secured to the weight-arm, substantially as set forth.

481,177. BRACKET.

DAVID M. IRELAND, Detroit, Mich. Filed Apr. 27, 1891. Serial No. 390,534. (No model.)



Claim.—1. A bracket consisting of a right-angled frame made from a strip of sheet metal or equivalent material, having a continuous hollow rib stamped from the sheet metal and terminating short of the ends of the arms and leaving a continuous flange along the sides and around the ends of said rib, said sheet-metal strip being cut away at the point of forming the angle to form the miter of the said ribbed portion, substantially as described.

2. In a thin sheet-metal bracket having two branches, the combination of two strengthening hollow ribs struck up from the metal sheet, meeting at a miter-joint at the angle of the branches and terminating at the outer ends in a boss, and a continuous flange extending on both sides of and around the ends of said ribs, substantially as described.

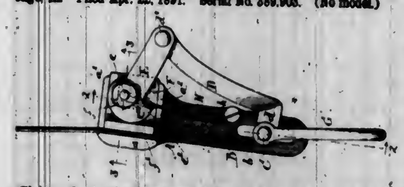
3. In a thin sheet-metal bracket having two branches, the combination of two strengthening hollow ribs struck up from the metal sheet, meeting at a miter-joint at the angle of the branches and terminating at the outer ends in a boss, a continuous flange extending on both sides of and around the ends of said ribs, and a brace supporting the branches of said bracket, substantially as described.

481,178. CASH-CARRIER.

GEORGE P. KNUBEY, Watertown, N. Y. Filed Dec. 17, 1891. Serial No. 415,369. (No model.)

Claim.—1. In a cash-carrier apparatus, the combination, with the cylinder 1, having a shaft mounted therein, of the cylinder 2, loosely secured to the aforesaid cylinder, means for raising the free end thereof, and the ball adapted to travel therein, as set forth.

2. In a cash-carrier apparatus, the combination, with the cylinder 1, having a shaft mounted thereon, said shaft being provided with heads upon its ends, of the cylinder 2, loosely secured to the aforesaid cylinder, means for raising the free end thereof, and the ball adapted to travel freely within said cylinder, as set forth.



3. In a cash-carrier apparatus, the combination, with the cylinder having a shaft mounted therein, said shaft being provided with heads upon its ends, a coil-spring surrounding said shaft and anchored between brackets, of the cylinder 2, loosely secured to the aforesaid cylinder, means for raising the free end thereof, and a ball adapted to travel freely therein, as set forth.

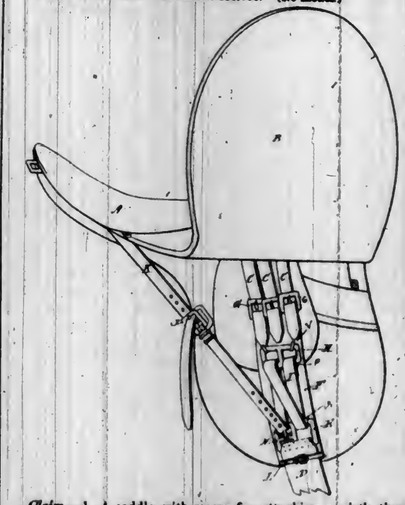
4. In a cash-carrier apparatus, the combination, with the cylinder 1, having a shaft mounted therein, of the cylinder 2, loosely secured thereto, means for raising the free end thereof, a ball adapted to travel freely therein, means for raising the free end of said cylinder, and means for holding the ball at the outer end during its upward travel, and means for releasing said ball, as set forth.

5. In a cash-carrier apparatus, the combination, with the cylinder 1, having a shaft mounted therein, of the cylinder 2, loosely secured to the aforesaid cylinder, means for raising the free end thereof, a ball adapted to travel freely therein, means for holding and releasing said ball, the cash-car C, adapted to travel upon the wire D, and the wire D, substantially as described, for the purposes set forth.

481,179. WIRE STRETCHER OR CLAMP.

JOHN M. KLEIN, Chicago, Ill. Filed Apr. 22, 1891. Serial No. 389,903. (No model.)

Claim.—1. A wire-clamp comprising a body A, provided at one end with a projecting arm B, having a long slot therein, and at the opposite end with a stationary jaw *a*, a movable jaw E, eccentrically pivoted to said body, a pitman or operating-bar D, pivoted at one end to the said movable jaw, and a bolt passing through the slotted end of the projecting arm B and connecting the pitman therewith, substantially as described.



2. A wire-clamp comprising a body A, provided at one end with a projecting arm B, having a long slot therein and at the opposite end with a stationary jaw *a*, a movable jaw E, eccentrically pivoted to said body, a pitman or operating-bar D, pivoted at one end to the said movable jaw, a bolt passing through the slotted end of the projecting arm B and connecting the pitman therewith, and a link or coupling G, connected to said bolt and adapted to swing in the plane of the movement of the clamping-jaws, substantially as described.

3. A wire-clamp comprising a body A, having a suitable offset *a*, a movable jaw E, eccentrically pivoted with respect to the body A, a suitable operating bar or pitman for shifting said movable jaw, and a clamping-plate interposed between the movable jaw E and the stationary jaw, said clamping-plate being slotted to admit the pivot-pin of the movable jaw, substantially as described.

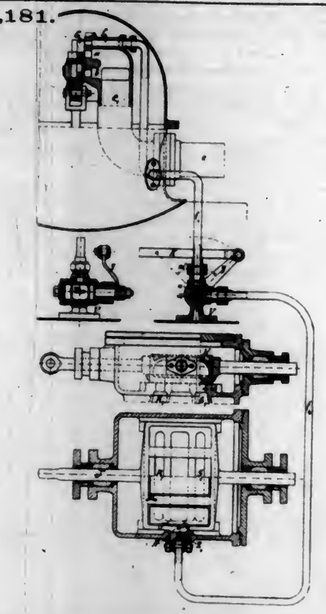
4. A wire-clamp comprising a body A, having suitable stationary jaw or offset *a*, and having transverse ribs *a'* and *a²*, a movable jaw E, eccentrically pivoted with respect to the body A, an operating bar or pitman for shifting said movable jaw, a clamping-plate F, having an offset *f'*, interposed between the movable jaw E and the stationary jaw or offset *a*, the body of said clamping-plate extending between the movable jaw E and the body A of the clamp.

481,180. SADDLE-GIRTH.

RUFUS A. LANE, New York, N. Y. Filed Nov. 12, 1891. Serial No. 411,706. (No model.)

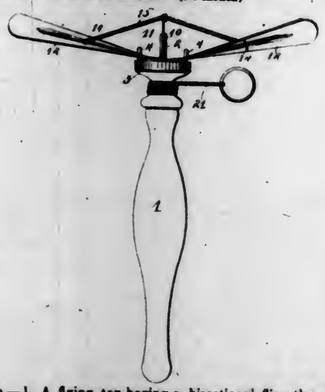
Claim.—1. A saddle with means for attaching a girth thereto, combined with a girth, one end being provided with buckles or other suitable adjustable attaching means, said girth being comprised of two parts and provided with a take-up device between them, consisting of loops and a strap or cord passing through the loops, leaving them at an angle with the girth and attached to the saddle within easy reach of the rider for adjustment when mounted.

2. A saddle with means for attaching a girth, combined with a girth attached thereto, one end being provided with buckles or other suitable adjustable attaching means, said girth being comprised of two parts and provided with a take-up device between them, consisting of a loop on one section and a loop and buckle on the other and a strap or cord passing through the loops and buckle, leaving them at an angle with the girth and attached to the saddle within easy reach of the rider for adjustment when mounted.



3. A saddle-girth comprising two sections provided with a device for adjustably attaching it to the saddle and a take-up device between said sections, consisting of a strap or cord connecting them, said strap or cord being adjustably attached to the saddle, and an automatic device for holding the slack taken up.

481,181. STARTING-GEAR FOR COMPOUND LOCOMOTIVES.



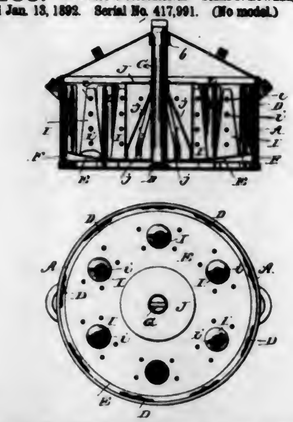
ROBERT LINDNER, Chemnitz, Germany. Filed June 15, 1891. Serial No. 396,532. (No model.) Patented in England Mar. 6, 1890, No. 3,853, and in Germany Nov. 26, 1890, No. 57,044.

Claim.—In a starting-gear for compound engines, the slide H, fitted to the valve-buckle N of the low-pressure valve, in combination with the pipe f^4 for the auxiliary steam, provided with a suitable valve V, and the high-pressure cylinder A, the receiver-pipe C, and the low-pressure cylinder B, having a port Z', fed by the steam-pipe f^4 and regulated by the slide H, for the purpose set forth.

481,181.

481,182. FLYING TOY. EMIL R. LOORMANN, St. Louis, Mo. Filed Apr. 12, 1892. Serial No. 428,814. (No model.)

Claim.—1. A flying toy having a bisectional flier the sections whereof are hinged together and means for imparting to said flier a rotating and consequent sailing motion, substantially as set forth.



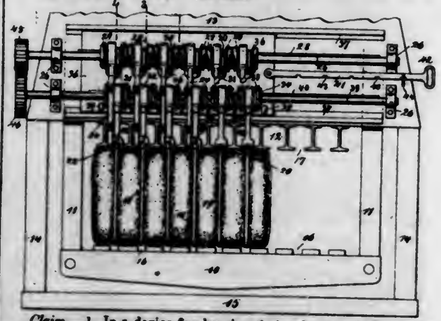
2. A flying toy having a bisectional flier the sections whereof are hinged together, a rotating spool for imparting to said flier a sailing motion, and means for communicating a rotary motion to said spool, substantially as set forth.

3. A flying toy having a bisectional flier the sections whereof are hinged together, an elastic cord passing from section to section and secured to the same, a rotating spool for imparting to said flier a sailing motion, and a cord for rotating said spool, substantially as set forth.

4. A flying toy comprising a manipulating-handle, a pin or stud firmly secured in one end of the handle and projecting from the same, a spool revolubly mounted on said pin or stud and fixed against detachment therefrom, and a bisectional flier loosely mounted on said spool, the sections of said flier being hinged together, substantially as and for the purpose set forth.

5. A flying toy comprising a manipulating-handle, a pin or stud firmly secured in one end of the handle and projecting from the same, a rotating spool mounted on said pin or stud and non-detachable therefrom, a bisectional flier mounted on said spool, the sections of said flier being hinged together, a pivoted triangular standard carried by said flier, and an elastic cord supported by said standard and secured to said flier for drawing the sections of the same together to facilitate the rapid descent of the same, substantially as set forth.

481,188. WASHING-MACHINE. SILAS P. LOWELL, Eugene, Oreg. Filed Jan. 13, 1892. Serial No. 417,991. (No model.)



Claim.—1. In a washing-machine, an agitator comprising a perforated disk or plate dished or concaved on its upper side, provided at its edge with a rim-flange, and the upright tubes on said disk or plate, such tubes being perforated, all substantially as set forth.

2. An improved agitator for washing-machines, comprising the plate or disk, the cylinder or turret mounted centrally on said plate or disk, a number of tubes on said disk, surrounding the central turret, said tubes being tapered toward their upper ends, whereby the clothes wrapped thereon may be readily lifted off and being hollow for the circulation of the water and steam, and the disk or plate having openings communicating with said tubes for the passage of water and steam into the latter, all substantially as and for the purposes set forth.

3. In a washing-machine, an agitator comprising a disk provided with openings, hollow upright tubes secured on said disk over the said openings, whereby water and steam may pass into their lower ends, the said tubes being perforated for the exit of the steam, and the central cylinder or turret perforated for the circulation of water and steam and adapted to keep the clothing from the center of the agitator, substantially as and for the purposes set forth.

4. In a washing-machine, substantially as described, the combination of the suds-box or body and the agitator journaled to revolve therein, formed with a perforated base-plate, and perforated upright tubes thereon, said tubes being arranged off the center of the disk, whereby they will move in a circular line as distinguished from being rotated axially when the disk is turned and being conical or tapered toward their upper ends, all substantially as set forth.

481,184. DEVICE FOR DRAWING TIE-BANDS AROUND BALES. JOSEPH J. MARTIN, Bellevue, and WILLIAM H. BROWNFIELD, Dayton, assignors of one-third to Louis K. Marty, Newport, Ky. Filed Feb. 27, 1892. Serial No. 423,025. (No model.)

Claim.—1. In a device for drawing tie-bands around bales, arms capable of engaging with the ends of a tie-band for the purpose of pulling the same close around the bale, a pivot upon which these arms, preferably arranged in series, are hung, tension devices, one for each arm and secured to this pivot, which latter is common to all arms and by which the rotary motion of this pivot is transmitted to said arms, and means to actuate the pivot, all as substantially shown and described.

2. In a device for drawing tie-bands around bales, an arm capable of gripping the free end of a tie-band for the purpose of pulling it closely around the bale, an elastic tension device connected to this arm and operating it in a manner to cause it to move away from the bale, and mechanism actuating this tension device, which latter by reason of its elasticity yields sufficiently to permit the mechanism actuating it to finish its movement in cases where the operation of the arm stops before that time, all as substantially shown and described.

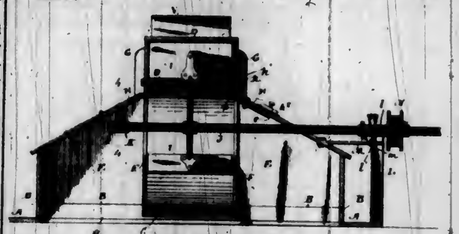
3. In a device for drawing tie-bands around bales, two pivoted arms preferably arranged in series and adapted to engage with their outer free ends with the ends of a tie band, tension devices which engage with each one of these arms and cause them to rotate on their pivots, and mechanism which actuates these tension devices in a manner to cause the arms of one series to rotate in a direction opposite to one of the arms of the other series, said tension devices by reason of their elasticity yielding sufficiently to permit any of the arms to stop at any time prior to the time when the mechanism actuating them stops, all as substantially shown and described.

4. In a device for drawing tie-bands around bales, arms preferably arranged in series and capable of engaging with the ends of the tie-bands, a shaft upon which the whole series of arms is hung, and elastic devices secured to this shaft and connected to the arms thereon, whereby the shaft when rotating is enabled to impart a swinging motion to said arms, which motion, however, as to its duration is independent from the rotary motion of the shafts and by reason of the yielding connection between them and the arms allows these latter to stop at any time previous to the termination of the rotation of the shafts, all as substantially shown and described.

5. In a device for drawing tie-bands around bales, two series of arms, the ends of one of these series provided with forks, the other with movable jaws, whereby they are enabled to act upon the ends of the said tie-bands, shafts upon which these arms are hung, means secured to said shafts and engaging with the arms for the purpose of imparting the motion of the shafts to the arms, said means being sufficiently elastic to permit the shafts to continue their rotation should any or all of the arms hung on them stop, and stationary cams located within the paths of the arms having the jaws, whereby these latter are closed upon coming in contact with said cams, all as substantially shown and described.

6. In a device for drawing tie-bands around bales, a series of arms capable of grasping and acting upon the ends of the said tie-bands for the purpose of pulling them closely around the bale, shafts upon which they are supported, collars secured to either side of said arms on the shafts and operatively connected with said shafts, and elastic or yielding means connecting said collars with said arms for the purpose of operating them, which means permit each one of the arms to stop independently and be not affected by the rotary movement of the shafts should the same continue, all as substantially shown and described.

7. In a device for drawing tie-bands around bales, arms preferably arranged in series and capable of engaging with the ends of the tie-bands, a shaft upon which the whole series of arms is hung, elastic devices secured to this shaft and connected to the arms thereon, whereby the shaft when rotating is enabled to impart its motion to said arms, which motion as to its duration, however, is independent from the rotary motion of the shaft, and means to rotate the shaft, all as substantially shown and described.



8. In a device for drawing tie-bands around bales, a series of arms capable of acting upon the ends of the bands for the purpose of pulling them closely around the bales, shafts upon which said arms are supported, elastic means secured to said shafts and engaging with the arms for the purpose of actuating them, means whereby the shafts are rotated, and means whereby all said arms are adjusted laterally to suit the position of the bale, and means to lock said arms in their adjusted position, all as substantially shown and described.

9. In a device for drawing tie-bands around bales, an arm for pulling the free end of a tie-band through the loop to which the other end of said band is secured, jaws connected to this arm for gripping the tie-band, a cam acting upon the movable jaw and closing the same, a spring 29, operatively connected to this arm, collars to which the ends of this spring are secured, a shaft upon which said collars are operatively affixed, and means for rotating the shaft, all as substantially shown and described.

10. In a device for drawing tie-bands around bales, an arm for pushing the loop to which one end of a band is secured close against the bale, the free end of this arm constructed and shaped to be capable of engaging with and acting upon said loop, a spring 35, operatively connected to this arm, collars to which the ends of this spring are affixed, a shaft upon which said collars are operatively secured, and means for rotating the shaft, all as substantially shown and described.

11. In a device for drawing tie-bands around bales, series of arms capable of engaging with the ends of the tie-bands, shafts upon which these arms are hung, and tension devices secured to said shafts and engaging with said arms, these latter provided with cut-outs 47 to permit the shafts to rotate without affecting the arms in cases where these latter stop, all as substantially shown and described.

481,185. DUST COLLECTOR AND CONVEYER. BENJAMIN F. MOHR, Mifflinburg, Pa. Filed Feb. 26, 1892. Serial No. 422,884. (No model.)

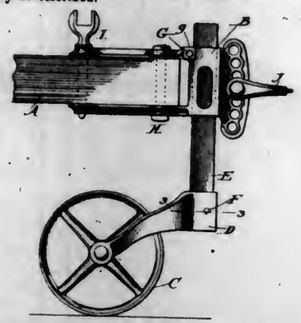
Claim.—1. In a dust collector and conveyer, the combination, with a base having an opening, of a fan-casing supported centrally upon said base above the plane of the same and provided with side receiving ports or openings and upper opposite inclined discharge-openings, a revolving fan, opposite bottomless collecting-compartments mounted upon said base and inclosing the side ports of said fan-casing and provided with top openings, detachable lids inclosing said openings, and clearing arms secured to said lids and projecting within the fan-casing, substantially as set forth.

2. In a dust collector and conveyer, the combination of a fan casing, opposite bottomless collecting-compartments upon each side of said fan casing, a bearing-casting adjustably secured within one of said compartments, a bearing-bracket located adjacent to the opposite collecting-compartment, an adjusting-rod connected with said bracket, and a fan-shaft mounted in said bearings, substantially as set forth.

3. In a machine of the class described, the combination, with the opposite compartments, the intermediate fan-casing, and the revolving fan-shaft, of a bearing-casting located in one of said compartments to receive the inner end of said shaft and provided with opposite slotted ends adjusting-bolts engaging said slotted ends and the sides of said compartment, a bearing-bracket receiving the outer end of said shaft and located adjacent to said opposite compartment, an adjusting-rod secured to said opposite compartment and engaging said bearing-bracket, and adjusting-nuts engaging said rod on both sides of said bracket, substantially as set forth.

4. In a dust collector and conveyer, the combination of an intermediate fan-casing having opposite side ports, upper inclined discharge-openings, flanged casting secured to the lower edges of said discharge-openings, the flexible discharge-tubes engaging under said castings and over the top of the fan-casing, and opposite bottomless collecting-compartments inclosing the side ports of said fan-casing, substantially as set forth.

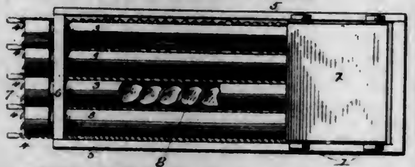
5. In a dust collector and conveyer, the combination of an intermediate fan-casing having opposite side ports, upper inclined discharge-openings, top securing-grooves and inclined side grooves in rear of said openings, semi-elliptical flanged or grooved securing-castings secured to the lower edges of said discharge-openings, the flexible discharge-tubes adapted to be secured under said flanged or grooved castings and into said top securing-grooves, removable cut-off gates working in said inclined grooves, a revolving fan, and the opposite bottomless collecting-compartments inclosing the side ports of said fan-casing substantially as set forth.



6. In a machine of the class described, the combination of a fan-casing having opposite side receiving-ports, upper inclined discharge-openings, top securing-grooves and inclined side grooves in rear of said openings, semi-elliptical flanged or grooved securing-castings secured at the lower edges of said discharge-openings, the flexible discharge-tubes adapted to be secured to said flanged or grooved castings and into said top securing-grooves, and removable cut off gates working in said inclined grooves, substantially as set forth.

481,186. COMBINED CLEVIS AND GAGE-WHEEL. GILPIN MOORE, Moline, Ill., assignor to the Deere & Company, same place. Filed Jan 3, 1891. Serial No. 376,663. (No model.)

Claim.—1. The combination, with a plow-beam, of a draft-clevis rigidly secured to the plow-beam and having an angular slot therein, a gage-wheel shank angular in cross-section and movable vertically in the slot, a transverse wedge-shaped bolt passing through the draft-



clevis and bearing against one edge of the angular shank to hold the latter in different positions of vertical adjustment, and a gage-wheel having a yoke formed with a socket of greater size than the shank and engaged therewith, so that the gage-wheel can trail the plow-beam without turning the shank, substantially as described.

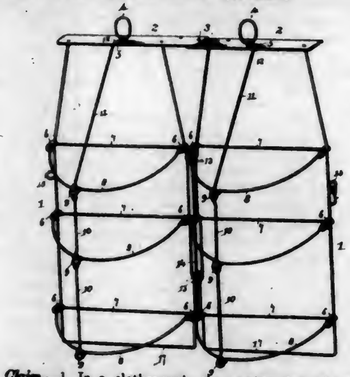
2. The combination, with a plow-beam, of a draft-clevis rigidly secured to the plow-beam and having a vertical angular slot therein, a gage-wheel shank angular in cross-section and movable vertically in the slot of the clevis, means for holding the shank in different positions of vertical adjustment in the slot of the clevis, a gage-wheel yoke having a socket widened at its forward portion and in which the shank is arranged, and a pin passing through the shank and socket to permit the gage-wheel to trail the plow-beam without turning the shank, substantially as described.

3. The combination, with a draft-clevis, of a non-rotary shank vertically adjustable in the clevis, and a gage-wheel having a shank D, provided with a socket *d*, which is widened at its forward portion to enable the gage-wheel to trail the plow-beam without turning the shank, substantially as described.

481,187. MINING-MACHINE. George F. Myers, Pittsburg, Pa. Filed Oct. 5, 1891. Serial No. 407,741. (No model.)

Claim.—1. A mining-machine comprising a plurality of hollow rotatory cutters arranged adjacent to each other and auxiliary rotatory drills located in the angles between said hollow cutters, substantially as described.

2. A mining-machine comprising a plurality of hollow rotatory cutters arranged adjacent to each other and auxiliary rotatory drills located in the angles between said hollow cutters, the said auxiliary drills having external conveying-spirals, substantially as described.



3. A mining-machine comprising a plurality of hollow rotatory cutters arranged adjacent to each other and containing interior conveyers and auxiliary rotatory drills located in the angles between said hollow cutters, the said auxiliary drills having external conveying-spirals, substantially as described.

481,188. YARD-STICK HOLDER. Edgar R. Northam, Raleigh, N. C. Filed Sept. 5, 1891. Serial No. 404,872. (No model.)

Claim.—As a new article of manufacture, a holder for yard-sticks, designed to be attached to a series of shelves and comprising a cup adapted to receive and support the lower ends of a number of yard-sticks and provided at its inner side with an opening to receive a securing-screw, and a spring having a circular form and provided at its middle with a screw-opening and having its ends in contact and curved outward to provide a flaring mouth and presenting convex faces to each other, said spring being adapted to receive within it and support the yard-sticks near their upper ends, substantially as described.

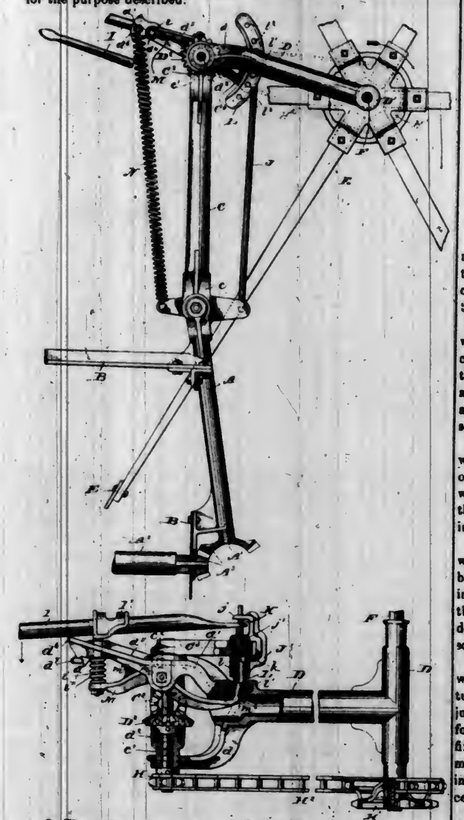
481,189. CLOTHES-DRIER. Elgamah Powell, Kokomo, Ind. Filed Mar. 21, 1892. Serial No. 425,775. (No model.)

Claim.—1. In a clothes-rack, the combination of two frames hingedly connected, bows movably attached to said frames and having eyes or loops at or about the central portions, links connecting said eyes or loops, supporting-rods connected to the uppermost of said eyes or loops, and cross-stays secured to said frames, substantially as described.

2. In a clothes-rack, the combination of two frames hinged together, heads secured to said frames having supporting-rings thereon, bows movably attached to said frames, links connecting said bows, cross-stays secured to the opposite sides of said frames, supporting-rods connected to the uppermost of said bows and having hooked ends to engage the heads, and means for locking said frames together, substantially as described.

3. In a clothes-rack, the combination of two frames hinged together and formed with eyes in parallel planes, cross-stays secured in said eyes, bows connected with said eyes and having of themselves eyes in the central portions thereof, links connecting said bows by engagement with said eyes thereof, supporting-rods connected to the uppermost bow of each frame, a removable rod hingedly connecting the said frames, and means for locking the frames together, substantially as described.

481,190. AUTOMATIC BRAKE. John H. Priestley, Meriden, Iowa. Filed Mar. 31, 1892. Serial No. 427,280. (No model.)



Claim.—1. The combination, with a running-gear having the rear bounds loosely connected with the reach and capable of a limited movement thereon, of a stationary brake-bar secured to the reach and provided at its ends with brake-shoes arranged to be engaged by the hind wheels, and a rock-shaft mounted on the brake-bar and carrying a stop-pin adapted to hold the rear bound against movement on the reach to prevent the brake being applied, substantially as described.

2. The combination of a running-gear having the rear bounds loosely connected with the main reach, a supplemental reach mounted on the main reach and connected with the rear bounds, a stationary brake-bar secured to the main reach and carrying brake-shoes arranged to be engaged by the hind wheels, a rock-shaft mounted on the brake-bar and provided intermediate its ends with a crank-loop and having an arm, and a pin connected with and carried by the crank-loop and arranged in an opening of the main reach and adapted to be projected above the latter to form a stop to be engaged by the supplemental reach, substantially as described.

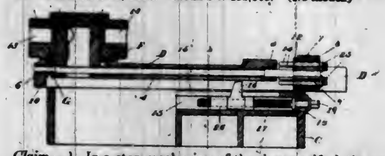
481,191. HARVESTER-REEL SUPPORT. Charles A. A. Rand, Chicago, Ill., assignor to the William Deering & Company, same place. Filed Mar. 14, 1892. Serial No. 424,762. (No model.)

Claim.—1. The combination, with the reel-standard carrying a quadrant, of a reel-supporting bracket pivoted to said standard at its upper end, a hand-lever, a latch controlled by said lever, and a radius-bar pivoted a convenient distance from the lower end of said standard and terminating at its upper end in a piece which carries said latch and slides in said quadrant, substantially as and for the purpose described.

2. The combination, with the reel-standard carrying a quadrant, of a reel-supporting bracket pivoted to said standard, a hand-lever supported in said bracket, a latch controlled by said lever and adapted to engage said quadrant, and a radius-rod having its upper end adapted to carry said latch and to slide in said quadrant, substantially as and for the purpose described.

3. The combination, with a reel-standard and bracket, of the quadrants C^3 and L, the latches K and M, a hand-lever controlling said bracket and latches, and a radius-bar having its upper end adapted to sustain both latching devices, substantially as and for the purpose described.

4. The combination, with the reel-standard having the quadrant C^3 and the reel-bracket carrying the latch M jointed together, of the radius-bar J, carrying a bracket adapted to support and guide the latch-pin *k*, that by engaging the quadrant on the reel-standard controls the fore-and-aft adjustment of the said standard, and to sustain a second quadrant that engaged by the latch M controls the position of vertical adjustment of the reel-bracket, and suitable means for controlling the said latches, all combined substantially as described.



5. The combination of the reel-standard having the quadrant C^3 and the reel-bracket jointed thereto and having the latch M with the radius-bar J, having the bracket J', adapted to sustain and guide the latch that engages the quadrant C^3 and to sustain the quadrant L that is engaged by the latch M, and a lever pivoted to said bracket J' in such a manner as to slide the latch that engages the said quadrant C^3 and supported in the slide-bolt that controls the latch M, whereby the movement of the lever sidewise in one direction releases the latch from the quadrant C^3 and in the other direction releases the latch M, substantially as described.

6. The combination, with a reel standard carrying the quadrant C^3, of a reel-bracket, a radius-bar carrying the latch K, that engages said quadrant and the quadrant L, the latch M, that engages the said quadrant L, and the hand-lever I, substantially as and for the purpose described.

7. The combination, with a reel-standard carrying a quadrant and a reel-bracket, of the radius-bar J, carrying the piece J', the latches K and M, the quadrant L, and the lever I, substantially as and for the purpose described.

8. The combination, with a reel-standard carrying a quadrant and a reel-bracket, of a radius-bar J, carrying the piece J', the latches K and M, the quadrant L, the lever I, and the spring-controlled sleeve I', substantially as and for the purpose described.

481,192. STOP MECHANISM FOR TURRET-LATHES. Francis H. Richards, Hartford, Conn., assignor to Walter Wood, Philadelphia, Pa. Filed Nov. 23, 1891. Serial No. 412,865. (No model.)

Claim.—1. In a stop mechanism of the class specified, the combination, with the turret-slide and with the turret revolubly mounted thereon, of an independent stop-carrier, adjustable stops carried by said carrier, and means actuating the stop-carrier with the turret, substantially as described.

2. In a stop mechanism of the class specified, the combination, with the slide-block, of the stop 16 adjustable thereon, the turret-slide carried on the slide-block and carrying the turret revolubly mounted thereon, the stop carrier furnished with adjustable stops, and a shaft and gearing actuating the stop-carrier with the turret to bring said adjustable stops successively into working position, substantially as described.

3. In a stop mechanism of the class specified, the combination, with the slide-block having the bore 15 and the slot above said bore, of the stop-slide fitting in said bore and having the stop extending upwardly through said slot, a screw engaging said stop-slide for moving the same in the slide-block, and the turret-slide having a stop engaging the stop 16, substantially as described.

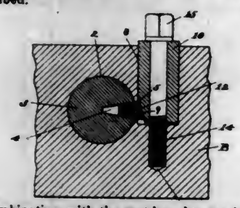
4. In a stop mechanism of the class specified, the combination, with the slide-block having a stop, of the turret-slide supported on said block and having the turret revolubly mounted thereon, the stop-cylinder journaled in the turret-slide and carrying the adjustable stops, the shaft for rotating the stop-cylinder, and gearing, substantially as described, actuating said shaft from the turret, substantially as described.

5. In a stop mechanism of the class specified, the combination, with a slide-block and a stop thereon, of the turret-slide having the turret revolubly mounted thereon, a stop-cylinder furnished with adjustable stops and revolubly supported on the turret-slide in position for one of its stops to engage said slide block stop, the turret-gear F, fixed to the turret, the pinion G, meshing with said turret-gear, and means connecting said pinion and stop-cylinder, whereby the stop cylinder is intermittently revolved to bring the turret-slide stops successively into working position, substantially as described.

6. In a stop mechanism, the combination, with the turret slide, of the turret and the independent stop-carrier, both supported on the slide and operatively connected for corresponding movements, and adjustable stops carried by the stop-carrier, substantially as described.

7. In a stop mechanism, the combination, with the turret-slide, of the turret revolubly mounted thereon and having its axis crosswise to the direction of the slide movement, a stop-cylinder revolubly mounted on the turret-slide and having its axis longitudinal of the slide movement, and stop-cylinder actuating devices operatively connecting the turret and said cylinder, substantially as described.

8. In a stop mechanism, the combination, with the slide having the bearing 7, of the cylinder journaled in said bearing and a series of stops adjustably fixed in said cylinder, substantially as described.

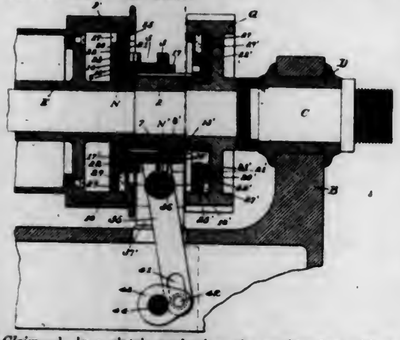


9. In a stop mechanism, the combination, with the slide-block having a stop, of the turret-slide supported on said block and having the turret revolubly mounted thereon, the stop-cylinder journaled in the turret-slide and carrying adjustable stops, and means operatively connecting the turret and stop-cylinder to have corresponding movements, substantially as described.

481,193. TOOL-HOLDING DEVICE. Francis H. Richards, Hartford, Conn., assignor to Walter Wood, Philadelphia, Pa. Filed Nov. 23, 1891. Serial No. 412,868. (No model.)

Claim.—1. The combination, with the part bored to receive and carry the shank and with the shank fitting said bore and having a tapered keyway, of the key fitting said keyway and means, substantially as described, carried by the shank-receiving part 4 forcing the key to expand the shank within the bore, substantially as described.

2. The combination, with the part bored to receive the shank and with the shank fitting said bore and having a tapered keyway, of the key fitting said keyway in the shank and projecting into a corresponding keyway in the said bored part and means forcing the key to expand the shank within the bore, whereby the key serves to expand the shank and to prevent the rotation thereof, substantially as described.



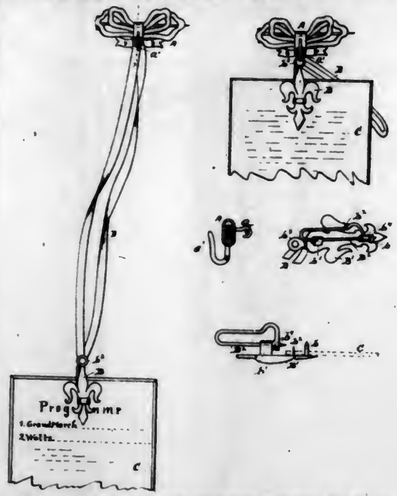
3. The combination, with the part bored to receive the shank and with the shank fitting said bore and having a tapered keyway, of the key fitting said keyway, a key-actuating wedge, and means operating said wedge to force the key into the keyway of the shank, substantially as described.

4. The combination, with the part bored to receive the shank and with the shank fitting said bore and having a tapered keyway, of the key fitting said keyway, the key-actuating wedge fitted to turn and slide in said shank-carrying part, and a screw for actuating the key through said wedge, substantially as described.

5. The combination, with the part bored to receive and carry the shank, of a shank fitting said bore and having in one side and longitudinally thereof a recess, substantially as described, a shank-expander in said recess, and means carried by the shank-receiving part and acting upon the shank-expander in a direction crosswise to the shank, whereby the shank is expanded at one side thereof within said bore, substantially as described.

481,194. FRICTION-CLUTCH. FRANCIS H. RICHARDS, Hartford, Conn., assignor to Walter Wood, Philadelphia, Pa. Filed Nov. 23, 1891. Serial No. 412,869. (No model.)

Claim.—1. In a clutch mechanism, the combination, with the friction-ring and its expanding-wedge, of the sliding clutch-ring, an adjustable wedge-actuating cam carried by the clutch-ring, and means for adjusting the cam to regulate the expansion of the friction-ring, substantially as described.



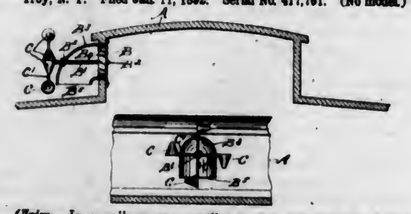
2. In a clutch mechanism, the combination, with the friction-ring carrier and the friction-ring thereon, of the friction-ring expanding wedge, the sliding clutch-ring, and a cam carried by the clutch-ring and constructed, substantially as described, to be expansible by a wedge therein, and means carried by the clutch-ring for adjusting the cam-wedge, substantially as described.

3. In a clutch mechanism, the combination, with the friction-ring carrier 22, having the groove 21 radially thereof, of the friction-ring on said carrier, means for holding said ring from rotation thereon, the friction-ring-expanding wedge fitted to slide in said groove, the cam actuating said wedge, and means for sliding said cam under and from under the wedge, substantially as described.

4. In a clutch mechanism, the improved cam, comprising the lower cam-plate, the upper cam-plate, and the cam-adjusting wedge intermediate to said plates and connecting the plates together by a sliding engagement therewith, substantially as described.

5. In a clutch mechanism, the combination, with the sliding clutch-ring having the cam-engaging slot, of the cam consisting of the plates engaging in said slot and having the wedge intermediate to said plates and the screw 17, carried in the ring and bearing against the wedge for adjusting the cam by the sliding of the wedge therein, substantially as described.

481,195. PROGRAM AND SCORE-CARD CHATELETTE. EDWARD R. ROEHM, Detroit, Mich., assignor to Roehm & Son, same place. Filed Feb. 23, 1892. Serial No. 422,450. (No model.)



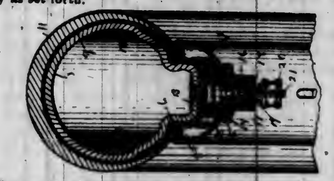
Claim.—1. A program and score-card chatelette having, in combination, a fastening device to engage the person, an attaching device to engage the program or card, consisting of a face-plate B', provided with means of attachment, whereby it may be secured to the program or card, and a suspending flexible connection secured to said fastening device and to said attaching device, said means of attaching said face-plate being invisible from the face of the program or score-card when in engagement therewith, substantially as described.

2. A program and score-card chatelette having, in combination, a fastening device A, provided with a hook and pin, an attaching device constructed to engage the program or card and to engage said hook, and a suspending flexible connection D, secured to both of said devices, substantially as described.

3. The fastening device B, constructed with a face-plate B', an eye *b*, and a reciprocating pin B^3 to engage said eye, substantially as described.

4. The fastening device B, constructed with a face plate B', an eye b^2 at its upper end, an eye *b* on its under side, a reciprocatory and rotatable pin B^3 to engage said eye *b*, and a prong b^3, arranged as set forth, substantially as described.

481,196. RAILWAY-CAR VENTILATOR. WINFIELD S. ROGERS, Troy, N. Y. Filed Jan. 11, 1892. Serial No. 417,761. (No model.)



Claim.—In a railway-car ventilator, the combination, substantially as set forth, of a car-wall provided with an opening leading sidewise horizontally from the interior of the car, a curved conduit covered exterior to said wall and forming a protecting-hood at said opening and having a downward discharge, an air-propelling wheel housed within said conduit and having a spindle projecting outwardly through the wall of said conduit, and a wind-driven wheel secured to said spindle exterior to the car and hood and separated from said air-propelling wheel by the wall of said conduit.

481,197. PNEUMATIC TIRE. CHARLES H. ROTH, Cincinnati, Ohio. Filed Nov. 14, 1891. Serial No. 411,869. (No model.)

Claim.—1. The combination of a wheel-tire inflated with air and a valve consisting of a chamber secured to a wheel-tire in a suitable manner, a valve, a stem, a spring, and a nut on the stem capable of clamping the valve permanently in place, substantially as set forth.

2. The combination of a wheel-tire inflated with air, a valve consisting of a chamber secured to the rim by a shoulder on the chamber within the rim and a nut exterior to the rim, a spring-case screwed to the chamber, having a valve-seat on its inner end, a valve, a stem, and a nut on the stem capable of drawing the valve against its seat, substantially as set forth.

3. The combination of a wheel-tire inflated with air, a valve consisting of a chamber secured to the rim by a shoulder on the chamber within the rim and a nut exterior to the rim, a spring-case screwed to the chamber, having a valve-seat on its inner end, a valve, a stem, a spring, and a nut on the stem cut away at its sides for the passage of air and capable of drawing the valve against its seat, substantially as set forth.

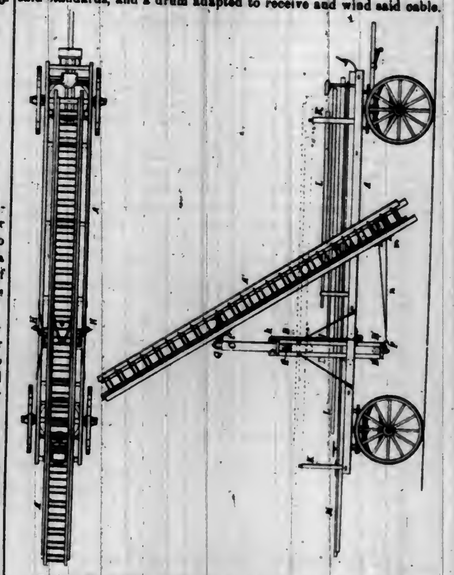
4. The combination of a wheel-tire inflated with air, a valve consisting of a chamber secured to the rim by a shoulder on the chamber within the rim and a nut exterior to the rim, a spring-case screwed to the chamber, having a valve-seat on its inner end, a valve, a stem, and a nut on the stem arranged to clamp the valve to its seat permanently and securely, substantially as set forth.

481,198. MACHINE FOR SCORING AND MARKING SHINGLES. JOHN T. ROSE, Tyrone, Pa., assignor of seven-eighths to John G. McCamant and George W. Friedly, same place. Filed Sept. 30, 1891. Serial No. 407,340. (No model.)

Claim.—A portable machine for scoring or marking shingles, comprising the base 3, the uprights 4 4, the bridge-piece 5, parallel with the base, the gage-board 13, the spring-arm 6, arranged parallel with the base and provided with a vertically-disposed and horizontally-slotted adjusting-plate 7, the rotary marking-wheel carried by the free end of the spring-arm and disposed parallel with and opposite the gage-board, and adjusting-screws passing through the slots in the adjusting-plate and secured in the bridge-piece, substantially as described.

481,199. FIRE-LADDER. ISAAC W. SALYERDS and LAWRENCE SHADBOLT, Scottsville, N. Y. Filed June 20, 1891. Serial No. 396,964. (No model.)

Claim.—1. In a fire-ladder, the combination of a truck, an elevatable ladder-support, a jib or yoke pivoted to said support by a vertical pivot, and means whereby the ladder is by gravity detachably fixed in horizontal bearings to said jib.



2. In a fire-ladder, the combination of a truck, an elevatable ladder-support, a jib or yoke pivoted to said support by a vertical pivot and provided with forks, as *r*, and a ladder having a horizontal shaft, as *o*, adapted to rest removably in said forks.

3. In a fire-ladder, the combination of a truck, standards having vertical guides, a slide moving in said guides, a ladder pivoted to said slide by a universal joint, and means for elevating said slide and for fastening said slide at any point of its path.

4. In a fire-ladder, the combination of a truck, standards having vertical guides, a slide moving in said guides, a ladder pivoted to said slide by a universal joint, means for elevating said slide and for fastening said slide at any point of its path, and means for adjusting and setting the ladder at different angles of elevation.

5. In a fire-ladder, the combination of a truck, standards having vertical guides, a slide moving in said guides, a jib or yoke pivoted to said slide by a vertical pivot, a ladder journaled to said jib or yoke by horizontal bearings, means for elevating said slide and for fastening said slide at any point of its path, and means for adjusting and setting said ladder at different angles of elevation.

6. In a fire-ladder, the combination of a truck, standards having vertical guides, a slide moving in said guides, a jib or yoke pivoted to said slide by a vertical pivot, a ladder journaled to said jib or yoke by horizontal bearings, pulleys attached to the outside of said slide, and pulleys attached to the upper part of said standards on either side, a rope, cable, or chain attached on either side to one of said standards near the top thereof, passing downward under the pulley attached to said slide, and thence upward over the pulley attached to said standards, and a drum adapted to receive and wind said cable.

7. In a fire-ladder, the combination of a truck, standards having vertical guides, a slide moving in said guides, a jib or yoke pivoted to said slide by a vertical pivot, a ladder journaled to said jib or yoke by horizontal bearings, pulleys attached to the outside of said slide, and pulleys attached to the upper part of said standards on either side, a rope, cable, or chain attached on either side to one of said standards near the top thereof, passing downward under the pulleys attached to said slide and thence upward over the pulleys attached to said standards, and a drum adapted to receive and wind said cable, a swivel-hook fastened directly beneath said vertical pivot, and a pivot attached to said hook and winding upon the drum fixed to said ladder.

481,200. SHEARS. EDWARD A. SANDERS, Chicago, Ill. Filed May 26, 1891. Serial No. 394,137. (No model.)

Claim.—1. In a pair of shears, the combination of a pair of shear-blades A and A', means connecting the blades and holding them against endwise displacement, mechanism having connection with the blades for opening and closing them, said mechanism including an eccentric adapted to bear in opposite directions against one of said blades for moving it in opposite directions, and means through which it bears indirectly against the other blade, and a pair of handles suitably connected with the other parts, substantially as set forth.

2. In a pair of shears, the combination, with the shear-blade A, having the handle C rigid therewith, of the shear-blade A', means connecting said blades and holding them against relative endwise movement, the handle C, movable independently of both blades, and mechanism having connection with said blades for opening and closing them, said mechanism including an eccentric adapted to bear in opposite directions against one of said blades for moving it in either direction, and means through which it bears indirectly against the other blade, substantially as set forth.

3. The combination, with a pair of relatively-movable blades and

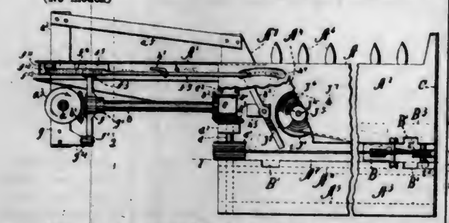
means connecting them, of a pair of eccentrics each having a bearing against one of said blades and means for operating said eccentrics, substantially as set forth.

4. The combination, with a pair of blades and means connecting them, of a pair of handles, a pair of eccentrics each bearing against one of said blades, and means connecting said eccentrics with one of said handles, substantially as set forth.

5. The combination, with the relatively-movable blades A A', having openings D D', and means connecting said blades, of the eccentrics E E', occupying said openings, respectively, the stud F, connecting said eccentrics, and the handle G, having suitable connection with said stud, substantially as set forth.

6. The combination, with the blades A A', having openings D D', and means connecting said blades, of the eccentrics E E', occupying said openings, respectively, the stud F, connecting said eccentrics, the plates H H', engaging said stud, and the handle G, to which said plates are connected, substantially as set forth.

7. The combination of the blades A A', having openings D D', arranged with respect to each other, so that each of said openings is partly overlapped by the blade in which the other is formed, producing shoulders a and a', means connecting said blades, the eccentrics E E', situated in said openings, respectively, and means for operating said eccentrics, substantially as set forth.

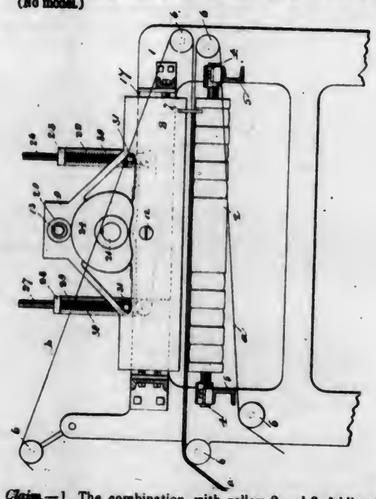


481,201. SAW. DANIEL C. SCHLABACH, Farmerstown, Ohio. Filed Dec. 8, 1891. Serial No. 414,378. (No model.)

Claim.—1. A circular saw comprising a blade provided with triangular teeth whose backs or upper edges form chords of a circle touching the points of all the teeth, the upper edge or back of the main portion or body which supports the tooth proper extending in a gentle curve from the heel of the tooth to the return bend of the gullet, substantially as described, and for the purpose set forth.

2. A saw-blade having its teeth formed integrally therewith, each tooth being provided with a main portion or body whose rear curved edge or back extends in a gradual curve from the heel of the point to the base of the gullet of the next tooth in rear thereof, and terminating in a triangular point whose back or upper edge forms the chord of a circle touching the extreme ends or points of the teeth in the circle, whereby the metal forming the tooth is distributed so as to afford the greatest strength where required to resist strains tending to warp the blade, while the point is provided with the desired thickness of metal between the heel thereof and the gullet, substantially as described.

481,202. GEAR-SHIFTING MECHANISM FOR HARVESTERS. GEORGE SCHUBERT, Walnut, Tex. Filed Aug. 3, 1891. Serial No. 401,612. (No model.)



Claim.—1. In a gear-shifting mechanism for harvesters, the combination, with a bar f^5, provided with a guide f^6, having a slot f^7 and a depression f^8 in said slot f^7, an antifriction roller f^{11} on said guide, a block or track f^9, having a recess f^{10}, a movable bearing f, pivoted to the harvester-frame with one end and extending with its other end to the guide f^6, and provided with an antifriction roller f^5 to operate in the guide f^6, a draw-rod h', a shaft a, and a shaft b, bevel-pinions a^3 and b', as shown, and for the purpose described.

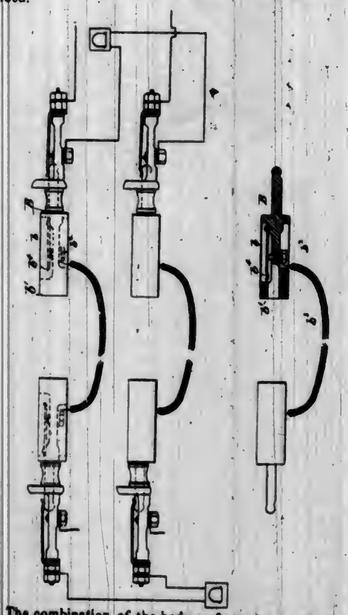
2. In a gear-shifting mechanism for harvesters, the combination, with a bar f^5, provided with a guide f^6, having a slot f^7 and a depression f^8 in said slot f^7, an antifriction roller f^{11} on said guide, a block or track f^9, having a recess f^{10}, a movable bearing f, pivoted with one end to the harvester-frame and extending with its other end in the slot f^7, substantially as shown, and for the purpose described, shaft a and shaft b, bevel-pinions a^3 and b', a shaft d, a drum d' on said shaft d, bevel-pinions b^3 and b^3 on the shafts b and d, a pivoted bearing e, a cord i, secured to the drum d' and to a spring-drum J^3, and attached to a conveyer to operate in the platform and connected to the rod f^5, a lever h^3, pivoted in the platform, as shown, and for the purpose described.

3. In a gear-shifting mechanism for harvesters, the combination, with a bar f^5, provided with a guide f^6, having a slot f^7 and a depression f^8 in said slot f^7, an antifriction-roller f^{11} on said guide, a block or track f^9, having a recess f^{10}, a movable bearing f, pivoted with one end to the harvester-frame and having an antifriction-roller on its other end to engage with the slot f^7, shaft a, and shaft b, bevel-pinion a^3 and bevel-pinion b', bevel-pinions b^3 and b^3 on shaft b and d, a pivoted bearing e, a drum d' on shaft d, a spring-drum J^3, pivoted in the platform, a sheave j', a cord i, passing over the sheave and having one end attached to the drum d' and the other end attached to the drum J^3, a conveyer attached to the said cord for operating in the platform, and a lever h^3, pivoted in the platform connected at one end to the bar f^5 and having its other end in the path of the conveyer, substantially as described.

481,203. FOLDING ATTACHMENT FOR PRINTING-PRESSES. RALPH C. SEYMOUR, Chicago, Ill. Filed Nov. 13, 1891. Serial No. 411,736. (No model.)

Claim.—1. The combination, with rollers 2 and 3, folding-blade 8, having an upward extension 9, an antifriction roller 20, journaled upon said extension, and a sliding block 10, secured to said folding-blade, of a guideway 15, adapted to receive said sliding block, shaft 21, cam 24, mounted upon said shaft and adapted to engage the roller 20, bar 25, secured to said folding blade, perpendicular rods 26 and 27, carried by said bar, standards 29, supporting the upper ends of said rods, and springs 30 upon said rods, substantially as described.

2. The combination, with folding-rollers, of a vertically-movable folding-blade, vertical guides on which the blade moves, a cam for elevating the blade, springs for depressing the blade, and means for adjusting the tension of the springs, substantially as described.

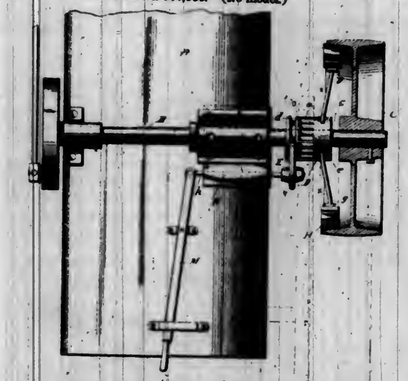


3. The combination, with a vertically-reciprocating folding-blade, of mechanism for raising said blade and folding-rollers, bar 25, rods 26 and 27, carried thereby, springs 30 on said rods, and nuts 31 for adjusting the tension of said springs, substantially as described.

481,204. PLUG SPRING-JACK. CHRISTOPHER A. SHEA, Boston, Mass. Filed Apr. 23, 1892. Serial No. 430,316. (No model.)

Claim.—1. The terminal or line connector herein described, the same consisting of two engaging circuit breaking and holding devices, each comprising a plug or terminal engaging device, a circuit-breaker, and a support or holder for a supplemental or additional testing-plug or circuit-breaker, and a flexible conductor connecting the insulated contact-points of the two devices, as and for the purposes described.

2. In a portable device for connecting or engaging electrically-charged line-terminals, a plug or terminal-engaging device, a flexible conductor, a circuit-breaker between the conductor and the engaging device, and a support or holder for a supplemental or additional testing-plug or circuit-breaker.



3. In a portable device of the character specified, a body or frame having at one end the terminal engaging or connecting piece and at the other end a support or hole for receiving and holding the end of a testing plug or instrument; a spring circuit-breaker carried by said body or frame, an insulated contact-point with which the spring is normally in contact, and a flexible conductor connected with the contact-point upon the side of the frame or body, as and for the purposes described.

4. The combination of the body or frame having the tongue or plug B, the extension b, the spring b^4, contact b^3, the extension having the plug hole b', as and for the purposes described.

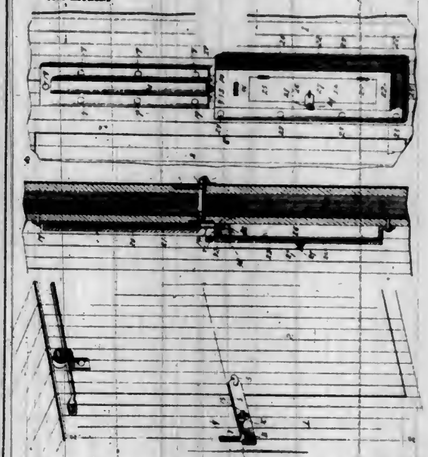
5. The combination of the rigid spring-jack switch A, having the contact-breaker a^3 and plug-hole a^4, with the portable connecting device comprising the plug B, the contact-breaker b^4, the contact-point b^3, the conductor b^2, and plug-hole b', substantially as and for the purposes described.

481,205. CLUTCH. REUBEN SHETTLER, Port Huron, Mich. Filed Oct. 13, 1890. Serial No. 367,980. (No model.)

Claim.—1. In a friction-clutch, the combination of a clutched wheel flared or coned interiorly, a hub sliding on the same shaft therewith, sectional brake-shoes, and elastic spokes connecting said hub to the said sectional shoe, said spokes being connected to the hub at an angle oblique to the axis of the shaft, whereby the perimeter of the sectional brake-shoe is increased as the angle between the spoke and the hub approaches a right angle.

2. In a friction-clutch, the combination, with a sliding pinion and a fly-wheel, of rods fixed to the pinion and curved outwardly therefrom and carrying on their outer ends friction-shoes adapted to engage the fly-wheel, whereby when said pinion has been moved toward the fly-wheel the rods carrying the friction-shoes will be somewhat straightened, so as to increase the frictional contact between the shoes and their connection with the fly-wheel.

3. In a friction-clutch, the combination, with a sliding sleeve, of a rod or rods secured about midway of their length thereto and curved therefrom and carrying friction-shoes at their ends, substantially as specified.



4. In a friction-clutch, the combination, with a sliding sleeve, of rods secured thereto about midway of their length and curved therefrom and also having their ends threaded, the shoe-irons perforated to receive the threaded ends of the rods, and jam-nuts for adjustably securing the irons to the rod, substantially as specified.

5. The sliding sleeve having the pinion-teeth formed therein and a wall or flange at the opposite end of said teeth, said sleeve also having an annular groove to receive the arm of the shifting lever and the rods carrying the shoes, which rods are curved or inclined outwardly, so that when their outer ends are met with resistance and their inner portions moved outwardly they will be somewhat straightened out, substantially as specified.

6. A friction-clutch having a sliding toothed sleeve adapted to mesh with a gear-wheel, in combination with yielding rods or bars carrying friction-shoes and having their ends bent outwardly and their inner portions fixed to the sleeve, substantially as specified.

7. The combination, with a power-shaft and fly-wheel thereon, of a sliding sleeve having a pinion and an annular groove formed therein, rods secured to said sleeve and curved therefrom, friction-shoes adjustably secured to said rods, the transversely-movable rod, the forked arm secured to one end of said shaft, and the hand-lever secured to the opposite end of the shaft, substantially as specified.

481,206. SEAL-LOCK. WASHINGTON SIMPSON, Argentine, Kans., and JOHN GEORGE, St. Joseph, Mo. Filed Feb. 8, 1892. Serial No. 420,776. (No model.)

Claim.—1. A car-seal register comprising a car-body and a car-door mounted movably upon said car-body, a hasp for retaining the door in closed position, and an oscillatory and longitudinally-movable bar, the outer end of said bar serving to retain the door in locked position and the inner end of the bar serving to sever an indicating-strip, substantially as set forth.

2. A car-seal indicator comprising a bar movable axially to unlock the car-door and also movable longitudinally to sever an indicating-strip and a guide-casing for the indicating-strip located above the severing end of the bar and located also within the car-body, substantially as set forth.

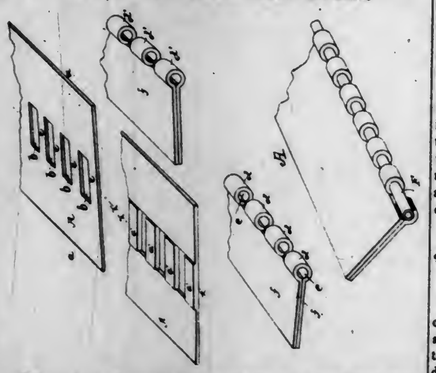
3. A car-seal indicator comprising a movable locking and severing bar working in the car-body, a guide-casing for the indicating-strips secured to the car-body above the severing end of the bar, and a receptacle for the severed strip-sections separate from the guide-casing and secured to the car-body below the severing end of the bar and below the guide-casing, the unlocking movement of the bar serving to sever the strip, substantially as set forth.

4. A car-seal indicator comprising a tubular sleeve located in the

car body and having an angular slot, a locking and severing bar of L form having its body portion provided with a radial stud to work in said slot, a guide-casing for an indicating-strip, and a receptacle for severed portions of said strip separate from the guide-casing and located oppositely from the point of location of said casing relative to the severing end of the bar, substantially as set forth.

5. A car-seal register comprising a hasp having a keyhole-slot, an L-shaped severing and locking bar working in the car-body and engaging a recess in the hasp, and a bolt having a flattened portion and an annular shoulder and designed to be connected at its outer end to the outer end of the locking and severing bar by a suitable seal, substantially as set forth.

6. A car-seal register comprising a receptacle for the severed indicating-strip sections, said receptacle being provided at its upper part with an internal movable partition for closing and opening said upper part of the receptacle, substantially as set forth.



7. A car-seal register comprising a receptacle for the severed indicating-strip sections, said receptacle being provided at its upper part with a sliding partition for opening and closing said upper part of the receptacle and provided, also, at its front with a door which when closed comes into contact with the outer margin of the partition and retains said partition in closed position, substantially as set forth.

8. A car-seal register comprising a receptacle for severed indicating-strip sections, a movable partition mounted in the upper part of the receptacle and arranged to open and close said part of the receptacle, and a slot formed in the upper part of the receptacle and below the partition, substantially as set forth.

9. A car-seal register comprising a vertical guide-casing for the indicating-strips, said casing being secured to the inner surface of the car and being also closed at its top and open at its bottom, and a longitudinally-movable severing-bar mounted in the car-body and working below the open bottom of the casing, substantially as set forth.

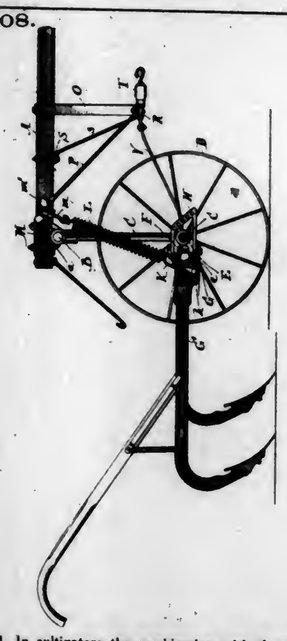
10. A car-seal indicator comprising a locking and severing arm of L shape and having its inner end provided with a knife-edge, a hasp-pin, and a seal connected to the pin and to the outer end of the severing arm, substantially as set forth.

481,207. STRUCTURAL BLANK. EUGENE C. SMITH, New York, N. Y. Filed Dec. 16, 1891. Serial No. 415,321. (No model.)

Claim.—1. A structural blank consisting of a folded sheet-metal strip having a series of knuckles along one edge of the strip and an eye in each knuckle.

2. A structural blank formed of folded sheet metal and having a series of knuckles along one edge of the strip, an eye in each knuckle, and a continuous reinforcement through all the eyes.

3. A structural blank formed of folded sheet metal and having a series of knuckles along one edge of the strip, an eye in each knuckle, and a continuous tube through said eyes.



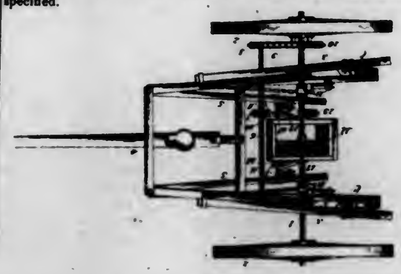
4. A reinforcement for the knuckles of hinge-butts, consisting of a continuous tube inserted through the eyes of said knuckles.

5. The combination of a continuous-folded sheet-metal blank having a rib with an eye in the rib and a continuous tube through said eye.

6. The combination of a continuous sheet-metal blank having a continuous rib with a continuous eye through said rib and a continuous reinforcement through said eye.

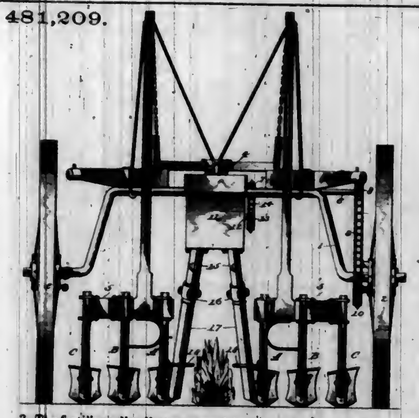
481,208. CULTIVATOR. WILLIAM SOBEY, Racine, Wis., assignor to the J. I. Case Plow Works, same place. Filed June 8, 1891. Serial No. 396,511. (No model.)

481,208.



Claim.—1. In cultivators, the combination, with the team-pole and with the beam-arms dependent therefrom, of the plow-beams in swivel connection with said arms, the bracket O, extending laterally from the team-pole, the singletree-levers pivoted to said bracket, the draft-rods joined to the singletree-levers R near their pivot-points and in suitable connection with the plow-beams, the links *s*, connected to the ends of the singletree-levers, and a lever S, pivoted to the pole and having its ends connected to the link *s*, substantially as described.

2. In cultivators of the class described, the combination, with the team-pole and the swinging radius arms or bars, and the plow-beams in swivel connection with said arms or bars, of the lateral bracket O, the singletree-levers pivoted to said bracket, the draft-rods connected with the singletree-levers R near their pivot-points and in suitable connection with the plow-beams, the links *s*, connected to the ends of the singletree-levers, and a lever S, pivoted to the tongue and having its ends connected to the link *s*, substantially as described.

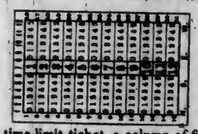


481,209. FERTILIZER-DISTRIBUTER. HARLOW C. STAHL, Bellevue, Ohio, and WILLIAM P. JOHNSTON, Monroe, La. Filed Mar. 5, 1892. Serial No. 424,185. (No model.)

Claim.—1. A fertilizer-distributer constructed to form a furrow on each side of the growing plants, deposit fertilizer in the furrow, and cover the same by one continuous operation, consisting, essentially, of the framework carrying the furrow-openers, the fertilizer-discharge tubes terminating in the rear of the furrow-openers, and the covering-shovels, as set forth.

2. The fertilizer-distributer comprising the axle, the opposite ground-wheels, and the converging shovel-carrying beams adapted to straddle a row, the hopper located thereabove, and the diverging distributing tubes or drills leading from the hopper and terminating directly in the rear of the inner shovels by the beams, substantially as specified.

481,209.



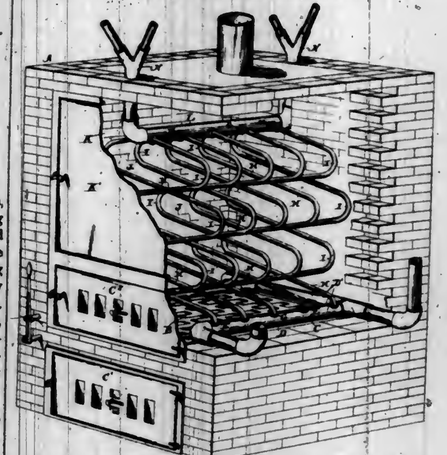
3. The fertilizer-distributer comprising the axle, the ground-wheels, the side bars, the opposite beams, and the series of shovel-carrying beams adapted to straddle a row, the superimposed centrally-located hopper, the agitating-shaft, means for communicating motion from the ground-wheels to the agitating-shaft, and the fertilizer-distributing tubes or drills depending from the hopper and terminating directly in rear of the inner shovels of the two series, substantially as specified.

4. The fertilizer-distributer comprising the axle, the ground-wheels, the side bars, the converging beams, and the series of shovels depending therefrom, the master-sprocket secured to the axle, the counter-shaft journaled in the side bars and carrying an inner and an outer sprocket, a chain connecting the latter with the sprocket of the ground-wheel, the hopper, the agitator-shaft therein, the sprocket-wheel on the outer end of the same, a chain connecting the inner sprocket of the shaft and the sprocket of the hopper, and fertilizer tubes or drills depending from the hopper and terminating in rear of the inner shovels or series, substantially as specified.

5. The fertilizer-distributer consisting of the straddle-row cultivator, a superimposed hopper, and distributing drills or tubes depending from the hopper and terminating in rear of the shovels, substantially as specified.

6. The fertilizer-distributer consisting of the straddle-row cultivator having the opposite series of shovels and their converging supporting-beams, the inner shovels being outwardly disposed and the outer shovels inwardly disposed, the superimposed centrally-located hopper, and the distributing tubes or drills depending from the hopper and terminating in rear of the outwardly-disposed shovels and in advance of the inwardly-disposed shovels, substantially as specified.

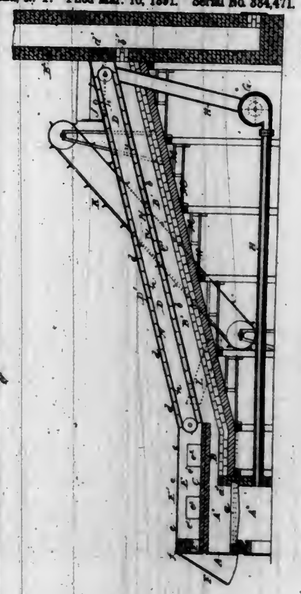
481,210. TIME-LIMIT TICKET. JOHN H. STEDMAN, Rochester, N. Y. Filed July 9, 1891. Serial No. 398,922. (No model.)



Claim.—1. In a time-limit ticket, a column of figures or characters denoting the hours of the day and figures or characters denoting fractional parts of the hours, said last-named figures or characters being arranged in lines or rows transverse to the column and opposite the figures or characters therein, substantially as described.

2. In a time-limit ticket, a central column of figures denoting the hours of the day and figures denoting fractional parts of the hours, arranged in lines or rows transverse to the column, and on each side thereof opposite the figures or characters denoting the hours, substantially as described.

3. In a time-limit ticket, a column of figures or characters indicating the hours of the day and transverse lines of figures or characters denoting fractional parts of said hours, arranged on each side of the column opposite to the figures or characters therein, those on one side of said column denoting fractions of the hours of a. m. and those on the opposite side fractions of the hours of p. m., substantially as described.



481,211. WATER-HEATER. CLARENCE STEES and GEORGE GRAUFFENBERGER, Altoona, Pa. Filed Mar. 22, 1892. Serial No. 425,896. (No model.)

Claim.—1. The combination, with the furnace having an enlarged cleaning-opening, of the hollow rectangular water-base of connected piping supported directly over the fire-grate, an upper horizontal distributing-pipe, and a series of vertically-arranged sinuous unbroken circulating pipes side by side with each other and removably connected to opposite side pipes of the hollow water-base and opposite sides of said distributing-pipe, said circulating-pipes being gently bent upon themselves at opposite sides of the furnace and passing to and from said opposite sides of the furnace to said distributing-pipe and intersecting centrally to form an interlaced pipe crown sheet for the fire-box, and a series of longitudinal open passages communicated with said cleaning-opening, substantially as set forth.

2. In a device of the class described, the combination, with the water-base, and the distributing-pipe having threaded perforations, and the circulating-pipes having screw-threaded ends, of the hollow securing-bushings provided with exteriorly-threaded shanks engaging the threaded perforations of the water-base and distributing pipes, and interiorly and reversely threaded flange sockets receiving the threaded ends of the circulating-pipes, substantially as set forth.

481,212. DRYING APPARATUS. WILLIAM D. SUNDERLIN, Green Island, N. Y. Filed Mar. 10, 1891. Serial No. 384,471. (No model.)

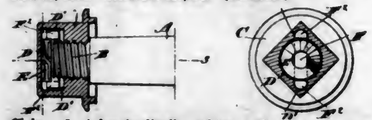
Claim.—1. In a drying apparatus, the combination, with a furnace, flue B, and inclined flue B', leading from the flue B, a smoke-stack with which the said flues communicate, covered delivery-chamber E and covered drying-chamber D, delivering to chamber E, a brick bed separating the delivery-chamber from the fire-chamber of the furnace, and an inclined metallic floor separating the said drying-chamber from the said inclined flue, of an air-inlet which communicates from the outside to the said delivery-chamber and an air-outlet for ventilating the said drying-chamber from its upper end, substantially as and for the purposes set forth.

2. In a drying apparatus, the combination, with a furnace, flue B, and an inclined flue B', leading from flue B and to a suitable smoke-stack, covered delivery-chamber E and inclined drying-chamber D, delivering into said chamber E, a brick bed between the delivery-chamber and the fire-chamber of the furnace, a metallic floor between the drying-chamber and the inclined flue, an air-inlet to the delivery-chamber, and an air-outlet from the upper end of the drying-chamber, of discharge openings provided with doors in the walls of the delivery-chamber, and an endless carrier moving through said drying-chamber in direction from the air-outlet toward the delivery-chamber, substantially as and for the purposes set forth.

3. In a drying apparatus, the combination, with a furnace, flue B, and an inclined flue B', leading from flue B and thence to a smoke-stack, covered delivery-chamber E and drying-chamber D, communicating with each other, a brick bed separating the delivery-chamber from the fire-chamber of the furnace, a metallic floor separating the drying-chamber from the said inclined flue, and an air-inlet opening from without to the said delivery-chamber, of an endless carrier working in the said drying-chamber in direction toward the delivery-chamber, an air-conduit leading from the upper end of the drying-chamber, and a ventilating-fan in the course of the said air-conduit, substantially as and for the purpose set forth.

4. In a drying apparatus, the combination, with a furnace, a delivery-chamber E, having in its wall an air-inlet opening, an inclined drying-chamber communicating with said delivery-chamber, and an endless carrier working in said drying-chamber in direction from its upper end toward the said delivery-chamber, of the adjustable hood F, capable of being heated by heat from the furnace and having its chamber communicating with the said air-inlet, an air-conduit leading from the upper end of the drying-chamber, a ventilating-fan having its inlet communicating with said air conduit, and a discharge-pipe leading from the ventilating-fan to the draft-chamber of the furnace, substantially as and for the purposes set forth.

481,218. BUCKLE. JUSTUS A. TRAUT, New Britain, Conn. Filed May 3, 1892. Serial No. 431,680. (No model.)



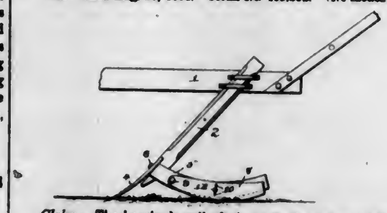
Claim.—1. In a buckle such as described, the combination, with the sheet-metal cross-piece and locking-lever, of the wire frame bent to form the side bars on which the sheet-metal cross-piece is clamped, the portion of said frame above the cross-piece being elevated and having the lever pivoted thereon and the portion below the cross-piece being depressed below the plane of the cross-piece, forming a cross-bar for the attachment of the web, whereby a clear straight passage is left for the co-operating web beneath the locking-lever and over the cross-piece and cross-bar, substantially as described.

2. In a buckle such as described, the combination, with the locking-lever and cross-piece, of the wire frame having the side bars to which the cross-piece is clamped, said frame below said cross-piece formed with bent-over loops to form ears for embracing the edges of the web, substantially as described.

3. In a buckle, the combination, with the wire frame bent to form the bottom cross-piece for the attachment of the suspender-end, the laterally-extending ears bent up over to embrace the edges of the web, the side bars, and the elevated pivoted bar extending across the buckle, of the sheet-metal cross-piece clamped on the side bars and the locking-lever having ears at each side embracing the pivot bar, substantially as described.

4. In a buckle, the combination, with the wire frame having its ends turned inwardly at the bottom to form a cross-bar, the locking-lever, and cross-piece, of the sheet-metal coupling bent around the ends of the frame forming the cross-bar to unite the same and having the extended ends with teeth i thereon, and the web passing between and clamped by the ends of the coupling, whereby the buckle is secured to the web without having the web passed around the cross-bar, substantially as described.

481,214. NUT-LOCK. AXEL WARNERJOLD, San Diego, Cal. Filed Nov. 25, 1891. Serial No. 413,036. (No model.)



Claim.—1. A longitudinally and internally grooved nut provided with a longitudinally-sliding spring-pressed key crossing the bore of the nut, the said spring pressing the key toward that end of the bore which receives the bolt, substantially as set forth.

2. The combination, with a bolt formed transversely across the face of its threaded end with a recess, of a nut screwing on the said bolt, a key fitted to slide longitudinally in the said nut in the rear of its threaded opening, the said key being adapted to engage the recess in the end of the said bolt, and a spring held in said nut and pressing the said key toward the end face of the bolt, substantially as shown and described.

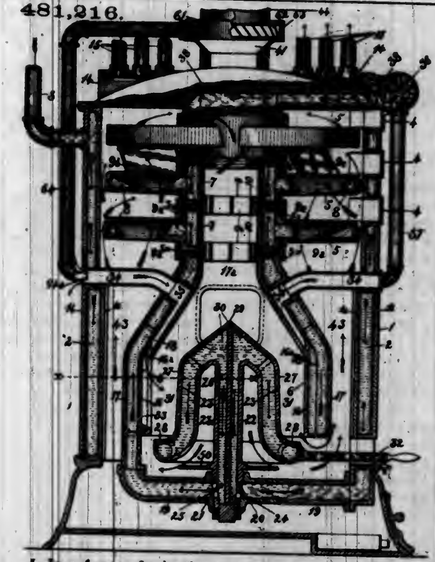
3. In a nut-lock, the combination, with a nut, of a key fitted to slide in the said nut in the rear of its threaded opening, the said key having a wedge-shaped shank and heads, the said nut having longitudinally-extending grooves in rear of its threaded opening and receiving said heads, substantially as shown and described.

4. In a nut-lock, the combination, with a nut, of a key fitted to slide in the said nut in the rear of its threaded opening, the said key having a V or wedge shaped shank and heads, the said nut having longitudinally-extending grooves in rear of its threaded opening and receiving said heads, and a spring pressing on the said key to engage its V-shaped shank with a recess in the end of the bolt, substantially as shown and described.

481,215. PLOW ATTACHMENT. GEORGE WATSON, Culpepper, Ala. Filed Aug. 20, 1891. Serial No. 403,232. (No model.)

Claim.—The herein-described plow attachment, consisting of the main curved bar adapted at its front end for detachable engagement with the lower end of the standard and the supplemental curved bar pivoted to the main bar and disposed along the side of the same and provided with a series of perforations concentric with the pivot, any of which may be thrown into register with an opening in the main bar, and a removable bolt for passing through the perforations of the two bars and thus adjusting the bars with relation to each other, substantially as specified.

481,216. APPARATUS FOR HEATING. GEORGE A. WATSON, Toronto, Canada, assignor of fifty-one one-hundredths to William Henry Laird, New York, N. Y. Filed Aug. 27, 1891. Serial No. 403,856. (No model.)



Claim.—1. In a furnace, the combination of a hollow conical grate forming a water-section, a water-section forming a fire pot surrounding the grate and in circulation therewith, and a series of circular water-sections in the upper portion of the furnace in circulation with the fire-pot.

2. In a furnace, the combination of a casing forming a water-section, a hollow fire-pot arranged concentrically therein and forming a water-section in circulation therewith, and a hollow grate arranged concentrically within the fire-pot and in circulation therewith and with the casing.

3. In a furnace for heating purposes, a fire-grate consisting of any suitable number of upright tubular bars tapering to a common apex at their upper ends, the lower ends of said bars connected together by a rim, and suitable means for supporting said grate within the fire-box, substantially as described.

4. In a furnace for heating purposes, a grate consisting of any suitable number of upright tubular bars, the upper ends of which taper to a common apex and form thereat a chamber suitable for a water-space, the lower ends of said bars connected together by a hollow rim, said bars serving as water-ways between the chamber at the top and the hollow rim, and suitable means for supporting said grate and providing means for circulation of water through the water-chambers in said grate, substantially as described.

481,216.

5. In a furnace for heating purposes, a grate consisting of any suitable number of tubular bars tapering on their upper ends to a common apex and forming thereon a chamber suitable for a water-space, the lower ends of said bars connected together by a hollow rim, said bars serving as water-ways between the chamber at the top and said hollow rim, said upright grate provided with a spindle, the lower end of which is journaled in bearings formed in a water-leg passing across the base of the fire-box and in circulation with one or more water-sections of the furnace, substantially as described.

6. In a furnace for heating purposes, a grate consisting of any suitable number of upright tubular bars, the upper ends of which taper to a common apex and the lower ends of which are connected together by means of a rim, and a chamber formed between the inner sides of said tubular bars serving as a combustion-chamber, said grate suitably supported in the fire box, substantially as described.

7. In a furnace for heating purposes, a grate consisting of any suitable number of upright bars, the upper ends of which taper to a common apex and form a chamber thereat suitable as a water-space, the lower ends of said bars connected together by a hollow rim, said bars connecting the water-space at top of said grate with said hollow rim and serving as water-ways between them, and a chamber formed between the inner sides of said bars, which chamber is utilized as a combustion-chamber, said grate suitably supported within said fire-box, substantially as described.

8. In a furnace for heating purposes, a grate consisting of any suitable number of upright bars, the upper ends of which taper to a common apex and form thereat a chamber suitable for a water-space, the lower ends of said bars connected together by a hollow rim, said bars serving as water-ways between said water-space and hollow rim, said upright grate suitably supported within the fire-box, a water-way connecting said grate with one or more of the water-sections of said furnace, substantially as described.

9. In a furnace for heating purposes, a grate consisting of any suitable number of upright bars, the upper ends of which bars taper to a common apex and form thereat a chamber suitable for a water-space, the lower ends of said bars connected together by a hollow rim, said bars serving as water-ways between said chamber and said hollow rim, said upright grate supported by a hollow spindle, the lower end of which is journaled in suitable bearings, said grate being divided into two sections by a diaphragm, said grate in circulation with one or more water-sections of the furnace, said diaphragm diverting the course of the flow of water through said grate, substantially as described.

10. In a furnace for heating purposes, a grate consisting of any suitable number of upright bars, the upper ends of which taper to a common apex and form thereat a chamber suitable for a water-space, the lower ends of said bars connected together by a hollow rim, said grate supported by a hollow spindle, said grate and spindle divided into two sections by a diaphragm, the lower end of said spindle journaled in bearings formed in the water-way passing across the fire-box, said diaphragm diverting the flow of water from said water-way through said upright grate, substantially as described.

11. In a furnace for heating purposes, a grate consisting of any suitable number of upright bars, the upper ends of which taper to a common apex and form thereat a chamber suitable as a water-space, the lower ends of said bars connected together by a hollow rim, said bars serving as water-ways between said chamber and said hollow rim, and a chamber formed between the inner sides of the upright bars and used as a combustion-chamber, said grate supported by a spindle, the lower end of which is journaled in suitable bearings, said grate and spindle divided by a diaphragm, said grate and spindle being in circulation with one or more water-sections of the furnace, substantially as described.

12. In a furnace for heating purposes, a grate consisting of any suitable number of upright bars, the upper ends of which taper to a common apex and form thereat a chamber suitable for a water-space, the lower ends of said bars connected together by a hollow rim, said bars serving as water-ways between said chamber and hollow rim, said grate supported by a hollow spindle, the lower end of which spindle is journaled in bearings formed in the water-way passing across the base of fire-box, said water-way connecting the water-space in the casing of the furnace with the water-space in the fire-pot walls, said spindle fitted with an ingress-port and an egress-port in that portion of it in said water-way, said grate and spindle divided by a diaphragm to divert the flow of the water from the water-space in the casing of the furnace across said water-way through said grate to the water-space in the fire-pot walls, substantially as described.

13. In a furnace for heating purposes, a grate consisting of any suitable number of tubular bars tapering on their inner ends to a common apex and forming thereat a chamber suitable for a water-space, the lower ends of said bars connected together by a hollow rim, said bars serving as water-ways between the chamber at the top and said hollow rim, said upright grate provided with a spindle, the lower end of which is journaled in bearings formed in a water-leg passing across the base of the fire-box and in circulation with one or more water-sections of the furnace, said spindle fitted with a baffle-plate to protect the bearings and heated products of combustion from the fire above, substantially as described.

14. In a furnace for heating purposes, a grate consisting of any suitable number of upright bars, the upper ends of which taper to a common apex and the lower ends forming thereat a chamber suitable for a water-space, the lower ends of said bars connected together by a hollow rim, said bars serving as water-ways between said chamber and said hollow rim, said upright grate supported by a hollow spindle, the lower end of which is journaled in suitable bearings, said grate being divided into two sections by a diaphragm, said grate in circulation with one or more water-sections of the furnace, said diaphragm diverting the course of the flow of water through said grate, said spindle fitted with a baffle-plate to protect the bearings and lower end of said spindle against the action of the heated air and products of combustion from the fire above, substantially as described.

15. In a furnace for heating purposes, a grate consisting of any suitable number of upright bars, the upper ends of which taper to a common apex and form thereat a chamber suitable for a water-space, the lower ends of said bars connected together by means of a hollow rim, said grate supported by a hollow spindle divided into two sections by a diaphragm, the lower end of said spindle journaled in bearings formed in the water-way passing across the fire-box, said diaphragm diverting the flow of water from said water-way through said upright grate, said spindle fitted with a baffle-plate to protect the bearings and lower end of said spindle against the action of the heated air and heated products of combustion from the fire above, substantially as described.

16. In a furnace for heating purposes, a grate consisting of any suitable number of upright bars, the upper ends of which taper to a common apex and form thereat a chamber suitable as a water-space, the lower ends of said bars connected together by means of a hollow rim, said bars serving as water-ways between said chamber and said hollow rim, and a chamber formed between the inner sides of the upright bars and used as a combustion-chamber, said grate supported by a spindle, the lower end of which is journaled in suitable bearings, said grate and spindle being in circulation with one or more water-sections of the furnace, said spindle provided with a baffle-plate to protect the bearings and lower end of said spindle against the action of the heated air and heated products of combustion from the fire above, substantially as described.

17. In a furnace for heating purposes, a grate consisting of any suitable number of upright bars, the upper ends of which taper to a common apex and form thereat a chamber suitable for a water-space, the lower ends of said bars connected together by a hollow rim, said bars serving as water-ways between said chamber and hollow rim, said grate supported by a hollow spindle, the lower end of which spindle is journaled in bearings formed in the water-way connecting the water-space in the casing of the furnace with the water-space in the fire-pot walls, said spindle fitted with an ingress-port and an egress-port in that portion of it in said water-way, said grate and spindle di-

vided by a diaphragm to divert the flow of the water from the water-space in the casing of the furnace across said water-way through said grate to the water-space in the fire-pot walls, said spindle fitted with a baffle-plate to protect the bearings and lower end of said spindle against the action of the heated air and heated products of combustion from the fire above, substantially as described.

18. In a furnace for heating purposes, a water-section consisting of a hub, a series of tubular water-arms radiating outwardly from said hub, the water-space in said hub and water-arms divided into any number of chambers, which chambers radiate outwardly from the inner wall of said hub, ingress-ports located on the under side of said hub in each alternate chamber, and an egress-port located on the upper side of said hub in the remaining chambers, substantially as described.

19. In a furnace for heating purposes, a water-section consisting of a hub and any suitable number of water-arms radiating outwardly from said hub, the water-space formed by said arms and hub divided into any number of chambers, and an ingress-port entering into each alternate chamber from the under side of said hub, and an egress-port entering out of the remaining chambers on the upper side of said hub, said water-arms consisting of a tubular pipe triangular-shaped in cross-section, substantially as described.

20. In a furnace for heating purposes, a water-section consisting of a hub from which radiates a series of water arms, each of which water-arms consists of a tubular pipe triangular-shaped in cross-section, said hub and water-arms being hollow and the space between them divided into any number of water-chambers by diaphragms radiating from the inner wall of said hub, each alternate chamber provided with an ingress-port and the remaining chambers provided with egress-ports, each of said water-arms consisting of two outwardly-radiating water-ways connected together at their outer ends, said ingress-ports so arranged that the water entering the chamber between two diaphragms flows outwardly through two adjacent water-ways of two adjacent water-arms and inward again to the hub through two remote water-ways of said water-arms, substantially as described.

21. In a furnace for heating purposes, a fire-pot consisting of double walls vertical from the base to a point level with the top of the fire-pot, from which point they taper inwardly to the coal-magazine, the space between said walls utilized as a water-space and connected to the water-space in the casing of the furnace by means of a water-leg passing across the base of the fire-box, said water-leg supporting the fire-grate, which fire-grate is hollow and forms one of the water-sections of said furnace, said fire-pot water-section in circulation with the remaining water-sections in the furnace, substantially as described.

22. In a furnace for heating purposes, the combination of a fire-pot, the walls of which taper to form a funnel-shaped mouth on the lower end of the coal-magazine, and a series of water-sections, each of which consists of a hub and any suitable number of water-arms radiating from said hub, said hubs and upper end of funnel-shaped mouth of coal-magazine screw-threaded on their inner faces to receive a coupling-nipple, said coupling-nipple provided on its inner face with a holding-surface for the coupling tool or wrench, said sections and fire-pot coupled by means of said nipples, substantially as described.

23. A furnace for heating purposes, consisting of a casing composed of an inner shell and an outer shell, a water-space between said shells, a fire-grate having a water-chamber formed therein, a water-chamber in said fire-grate connected with water-chamber in the casing of the furnace by means of a water-leg, a fire-pot consisting of double walls with a water-space between them, the water-space in said fire-pot in circulation with water-space in fire-grate, and a series of water-sections in circulation with the fire-pot water-section and with each other and with a water-head, to which are connected the flow-pipes leading to their respective destinations, and the return-pipes connected to water-chamber in said casing, substantially as described.

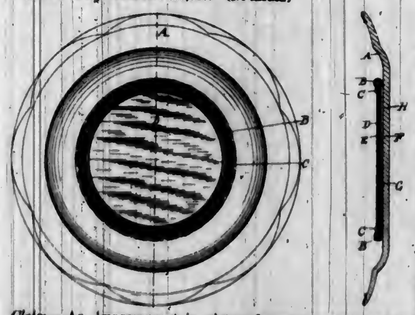
24. A furnace for heating purposes, consisting of an outer and inner shell having a water-space between them, a hollow fire-grate having formed therein a water-chamber, which water-chamber is connected to the water-space in casing of said furnace by means of a suitable water-leg, a fire-pot having a water chamber formed therein, which water-chamber is connected to a water-chamber in the fire-pot by means of the water-leg, a series of water sections located above the fire-pot, each of which consists of a hub and any suitable number of water-arms radiating from said hub, said sections suitably connected together and in circulation with the other water-sections of the furnace and with a water-head, to which water-head are connected the flow-pipes of the furnace, leading to their respective destinations, and the return-pipes entering said water-chamber in the casing of the furnace, substantially as described.

25. In a furnace for heating purposes, consisting of an outer and inner shell with a water-chamber between them, a fire-grate having a water-chamber formed therein, which water-chamber in the fire-grate being in circulation with the water-chamber in the casing of the furnace, a fire-pot consisting of two walls with a water-space between them, which water-space is in circulation with the water-space in the fire-grate, a series of water-sections located above the fire-pot, each of which water-sections consists of a hub and any suitable number of water-arms radiating from said hub, the chamber formed in said hub and water-arms divided into any number of sub-chambers by diaphragms, an ingress-port entering into each alternate sub chamber, and an egress-port entering out of the remaining chambers, substantially as described.

26. A furnace for heating purposes, consisting of a casing composed of an inner and outer shell, a water-space between said shells, a fire-pot having formed therein a water-space, which water-space is connected with a water-space in the casing of the furnace, a fire-pot having formed therein a water-chamber, which water-chamber is in circulation with the water-space in the fire-grate, the walls of which fire-pot taper inward at their upper ends and form a funnel-shaped mouth for the coal-magazine, a series of water-sections located above said fire-pot, each of which water-sections consists of a hub and any suitable number of water-arms radiating outward from the inner wall of said hub, said hubs and upper end of fire-pot screw-threaded on their inner faces to receive the coupling-nipple, which coupling-nipple is provided on its inner face with a holding-surface for the coupling tool or wrench, and a water-head in circulation with said water-sections, to which water-head are connected the flow-pipes leading to their respective destinations, return-pipes being connected to the water-chamber in the casing of the furnace, substantially as described.

27. A furnace for heating purposes, provided with a fire-box consisting of a fire-pot, the inner walls of which are corrugated and the inner ends of said corrugations enlarged, a grate consisting of upright tubular bars connected together at the top and bottom, a fuel-space between the bars of said upright grate and the inner walls of said fire-pot, and a combustion-chamber between the inner sides of said grate-bars, substantially as described.

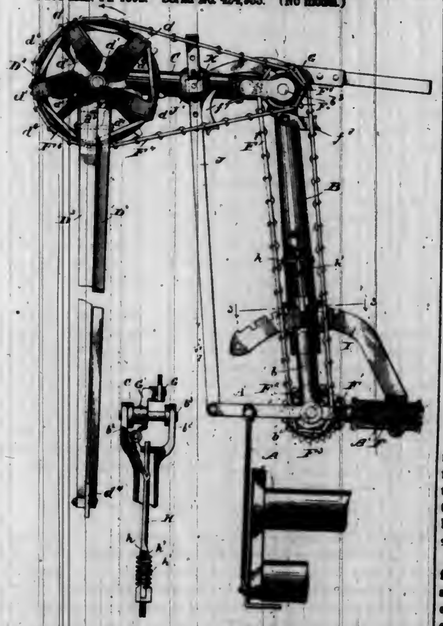
28. A furnace for heating purposes, provided with a fire-box, which fire-box consists of a fire-pot, the walls of which fire-pot are upright to a certain point, then taper inwardly and form a funnel-shaped mouth for the coal-magazine, the inner walls of said fire-pot corrugated to the top of the vertical level, said corrugations enlarged to their inner ends, a grate consisting of upright bars connected together at their base by a rim and their upper ends tapered inwardly to a common apex, and a combustion-chamber formed on the inner side of the grate-bars, said grate suitably supported in said fire-box, substantially as described.



29. A furnace for heating purposes, provided with a fire-box consisting of a fire-pot, the walls of which are vertical to a certain point and taper from said point inwardly, forming a funnel-shaped mouth for the coal-magazine, the inner walls of said fire-pot corrugated, the inner ends of which corrugations are enlarged, a fire-grate consisting of upright bars vertical to a point level with the top of the vertical part of fire-pot walls and tapering from said point to a common apex, a combustion-chamber formed on the inner sides of said grate-bars, and a fuel-space between said space and fire-pot walls, substantially as described.

30. A furnace for heating purposes, provided with a fire-box consisting of a fire-pot, the walls of which fire-pot are vertical to a certain point and taper from such point inwardly and upwardly, forming a funnel-shaped mouth for the coal-magazine, the inner walls of said fire-pot being corrugated on the vertical portions, said corrugations enlarged on their inner ends, a water-chamber formed in the said fire pot walls, a fire-grate consisting of upright tubular grate-bars, the upper ends of which taper inward to a common apex, forming at the top a water-chamber, a hollow rim connecting the lower ends of said grate-bars, said grate-bars serving as water-ways between said chamber at the top and said hollow rim, said grate supported by a spindle journaled in bearings formed in the water-way passing across the base of said fire-box from the water-chamber in the casing of furnace to water-chamber in the fire-pot walls, the water-space in said fire-grate being in circulation with water-space in the casing of the furnace and with fire-pot water-space, the casing of the furnace consisting of an inner and outer shell with water-space between them, which water-space is in circulation with the water-space in fire-grate and fire-pot, a series of water-sections located above said fire-pot, each of which water-sections consists of a hub and any suitable number of water-arms radiating outward from said hub, and a water-head located above said water-sections, the return-pipes entering water-section in the casing of the furnace, and flow-pipes leading from the water-head, the fire-grate being provided with a hollow shaker fitted with a faucet, substantially as described.

31. A furnace for heating purposes, consisting of a series of water-sections, which water-sections are composed of a hub and any suitable number of water-arms radiating outward from said hub, said hubs screw-threaded on their inner faces and coupled by means of a nipple having a right and left thread cut on its outer face and fitted on its inner face with a holding-surface for the coupling-tool or wrench, and a circular baffle-plate surrounding each of the joints formed by the union of the hubs of said sections, substantially as described.



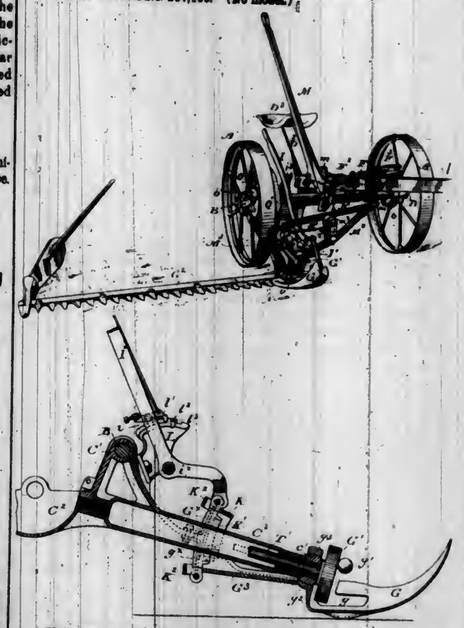
32. A furnace for heating purposes, consisting of a series of water-sections, each of which is composed of a hub and any suitable number of water-arms radiating from said hub, said hubs screw-threaded on their inner faces and coupled together by means of a nipple having a right and left screw-thread cut on its outer face and fitted on its inner face with a holding-surface for the tool or wrench, a baffle-plate surrounding each of the joints formed by the union of said water-sections, and suitable packing between said baffle-plate and hub, substantially as described.

481,217. PICTURE-FRAME. PAUL WIENER, Chicago, Ill. Filed Apr. 23, 1892. Serial No. 430,319. (No model.)

Claim.—An improvement in picture-frames, consisting of the metal band I J, provided with an internal flange at one edge and the portion J reduced in width to form a space for inserting a glass, picture-card, and a paper-board back, in combination with a semicircular plate G, provided with an internal flange inserted within and secured to the rim portion I, the dish-shaped back A, and a border B, placed around the rim I J, as and for the purpose specified.

481,218. HARVESTER-REEL SUPPORT. JOHN F. APPLEBY, Chicago, Ill., assignor to the William Deering & Company, same place. Filed Mar. 14, 1892. Serial No. 424,983. (No model.)

Claim.—1. The combination, with a reel-standard pivoted at its base, of a quadrant secured to the harvester-frame, a latch, a hand-lever having the horizontally-sliding fulcrum, and mechanism connecting said latch with said fulcrum, whereby lateral movement of the lever-fulcrum produces a disengaging movement of the latch, substantially as and for the purpose set forth.



2. The combination, with a reel-standard pivoted at its base, of a quadrant secured to the harvester-frame, a latch-rod, a hand-lever having a sliding fulcrum, and a bell-crank connecting said latch-rod to said fulcrum, substantially as and for the purpose set forth.

3. The combination, with a hollow reel-standard pivoted at its base, of a latch-rod within said standard, a quadrant with which the said latch engages, secured to the harvester-frame, a hand-lever having the horizontally-sliding fulcrum, and a bell-crank pivoted below the fulcrum-pin, having an arm reaching substantially to the center of the standard and to a rod connecting said latch to said fulcrum-piece, substantially as and for the purpose set forth.

4. The combination, with the pivoted standard B, of the quadrant I, the arm C, pivotally connected to the standard B, the bar J, and the locking-pins K and H, the former adapted to engage the said bar J and the latter the quadrant I and both connected to the lever G in such a manner that the latter may operate either of the latching devices at will, substantially as and for the purpose set forth.

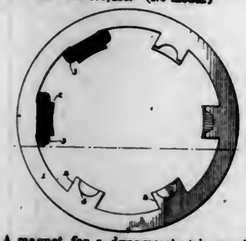
5. The reel-spider, the reel-arms seated therein, the seats for the said arms, having a flange at one side and a single bolt passing through the said flange and through both of said arms, one of which arms passes behind the connecting-bar d^9, and a reel-fan secured to the ends of the said arms and adapted to draw them nearer together, thus forcing one of the arms against the outer walls of its socket and the other arm against the connecting-bar d^9, substantially as described.

481,219. MOWER. WILLIAM R. BAKER, Chicago, Ill., assignor to the McCormick Harvesting Machine Company, same place. Filed Oct. 4, 1888. Serial No. 287,168. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of the main axle, the two carrying-wheels, the floating gear-frame having gear-case and forwardly-extending crank-shaft sleeve at the grass side of the machine, the finger-bar ball jointed directly to the end of said sleeve, and the vertical guide-brace connected with the heel extension of said finger-bar and arranged to play against said sleeve in rear of the shoe.

2. The combination, substantially as hereinbefore set forth, of the floating gear-frame, the finger-bar directly hinged to the crank-shaft sleeve at the grass side of the machine by a universal joint, the heel extension from the inner shoe, the guide-loop from said heel extension embracing said sleeve, and the tilting or rocking lever.

3. The combination, substantially as hereinbefore set forth, of the floating gear-frame having the crank-shaft sleeve at the grass side, the finger-bar directly hinged to said sleeve by a universal joint, the heel extension from the inner shoe beneath said sleeve, the annular bearing for said extension embracing the sleeve, and the guide-loop having an annular journal entering said bearing.



4. The combination, substantially as hereinbefore set forth, of the

floating gear-frame having the crank-shaft sleeve at the gram side, the finger bar directly hinged to said sleeve by a universal joint, the heel extension from the inner shoe beneath said sleeve, the annular bearing from the extension embracing the sleeve, the guide loop having an annular journal entering said bearing, and the keepers from the floating gear-frame retaining said loop and its journal in position.

5. The combination, substantially as hereinbefore set forth, of the floating gear-frame having a crank-shaft sleeve at the gram side, the finger-bar directly hinged to said sleeve by a universal joint, the heel extension from the inner shoe beneath said sleeve, the annular bearing from said heel extension embracing the sleeve, the guide-loop having an annular journal entering said bearing, and the tilting lever pivoted to the frame and also the guide-loop.

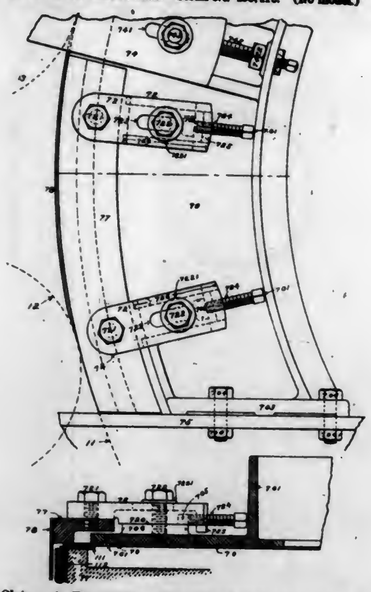
6. The combination, substantially as hereinbefore set forth, in a side-cut mower, of the floating gear-frame, the finger-bar hinged directly thereto at the gram side of the machine, the standard from the heel of the finger-bar, the coiled spring connecting said standard with the floating frame, and the lifting-lever connected with said standard.

481,220. ELECTRIC MOTOR AND GENERATOR. CHARLES S. BRADLEY, Avon, N. Y., and JAMES J. WOOD, Fort Wayne, Ind. Filed Aug. 22, 1891. Serial No. 403,413. (No model.)

Claim.—1. A magnet for a dynamo-electric machine or motor comprising a laminated core, the side plates of the core having their polar projections bent over the end of the magnetizing-coils to retain them in position.

2. A multipolar magnet for a dynamo-electric machine or motor, comprising a series of laminated rings having projecting pole-pieces, the outer layers of the ring having their polar projections bent outwardly, so as to retain the magnetizing-coils in position.

3. A magnet for a multipolar machine comprising a series of laminated iron plates having projecting pole-pieces, auxiliary plates with similarly-located projections superposed upon the iron plates, each projection being provided with a recess, so as to form two tongues to each set of coils, and polarizing-coils anchored by the said tongues when bent.



481,221. SAW-SET. SAMUEL W. BUENOS, Argentine, and AMBROSE BASH, Turner, Kans.; said Buenos assignor to George A. Taylor, Argentine, Kans. Filed Feb. 1, 1892. Serial No. 419,863. (No model.)

Claim.—1. A hand saw-setting implement comprising a pair of pivotal movable handles or arms having each a setting spur or jaw, a pivot bolt or pin extending through said arms, a pair of clamping-yoke sections pivoted upon the bolt or pin and provided with a separating-spring, and a stirrup adjustably connected to said yoke members and having eccentric portions for engaging one of the said members and drawing said members toward each other, substantially as set forth.

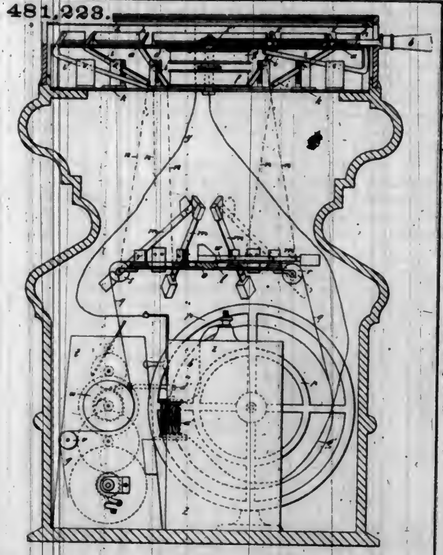
2. A hand saw-setting implement comprising a pair of pivotally-connected handles or arms, each having a setting jaw or spur, a pivot pin or bolt passing through said arms, a pair of clamping-yoke members pivotally connected to said bolt or pin, a spring for separating said yoke members, a pair of bolts passing transversely through said yoke members, and a stirrup connected to the heads of said bolts and having eccentric ends for engaging one of the yoke members and drawing said members toward each other, substantially as set forth.

481,222. DEVICE FOR SUPPORTING AND ADJUSTING THE FRONT AND BACK COVERS OF CARDING-ENGINES. WILLIAM P. CANNING, Lowell, Mass., assignor to the Lowell Machine Shop, same place. Filed June 3, 1892. Serial No. 435,418. (No model.)

Claim.—1. The combination, with a main bend or arch of a carding-engine, a cover, and a plate-bend to which the cover is secured, of supporting-brackets which, respectively, are connected with the plate-bend near the opposite ends of the plate-bend and means for adjustably securing the said brackets to the main bend or arch, substantially as described.

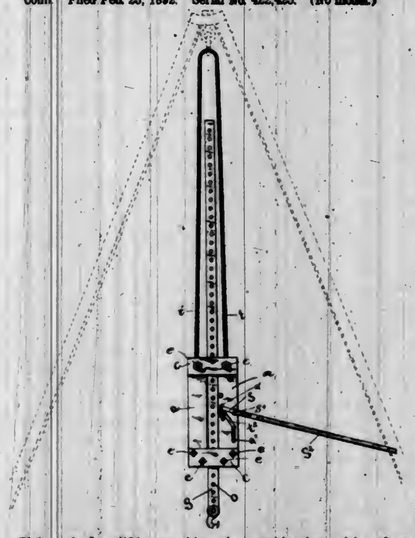
2. The combination, with the main bend or arch of a carding-engine provided with plane-surfaced spots 706, a cover, and a plate-bend to which the cover is secured, of supporting-brackets which, respectively, are connected with the plate-bend near the opposite ends of the plate-bend and each of which brackets is provided with a plane face 726, fitted to move upon the plane surface of the corresponding spot 706, means for holding the said brackets to the main bend or arch, and means for adjusting the said brackets with relation to the main bend or arch, substantially as described.

3. The combination, with the main bend or arch of a carding-engine provided with plane-surfaced spots 706, a cover, and a plate-bend to which the cover is secured, of supporting brackets 72 72, which, respectively, are connected with the plate bend near the opposite ends of the plate-bend and each of which brackets is provided with a plane face 726, fitted to move upon the plane surface of the corresponding spot 706, and also is formed with a slot 723 and a flange 725, a bolt 722, passing through the slot 723 and into the main bend or arch, and a set-screw 724, fitted to a threaded hole in the flange 725 and taking bearings at its ends against projections on the main bend or arch, substantially as described.



481,223. SHIP'S TELEGRAPH. ALBERT R. W. H. CORDS, Hamburg, Germany. Filed Jan. 14, 1892. Serial No. 418,006. (No model.)

Claim.—1. The combination of a transmitting-lever *c*, adapted to operate the pointer of the receiving-instrument, with a series of levers *i*, vibrated by lever *c*, and with a set of recording-levers *m*, connected to levers *i*, substantially as specified.

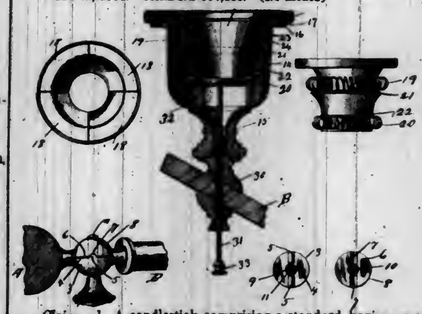


2. The combination of a ship's dial with a notched ring *h*, transmitting-lever *c*, adapted to move over the dial, levers *i*, engaging the notched disk and vibrated by the lever *c*, and with recording-levers *m*, connected to levers *i*, substantially as specified.

3. The combination of a ship's dial with the transmitting-lever *c*, intervening levers *i*, recording-lever *m*, a paper-feeding clock-work having a ratchet-wheel *f'*, a detent armature engaging the same, and with the ring *x*, adapted to make contact with the lever *c* and to close the circuit for intermittently releasing the clock-work, substantially as specified.

481,228.

481,224. LIFTING-MACHINE. JOSEPH S. CROUCH, Centre Groton, Conn. Filed Feb. 23, 1892. Serial No. 422,425. (No model.)



Claim.—1. In a lifting-machine, the combination, with a frame the upper portion of which is provided with two bolts, and the side plates each provided with a hole adjacent to each of the bolts, said holes being covered by the cross-pieces of the frame, of a supporting-rod doubled upon itself and the ends formed into eyes which surround the bolts and each eye having its outer surface provided with a notch near the end, and a locking-pin through each hole of the plates and through each notch of the eyes, substantially as set forth.

2. In a lifting-machine, the combination, with a frame comprising front and rear side pieces, top and bottom cross-pieces, and interposed plates at the bottom of the side pieces, whereby a space is formed between the opposite cross-pieces and the top and rear side pieces, respectively, of a rack within said space, comprising two perforated bars, the inner faces of which are even with the inner faces of the side pieces, a series of cross-bars secured in the perforations of the perforated bars, an operating and a retaining pawl pivotally secured between the front side pieces, the free ends of which are adapted to pass the joint between the edges of the rack and the side pieces and engage with the cross-pieces of the rack, and a lever for moving the operating-pawl, substantially as set forth.

3. In a lifting-machine, the combination, with the frame, each side of which is provided with two slots, one of which is curved, of a vertically-movable rack within the frame, a bifurcated lever pivotally secured to the side of the frame, the inner ends of said bifurcation being connected by means of a bolt through the curved slot, a hook pivotally secured upon the bolt within the frame, two arms or links pivotally secured to the bolt upon the outside of the frame, the free ends of which are connected by means of a bolt through the other slot, a spring upon said last-mentioned bolt, the free end of which engages with the pawl upon the first-mentioned bolt, and a retaining-bolt within the frame for engaging with the rack, substantially as set forth.

4. In a lifting-machine, the combination, with a frame, of a rack therein, a lever pivotally secured to the frame, the inner end of which is provided with a bolt, a retaining-pawl within the frame, and an arm secured to each pawl, said arms extending toward the outer end of the lever, whereby they may be operated and the pawls withdrawn from the rack and the rack be permitted to descend, substantially as set forth.

481,225. CANDLESTICK. JOHN P. DALKIDEN, Chicago, Ill. Filed June 22, 1891. Serial No. 397,108. (No model.)

Claim.—1. A candlestick comprising a standard having smooth faces, arms having smooth faces, a pivot-pin passing through those portions of the standard and arms having said smooth faces and having screw-threaded connection with one of said parts, and interfitting grooves and ribs on said smooth faces.

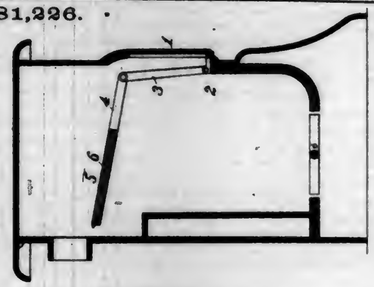
2. A candle-holding cup having an inward and downward projecting rim at its upper end portion and a plurality of curved spring-plates located within said cup and provided with upwardly and outwardly projecting flanges located beneath and surrounding said rim.

3. A candle-holding cup provided with a cap having an inwardly and downwardly projecting rim and a plurality of curved spring-plates located within said cup and provided with upwardly and outwardly projecting flanges located beneath and surrounding said rim.

4. A candle-holding cup provided with a plurality of curved plates and a spring surrounding and retained upon said plates.

5. A candle-holding cup provided with a plurality of curved plates provided on their rear faces with shoulders located near their upper and lower ends and springs surrounding said plates and located adjacent said shoulders.

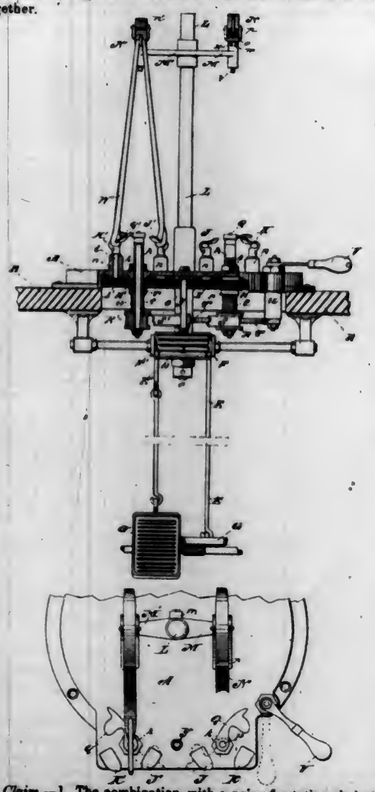
6. A candle-holding cup provided with a plurality of curved spring-plates provided on their rear face with shoulders located in horizontal alignment to form a continuous annular shoulder and a spring surrounding said plates and located adjacent to said shoulder.



7. A candle-holding cup having a downwardly-projecting rim at its upper end portion, a ring supported upon shoulders on said cup and a plurality of curved spring-plates located within said cup and provided with outwardly-bent flat portions resting on said ring and upwardly-projecting flanges surrounding said rim.

481,226. STOVE. ISAAC DE HAVEN, Allegheny, Pa. Filed Mar. 18, 1892. Serial No. 425,412. (No model.)

Claim.—1. In a stove, the combination of a vertically-moving door and a movable deflecting-plate connected thereto and adapted to serve as a counter-balance for the door, substantially as set forth.

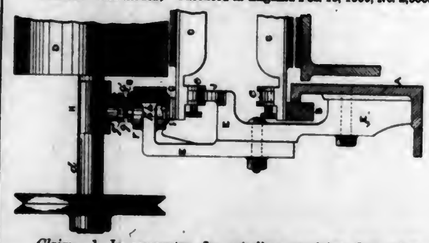


2. In a stove, the combination of a vertically-movable door and a pivoted deflecting-plate provided with forwardly-projecting arms connected to the door, whereby the latter is adapted to serve as a counter-balance for the door, substantially as set forth.

481,226.

481,227. SKEIN-TWISTING MACHINE. LUCIUS DINOCK, Leeds, Mass. Filed Feb. 13, 1892. Serial No. 421,433. (No model.)

Brief.—The middle of the skein is thrown over the finger N and an end placed on each of the hooks J K. By means of the treadle G the hooks are rotated to twist each half of the skein. Then by means of the lever V the switch-carrier Q carries the loop end of the skein from the hook K to the hook J. Then by the treadle G' the hook J is rotated in the opposite direction to twist the two halves of the skein together.



Claim.—1. The combination, with a pair of rotating skein-twisting hooks and with mechanism for rotating and stopping them in a determined position, of a switch-carrier adapted to enter the loop of a skein upon one hook from the rear of said hook when the two hooks are at rest with their mouths opposite and transfer said loop to the other hook and means, substantially as shown and described, for reciprocating the switch-carrier.

2. The combination, with a pair of rotating skein-twisting hooks and with mechanism for rotating and stopping them in a determined position, of a switch-carrier device consisting of a rotating carrier pivoted, as shown and described, to rotate over the hooks and transfer the loop of the skein from one hook to the other, and a rock-shaft journaled in its frame and provided with a handle and lever-arm, and belt and pulley connecting the arm with the spindle of the switch-carrier, whereby the reciprocation of the carrier is effected upon the rotation of the handle.

3. The combination of a pair of skein-twisting hooks adapted to distend the loop end of a skein, leaving them for the purpose described, means for rotating and stopping them in the required position, and a reciprocating switch-carrier for transferring a loop end of the skein from one hook to the other.

4. The combination, with skein-twisting hooks of the character described, of a switch-carrier having its end in the form, as shown and described, of a wedge or cone provided with shoulders at its base and adapted thereby to enter a loop upon a hook and take said loop therefrom.

481,228. CARDING-ENGINE FOR GRINDING REVOLVING FLATS WHEN IN SITU. JAMES EDGE, Gorton, England, assignor of one-half to Samuel Herbert Brooks, same place. Filed Dec. 31, 1890. Serial No. 376,405. (No model.) Patented in England Feb. 18, 1889, No. 2,535.

Claim.—1. In apparatus for grinding revolving flats when *in situ*, the combination, with an upright supporting-bracket having a socket at the upper end, of a slide or stud moving therein, fitted with a journal for the grinding-roller at one end and at the other with a guide-surface for the flats, substantially as described.

2. In apparatus for grinding revolving flats of carding-engines, the combination, with the upright supporting-bracket, of the sliding stud G, having a bearing-surface at its lower end for the flats, stud *g*, screwed therein, and journal for axle of grinding-roller pivoted thereto, substantially as described.

3. In apparatus for grinding the revolving flats of carding-engines, the bearing-surface inclined in opposite directions, forming an angle of about one hundred and seventy-six degrees or thereabout, against which the working surfaces of the flats bear while being ground, substantially as described and shown.

4. In apparatus for grinding the revolving flats of carding engines, the combination, with the supporting-bracket E, of the socket F, sliding stud G, journal H, and plate I, substantially as described.

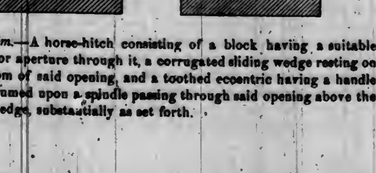
5. In apparatus for grinding the revolving flats of carding-engines, the combination, with the supporting-bracket E E and socket F, of the sliding piece G, the journal H for the grinding-roller, the adjusting-screw *g*, and the plate I, against the under side of which the working surface of each flat bears, substantially as described.

6. In apparatus for grinding the revolving flats of carding-engines, the combination, with the double supporting-bracket E E and socket F, of the sliding piece G, the journal H for the grinding-roller, the plate I, against the under side of which the working surface of each flat bears, and the lifting plate or guide J, formed in one piece with or affixed to the lower bracket E, substantially as described.

7. In apparatus for grinding the revolving flats of carding-engines, the combination, with the supporting-bracket E, socket F, end sliding piece or stud G, and plate I, of the adjusting-screw *g*, nut *g'*, and journal H, substantially as described.

8. In apparatus for grinding the revolving flats of carding-engines, the combination, with the supporting-bracket E, socket F, sliding piece or stud G, journal H, and plate I, of the slot *h'* and pin *h*, substantially as and for the purpose described.

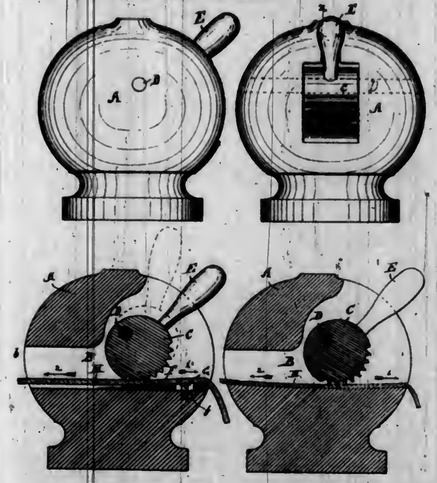
9. In apparatus for grinding the revolving flats of carding-engines, the combination, with the supporting-bracket E, socket F, stud G, journal H, and plate I, of the bracket E', lever K, carrying the lifting-plate J, bracket *k*, pin *k'*, and knife-edge *c*, substantially as described.



10. In apparatus for grinding the revolving flats of carding-engines, the combination, with the grinding-roller D, flat C, and curved projecting piece *c* thereon, of the supporting-bracket E, the socket F, the sliding piece or stud G, adjusting-screw *g*, socket H, inclined surface plate I, and lifting-plate J, substantially as described and shown.

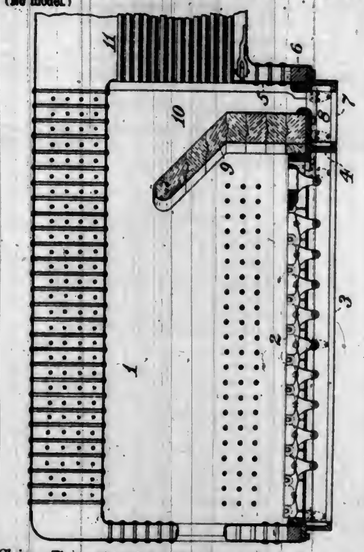
481,229. WEATHER-STRIP. AMBON M. EWERS, Edison, Ohio. Filed Jan. 2, 1892. Serial No. 416,594. (No model.)

Claim.—1. In a weather-strip, the combination, with the inclined section *c*, adapted to be rigidly connected with the door, as described, a lip c^4 on said section *c* and slotted openings *d* therein, of the lower strip-section *f*, having an upturned lip on its rear portion adapted when its body is inclined to meet the under side of the plate *c*, said plate *f* having its rear portion doubled, as described, and hinge-tongues *g*, formed integral with said doubled portion and engaging with said slotted openings *d* of the section *c*, substantially as and for the purpose specified.



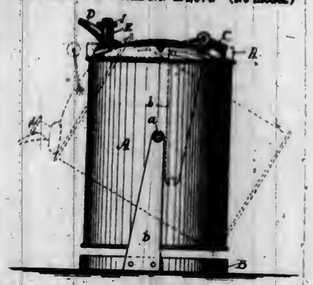
2. In a weather-strip, the combination, with the inclined section *c*, adapted to be rigidly connected with the door, as described, a lip c^4 on said section *c* and slotted openings *d* therein, of the lower strip-section *f*, having an upturned lip on its rear portion, adapted when its body is inclined to meet the under side of the plate *c*, said plate *f* having its rear portion doubled, as described, one or more stop-pins *f'*, adapted to form a rest for the rear portion of said plate *f*, and hinge-tongues *g*, formed integral with said double portion and engaging with the slotted openings *d* of the section *c*, substantially as and for the purpose specified.

481,230. NUT AND BOLT WRENCH. JOHN HOVAL, Stafford, Tex. Filed Feb. 9, 1892. Serial No. 420,570. (No model.)



Claim.—A wrench-head having a handle and a longitudinal slot through the wrench-head, a slidable bar having a jaw moving in said slot, a rack upon said bar, a worm-wheel in the wrench-head, meshing with the rack, and a jaw upon the wrench-head, jointly with a screw-driver inserted in the end of the slidable bar, said wrench-head having a plane outer surrounding surface in proximity to the longitudinal slot, substantially as and for the purpose herein specified.

481,231. HORSE-HITCH. ALBERT JOHNSON, Haverhill, Mass., assignor of one-half to Frank H. Dunmore, same place. Filed Mar. 8, 1892. Serial No. 424,182. (No model.)



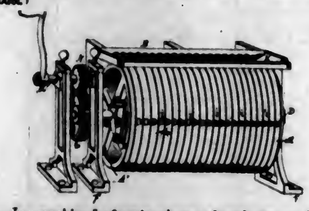
Claim.—A horse-hitch consisting of a block having a suitable opening or aperture through it, a corrugated sliding wedge resting on the bottom of said opening, and a toothed eccentric having a handle and fulcrumed upon a spindle passing through said opening above the sliding wedge, substantially as set forth.

481,232. BRICK ARCH FOR LOCOMOTIVE FIRE-BOXES. FRANCH W. JOHNSTON, Mexico, Mexico. Filed Feb. 13, 1892. Serial No. 421,404. (No model.)

Claim.—The combination, with a locomotive fire-box, of a transverse girder or support fixed below the bottom of the fire-box and independently of the side sheets thereof, as by connections to the mud-ring, and a brick arch built upon and supported by said girder independently of the fire-box sheets and extending across the fire-box, substantially as set forth.

481,233. CAN FOR OIL, &c. ARTHUR E. KUHN, Chicago, Ill. Filed Mar. 12, 1892. Serial No. 424,674. (No model.)

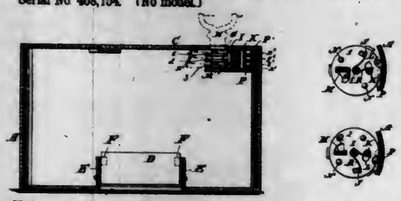
Claim.—1. The combination, with a can, of a removable stand having standards *b*, to which the can is pivoted, and a base-ring B, consisting of a band or hoop of less diameter than the top of the can, which when packed for shipping rests upon the top of the can and projects upward therefrom, whereby it protects the parts attached thereto, substantially as set forth.



2. The combination, with a can, of the tube E, communicating with the interior thereof and having a bearing *e'* for the valve-seat, the spout D, communicating with said tube, a cap closing the outer end of said tube, a removable valve-seat, means for holding it against the bearing *e'*, a valve-stem passing through the cap and valve-seat, a valve secured to said stem and adapted to seat outward, and a spring engaging the stem and holding the valve normally seated, substantially as set forth.

3. The combination, with a can, of the tube E, communicating with the interior thereof and having a bearing *e'* for a valve-seat, the spout D, communicating with said tube, the screw-cap H, closing the outer end of said tube, the valve-seat F, means connecting the valve-seat and screw-cap, whereby the seat is forced against its bearing by the screwing on of the cap, a valve-stem passing through the cap and valve-seat, an outward seating-valve secured to said stem, and a spring holding said valve normally seated, substantially as set forth.

4. The combination, with a can, of the tube E, communicating

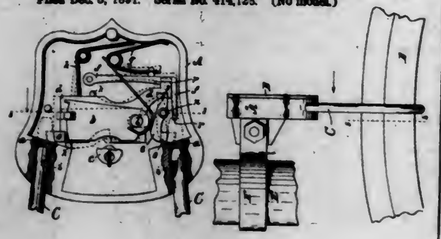


with the interior thereof, the spout D, communicating with said tube, the bearing *d'* in said tube, the screw-cap H, closing the outer end of the tube, the valve-seat F, a strut rigidly connecting the cap and valve-seat, so that when the former is screwed in the latter is forced against the bearing *d'*, a valve-rod extending through the screw-cap and valve-seat, an outward seating-valve secured to the valve-stem, and a spring for holding said valve normally seated, substantially as set forth.

481,234. MACHINE FOR FORMING SHAPES OF CANDY. CHARLES M. KURTZ, Allegheny, Pa. Filed Aug. 14, 1891. Serial No. 402,677. (No model.)

Claim.—In a machine for forming shapes of candy, the combination, with the frame, of a revoluble cylinder mounted therein provided with corrugations on its periphery and a series of openings in said corrugations, a shell similarly corrugated and mounted on the frame, means for revolving the cylinder, levers pivoted on the heads of said cylinder, a rod connecting said levers, a series of teeth or projections mounted on the rod registering with and projecting through the openings in the cylinder, and handles on the levers, substantially as and for the purposes described.

481,235. LOCK. JOSEPH LOCK, Brooklyn, N. Y. Filed Oct. 8, 1891. Serial No. 408,154. (No model.)



Claim.—1. The combination, with a box having internal projections P, of a cover having a keyhole G and a pin I, the tumblers journaled on the pin and having depressions O in their peripheries, and a key H, which stands transversely to the keyhole in the cover when rotated to turn the tumblers and register their depressions with the internal projections of the box, substantially as described.

2. The combination, with a box having internal projections P, of a cover having a keyhole G and a pin I, the tumblers journaled on the said pin and having reversely-arranged keyholes G and slots L, and provided with peripheral depressions O, a pin K, secured to the cover and extending through the slots in the tumblers, and a key H, which by its single movement to unlock the lock turns the tumblers in reverse directions, substantially as described.

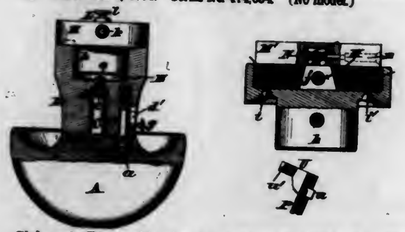
3. The combination, in a tumbler-lock, of the pin I, the tumblers journaled on the pin and provided with keyholes G, slots L, and studs *s*, the pin K, extending through the slots in the tumblers, and the springs R, engaged with the pivot-pin of the tumblers and bearing against the studs of the latter, and the pin which extends through the slots thereof, substantially as described.

481,236. BICYCLE-LOCK. EDWIN W. MACAULEY, Rochester, N. Y. Filed Dec. 5, 1891. Serial No. 414,128. (No model.)

Claim.—1. A lock having, in combination with tumblers, a sliding bolt and a pivoted or lever bolt joined to each other to move in opposite directions, substantially as shown and described.

2. A lock having tumblers, in combination with a sliding bolt and a pivoted or lever bolt joined to the sliding bolt to move oppositely to the latter and an actuating-spring and a detent for the sliding bolt, substantially as shown.

3. A lock having tumblers, in combination with a sliding bolt and a pivoted bolt to move simultaneously with the sliding bolt, the latter being joined to the pivoted bolt to move it toward the right when the sliding bolt moves toward the left or toward the left when the sliding bolt moves toward the right, and a hasp formed with openings or rests to receive the bolts, substantially as shown and described.



4. A lock having tumblers, in combination with a sliding bolt and a pivoted bolt joined to the sliding bolt to move oppositely to the latter, a spring to actuate the sliding bolt, and a detent for the sliding bolt, and a removable hasp formed with rests to receive the respective bolts, the detent being in position to be encountered by the hasp to be thrown off the sliding bolt to release the latter, substantially as described.

481,237. FIRE-GRATE. JOHN H. MEERTENS, Harkorten, near Haspe, Germany, assignor to Ernst Joseph Koster, same place. Filed Jan. 28, 1892. Serial No. 419,502. (No model.)

Claim.—A hollow fire-grate adapted to have water circulated through it to prevent the burning on of slag, characterized by the combination of hollow grate-bars *d'*, having reduced perforated ends, with the hollow side bars receiving such ends and with nuts *d* for attaching the grate bars to the side bars, substantially as specified.

481,238. ENGRAVER'S BLOCK. ADOLPH MUEHLMATT, Newport, Ky. Filed Dec. 4, 1891. Serial No. 414,034. (No model.)

Claim.—1. The combination, in an engraver's block, of a base, an unshiftable spindle projecting therefrom, and a bodily-detachable standard having an axial bore traversed by said spindle, the upper end of said standard being provided with a cylindrical socket to receive the neck of a work-holder, substantially as herein described.

2. The combination, in an engraver's block, of a detachable head carrying a reversely-threaded screw, a pair of nut slides engaged with said screw, and an unshiftable stud projecting from each slide, each stud being provided with a circumferential groove having an annular collar at top, and each collar having a break or interruption in it, for the purpose described.

3. The combination, in an engraver's block, of a base, an unshiftable spindle projecting therefrom, a center in the upper end of said spindle, a bodily-detachable standard having an axial bore traversed by said spindle, a cylindrical socket in the upper end of said standard, and a concealed screw engaged with the bottom of said socket, which screw can be brought to bear against said center for the purpose of elevating said standard, as herein described.

4. The combination, in an engraver's block, of the base A, having a flat bearing B, provided with an unshiftable spindle C and a pit *a* at

one side of said spindle, and the bodily-detachable standard D, having an axial bore *d*, traversed by said spindle, a secondary bore F, and a spring-bolt G, fitted within this bore F, all as herein described.

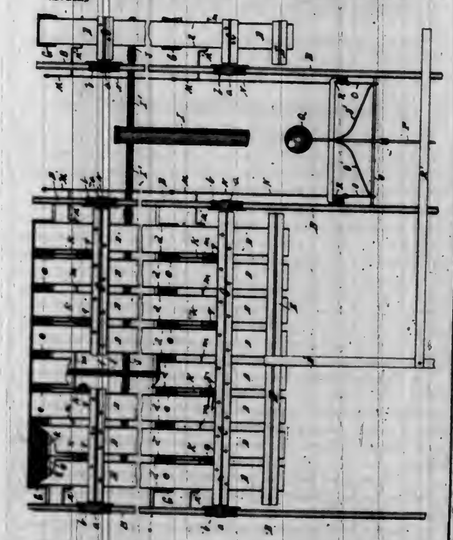
5. The combination, in an engraver's block, of a jaw having a socket N and a screw-point *n*, entering at one side of said socket, for the purpose described.

6. The combination, in an engraver's block, of a jaw having a hinged leaf P and adjusting-screw R, for the purpose described.

7. The combination, in an engraver's block, of a jaw having an adjustable hinged leaf P, with a slot *p'* near its top, for the purpose described.

8. The combination, in an engraver's block, of a jaw having an adjustable hinged leaf P, provided with a pair of undercut side flanges *p''*, for the purpose described.

9. The combination, in an engraver's block, of a base, an unshiftable spindle projecting therefrom, a center in the upper end of said spindle, a bodily-detachable standard having an axial bore traversed by said spindle, a concealed screw fitted within said standard and adapted to bear against said center, and a locking device wherewith the standard can be temporarily fastened to said base, substantially as herein described, and for the purpose set forth.



10. The combination, in an engraver's block, of a detachable head carrying a reversely-threaded screw, a pair of nut-slides engaged with said screw, an unshiftable stud projecting from each slide, a circumferential groove in each stud, an annular collar at the top of the groove, a break or interruption in the collar, a jaw having the socket to surround either stud, and a screw tapped in said jaw, the point of said screw being adapted to engage with said groove, in the manner described, and for the purpose stated.

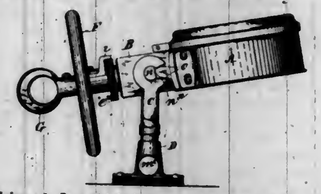
481,239. MANUFACTURE OF PAPER-BOARD TUBS. WILLIAM W. MCEWAN, Belvidere, N. J. Filed Nov. 27, 1891. Serial No. 413,211. (No model.)

Claim.—The herein-described method of making hollow ware from paper-board and the like, which consists in drawing or manipulating the material substantially into the desired shape, encircling the article with a hoop, expanding the article against the hoop to embed the same, and finishing or drying the article, substantially as shown and described.

481,240. HYDROCARBON-GAS-BLACK MACHINE. LESTER J. MCNUTT, Warren, Pa. Filed May 17, 1892. Serial No. 433,361. (No model.)

Claim.—1. The combination, in a hydrocarbon-gas-black machine, with a series of plates and driving mechanism operating to move the said plates back and forth over a series of gas-jets, of a series of scrapers engaging with the under surfaces of the said plates when the plates are moving in one direction and weight-and-lever mechanism operating to disengage the said scrapers from the plates when the plates are moving in the reverse direction, substantially as and for the purpose set forth.

2. The combination, in a hydrocarbon-gas-black machine, with a series of plates and driving mechanism operating to move the said plates back and forth over a series of gas-jets, of scrapers engaging with the edges of the said plates, substantially as and for the purpose set forth.



3. The combination, in a hydrocarbon-gas-black machine, of a series of narrow parallel longitudinal plates having a reciprocal motion forward and back with scrapers having weighted levers thereon for holding them up into contact with the under surfaces of said plates and bell-crank-lever mechanism for automatically withdrawing the scrapers from the under surfaces of said plates, substantially as and for the purpose set forth.

4. The combination, in a hydrocarbon-gas-black machine, of a series of narrow parallel longitudinal plates having a reciprocal motion forward and back over a series of gas-jets with a series of scrapers engaging with the under surfaces of said plates as they move in one direction and disengaged therefrom when the plates move in the opposite direction and another series of scrapers engaging with the edges of said plates during their traverse in one or both directions, substantially as and for the purpose set forth.

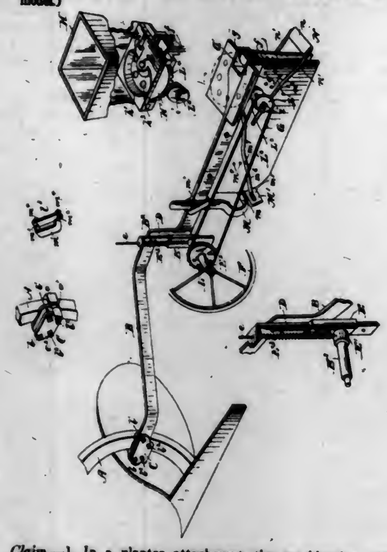
5. The combination, in a hydrocarbon-gas-black machine, of a series of narrow parallel longitudinal plates having a reciprocal motion forward and back over a series of gas-jets, a series of hoppers located apart from each other and under said plates substantially the distance of the traverse of the plates, and an endless conveyer for removing the accumulated black from the bases of said hoppers, with scrapers located under said plates and over said hoppers, adapted to remove the black from the plates and into said hoppers during the traverse of the plates in one direction and be disengaged from said plates when they move in the opposite direction.

6. The combination, in a hydrocarbon-gas-black machine, of a series of scrapers operating under reciprocating plates with bell-crank levers, stops on the frame, and weights operating said levers to automatically withdraw the scrapers from the plates during their traverse in one direction, and lever-and-catch mechanism and stops on the frame for raising and retaining said weights in a raised position, so as to allow the scrapers to operate during the traverse of the plates in the other direction, substantially as and for the purpose set forth.

481,241. SHIP'S LOG. JOHN S. NEGUS, Brooklyn, N. Y. Filed Apr. 22, 1892. Serial No. 430,151. (No model.)

Claim.—1. In a ship's log, the combination, with a registering mechanism, its case provided with trunnions and the support in which said trunnions find a bearing, of the rotative operating-spindle E, provided near its inner end with a driver for said mechanism, and an antifriction-bearing to reduce the friction arising from the longitudinal strain or pull, and with a ball-bearing near its outer end to reduce the friction due to lateral and oblique strains, substantially as set forth.

2. A ship's log having its rotating spindle E provided with an antifriction-bearing near its inner end to reduce the friction arising from the longitudinal strain or pull, a ball-bearing near its outer end to reduce the friction due to lateral and oblique strains, and a balance-wheel fixed concentrically thereon.



3. The combination, with the rotator and rotator-line of a ship's log, of the block B, mounted to rock on trunnions, the register mechanism and its case, and the register-operating spindle rotatively mounted in said block and attached to the rotator-line, said spindle being provided with an antifriction-bearing near its inner end to reduce the friction arising from the longitudinal strain or pull, and a ball-bearing near its outer end to reduce the friction due to lateral and oblique strains, substantially as set forth.

4. In a ship's log, the combination, with the socketed support C, provided with trunnion-bearings having narrow openings *o* in their

sides, of the block B, provided with trunnions *n*, having reduced flattened faces $n^{\times}$ substantially at right angles to the bore of said lock, and the spindle E, rotatively mounted in said bore, substantially as and for the purposes set forth.

5. In a ship's log, the combination, with the socketed support C, provided with trunnion-bearings having narrow openings *o* in their sides, the block B, provided with trunnions *n*, having reduced flattened faces $n^{\times}$ substantially at right angles to the bore of said block, and the spindle E, rotatively mounted in said block, of the balance-wheel F, concentrically mounted on said spindle, substantially as and for the purposes set forth.

481,242. PLANTER ATTACHMENT FOR PLOWS. JOHN P. HUSERT, Dubuque, Iowa. Filed Apr. 16, 1891. Serial No. 389,142. (No model.)

Claim.—1. In a planter attachment, the combination, with a planter beam, of the standard D, provided with the lip or bent upper end, the sliding plate E, mounted upon the standard and having the sleeve E', a coiled spring located intermediate the latter and the said lip and encircling the rod *e*, and the traction-wheel shaft mounted in the sleeve and carrying the traction-wheel, as and for the purpose specified.

2. In a planter attachment, the combination, with the plow-beam, of a planter-beam secured at one end thereto, a ground-wheel carried by said planter-beam, the furrow-opener secured to the planter-beam in rear of the ground-wheel and provided at its rear end with a chamber, as described, the flanges on said furrow-opener, the seed-box supported on said flanges above the chamber and having a slotted bottom, a revoluble seed plate having seed-openings adapted to register with the opening in the bottom of the seed-box, and suitable devices for turning the said seed-plate, as and for the purpose specified.

3. In a planter attachment, the combination, with the plow-beam, of a planter-beam secured thereto, a ground-wheel carried by said planter-beam, the furrow-opener secured to the planter-beam in rear of the ground-wheel and provided at its rear end with the chamber described, the flanges on said furrow-opener, a seed-box supported on said flanges above the chamber and having a slotted bottom, a revoluble seed-plate having seed-openings adapted to register with the opening in the bottom of the seed-box, suitable devices for turning said seed-plate, and hoes M' N, carried by the furrow-opener and occupying positions respectively in front and in rear of the same, as described, for the purpose specified.

4. The combination, with the planter-beam, of a ground-wheel supported thereby, the furrow-opener secured to the beam in rear of the ground-wheel and provided at its rear end with a chamber G', a seed-box mounted upon the furrow-opener above the chamber, a seed-plate revolubly mounted within the seed-box and having seed-openings and teeth A^3, as described, a horizontally-arranged vibrating arm provided with a dog engaging the teeth of the seed-plate, a second vibrating arm arranged above the other arm and provided with a dog engaging with the teeth of the seed-plate, gearing between the said arms for vibrating them simultaneously in opposite directions, and a rod secured at one end to the ground-wheel and at the other end to the lower arm, for the purpose specified.

5. The combination, with the planter-beam, of a ground-wheel supported thereby, the furrow-opener secured to the beam in rear of the ground-wheel and provided at its rear end with a chamber, as G', a seed-box mounted upon the furrow-opener above the chamber, a seed-plate revolubly mounted within the seed-box and having seed-openings and teeth A^3, a horizontally-arranged vibrating arm provided with a dog engaging with the teeth of the seed-plate and having a fluted upper face, a second vibrating arm arranged above the other arm and provided with a dog, also engaging with the teeth of the seed-plate and having a fluted lower face, and a fluted roller located intermediate the fluted portions of the arms and engaging the same, whereby said arms may be vibrated simultaneously in opposite directions, for the purpose specified.

6. In a planter attachment, the combination, with the planter-beam provided with the plate G, of the hoes M' and N, the rods m^3, to the ends of which are pivotally secured the said hoes and springs secured to the rods m^3 and the hoes, openings in the plate G, and bolts passing through the rods and entering said openings, as and for the purpose specified.

7. In a planter attachment, the combination, with the planter-beam, of the vertically-arranged furrow-opener G, the colter M, adjustably secured to said beam in front of the furrow-opener, the smoothing-hoe adjustably carried by the furrow-opener and occupying a position intermediate the forward end of the same and the colter, and the covering-hoe, also adjustably carried by the furrow-opener and occupying a position in rear of the same, all arranged for co-operation, substantially as described.

8. In a planter attachment, the combination, with the planter-beam, of a traction-wheel carried thereby, a vertically-arranged blade secured to said beam in rear of the traction-wheel and provided with a chamber, as described, a seed-box mounted upon said blade and provided with a revoluble seed-plate having opening adapted to coincide with said chamber when the plate is revolved, and means located intermediate the traction-wheel and the seed-plate for imparting rotation to the latter from the traction-wheel, as and for the purpose specified.

9. In a planter attachment, the combination, with the planter-beam provided with a plate G, of the hoes M' N, pivotally secured to the ends of the rods m^3, openings in said plate G, and bolts passing through said arms or rods m^3 into said openings, as and for the purpose specified.

481,248. FIREPROOF-FLOOR CONSTRUCTION. WILLIAM ORR, Trenton, N. J. Filed Dec. 21, 1891. Serial No. 415,710. (No model.)

Claim.—1. The combination, with the beams, of a series of suspenders supported by said beams and extending from beam to beam and a hollow tile-filling laid on and supported by said suspenders and forming a flooring or floor-support, substantially as described.

2. The combination, with the beams, of a series of suspenders supported by the tops of the beams and extending downward near the beams and then from beam to beam and a hollow tile-filling laid on and supported by said suspenders and forming a flooring or floor-support, substantially as described.

3. The combination, with the beams, of a series of suspenders supported by said beams and extending from beam to beam, a hollow tile-filling laid on and supported by said suspenders and forming a flooring or floor-support, and a ceiling of fireproof material supported by said suspenders and closing the bases of said tile, substantially as described.

4. The combination, with the beams, of a series of suspenders supported by said beams and extending from beam to beam and a hollow tile-filling forming a top web extending from beam to beam and forming a flooring or floor-support and supporting-ribs extending downward from the web and resting on said suspenders, substantially as described.

5. The combination, with the beams, of a series of suspenders supported by the beams and extending from beam to beam, a hollow tile-filling forming a top web extending from beam to beam and forming a flooring or floor-support, and supporting-rib extending downward from the web and resting on said suspenders and a ceiling of fireproof material supported by said suspenders, substantially as described.

6. The combination, with the beams, of a series of suspenders supported by the beams and extending from beam to beam and a hollow tile-filling forming a top web extending from beam to beam and forming a flooring or floor support and a series of supporting-ribs extending downward from the web and from beam to beam and resting on said suspenders, substantially as described.

7. The combination, with the beams, of a series of suspenders supported by the tops of the beams and extending downward and then from beam to beam and a hollow tile-filling supported by said suspenders and filling the space between the webs of the beams, substantially as described.

8. The combination, with the beams, of a series of suspenders supported by the tops of the beams and extending downward and then from beam to beam and a hollow tile-filling supported by the suspenders and filling the space between the webs of the beams, the tile being grooved to receive and fireproof the lower flanges of the beams, substantially as described.

9. The combination, with the beams, of a series of suspenders supported by said beams and extending from beam to beam and a tile-filling consisting of a series of tile supported by said suspenders and having their tops constructed to receive and support the free edge of the next tile, so as to form a level surface, substantially as described.

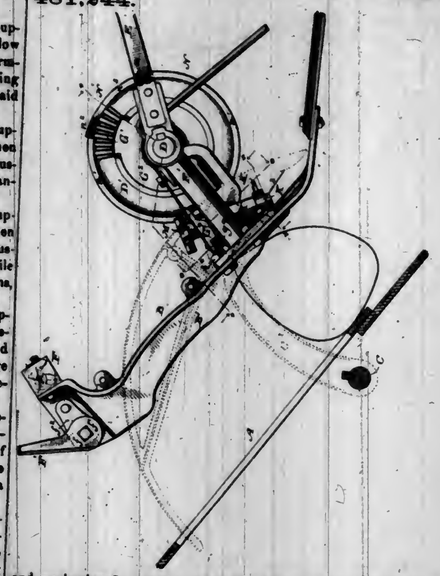
10. The combination, with the beams, of a series of suspenders supported by said beams and extending from beam to beam and a tile-filling consisting of a series of tile, each extending the full depth of the filling and having one side supported on the suspenders and the free edge of the top block supported on the next tile, so as to form a level surface, substantially as described.

11. The combination, with the beams, of a series of suspenders supported by said beams and extending from beam to beam and a tile-filling consisting of a series of tile, each extending the full depth of the filling and having one side supported on the suspenders and extending transversely to the beams, and the free edge of the top block supported in a recess on the next tile, so as to form a level surface, substantially as described.

12. The combination, with the beams, of a series of suspenders supported by said beams and extending from beam to beam and a tile-filling supported by said suspenders, consisting of a series of tile, each extending the full depth of the filling and forming a flooring or floor-support, substantially as described.

13. The combination, with the beams A and suspenders B, supported thereby and extending from beam to beam, of vertical tile-blocks resting on said suspenders and forming a support for the flooring, substantially as described.

14. The combination, with the beams A, of suspenders B, supported by said beams and extending from beam to beam, and vertical tile-blocks resting on said suspenders and forming a support for the floor and having horizontally-projecting ribs 11 and blocks 12, supported on said ribs, substantially as described.



481,244. GRAIN-BINDER. HENRY H. PRIDMORE, Chicago, Ill., assignor to the McCormick Harvesting Machine Company. Filed Oct. 17, 1887. Serial No. 252,535. (No model.) Patented in England Apr. 30, 1887. No. 6,326.

Claim.—1. The combination, substantially as hereinbefore set forth, with the tying-bill and mechanism which gives it a single revolution and stops it with its jaws trending outward in the direction of the cord slot, of the finger projecting from one side of the cord-slot beneath and slightly in advance of the tying-bill and the pocket on the other side, into which the end of said finger enters, having a continuous bottom merging into the flange beneath the cord-slot, whereby the cord-strands are bent over said flange in order to pass the end of the finger.

2. The combination, substantially as hereinbefore set forth, with the tying-bill and mechanism which gives it a single complete revolution and stops it with its jaws trending outward in the direction of the extended cord-slot, of a rotary cord-holder on the outer side of said tying-bill, and actuating mechanism giving the holder-disk a partial turn to carry the cord-strands transverse to the tyer-spindle, then stopping it temporarily while the tying jaws come around, and then moving it onward again to complete the fraction of a revolution due to each binding operation.

3. The combination, substantially as hereinbefore set forth, with the tying-bill and mechanism which stops it at the end of its knotting revolution with its jaws trending outward in the direction of the extended slot in the breast-plate, of a rotary holder-disk outside of the tying-bill, in a plane transverse to that in which the cord is laid and rising from the breast-plate, a holder shoe extending from the opposite side of the cord-slot and bent down to pass beneath the under edge of the disk, whereby a mouth is formed to receive and direct the cord,

481,244.

and mechanism for rotating the holder-disk to carry the cord along the shoe and away from the slot toward or past the knotter-spindle, bending or wrapping the strands thereover to meet the tying-jaws as they come around.

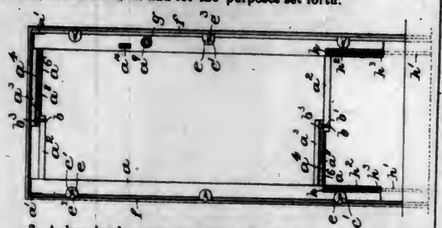
4. The combination, substantially as hereinbefore set forth, with the tying-bill, of a flat holder-disk outside thereof and practically vertical to the breast-plate, a shoe coacting with said disk, a holder-spindle directed inward beneath the tyer-cam and past the tyer-spindle, and actuating mechanism on said tyer-cam for rotating the holder-spindle at each tying operation.

5. The combination, substantially as hereinbefore set forth, with the tying-bill and tyer-cam, of the flat holder-disk outside of the tying-bill, its coacting shoe, the holder-spindle directed obliquely inward and upward beneath the tyer-cam and having a pinion at its inner end, and oblique teeth on the tyer-cam, whereby said pinion is rotated.

6. The combination, substantially as hereinbefore set forth, with the tying-bill and tyer-cam, of the holder-disk outside of the tying-bill, its coacting shoe, the holder-spindle directed obliquely inward and upward beneath the tyer-cam and having a pinion at its inner end, oblique teeth on the tyer-cam, whereby said pinion is rotated, and delay-flanges between said oblique teeth.

7. The combination, substantially as hereinbefore set forth, with the tying-bill and tyer-cam, of the inclined holder-spindle directed from the outer side of the tyer-spindle inward past it beneath the tyer-cam, the pinion at the inner end of said spindle, the holder-disk at the outer end thereof, the shoe coacting with said disk, and the delay-ledges and oblique teeth on the periphery of the tyer-cam engaging with the pinion, whereby said holder-spindle is rotated.

8. The combination, substantially as hereinbefore set forth, with the tyer-cam and its peripheral flanges, having oblique reaches succeeded by straight or delay reaches, of the holder-pinion having its teeth formed with straight faces and flanks to about half their thickness and with oblique faces and flanks to the other half, arranged alternately to one side and the other, whereby wear is reduced.



9. The combination, substantially as hereinbefore set forth, with the holder and its spindle, of a wheel D', having a peripheral flange or flanges with straight and oblique reaches, and a pinion M, having its teeth formed with alternate straight faces *o* and *o'* to about half their thickness, and with oblique faces o^2 o^3 to about the other half of their thickness.

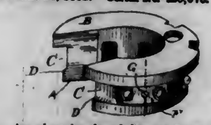
10. The combination, substantially as hereinbefore set forth, with the breast-plate, of the metal bridge-arm F' at its inner end, the bolt *f*, whereby it is secured to a flange from said breast-plate, and the serrated disks f' f^3, whereby said bridge-arm is held in any desired adjustment upon the axis of its securing-bolt.

481,245. DOOR-JAMB SETTER. JACOB RITTERBUSH, Newark, N. J. Filed Nov. 27, 1891. Serial No. 413,196. (No model.)

Claim.—1. A door-jamb setter consisting of side pieces connected with each other by cross-arms arranged in pairs and capable of adjustment sidewise, and a scale on one of said arms, clamping-plates on said side pieces, and means for adjusting said clamping-plates toward or from the edges of a door-jamb frame, substantially as and for the purposes set forth.

2. A door-jamb setter consisting of side pieces, connecting arms or guides between said side pieces, and means for adjusting the same and holding them locked in such adjustment, and a scale on one of said arms, clamping-plates on said side pieces, and means for adjusting said clamping-plates toward or from the edges of a door-jamb frame, substantially as and for the purposes set forth.

3. A door-jamb setter consisting of side pieces connected with each other, perforated plates c^4 and c^5, secured to said side pieces, rods c', extending through said plates and side pieces and secured thereto, a clamping-plate d on the one threaded end of each of said rods, a clamping-plate e on the opposite end of each rod, provided with means for adjustably securing said plates e upon the rod, and adjusting-screws in each of said plates d and e, all arranged substantially as and for the purposes set forth.



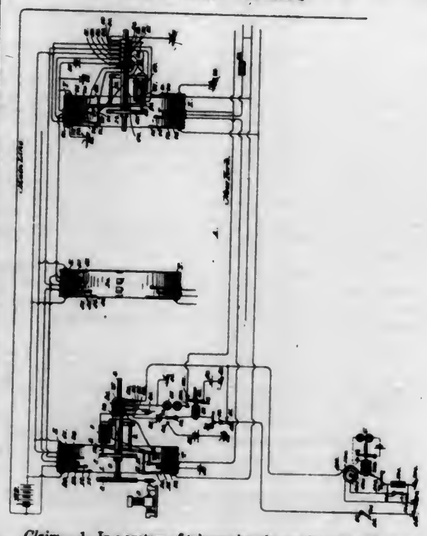
4. A door-jamb setter consisting of side pieces provided with perforated plates c^4 and c^5, secured to said side pieces, rods c', extending through said plates and side pieces and secured thereto, a clamping-plate d on the one threaded end of each of said rods, a clamping-plate e on the opposite end of each rod, provided with means for adjustably securing said plates e upon the rod, adjusting-screws in each of said plates d and e, and adjustably-arranged sliding arms connecting said side pieces, said arms being provided with a yoke, and adjusting-screws for securing said arms in their adjusted positions, all arranged substantially as and for the purposes set forth.

5. A door-jamb setter consisting of side pieces a a, connected with each other by cross-arms arranged in pairs and capable of adjustment sidewise and a scale on one of said arms, clamping-plates on said side pieces, means for adjusting said side pieces toward or from the edges of a door-jamb frame, and adjustable slides in the lower ends of said side pieces, provided with scales, substantially as and for the purposes set forth.

6. A door-jamb setter consisting of side pieces a a, connected with each other by cross-arms adapted to slide upon each other, and a scale on one of said arms, perforated plates c^4 and c^5, secured to said side pieces, rods c', extending through said plates and side pieces and secured thereto, a clamping-plate on the one threaded end of each of said rods, a clamping-plate e on the opposite end of each rod, provided with means for adjustably securing said plates e upon the rods, and adjusting-screws in said plates d and e, substantially as and for the purposes set forth.

7. A door-jamb setter consisting of side pieces a a, connected with each other by cross-arms adapted to slide upon each other, and a scale on one of said arms, perforated plates c^4 and c^5, secured to said side pieces, rods c', extending through said plates and side pieces and secured thereto, a clamping-plate on the one threaded end of each of said rods, a clamping-plate e on the opposite end of each rod provided with means for adjustably securing said plates e upon the rods, adjusting-screws in said plates d and e, and adjustable slides in the lower ends of said side pieces, provided with scales, substantially as and for the purposes set forth.

481,246. THERMAL CUT-OUT. ALBERT P. SEYMOUR, SYRACUSE, N. Y. Filed Mar. 21, 1892. Serial No. 425,673. (No model.)



Claim.—1. An electric chandelier or fixture cut-out or junction-block having body A and head B, provided with a flange or rim extending over the body and formed, as described, to permit it to be molded in a single piece and provided with attached metal-work secured in place upon its side by screws passing through the flange or rim of the head parallel with the axis of the block through ears or projections from such metal-work.

2. In a chandelier or fixture cut-out substantially such as described, a block A, of porcelain or similar vitreous substance, having the recesses I and metal angle-pieces fastened to the side of the block over said recesses by screws passing through the head of the block instead of laterally through the body of the block, as and for the purpose described.

3. In a chandelier or fixture cut-out or junction device, a curved block of porcelain or similar insulating substance formed, as described, to permit it to be struck up or molded by a single operation and having recesses I for the metal-work, and openings into said recesses from the head of the block for the reception of fastening screws or bolts.

4. The combination, substantially as described, with the porcelain or similar block of insulating material having recesses on its side, of metal angle-pieces slightly springy, provided with binding-screws, and fastening-screws passing through one angle from the end or head of the block, as and for the purpose described.

481,247. TELEGRAPHY. JAMES G. SMITH, New York, N. Y. Filed Nov. 2, 1889. Serial No. 329,067. (No model.)

Claim.—1. In a system of telegraphy, the combination of a transmitting local-subscribers' circuit, a main line, a receiving local-subscribers' circuit having a number of subscribers' stations arranged thereupon in series and having apparatus and connections by means of which any particular subscriber called may cut out all other subscribers on the same local-subscribers' circuit, an automatic switch actuated from the transmitting local-subscribers' circuit, and controlling circuit connections between said transmitting local circuit and main line, and a second automatic switch actuated by current on the main line and controlling circuit connections between the main line and the receiving local-subscribers' circuit, substantially as described.

2. In a system of telegraphy, the combination of a transmitting local-subscribers' circuit, a main line, a series of receiving local-subscribers' circuits, an automatic switch actuated from the transmitting local-subscribers' circuit, and controlling circuit connections between said transmitting local circuit and the main line, and a second automatic switch actuated by current on the main line and controlling circuit connection between the main line, a local auxiliary circuit, and an auxiliary automatic switch actuated by current on said auxiliary circuit, and controlling circuit connections between the auxiliary circuit and the receiving local-subscribers' circuit, substantially as described.

3. In a system of telegraphy, the combination of a transmitting local-subscribers' circuit, a main line, a series of receiving local-subscribers' circuits, an automatic switch actuated from the transmitting local-subscribers' circuit, and controlling circuit connections between said transmitting local-subscribers' circuit and the main line, a second automatic switch actuated by current on the main line, and controlling circuit connections between the main line and a series of local auxiliary circuits, and an auxiliary automatic switch for each auxiliary circuit actuated by current on the latter, and controlling circuit connections between the auxiliary circuit with which it is connected and the appropriate local-subscribers' circuit, substantially as described.

4. In a system of telegraphy, the combination of a series of transmitting local-subscribers' circuits, a receiving local-subscribers' circuit a main line common to all local-subscribers' circuits, a series of automatic switches, one for each transmitting local-subscribers' circuit, each actuated from its appropriate transmitting local-subscribers' circuit, and controlling circuit connections between said transmitting local circuit and the main line and cutting out all other transmitting local-subscribers' circuits from said main line, and a second automatic switch actuated by impulses transmitted over the main line from a distant transmitting local circuit, and controlling circuit connections between the main line and the receiving local-subscribers' circuit, substantially as described.

5. In a system of telegraphy, the combination of a transmitting local-subscribers' circuit, a series of main lines, a receiving local-subscribers' circuit, an automatic switch actuated from the transmitting local-subscribers' circuit, and controlling circuit connections between the transmitting local-subscribers' circuit and any one of the main lines that happens to be idle and in order, a second automatic switch actuated by impulses transmitted over the automatically selected main line from the distant transmitting-subscribers' circuits, and controlling circuit connections between said main line and the receiving local-subscribers' circuit, substantially as described.

6. In a system of telegraphy, the combination of a series of transmitting local-subscribers' circuits, a receiving local-subscribers' circuit, a series of main lines common to all the local-subscribers' circuits, an automatic switch for each transmitting local-subscribers' circuit actuated from said circuit, and controlling circuit connections between the same and one or the other of the main lines and cutting out all other transmitting local-subscribers' circuits from said selected main line, a second automatic switch actuated by impulses transmitted from the distant transmitting local-subscribers' circuit over the particular main line being at the time utilized, and controlling circuit connections between said main line and the receiving local-subscribers' circuit, substantially as described.

7. In a system of telegraphy, the combination of a transmitting local-subscribers' circuit, a series of receiving local-subscribers' circuits, a series of main lines common to all the local-subscribers' circuits, an automatic switch actuated from the transmitting local-subscribers' circuit, and controlling circuit connections between said transmitting local circuit and one or the other of the main lines, and a second automatic switch actuated by impulses transmitted from the distant transmitting local-subscribers' circuit over the selected main line, and controlling circuit connections between the particular main line being at the time utilized and one or the other of the series of receiving local-subscribers' circuits, substantially as described.

8. In a system of telegraphy, the combination of a series of transmitting local-subscribers' circuits, a series of receiving local-subscribers' circuits, a series of main lines common to all the local-subscribers' circuits, an automatic switch apparatus for each transmitting local-subscribers' circuit actuated from said circuit, and controlling circuit connections between the same and one or the other of the series of main lines and cutting out all other transmitting local-subscribers' circuits from said selected main line, and a second automatic switch apparatus actuated by impulses transmitted from a distant transmitting local-subscribers' circuit over the particular main line being at the time utilized, and controlling circuit connections between said main line and one or the other of the receiving local-subscribers' circuits, substantially as described.

9. In a system of telegraphy, a series of transmitting local-subscribers' circuits, a series of main lines, a series of receiving local-subscribers' circuits, an automatic switching apparatus for each transmitting local-subscribers' circuit, operating upon a signal from a subscriber on its particular local circuit to connect the said circuit with one of the main lines that happens at the time to be idle and cutting out all other transmitting local-subscribers' circuits from said selected main line, a second automatic switching apparatus operated by the current on the main line to connect said main line with any predetermined receiving local-subscribers' circuit, and an apparatus at the transmitting local-subscribers' station for automatically arresting said second switching apparatus to make connection with said predetermined receiving local-subscribers' circuit, so that communication between the distant local subscribers may be carried on, substantially as described.

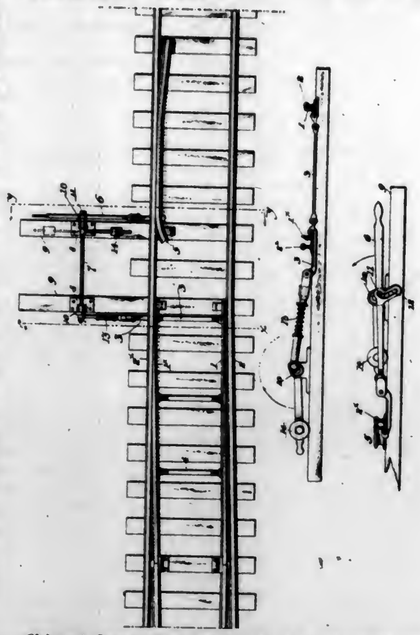
10. In a system of telegraphy, a series of transmitting local-subscribers' circuits, a series of main lines, a series of receiving local-subscribers' circuits, an automatic switch apparatus for each transmitting local-subscribers' circuit, operating upon a signal from any subscriber on said transmitting local-subscribers' circuit to connect said last-mentioned circuit with one of the main lines which happens at the time to be idle and to cut out all other transmitting local-subscribers' circuits from the main line so selected, a second automatic switching apparatus operated by the current on the main line, having a series of movable contacts and a series of stationary sets of contacts corresponding in number to the number of receiving local-subscribers' circuits, said series of movable contacts operating to cause an electrical impulse to be sent back to the transmitting local-subscribers' station each time a set of contacts belonging to a receiving local-subscribers' circuit is touched and passed, and an apparatus at the transmitting local-subscribers' station actuated by the impulses aforesaid and operating to arrest said second automatic switching apparatus when at the point for connection with the predetermined local-subscribers' circuit, so as to enable communication to be had between the transmitting local subscriber and the said predetermined remote receiving subscriber, substantially as described.

11. In a system of telegraphy, a transmitting local-subscribers' circuit, a main line, a series of receiving local-subscribers' circuits, an automatic switching apparatus for the transmitting local-subscribers' circuit, operating upon a signal from a subscriber on said local circuit to connect said circuit with the main line and throw a current-generator on said main line, a second automatic switching apparatus connected to the main line and operated by the current thereon and having a movable set of contacts and a series of sets of stationary contacts corresponding in number to the number of receiving local-subscribers' circuits, said movable set of contacts operating as it touches and passes each successive set of stationary contacts to ground the main line and send an electrical impulse over the same to the distant-transmitting local-subscribers' station, and an electro-mechanical apparatus at the transmitting local-subscribers' station, adapted to advance step by step under the aforesaid impulses and when the stationary set of contacts belonging to the predetermined receiving local-subscribers' circuit desired to be connected is reached by the movable set of contacts to afford a new path for the main-line current, which changes the electrical condition of the main circuit and causes the switching apparatus to be arrested while communication is being had between the distant local-subscribers' station.

12. In a system of telegraphy, a series of transmitting local-subscribers' circuits, a series of main lines, a series of receiving local-subscribers' circuits, an automatic switch apparatus for each transmitting local subscribers' circuit, operating upon a signal from any subscriber on said local transmitting-subscribers' circuit to connect said last-mentioned circuit with one of the main lines which happens at the time to be idle and to cut out all other transmitting local-subscribers' circuits from the main line so selected, a second automatic switching apparatus connected to and operated from the main line and having a movable set of contacts, and a series of sets of stationary contacts corresponding in number to the number of receiving local-subscribers' circuits, said movable set of contacts operating as it touches and passes each successive set of stationary contacts to ground the main line and send an impulse to the transmitting local-subscribers' station, and an electro-mechanical apparatus at the last-named station, which advances step by step in response to the aforesaid electrical impulses until the set of contacts of the predetermined receiving local-subscribers' circuit is reached, whereupon a new path for the main-line current is afforded, which changes the condition of said main-line circuit and causes the arrest of the movable set of contacts of the switching apparatus, substantially as described.

13. In the herein-described system of telegraphy, the combination of a main line, a transmitting local-subscribers' circuit, an automatic switching apparatus by which said transmitting local-subscribers' circuit is connected to the main line, consisting, essentially, of the frame bearing the sets of stationary contacts, the continuously-rotating shaft having the perforated disk secured thereto, the sleeve mounted upon said shaft, carrying the armature-bar provided with contacts, as described, the electro-magnet, the spring and the commutators, the battery and circuit connections for holding the armature-lever normally disengaged from the rotating disk, the battery and circuit connections for disengaging the armature-lever from the disk when in position for connection with the main line, and the hand-switches and connections under control of the operator at the transmitting local-subscribers' station, all arranged and operating substantially as described.

14. In the herein-described system of telegraphy, the combination of a series of main lines, a transmitting local-subscribers' circuit, and automatically switching apparatus by which said transmitting local-subscribers' circuit is connected to one or the other of the main lines, said switching apparatus consisting, essentially, of the frame bearing the sets of stationary contacts, a continuously-rotating shaft having the perforated disks secured thereto, the sleeve mounted upon said shaft, carrying the armature-bar provided with contacts, as described, the electro-magnet, the spring and the commutators, the battery and connections for holding the armature-lever normally disengaged from the rotating disks, the battery and connections for disengaging the armature-lever from the disk when in position for connection with one or the other of the main lines, and the hand-switches and connections under control of the operator at the transmitting local-subscribers' station, all arranged and operating substantially as described.



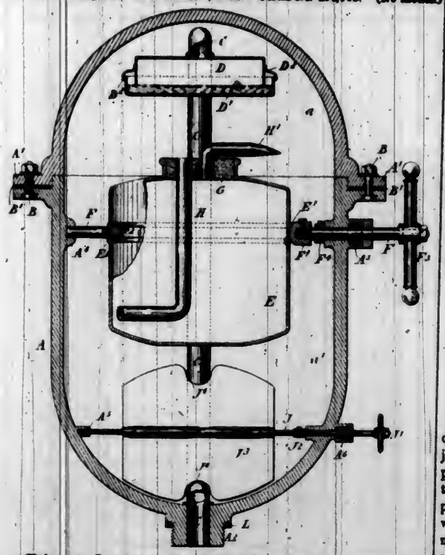
15. In the herein-described system of telegraphy, the combination of a series of main lines, a series of transmitting local-subscribers' circuits, and a series of automatic switching apparatus, one for each transmitting-subscribers' circuit, each consisting, essentially, of a frame bearing the sets of stationary contacts, a continuously-rotating shaft having the perforated disks secured thereto, the sleeve mounted upon said shaft, carrying the armature-bar provided with contacts, as described, the electro-magnet, the spring and the commutators, the battery and connections for holding the armature-lever normally disengaged from the rotating disks, the battery and connections for disengaging the armature-lever from the disk when in position for connection with one or the other of the main lines, and the hand-switches and connections under control of the operator at the transmitting local-subscribers' station, all arranged and operating substantially as described.

16. In the herein-described system of telegraphy, the combination, with the main line and its battery, of the series of receiving local-subscribers' circuits and the automatic switching apparatus for establishing connection between said main line and one or the other of the receiving local-subscribers' circuits, said switching apparatus consisting, essentially, of the frame, with its series of sets of contacts corresponding to the number of receiving local-subscribers' circuits, the constantly-rotating shaft bearing the perforated disk, the sleeve mounted upon said shaft, carrying the armature-lever provided with contacts, as described, the electro-magnets, one of which is energized by the current of the main line and the other by the current of a local battery, the retracting-spring, and the commutators, with the commutator-brushes and circuit connections arranged and operating substantially as described.

17. In the herein-described system of telegraphy, the combination, with a main line, of a transmitting local-subscribers circuit and automatic switching apparatus, by which said transmitting local-subscribers' circuit is connected to the main line, consisting of the frame with its sets of stationary contacts, the continuously-rotating shaft having the perforated disk secured thereto, the sleeve mounted upon said shaft, carrying the armature-bar provided with contacts, as described, the electro-magnet, the spring and the commutators, the battery and circuit connections for holding the armature-lever normally disengaged from the rotating disk, the battery and circuit connections for disengaging the armature-lever from the disk when in position for connection with the main lines, and the hand-switches and connections under the control of the operator at the transmitting local-subscribers' station, the battery on the main line, the series of receiving local-subscribers' circuit, the automatic swinging apparatus for establishing connection between the main line and one or the other of the receiving local-subscribers' circuits, said switching apparatus consisting, essentially, of the frame with its series of sets of contacts corresponding to the number of receiving local-subscribers' circuits, the constantly-rotating shaft bearing the perforated disk, the sleeve mounted upon said shaft, carrying the armature-lever provided with contacts, as described, the electro-magnets, one of which is energized by the current of the main line and the other by the current of a local battery, as described, the retracting-spring and the commutators with commutator-brushes and circuit connections, as described, and the apparatus at the transmitting local-subscribers' station for effecting the arrest of the switching apparatus and establishing connection with the desired receiving local-subscribers' circuit, consisting of the perforated dial, the metallic stud, the movable arm, the electro-magnet, and means for advancing the arm step by step by impulses sent over the main line, as described, and the rheostat and switches and circuit connections, substantially as set forth.

18. In the herein-described system of telegraphy, the combination, with the series of main lines, of the series of transmitting local-subscribers' circuits, the series of receiving local subscribers' circuits, a series of automatic switching apparatus, one for each transmitting local-subscribers' circuit, by which any one of said transmitting local-subscribers' circuits may be connected to an idle main line, said automatic switching apparatus consisting of the frame and sets of stationary contacts, the continuously-rotating shaft having the perforated disk secured thereto, the sleeve mounted upon said shaft, carrying the armature-bar provided with contacts, as described, the electro-magnet, the spring and the commutators, the batteries and circuit connections, as described, means such as described for cutting out all the other transmitting local-subscribers' circuits from said selected main line, the automatic switching apparatus for establishing connection between the main line and one or the other of the receiving local-subscribers' circuits, said switching apparatus consisting, essentially, of the frame with the series of sets of contacts corresponding to the number of the receiving local-subscribers' circuits, a constantly-rotating shaft bearing the perforated disk, the sleeve mounted loosely upon said shaft, carrying the armature-lever and provided with contacts, as described, the electro-magnets and retractile spring for operating said armature-lever and the commutator-brushes and circuit connections, as described, and the apparatus at the transmitting local-subscribers' station for effecting the arrest of the distant switching apparatus and establishing connections between the main line and the desired receiving local-subscribers' circuit, consisting of the perforated dial, metallic stud, movable arm, the electro-magnet, and means for advancing the arm step by step by impulses sent over the main line, as described, and the rheostat, hand-switches, and circuit connection, substantially as set forth.

481,248. AUTOMATIC RAILROAD-SWITCH. William Spielman, Camden, N. J., assignor to Ambrose Dalley, Willoughby K. Butterworth, and Joseph L. Dalley, Philadelphia, Pa. Filed Apr. 14, 1891. Serial No. 388,910. (No model.)



Claim.—1. In an automatic railroad-switch, the combination, with the main rails, of a pair of point-rails, a movable guard-rail normally operative to provide a continuous main line connected to a shaft suitably journaled adjacent to said main rails, a switch-rod mounted on said shaft and connected to the point-rails, a spring on said rod, and a weighted switch-lever on said shaft to retain said rails in normally operative combination with the main rails in the manner described, whereby a misplaced switch will be automatically opened by the operation of the mechanism described upon the passing of the flange of a car-wheel between the point-rails and main rails when the train is traveling in one direction and between the guard-rail and main rail when the train is traveling in the opposite direction, as set forth.

2. In an automatic railroad switch, the combination, with the main rails, of a pair of point-rails, a movable guard-rail normally operative to provide a continuous main line connected to a shaft suitably journaled adjacent to said main rails, a switch-rod mounted on said shaft and connected to the point-rails, a spring on said rod, and a weighted switch-lever on said shaft to retain said rails in normally operative combination with the main rails in the manner described, whereby a misplaced switch will be automatically opened by the operation of the mechanism described upon the passing of the flange of a car-wheel between the point-rails and main rails when the train is traveling in one direction and between the guard-rail and main rail when the train is traveling in the opposite direction, and a second switch-lever mounted on said shaft, attached to the movable guard-rail and adapted to move said guard-rail away from the main rail and free of passing car-wheels to permit the switching of a train from the main line onto a branch line, as described.

3. In an automatic railroad-switch, the combination, with the main rails and point-rails, of a movable guard-rail, a shaft suitably journaled adjacent to said main rails and switch-rod connection between said shaft and point-rails, and a slotted switch-lever attached to said guard-rail, mounted on said shaft and working thereon by means of said slot, said guard-rail normally operative to provide a continuous main track in the manner described and adapted to be moved apart from said main rails free of passing car-wheels by the raising of said lever to permit the switching of a train from the main line onto a branch line, as described.

481,249. AERATION OF LIQUIDS. Edward Williams, Aberayron, England. Filed Mar. 7, 1892. Serial No. 424,062. (No model.)

Claim.—1. In an apparatus such as described, the combination, with the outer vessel and the invertible vessel mounted within it, of the washer at the top of the outer vessel and the tube leading from the washer to the outlet-opening at the bottom of the outer vessel, substantially as described.

2. In an apparatus such as described, the combination, with the outer vessel having the discharge-opening at the bottom and the acid-receptacle within said outer vessel, of the gas-washer also within the outer vessel and at the top of the same and the tube leading from said washer down to the discharge-opening at the bottom, whereby the device is adapted to be applied directly in upright position to the vessel containing the liquid to be aerated, substantially as described.

3. In an apparatus such as described, the combination, with a gas-generating vessel, of an invertible vessel located within it and having two tubes, one forming the discharge-opening and the other extending to the bottom and forming the passage for the entrance of air as the vessel is inverted, and means for inserting said vessel from the exterior, substantially as described.

481,250. PIPE-COUPLING. Dana A. Barnes, Syracuse, N. Y. Filed July 6, 1891. Serial No. 398,472. (No model.)

Claim.—1. In a coupling of the class described, the combination, with the heads having cam-faced flanges, of cam-rings having oscillatory bearings directly on the heads and formed to connect with each other, as set forth.

2. The combination, with the heads, of the cam-rings, each provided with a tongue, and a yoke projecting from diametrically-opposite sides and at right angles to each other, the tongue of one constructed and arranged to pass into the yoke of the other, as set forth.

3. The combination, with the heads, of the cam-rings, each provided with stop-shoulders diametrically arranged, and a tongue and a yoke projecting from diametrically-opposite sides and at right angles to each other, the tongue of one arranged to enter and engage the walls of the other, as set forth.

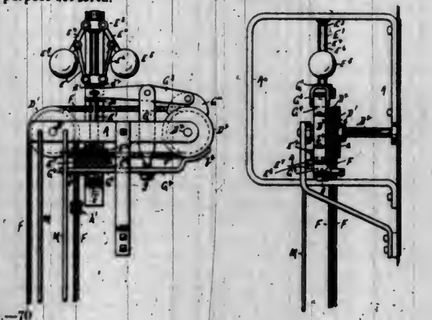
4. The combination, with the heads formed with overhanging annuli, of the cam-rings embracing the heads and formed with tongues and yokes, the tongues being formed with cam depressions on their acting faces and the yokes with projections constructed to ride into and engage said depressions, as set forth.

5. In a coupling of the class described, a ring formed with opposite cam-surfaces, a tongue, and a yoke, said tongue and yoke projecting from diametrically-opposite sides and the yoke having an opening inclosed on three of its sides, as set forth.

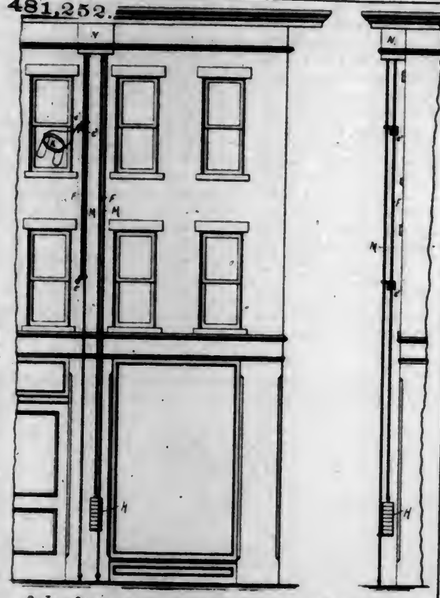
6. In a coupling of the class described, a ring having oppositely-extended cam-surfaces, stop-shoulders upon substantially diametrically-opposite sides, a tongue, and a yoke, said tongue and yoke projecting from diametrically-opposite sides, as set forth.

7. In a coupling of the class described, a ring having oppositely-extending cam-surfaces, stop-shoulders, a lip or tongue with a depression on its acting face and a beveled end, and a diametrically-opposite yoke having a cross-bar with cam end face combined with a like ring and body portion for each ring, as and for the purpose specified.

481,251. PAPER-HANGING MACHINE. Lyman D. Barton, Kilbourn City, Wis. Filed May 14, 1892. Serial No. 433,018. (No model.)



Claim.—1. The combination of an annular shell or case, a paste-distributing cylinder journaled within said case, a paper shaft or roller journaled in supports on the shell, a pressure-roller journaled above the paste-distributing cylinder and held in place by spring-controlled detents pivoted on the case or shell, another roller journaled above the paste-cylinder and adapted to force the sheet of paper against the wall, a brush, and a trough supported on the case below the last-mentioned-roller and having its bottom perforated, substantially as described.



2. In a paper-hanging machine, the combination, with a shell or case provided with means for supporting a roll of paper, of a perforated cylinder journaled within said case, a roller journaled in slots in the end walls of the case or shell, pivoted detents connected to the end walls of the shell and extending across the slots therein, coiled springs attached to said detent and to the shell or casing, a brush carried by the shell or case, and a roller journaled in arms attached to the shell or case and adapted to press the paper carried by said case against the wall, substantially as shown and described.

481,252. FIRE-ESCAPE. Julius D. Brainard, St. Paul, Minn. Filed Apr. 25, 1891. Serial No. 390,476. (No model.)

Claim.—1. In a fire-escape apparatus, two sheaves or pulleys D' D^2, capable of passing around said sheaves or pulleys and with its ends hanging therefrom, a counter-weight upon one of said pendent ends, means whereby the person desiring to use the apparatus can be attached to the other pendent end, guide rods or wires M, to which said counter-weight and the suspension apparatus of the person using the apparatus is loosely connected, a brake adapted to act upon said sheaves or pulleys, and a governor connected to said brake and adapted to be actuated by said cable, so that the speed of the descent of the person using the apparatus will be regulated and the counter-weight and descending person guided during the trip, substantially as and for the purpose set forth.

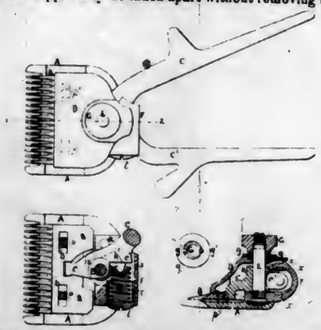
481,252.

2. In a fire-escape apparatus, two sheaves or pulleys D' D^2, a cable passing around said sheaves or pulleys and with its ends hanging therefrom, a counter-weight upon one of said pendent ends, means whereby the person desiring to use the apparatus can be attached to the other pendent end, a brake adapted to act upon said sheaves or pulley, and a governor connected to said brake and adapted to be actuated by said cable, so that the speed of the descent of the person using the apparatus will be regulated, in combination with a pivoted lever G^3, supporting said brake and through which said cable passes, whereby when the weight of the person using the apparatus is removed from the cable an enlargement upon the cable will actuate said lever and set the brake, so as to check the movement of the cable and prevent the cable running off the sheaves, substantially as and for the purpose set forth.

481,253. SHOE-HORN. DAVID CADY, Indianapolis, Ind. Filed Apr. 12, 1892. Serial No. 428,837. (No model.)

Claim.—1. A shoe-horn having its upper end curved or bent backward and adapted to extend between the fingers of the user, whereby it is enabled to be handled in the manner herein shown and described.

2. A shoe-horn having its upper end flattened and formed into a curve, which curve starts forward at the initial point, forming a projection or offset above the dished portion thereof, substantially as shown and described, and for the purpose set forth.



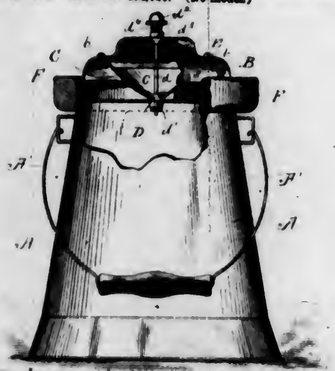
481,254. HAIR-CLIPPER. CYRUS CARLETON, Providence, R. I., assignor to the Brown & Sharpe Manufacturing Company, same place. Filed Sept. 29, 1891. Serial No. 407,157. (No model.)

Claim.—1. A hair-clipper having a movable cutter and a pivoted operating-lever therefor, with a push spiral spring within the cover or frame close to the pivot to act on the said lever.

2. A hair-clipper having a frame, movable cutter, and operating-lever, with a pocket in the frame containing a push spiral spring to act upon the operating-lever.

3. A hair-clipper having a movable cutter and an operating-lever therefor, a push spiral spring within the frame or cover close to the pivot, and means for retaining the spring in place when the clipper is taken apart and the operating-lever is removed.

4. A hair-clipper having a frame, a movable cutter, and an operating-lever therefor, in combination with a push spiral spring, the frame having a pocket with removable cover or thimble to retain the spring, the inner end of the pocket being provided with shoulders, whereby the clipper may be taken apart without removing the spring.

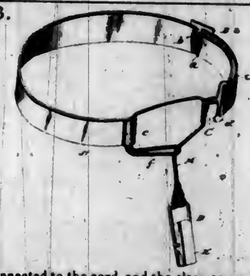


5. A hair-clipper having a frame, a movable cutter, and an operating-lever, with a push spiral spring to act on the lever, and a pocket with a beveled bottom for the reception of the spring.

6. A hair-clipper having a securing-nut with a tubular extension carrying a spring-washer secured thereto by forced-up lips or projections on the extension.

7. A hair-clipper having a frame, movable cutter, and a pivoted operating-lever therefor, a cap, securing-bolt, and retaining-nut for the cap, the hub of the operating-lever being out of contact with the cap and having a shoulder to take under an overhanging part of the frame.

481,255. COMMODE. JOHN W. CLERKE, Cleveland, Ohio. Filed Sept. 3, 1891. Serial No. 404,626. (No model.)



Claim.—In a commode, the combination, with a tapering receptacle and a cover fitted to its upper end, of a seat-ring larger in its internal diameter than the external diameter of the cover and adapted to pass over the latter and rest on the tapering exterior of the receptacle, substantially as set forth.

481,256. GARMENT-SUPPORTER. GEORGE J. CLINE, Goshen, Ind. Filed May 31, 1892. Serial No. 435,025. (No model.)

Claim.—1. As an improved article of manufacture, the garment-supporter described, comprising the limb-encircling band, the hook secured to one end thereof, the cord passing through the hook and also connected with the opposite end of the limb-encircling band and provided with loop *f*, the buckle mounted on said band, the loop *c*, formed by connecting one end of the band to the buckle, the clamp on the free end of the cord comprising the two members, the loop connecting said clamp to said cord, and a spring also mounted upon the free end of the loop and pressing against the members of the clamp, all adapted to operate substantially as specified.

2. In a garment-supporter substantially as described, the combination, with the cord, of the loop of a general rectangular form having

481,256.

one of its ends connected to the cord, and the clasp comprising the two members pivotally mounted upon the free end of the loop and adapted to turn within said loop, and the spring also mounted on the free end of the loop, substantially as specified.

3. In a garment-supporter substantially as described, the combination, with the clasp and the loop formed from a piece of wire and carrying the clasp and having its free ends formed into the eyes *m*, of the cord having its ends passed through the eyes of the loop to form the loop *i* and then passed through the said loop *i*, substantially as and for the purpose set forth.

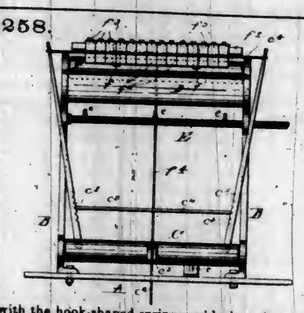
481,257. PIPE-WRENCH. WILLIAM H. DECHANT, Reading, Pa. Filed Dec. 12, 1891. Serial No. 414,866. (No model.)

Claim.—1. The herein-described wrench, consisting of a frame or lever and a band of flexible material secured to said frame or lever, adapted to partially encircle a pipe and extending thence through an opening in said frame or lever, the free end of said band on its way from the pipe to the frame extending between said pipe and the lower end of said frame and adapted to be held in close contact with the pipe by said lower end of the frame.

2. The herein-described wrench, consisting of a frame or lever having horizontal rods *e*, *f*, and *g*, and a band of flexible material, as of cloth, secured to said rod *e*, adapted to partially encircle a pipe and extending thence through an opening between said rods *f* and *g*, said rod *g* serving to hold the adjacent portion of the fabric in close contact with the pipe, substantially as described.

3. The herein-described wrench, consisting of a frame or lever having a horizontal bar *e*, and a band of flexible material doubled upon itself engaging said bar at its upper end, adapted to partially encircle a pipe and extending thence through an opening in said frame or lever, the free end of said band on its way from the pipe to the frame extending between said pipe and the lower end of said frame and adapted to be held in close contact with said pipe by said lower end of the frame, substantially as described.

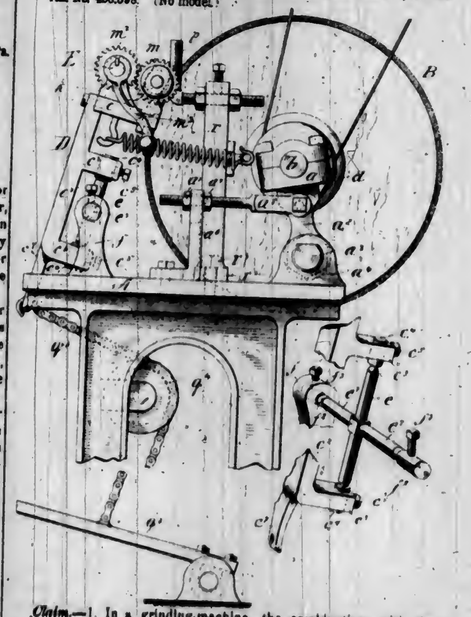
4. The herein-described wrench, consisting of a frame or lever having horizontal bars *e*, *f*, and *g* and opening *h*, and a band of flexible material, as of cloth, doubled upon itself, engaging said bar *e* at its upper end, extending from opposite sides of the same parallel with each other to and through said opening and adapted to partially encircle a pipe in its passage from the bar *e* to the opening, and bar *g* serving to hold the adjacent portion of the band in close contact with the pipe, substantially as described.



481,258. BINDERY PASTING-MACHINE. JOSEPH L. DENNIS, Atlanta, Ga., assignor of one-half to Tomlinson F. Brewster, same place. Filed Mar. 19, 1891. Renewed May 31, 1892. Serial No. 435,069. (No model.)

Claim.—1. In a device of the class specified, the combination of the shaft C, carrying-arms projecting therefrom; a cord secured at each end to one of said arms at its distal extremity, means for forcing said arms apart for the purpose of tightening said cord, and means for supplying said cord with paste, for the purpose specified.

2. The combination of a binding cord, supporting-arms therefor, a rock-shaft to which said arms are secured, a glue-pot, a dipping-plate *e*, means to swing the dipping-plate from the glue-pot into the path of the binding-cord, consisting of a rock-shaft and suitable plate-supporting arms secured thereto, and means to operate said shaft, all substantially as described.



3. In a device of the class specified, the combination of the rock-shaft F, the carrying-arms *f*, secured to said rock-shaft, the connecting cross-bar on the free ends of the carrying-arms, and the movable plates

481,258.

provided with the hook-shaped springs, said plates being adapted to be removably attached to the cross-bar, all substantially as described.

481,259. MACHINE FOR GRINDING CUTLERY AND OTHER HANDLES. FREDRICK C. FRICKER, Northampton, Mass., assignor to the Northampton Cutlery Company, same place. Filed Feb. 6, 1892. Serial No. 420,598. (No model.)

Claim.—1. In a grinding-machine, the combination, with the grinding-wheel, of a work-holder support pivotally mounted to have a swinging movement toward and from the face of the grinding-wheel, the work-holder rotatably mounted thereon and means for imparting rotation thereto, a spring for forcing the said support toward the wheel, and a treadle having a flexible connection extended therefrom to an engagement with the support for withdrawing the latter from the grinding-wheel, substantially as described.

2. In a grinding-machine, the combination, with a table having supports for the grinding-wheel and a pair of separated uprights, of a work-holder support having parallel separated brackets, a bar or member having its extremities in engagement with said brackets, whereby there may be a rotational movement of the bracketed holder relative to the bar and said bar being provided with rigid members extended therefrom at right angles to its length and mounted for a rocking movement in said separated uprights, and the work-holder mounted on the said support, substantially as described.

3. In a machine for grinding cutlery and other handles, the combination, with a grinding-wheel and a work-holder support which is movable toward and from the face of the grinding-wheel, of separated work-holders mounted on said support thereof, comprising a bearing or journal, a sleeve therein constrained against endwise movement, a screw-shaft through the sleeve, having one extremity adapted to engage the article to be worked upon and free for an endwise movement

relative to the sleeve, but constrained against rotation, a nut-screw engaging the said screw-shaft and having an engagement with said sleeve, whereby there may be no movement axially of the one relative to the other, but whereby they may independently rotate, and means for imparting rotation to the sleeve, substantially as described.

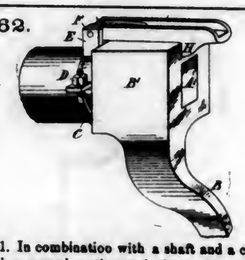
4. In a machine for grinding cutlery and other handles, the combination, with a grinding-wheel and a moveble support, of separated work-holders on said support, one comprising a journal-bearing, a sleeve rotatable thereon, having a shoulder at one end of the bearing and a gear-wheel at the other, and the sleeve also having the peripherally-grooved extremity, the splice-grooved and screw-threaded shaft passed through the sleeve and having at its one end a handle-engaging member, the nut engaging the shaft and provided with the annular flange the pin j^3, and the pin j^3, all arranged as and for the purpose set forth.

481,260. APPARATUS FOR STARTING RACERS. EDWIN FORBES, Flatbush, N. Y. Filed Dec. 30, 1891. Serial No. 416,514. (No model.)

Claim.—1. The combination, in an apparatus for starting races, of a swinging carrier and standards containing bearings therefor, a gate suspended from said carrier, an automatic lifting device applied to said carrier for lifting said gate, and a controlling device applied to said carrier for controlling the operation of the lifting device, substantially as herein set forth.

2. The combination of the posts or standards A, the swinging carrier consisting of the shaft B, arms C C, and pivot D, the gate E, suspended from said pivot, the pulley F on said shaft, the cord or rope *b*, the weight G, and the windlass H, all substantially as herein set forth.

481,261. LATCH AND LOCK COMBINED. JAMES A. GIBBS, Chicago, Ill., assignor to the Adams & Westlake Company, same place. Filed Mar. 14, 1892. Serial No. 424,742. (No model.)

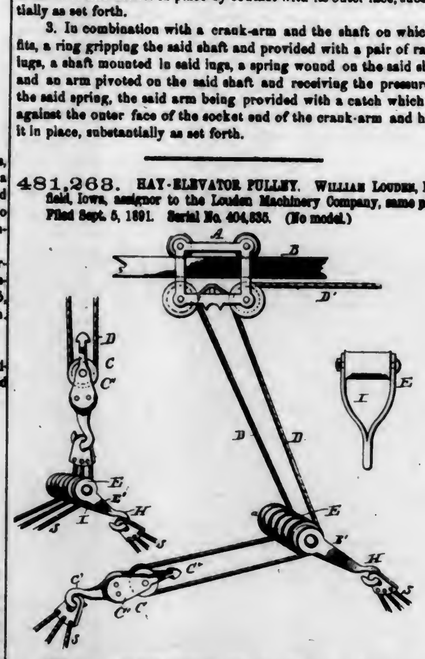


Claim.—1. The combination, in a door-latch, of plates adapted to be secured to the opposite sides of the door, hollow spindles journaled in each of said plates and provided with lugs on their inner ends and with knobs secured to their outer ends, whereby they are secured in said plates independent of each other, a square spindle connecting said hollow spindles, and latch-operating devices connected to said spindles, substantially as described.

2. The combination, in a door-latch, of a casing secured to the edge of the door and containing the catch and latch-rod, the inner end of said rod projecting into a recess which extends through the door and is adapted to receive the plates forming the casing for the operating mechanism, a yoke forming a part of the operating mechanism and extending beyond the inner plate inclosing said operating mechanism, means of attaching the projecting portion of said yoke to the latch-rod, plates adapted to be secured to opposite sides of the door and connected by clamping-screws, hollow spindles journaled in each of said plates, and a square spindle connecting said hollow spindles, substantially as described.

3. The combination, in a door-latch having the operating mechanism and the latch proper in separate cases, of a latch-rod connecting the latch and operating mechanism and having a head C, to which it is adjustably connected by a screw, a yoke adapted to receive the inner end of the latch-rod, and a fastening connecting said latch-rod and yoke, which prevents the turning of said rod, substantially as and for the purpose specified.

481,262. CRANK-HANDLE FASTENING. THOMAS H. HEARD and WILLIAM K. BERRISHAW, Derby, England. Filed Oct. 30, 1891. Serial No. 409,351. (No model.) Patented in England Feb. 6, 1890, No. 1,975.



Claim.—1. In combination with a shaft and a crank-arm fitting thereon, a spring-pressed catch attached to said shaft and taking position outside of the said crank-arm to prevent the separation of the latter from the shaft, substantially as set forth.

2. In combination with a crank-arm and the shaft on which it fits, a ring gripping the said shaft and a spring-pressed catch attached to the said ring and arranged to overlap the socket end of the said crank-arm and hold it in place by contact with its outer face, substantially as set forth.

3. In combination with a crank-arm and the shaft on which it fits, a ring gripping the said shaft and provided with a pair of raised lugs, a shaft mounted in said lugs, a spring wound on the said shaft, and an arm pivoted on the said shaft and receiving the pressure of the said spring, the said arm being provided with a catch which fits against the outer face of the socket end of the crank-arm and holds it in place, substantially as set forth.

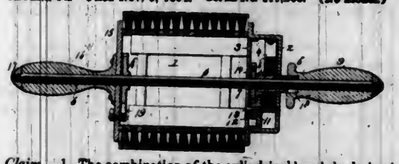
481,263. HAY-ELEVATOR PULLEY. WILLIAM LOUDEN, Fairfield, Iowa, assignor to the Louden Machinery Company, same place. Filed Sept. 5, 1891. Serial No. 404,835. (No model.)

Claim.—1. The combination, with a hoisting-rope, of an elevator-pulley and a binding-pulley, the frame of the binding-pulley being adapted to permit the passage therethrough of the elevating-pulley, substantially as set forth.

2. The combination, with a hay-carrier and a hoisting-rope, of an elevator-pulley and pulley-frame and a binding-pulley, said binding-pulley being adapted to permit the elevating-pulley to pass therethrough and engage the carrier, substantially as set forth.

3. The combination, with a hoisting-rope, of two pulleys, sling-ropes connected with the frames of said pulleys and adapted to embrace a bundle or load of hay, the frame of one of said pulleys being of sufficient size to permit the passage through it of the other pulley and its frame and the sling-ropes, substantially as set forth.

4. The combination, with a hay-carrier, of a binding-pulley having a loop and an elevating-pulley adapted to pass through said loop, substantially as set forth.



5. The combination, with a hay-carrier, of two pulleys, each connected to sling-ropes, the supporting-frame of one of said pulleys being of a size sufficient to permit the passage of the other pulley, substantially as set forth.

6. The combination, with a hay-carrier, of two pulleys, one of said pulleys being made of a series of sheaves and having an open supporting-frame adapted to permit the passage through it of the other pulley, substantially as set forth.

7. The combination, with a hay carrier, of two pulleys, one of said pulleys being made up of a series of sheaves or rollers the sheaves or rollers being smaller at the center of the pulley than at the edges, said pulley having an open frame adapted to permit the passage of the other pulley, substantially as set forth.

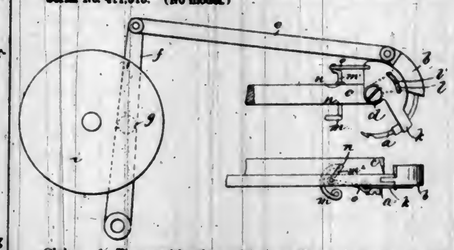
8. The combination, with a hay-carrier, of two pulleys and an open frame for one of said pulleys, adapted to permit the passage therethrough of the other pulley, said frame being made with a flaring mouth, substantially as set forth.

481,264. REVOLVING HAIR-BRUSH. WESLEY J. MILLER, Harrisburg, Pa. Filed Nov. 9, 1891. Serial No. 411,263. (No model.)

Claim.—1. The combination of the cylindrical brush-body having the end cap 2, the end plate 15, and the handle 16, secured on said end plate, the rod 6, having the ratchet-wheel 18 secured upon it, the pawl adapted to be thrown into engagement with said ratchet-wheel, the sleeve 5, having the squared outer end, the coiled spring 4, arranged as specified, and the sliding handle 9, formed with the squared socket at its inner end, substantially as set forth.

2. The combination of the cylindrical brush-body having the end cap 2, the end plate 15, and the handle 16, secured on said end plate, the rod 6, having the ratchet-wheel 18 and the gear-wheel 14 secured upon it, the pawl adapted to be thrown into engagement with said ratchet-wheel, the sleeve 5, arranged as specified, formed with the squared outer end, and having the small gear-wheel 8 at its inner end, the gear-wheels 11 and 12, secured together and mounted on the spindle 13, the coiled spring 4, secured at its inner end to the sleeve 5 and at its outer end to the end cap 2, and the sliding handle 9, formed with the squared socket in its inner end, substantially as set forth.

481,265. SHOE-BLACKING HOLDER AND REST. ROBERT D. MCMANUS, Hartford, Conn. Filed June 22, 1887. Serial No. 242,106. (No model.)



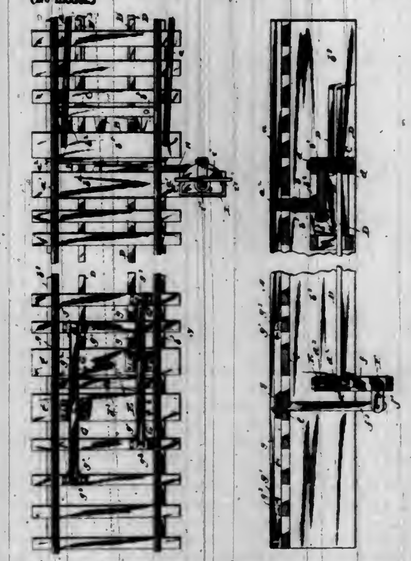
Claim.—1. The improved blacking-holder and rest comprising a base-plate adapted to be fixed in a vertical position and having a blacking-receptacle and a foot rest attached to said base-plate and having a swinging movement in a plane at right angles to the plane of the base-plate, all substantially as described.

2. The improved blacking-holder and rest comprising a base-plate adapted to be fixed in a vertical position and having a blacking-receptacle, a swinging foot-rest connected with the base-plate and having a swinging movement in a plane at right angles to the plane of the base-plate, and the stop that limits the swinging movement of said foot-rest, all substantially as described.

3. In a blacking-holder, in combination, a base-plate adapted to be fixed in a vertical position and having a blacking-receptacle, and a swinging foot-rest connected with the base-plate in such manner that it shall have a swinging movement in two directions in planes at right angles to the plane of the base-plate, all substantially as described.

4. In combination, in a blacking-holder, a base-plate adapted to be fixed in a vertical position and having a blacking-receptacle, an arm connected with said base-plate and having a swinging movement in a plane at right angles to said base plate, the stop that limits the swinging movement of said arm, and the swinging foot-rest having a swinging movement in a plane at right angles to the arm, all substantially as described.

481,266. SEWING-MACHINE. ENOS PATTEN, Lynn, Mass., assignor to the Lynn Lasting Machine Company, same place. Filed Nov. 13, 1891. Serial No. 411,813. (No model.)

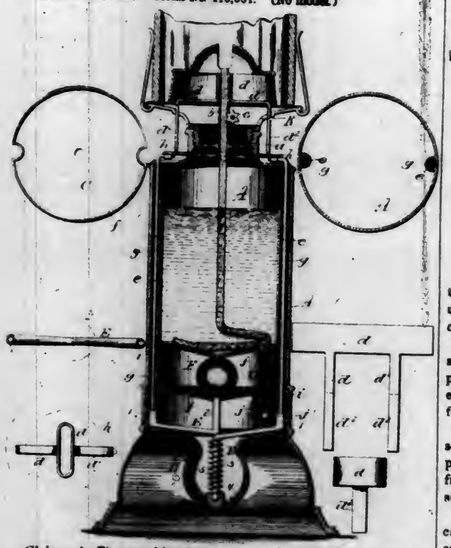


Claim.—1. The combination, with a needle-carrier, of a cast-off operated therefrom and a thread guide or looper operatively connected with the cast-off and actuated therefrom, substantially as described.

2. The combination, with a pivoted needle-carrier and a pivoted cast-off operated from the needle-carrier, of a pivoted thread guide or looper operatively connected with the cast-off and actuated therefrom, substantially as described.

3. The combination, with the pivoted needle carrier and the pivoted cast-off operated therefrom, of the thread guide or looper, a pinion connected therewith, and a rack in engagement with the said pinion and operatively connected with the cast-off, substantially as described.

481,267. RAILWAY-SWITCH. SIVERT PETERSON and AUGUST BALAND, Menominee, Wis. Filed Aug. 26, 1891. Serial No. 403,801. (No model.)



Claim.—1. The herein-described railroad-switch, comprising the switch-rails, the sliding cross head connected thereto, the corresponding locking-arms pivoted to said cross-head, the pivoted head or block having an arm engaging said cross-head, and the operating-bars connected to said head or block, substantially as set forth.

2. The herein-described railroad switch, comprising the switch rails, the sliding cross-head connected thereto, the corresponding locking-arms, the pivoted head or block having an arm engaging said cross-head, the operating bars connected thereto, the pivoted cross-head to which said bars are also connected, the rock-shaft for operating said latter cross-head, and the depressible bars for effecting the rocking of said shaft, substantially as set forth.

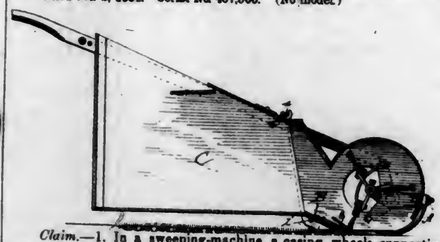
3. The herein-described railroad-switch, comprising the switch-rails, the cross-head connected thereto, the pivoted head or block having an arm engaging said cross-head, the operating-bars connected thereto, the pivoted cross-head to which said bars are also connected, the rock-shaft having an upwardly-projecting arm engaging a stud of said pivoted cross-head and also having opposite lateral arms at its ends, the vertical bars connected to said lateral arms, and the depressible bars for effecting the lowering of said vertical bars, substantially as set forth.

4. The combination, with the switch-rails, of the sliding cross-head connected thereto, the arm having a pivoted bearing or support and engaging said sliding cross-head, the link-bar or pitman connected to said arm, the vertical rod or shaft to the lower end of which said pitman is connected, the stand or frame through which said rod or shaft is extended, the block on said rod or shaft having a hole or opening and an elongated slot corresponding with said shaft, and also having an outer slotted or grooved end, the arm pivoted in said slotted or grooved end, and means for locking said arm, substantially as set forth.

481,268. LAMP-EXTINGUISHER. JOHN B. PRICE, Wollaston, Mass. Filed Nov. 2, 1891. Serial No. 410,681. (No model.)

Claim.—1. The combination, with a lamp, of an extinguisher adapted to embrace the wick-tube, rods extending parallel with the body of the lamp and adapted to engage the extinguisher, a bracket connected with said rod, a spring adapted to normally force said bracket and rods upwardly, and a weight adapted to automatically maintain said rods normally out of contact with the extinguisher against the tension of said spring and automatically release said bracket and rods when the lamp is jarred or overturned and cause the extinguisher to be elevated to extinguish the light, substantially as set forth.

2. The combination, with a wick-tube, an extinguisher embracing this tube, and devices projecting outwardly from this extinguisher, of a ring surrounding a portion of the burner and adapted to move up and draw thereon and located in position to strike these projecting devices when it moves out of its normal position and means for locking the ring, said means being located and arranged to automatically unlock the ring when the lamp is suddenly jarred or tilted out of its perpendicular position, substantially as set forth.



3. The combination, with a lamp and an extinguisher adapted to embrace the wick-tube, of rods adapted to run parallel with the lamp-body and engage said extinguisher, a receptacle having a conical bottom located near the lower end of the body of the lamp and adapted to produce the bottom of the oil-receptacle, a spherical weight within said receptacle, a bracket connected with said rods and having an arm adapted to project through an opening in the conical bottom of the receptacle and be engaged by the weight, a casing at the bottom of the lamp-body, into which one arm of said bracket projects, and a spring encircling said last-mentioned arm and adapted to force the bracket upwardly against the weight, substantially as set forth.

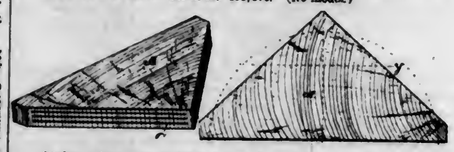
4. The combination, with a lamp and an extinguisher adapted to embrace the wick-tube, of rods adapted to engage said extinguisher, a bracket attached to said rods, a chamber having a conical bottom and adapted to receive one arm of said bracket in the bottom thereof, a spherical weight in said receptacle, a casing removably attached to the bottom of the lamp-body, and a spring in said casing adapted to force the bracket and attached rods upwardly, said spring being of a tension less than the force exerted by the spherical weight, substantially as set forth.

5. The combination, with a lamp and an extinguisher adapted to embrace the wick-tube, of rods adapted to engage the extinguisher, a bracket having arms provided with sockets for the reception of the lower ends of said rods, a sphere for normally holding the bracket in its depressed position, and a yielding device for elevating said rods when the sphere is moved from its normal position, substantially as set forth.

6. The combination, with an extinguisher, rods connected thereto, and a spring or springs for elevating said rods, of a chamber having a sloping bottom and a sphere fitting snugly between the top and bottom walls of said chamber and adapted when in its lowest position to rest on a projection from the rods and hold said rods depressed, substantially as set forth.

481,269. LAWN-SWEEPER. OTIS D. THOMPSON, Elkhart, Ind. Filed Oct. 2, 1891. Serial No. 407,500. (No model.)

Claim.—1. In a sweeping-machine, a casing, wheels supporting the same, a frame pivotally supported, and the brush-shaft supported upon said frame, said frame passing around the front and sides of the casing outside thereof, substantially as described.



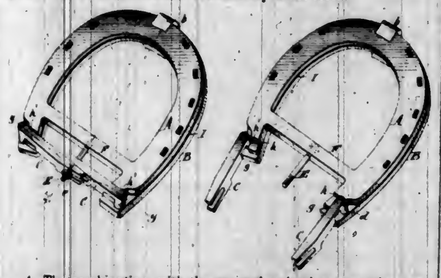
2. In a sweeper, a casing, a pivotally-supported frame passing across the front and around the sides of said casing, a sweeper supported upon said frame, a spring connecting said frame at its front end with the casing, and means for limiting the movement of said frame.

3. In a sweeper, a casing, wheels supporting said casing, castings secured to said casing and providing journals for the wheels, a frame pivoted on said journals, with a brush carried on the arms of said frame, and a cross bar on said frame extending in front of said casing, substantially as described.

4. In combination with a casing, a brush shaft suitably supported, castings secured to each end of the casing, having radial arms, and a central journal and wheels on said journals, substantially as described.

5. A shoe for a sweeper, having fingers made of wire pivoted at their rear ends, with parallel forward extensions and turned-up rear extensions, substantially as described.

481,270. BEDBUG-TRAP. FREDERIK F. BAGGESEN, Brooklyn, N. Y. Filed Oct. 12, 1891. Serial No. 408,476. (No model.)

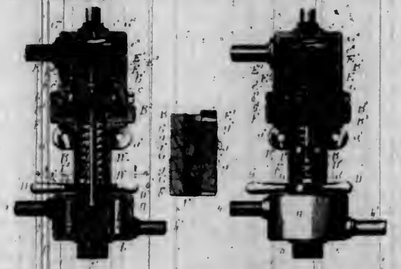


Claim.—As a new article of manufacture, a bedbug-trap consisting of a block of wood triangular, or approximately so, in shape, sawed across the grain and having parallel saw-kerfs therein extending in the same direction, the corners of said block being left uncut.

481,271. HORSESHOE. OSCAR E. BROWN, Buffalo, N. Y. Filed Nov. 14, 1891. Serial No. 411,931. (No model.)

Claim.—1. The combination, with the upper shoe, of the lower shoe provided at its toe portion with a hook interlocking with the adjacent portion of the upper shoe and at its rear end with a lever engaging with the rear end of the upper shoe, and a retaining device for locking the lever in place, whereby the two parts of the shoe are securely fastened together, substantially as set forth.

2. The combination, with the upper shoe, of the lower shoe provided at its toe portion with a hook interlocking with the toe of the upper shoe and at its heel portions with locking-levers which overlap the heels of the upper shoe, and a retaining device whereby the levers are held in their locked position, substantially as set forth.



3. The combination, with the upper shoe provided at its heel with shoulders, of the lower shoe provided at its toe portion with a hook interlocking with the toe of the upper shoe and at its rear portions with locking-levers which overlap the heels of the upper shoe and bear against the shoulders thereof, substantially as set forth.

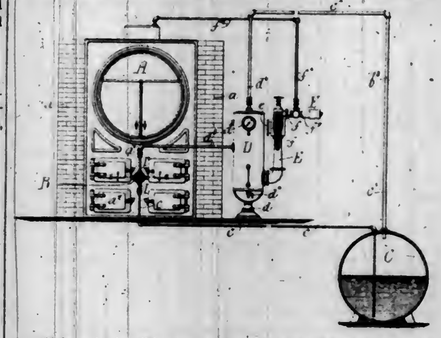
4. The combination, with the upper shoe having a cross-bar connecting its rear portions, of a lower shoe provided with a locking-lever engaging with a heel of the upper shoe, and a retaining-bolt attached to said connecting-bar and having a nut whereby the locking-lever is held upon the bolt, substantially as set forth.

5. The combination, with the upper shoe having its heels provided with shoulders, of the lower shoe provided at its front portion with a hook engaging with the toe of the upper shoe and at its rear portions with locking-levers overlapping the rear portions of the upper shoe and abutting against said shoulders, and a tightening-bolt arranged on the upper shoe and whereby the levers are held in their locked positions, substantially as set forth.

481,272. PRESSURE-REGULATING DEVICE. CHARLES F. A. CONVERT, Chicago, Ill., assignor to the Liquid Carbonic Acid Manufacturing Company, same place. Filed Feb. 18, 1891. Serial No. 381,781. (No model.)

Claim.—1. The combination, with a tubular casing and a stationary tube in the casing, of a piston sliding in the casing and surrounding the tube, said piston having a cylindric recess at its outer or upper end and holes leading from said recess outwardly to the interior of the casing, a packing in said recess opposite the open end of the tube, a screw-plug closing the recess and holding the packing within the same, a spring for actuating the piston, a packing-ring located in said recess of the piston and surrounding the tube, and a second spring located within said recess and bearing against said packing-ring, substantially as described.

2. The combination, with a slotted tubular casing and a stationary tube within the casing, of a piston sliding in the casing and surrounding the tube, said piston being provided with holes extending outwardly from the recess and with a packing located opposite the open end of the tube, a spring for actuating said piston, located within the casing, a follower sliding in the casing and provided with arms extending outwardly through the slots in the same, and a nut having a screw-threaded engagement with the casing and adapted to engage said arms for moving the follower, substantially as described.



3. A regulating-valve comprising a tubular casing, consisting of a cylinder, a tubular frame attached thereto, and a plug closing the end of the tubular frame and screw-threaded on its outer surface, said casing being provided with a longitudinal passage for the liquid or gas and a spring-actuated valve controlling the same, and a hollow annular drum or chamber surrounding the tubular frame and attached to the latter by screw-threaded attachment to the said plug, substantially as described.

4. The combination, with a tubular casing consisting of a cylinder and a tubular frame having screw-threaded connection with the cylinder, of a stationary tube secured within the tubular frame, a piston smaller than the cylinder and surrounding the tube, said cylinder having a packing located opposite the open end of the tube, a plurality of laterally-expansible packing-rings located within and filling the space between the cylinder and piston, and a spring also located in said space and acting upon said packing-rings, substantially as described.

5. The combination, with the tubular casing consisting of a cylinder and a tubular frame, the cylinder being larger than the frame and connected with the same by a screw-joint, of a stationary tube secured within the tubular frame, a piston smaller than the cylinder surrounding the tube, said cylinder having a packing located opposite the open end of the tube, an annular guide for the piston, located in the cylinder in contact with a shoulder on the frame, packing-rings located in the space between the piston and cylinder and in contact with said guide, and a spring also located in said space and acting on the packing-rings, substantially as described.

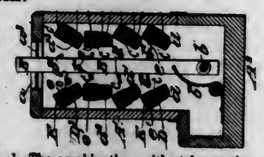
6. The combination, with a casing consisting of a cylinder, a tubular frame attached thereto, and a screw-plug closing the end of the frame, of a tube secured in the plug, a piston in the cylinder surrounding the tube and provided with a packing opposite the open end of the same, a spring within the frame acting on the piston, and a tubular guide rigidly secured in the plug and extending into the frame, substantially as described.

481,273. HYDROCARBON-BURNER AND DEVICE FOR AUTOMATICALLY FEEDING THE SAME. CHARLES F. A. CONVERT, Chicago, Ill., assignor to the Liquid Carbonic Acid Manufacturing Company, same place. Filed June 30, 1891. Serial No. 398,007. (No model.)

Claim.—1. An oil-burner regulating device consisting of an automatically-operated valve communicating at one end with a source of steam or gas supply and communicating at the other end with a suitable reservoir, of suitable pipes connecting said reservoir with the source of fuel-supply and with an oil-burner, and a pipe or pipes connecting said oil-burner with said source of fuel-supply, substantially as specified.

2. In an oil-burning device, the combination of a burner connected with a suitable source of oil-supply, a reservoir connected at one end with an air and steam inlet blower and at its other end with the said burner and the oil-supply tank, a blower for supplying steam and air to the said reservoir, and an automatic regulating device controlling the inlet of steam to said blower, substantially as specified.

3. The combination of the housing provided with an air-inlet and a discharge-nozzle and adapted for rigid attachment to a furnace-front, the steam and air tube H, adjustably secured therein and projecting beyond the outer end of the housing, said tube terminating at its inner end in a flaring discharge-nozzle, an oil-tube H', adjustably secured in tube H and projecting beyond the outer end thereof, and a rod adjustably secured within the oil-tube and having its exposed inner end shaped to receive an adjusting-tool, substantially as described.



4. The combination of the housing provided at its inner end with a discharge-opening and at its outer end with an air-inlet and a tapped hole, the steam and air tube H, threaded between its ends to engage said tapped hole, said tube terminating at its inner end within the housing in a flaring discharge-nozzle and having at its outer end a female thread, the oil-tube H', threaded between its ends to engage the female thread of tube H, and provided at its closed outer end with a threaded socket and a rod threaded at its outer end to engage said

sockets, and provided at its inner end with an enlarged head slotted to receive a screw-driver, substantially as described.

5. In an oil-burning apparatus, the combination of the boiler A and burner B, reservoir D, blower E, regulator F, and oil-supply tank G, the pipe a^3, connecting the burner with the reservoir, the pipes d^3 d, connecting the latter with the tank G, the pipe c, connecting the tank with the burner, the pipe f, connecting the regulator with the boiler, all operating substantially as and for the purpose specified.

6. A device for regulating oil burners, comprising a burner, a supply-tank connected therewith, a reservoir, also connected with said burner, a steam-supply pipe provided with an automatically-regulating valve and leading to a blower having an air-inlet, said blower being connected with said reservoir, and suitable connections whereby the several parts operate, as described, to feed steam and air under pressure to the burner and to feed air under a lesser pressure to the supply-tank, substantially as specified.

481,274. WORKMAN'S CHECKING AND RECORDING APPARATUS. CHARLES P. COTTRELL, Stonington, Conn., assignor to C. B. Cottrell & Sons, Westerly, R. I. Filed Apr. 25, 1892. Serial No. 430,472. (No model.)

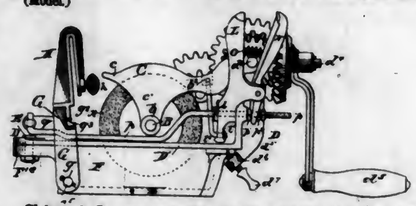
Claim.—1. The combination, with strips or sheets provided with series of characters corresponding to a number of workmen and means for presenting any one of the series at pleasure in a predetermined position, of a series of checking devices corresponding to a series of the characters and under the control of the operator to check one or more of the characters at pleasure, substantially as set forth.

2. The combination, with a plurality of movable supports for sustaining record-receiving strips and means for operating said movable supports, of a series of vibrating levers, each provided with a plurality of impression-making devices and free to move to bring the impression-making devices into engagement with one or another of the record-receiving strips upon the movable supports, substantially as set forth.

3. The combination, with movable supports for sustaining record-receiving strips or sheets and means for operating them, of a series of vibrating levers located between the said supports and provided with record-making devices, said levers being free to swing in opposite directions into engagement with the impression-receiving strips carried by the supports, substantially as set forth.

4. The combination, with movable supports for the impression-receiving material arranged in series and means for operating them, of a series of vibrating levers arranged between two series of supports and provided with impression-making devices, said levers having free swinging movements back and forth into positions to engage the impression-receiving material upon the supports, substantially as set forth.

5. The combination, with swinging supports connected in pairs, means for simultaneously swinging the members of a pair, and means for securing record-receiving sheets or strips to the supports, of vibrating levers provided with impression-making devices and located between the members of the pairs of supports, the said members being free to move toward the opposite members of the pairs, substantially as set forth.



6. In combination, a plurality of series of rocking supports, toggle-lever connections for uniting them in pairs, keys or pedals connected with the toggle-levers for operating the supports in pairs, retracting-springs in connection with the supports, means for securing the material to receive the impression to the supports, record-making devices located between the series of supports, and means for operating the record-making devices, substantially as set forth.

7. In combination, rollers for supporting record-receiving material, means for swinging the rollers bodily toward and away from each other, means for rotating the rollers about their own axes, and vibrating levers carrying impression-making devices and located between the rollers for impressing the material carried by them, substantially as set forth.

8. In combination, supply-rollers for supporting record-receiving material, rollers for receiving the material from the supply-rollers, a rest intermediate of the supply and receiving rollers, over which the material may be drawn, a rocking support, in which one of the supply-rollers and one of the receiving-rollers are mounted and to which the rest is secured, a series of vibrating levers carrying impression-making devices, and means for bringing the rocking supports into position to present the material to be impressed to the action of the impression-making devices, substantially as set forth.

9. The combination, with a pair of supports adapted to hold record-receiving material upon them, of a series of vibrating levers supported to rock back and forth between said supports toward one or the other at pleasure, substantially as set forth.

481,275. MACHINE FOR GRINDING MOWER-KNIVES. RUFUS DUTTON, New York, N. Y. Filed Dec. 16, 1890. Serial No. 374,943. (Model.)

Claim.—1. In a mower-knife-grinding machine, a frame for holding a mower-knife and a frame supporting a grinding-wheel, and the said frames swiveled with respect to each other, so that the grinding-wheel grinds in succession the two opposite beveled edges of the same knife-section, as herein described.

2. In machines for grinding mower-knives, a knife-clamp and its frame, a grinding-wheel and its frame, and the said frames swiveled with respect to each other by a pivot which is placed at the intersection of the perpendiculars drawn from the lines of the two opposite beveled edges of the same knife-section and from points on said lines which are each distant inwardly from the extreme edges of the said knife-section one half the width of the face of the grinding-wheel, as described.

3. In a mower-knife-grinding machine, the combination of a knife-clamp and its frame, a grinding-wheel and its frame, a pivot swiveling the two frames with respect to each other and the said pivot placed in front of the grinding-wheel a greater distance than is the knife-clamp, and stops for restricting the lateral oscillations of the grinding-wheel to such an arc that the grinding-wheel will grind in succession the two opposite beveled edges of the same knife-section, as described.

4. In a mower-knife-grinding-machine, the combination of a knife-clamp and its frame, a grinding-wheel and its frame, a pivot swiveling the said frames with respect to each other and the said pivot placed in front of the grinding-wheel a greater distance than is the knife-clamp, stops for restricting the lateral oscillations of the grinding-wheel to such an arc that the grinding-wheel will grind in succession the two opposite beveled edges of the same knife-section, and means for locking the grinding-wheel frame in any lateral position, as described.

5. In a mower-knife-grinding machine, the combination of a knife-clamp adapted to hold a knife substantially vertical and a knife-clamp frame, a grinding-wheel mounted in a wheel-arm which is hinged parallel to the axis of the grinding-wheel on a wheel-frame, a pivot swiveling the knife-clamp frame and the wheel-frame with respect to each other and placed at a greater distance in front of the grinding-wheel than is the knife-clamp, a lever pivoted on the wheel-frame, and a link connecting an arm of the lever with the wheel-arm at a point between the wheel-arm hinge and the axis of the grinding-wheel, as described.

6. In mower-knife-grinding machines having an oscillating and reciprocating grinding-wheel and a reciprocating knife-clamp, the means organized into a single lever controlled by one hand of the operator for reciprocating and oscillating the grinding-wheel and for reciprocating the knife-clamp, herein described.

7. The combination, in a mower-knife-grinding machine, of a grinding-wheel mounted in a frame, a knife-clamp frame hinged parallel to the axis of the grinding-wheel, a compressible thumb-lever pivoted on the wheel frame, a connecting-rod connecting an arm of the thumb-lever with the knife-clamp frame, and a spring in the thumb-lever adapted to throw the knife-clamp frame away from the face of the grinding-wheel, as described.

8. The combination, in a mower-knife-grinding machine, of a grinding-wheel and its frame, a knife-clamp frame hinged parallel with the axis of the grinding-wheel, a pivot swiveling the said frames with respect to each other, a compressible thumb-lever pivoted on the wheel-frame, a connecting rod having one of its ends pivotally connected with the knife-clamp frame at a point substantially on line with the aforesaid swiveling-pivot and its other end connected with the thumb-lever, and a spring in the thumb-lever adapted to throw the knife-clamp frame away from the grinding-wheel, as described.

9. In mower-knife-grinding machines having hinged and swiveled knife-clamp frames and wheel-frames, the means for reciprocating the knife-clamp frame and for reciprocating and swiveling the wheel-frame herein described, to wit: a hand-lever pivoted on the wheel-frame by a hollow pivot, a compressible thumb-lever pivoted on the hand-lever, a rod passing through the hollow pivot and connecting the thumb-lever with the knife-clamp frame at a point which is substantially in line with the swiveling-point of the wheel-frame, and a spring in the thumb-lever for throwing the knife-clamp frame away from the grinding-wheel, as described.

10. In mower-knife-grinding machines, a vibratory knife-clamp having the frame, the pivotal supports, the guide seat for the knife, and a jaw or jaws, all in one integral piece, as described.

11. In mower-knife-grinding machines, a knife-clamp frame, knife-clamp jaws, a flange across the face of the knife-clamp frame for guiding the upper edge of a knife-back, and brackets on the face of the knife-clamp frame for supporting the lower edge of a knife-back, all formed in one integral piece, as described.

12. In a mower-knife-grinding machine, a knife-clamp and its frame, a grinding-wheel mounted on a reciprocating arm, and a water-trough, and the whole so organized that the grinding-wheel dips into the water in the trough when at rest and is raised above the water in the trough during grinding, as described.

13. In a mower-knife-grinding machine, the grinding-wheel mounted in a frame which is pivoted to oscillate laterally over the front end of a water-trough, and the rear end of said water-trough shaped as an arc of a circle struck from the pivot as a center, and stops on the rear end of a water-trough to limit the oscillations of the wheel-frame, as described.

14. In mower-knife-grinding machines, a grinding-wheel swiveled to oscillate laterally on a pivot near the front end of a water-trough, and the rear end of the water-trough shaped as an arc of a circle struck from the pivot as a center, and adjustable stops on the rear end of the trough to vary the arc through which the wheel-frame oscillates, as described.

15. In mower-knife-grinding machines, the combination of a knife-clamp and its frame, a grinding-wheel and its frame, a pivot swiveling the two frames with respect to each other, and means for varying the distance between the pivot and the face of the grinding-wheel, as described.

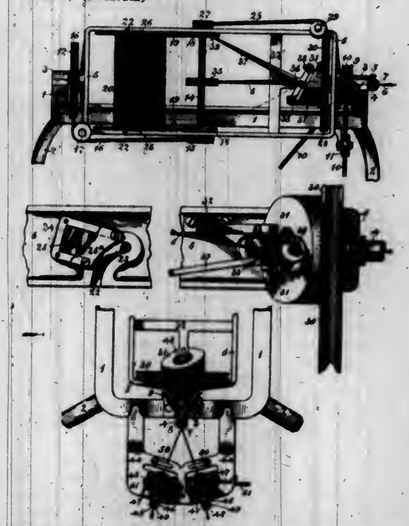
16. In mower-knife-grinding machines, a knife-clamp mounted on a frame which is hinged to a base, a grinding-wheel mounted in a wheel frame on an axis parallel to knife-clamp-frame hinge, and the wheel-frame swiveled on the base by a shiftable pivot, a slot in which the pivot plays, formed in the base perpendicular to the axis of the wheel, and means for locking the pivot in the slot, as described.

17. In mower-knife-grinding machines having a grinding-wheel frame and a knife-clamp frame swiveled with respect to each other, a shiftable swiveling-pivot consisting of a swiveling-bolt passed with a working fit through the head of an eyebolt, the said eyebolt threading in the grinding-wheel frame and the said swiveling-bolt passing through a slot in the base of a machine, a pinion with a working fit on the swiveling-bolt and meshing with a rack on the base of the machine, and a lock-nut on the swiveling-bolt to lock the pinion, as described.

481,276. TUBULAR LANTERN. JOHN S. GALL, Rochester, N. Y., assignor to the Steam Gauge and Lantern Company, same place, and The R. E. Dietz Company, New York, N. Y. Filed Oct. 5, 1888. Serial No. 287,841. (No model.)

Claim.—1. The combination, with the lantern-frame provided with a depending central tube, of a vertically-movable globe-frame provided with a bell which slides on said central tube, an eye secured to said bell, and a lifting-lever pivoted to the lantern-frame near one side thereof and passing through the eye of the bell to the opposite side of the lantern-frame, substantially as set forth.

2. The combination, with the lantern-frame provided with a depending central tube and the vertically-movable globe-frame provided with a bell which slides on said tube, of a lifting-lever pivoted to the lantern-frame at one side thereof and extending across the lantern-frame to the opposite side and connected between its fulcrum and its free end with the upper portion of the globe-frame and an upright catch secured to the lantern-frame adjacent to the free end of the lifting-lever and provided with an upper and a lower stop, with either of which the lifting-lever can be engaged, substantially as set forth.



481,277. GRASS-RECEIVER FOR LAWN-MOWERS. FRANCIS L. GOLBRANT, Indianapolis, Ind. Filed May 7, 1892. Serial No. 432,114. (No model.)

Claim.—1. In a grass-receiver for lawn-mowers, brackets secured to the forward ends of the sides of such receiver by screw-bolts and a slot in each of such brackets through which one of such screw-bolts works, the forward ends of such brackets divided into two flanges which are adapted to fit over the arms of a lawn-mower handle, the lower ends of such flanges to be clamped together by a suitable screw-bolt, whereby such receiver may be attached to different kinds of lawn-mowers, substantially as shown and described.

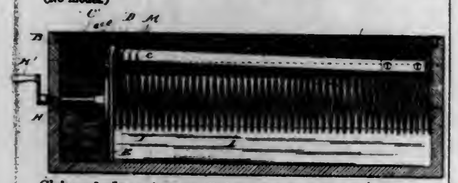
2. A grass-receiver for lawn-mowers, consisting of a bottom piece, two side wings connected thereto, a removable cross-piece connecting the rear of such side wings, such cross-piece centrally attached by a bolt to the handle of the lawn-mower, brackets secured to the forward ends of such side wings by screw-bolts, and a slot on each of such brackets through which one of such screw-bolts works, the other ends of such brackets provided with two flanges adapted to fit over the arms of the lawn-mower handle and to be clamped to the same by screw-bolts, substantially as shown and described.

481,278. SPINNING-MACHINE. WILLIAM S. HUNTER, Belleville, and WALTER H. AVIS, Toronto, Canada. Filed Dec. 30, 1890. Serial No. 376,296. (No model.)

Claim.—1. In a twine-spinning machine, the combination of the fixed main frame having a flier-frame journaled to revolve therein, the hollow axis in one of the trunnions being provided with a tubing device, as described, the pulley fixed on the hollow trunnion as a means by which the flier-frame is revolved, the fixed pulley at the other end of the flier-frame and secured to the main frame, the belt passing over said fixed pulley on the main frame and over a pulley on a transverse shaft carried near the center of the flier-frame, the transverse shaft belted to said fixed pulley, and the friction-wheels carried on said transverse shaft to revolve the bobbin-spool, substantially as shown and described.

2. In a twine-spinning machine, the combination of the fixed main frame having a flier-frame journaled to revolve therein, the hollow axis of one of the trunnions being provided with a tubing device, as described, the pulley fixed on the hollow trunnion as a means by which the flier-frame is revolved, the fixed pulley at the other end of the flier-frame and secured to the main frame, the belt passing over said fixed

pulley on the main frame and over a pulley on a transverse shaft, the transverse shaft belted to said fixed pulley, the friction-wheels carried on said transverse shaft to revolve the bobbin-spool, and the grooved wheel on the center of the transverse shaft to draw the twine, substantially as shown and described.



3. In a twine-spinning machine, the combination of the fixed main frame having a flier-frame journaled to revolve therein, the hollow axis in one of the trunnions being provided with a tubing device, as described, the pulley fixed on the hollow trunnion as a means by which the flier-frame is revolved, the fixed pulley at the other end of the flier-frame and secured to the main frame, the belt passing over said fixed pulley on the main frame and over a pulley on a transverse shaft, the transverse shaft belted to said fixed pulley, the friction-wheels carried on said transverse shaft to revolve the bobbin-spool, the grooved wheel on the center of the transverse shaft to draw the twine, the pulley on the opposite end of the transverse shaft, the belt passing over said pulley and a pulley having a cam thereon, the pulley having a cam on its side, said cam on said pulley to operate a laying-arm, and the laying-arm supported in the flier-frame and vibrated by said cam on the pulley, substantially as shown and described.

4. In a twine-spinning machine, the removable platform on the front of the main frame, having a number of hollow axes journaled to revolve therein, each provided with a tubing, a pulley on each hollow axis, by which it is revolved, and a nipper-spring on the platform in the rear of each axis to maintain the twist imparted by said axis, substantially as shown and described.

481,279. COMPOSITION OF MATTER FOR THE MANUFACTURE OF ARTIFICIAL STONE. JOSEPH E. KESSLING and CHARLES FUCHS, Jr., New York, N. Y., assignors to the Pyrolith Company, of New Jersey. Filed May 2, 1892. Serial No. 431,474. (No specimens.)

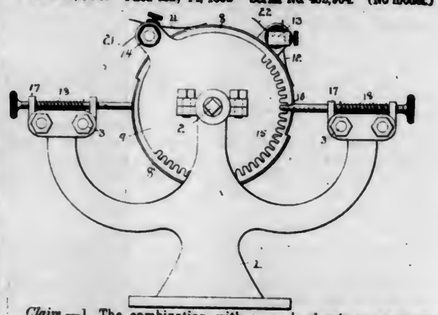
Claim.—A composition of matter for artificial stone, consisting of a basic cement of oxide and neutral chloride of magnesium, sand, or analogous material, asphaltum, and a solution of albumen.

481,280. COIN-CONTROLLED VENDING APPARATUS. ALEXANDER S. KIDBY, Chicago, Ill. Filed May 7, 1892. Serial No. 432,154. (No model.)

Claim.—1. In a coin-controlled vending-machine, the combination of the box A, having the slots D and L' and the partition E, with a spiral carrier and ejector secured at one end to the rear end of the box and its other end secured to the shaft H, by which it is adapted to be rotated, the shaft H, having the handle H', the disk G, mounted on the said shaft, having the annular flange b and the lugs b' b^3, and the bolt c, adapted to engage the disk G and to be disengaged therefrom by a coin, substantially as described.

2. In a coin-controlled vending-machine, the combination of the box A, having the slots D and L', with the partition E, having the lugs c', c^3, c^4, and c^5, a spiral carrier and ejector, the shaft H, having the handle H', the disk G, mounted on the said shaft and having the cam H^3, annular flange b, the lugs b' b^3, and recessed or cut-away portion g g', the plate c^6, secured over the lugs c' c^3, the spring-actuated bolt c, adapted to operate between the lugs c^3 and c^4 and to engage the disk G and to be disengaged therefrom by a coin, and the lever K, pivotally secured at one end and having at its other end the spring k, all constructed, arranged, and operating substantially as and for the purpose set forth.

3. In a coin-controlled vending-machine, the combination of the box A, having the slots D and L', with the partition E, having the lugs c', c^3, c^4, and c^5, the spiral spring carrier and ejector I, the shaft H, having the handle H', the disk G, mounted on said shaft and having the annular flange b, the lugs b' b^3 and recessed portion g g', the plate c^6, secured over the lugs c', c^3, and c^4, and the spring-actuated bolt c, adapted to operate between the lugs c^3 and c^4 and to engage the disk G and to be disengaged therefrom by a coin, substantially as described.



4. In a coin-controlled vending-machine, the combination of the box A, having the glass top C and slots D and L', with the partition E, having the enlargement e, lugs c', c^3, and c^4, the spiral spring carrier and ejector I, having the disk or plate I', the shaft H, having the handle H', the disk G, mounted on said shaft and having the annular flange b, the lugs b' b^3, having the bevels b^2 and b^4, respectively, and recessed portion g g', the plate c^6, secured over the lugs c', c^3, and c^4, and the spring-actuated bolt c, adapted to operate between the lugs c^3 and c^4 and to engage the disk G and to be disengaged therefrom by a coin, substantially as described.

5. In a coin-controlled vending-machine, the combination of the box A, having a hinged lid B, glass cover C, and slots D and L', with the partition E, having the enlargement e, lugs c', c^3, c^4, and c^5, a spiral carrier and ejector, the shaft H, having the handle H', the disk G, mounted on said shaft and having the cam H^3, annular flange b, the lugs b' b^3, having the bevels b^2 and b^4, respectively, and recessed portion g g', the plate c^6, secured over the lugs c', c^3, and c^4, the spring-actuated bolt c, adapted to operate between the lugs c^3 and c^4 and to engage the disk G and to be disengaged therefrom by a coin, and the lever K, fulcrumed at one end to the partition and having at its other end the spring k to press it against the cam H^3, all constructed, arranged, and operating substantially as and for the purpose set forth.

6. In a coin-controlled vending-machine, the combination of the box A, having the slots D and L', with the partition E, having the lugs c', c^3, c^4, and c^5, the spiral spring carrier and ejector I, the shaft H, having the handle H', the disk G, mounted on said shaft and having the cam H^3, lugs b' b^3, and recessed portion g g', the bolt c, adapted to operate between the lugs c^3 and c^4 and to engage the disk G and to be disengaged therefrom by a coin, and the lever K, fulcrumed at one end to the partition E and having at its other end the spring k to press it against the cam H^3, all constructed, arranged, and operating substantially as set forth.

7. In a coin-controlled vending-machine, the combination of the box A, having the slots D and L', the piece m, and adjustable guide N, with the partition E, having the enlargement e, lugs c', c^3, c^4, and c^5, the spiral spring carrier and ejector I, the shaft H, having the handle H', the disk G, mounted on said shaft and having the annular flange b, the lugs b' and b^3, having the recessed portion g and g', the plate c^6, secured over the lugs c' c^3 c^4, and the spring-actuated bolt c, adapted to operate between the lugs c^3 and c^4 and to engage the disk G and to be disengaged therefrom by a coin, substantially as described.

481,281. CIRCUIT-CHANGING APPARATUS. ALMON D. PAGE, Newark, N. J. Filed May 14, 1892. Serial No. 432,964. (No model.)

Claim.—1. The combination, with a supply-circuit or source of electric current, of translating devices the circuit of which is to be changed periodically, and a circuit-changer having contact devices the distance between which can be varied at will, a body having a conducting-section against which said contact devices are adapted to bear, and means for producing relative motion between said contact devices and said body, whereby the circuit can be changed and the frequency of the changes can be varied, substantially as described.

2. A circuit-changing apparatus having, in combination, contact devices the distance between which can be varied at will, a body having a conducting-section against which said contact devices are adapted to bear simultaneously, and means for producing relative motion between said contact devices and body, substantially as described

3. A circuit-changing apparatus having, in combination, contact devices carried by adjustable disks or plates, whereby the distance between the contact devices can be varied at will, a disk or body having conducting-sections against which said contact devices are adapted to bear, and means for moving said body, substantially as described.

4. The combination, in a circuit-changing apparatus, of a rotatable body on which is a conducting-section, and contact devices, each bearing or adapted to bear thereon, such contact devices being adjustable toward and from each other, whereby the duration of closure of the circuit may be varied, substantially as described.

5. The combination, in a circuit-changing apparatus, of a body having one or more conducting-sections, contact devices bearing or adapted to bear thereon, said contact devices being adjustable with relation to each other to vary the intervals at which the changes are made, and means for moving the body relatively to the contact devices, substantially as described.

6. The combination, in a circuit-changing apparatus, of a disk on the periphery of which are one or more conducting-sections, means for rotating said disk, contact devices bearing or adapted to bear on the conducting section or sections, said contact devices or either of them being carried on a disk or plate loosely mounted on the axis of the first-mentioned disk and having a stop or detent-pawl for holding it in the position to which it is adjusted, whereby the distance between the contact devices can be adjusted and maintained, and thereby the duration of closure of the circuit varied at will, substantially as described.

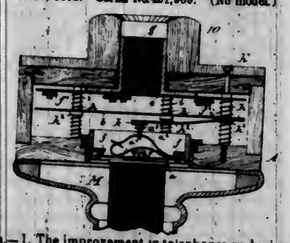
7. The combination, in a circuit-changing apparatus, of a stepped disk having two conducting-sections, each substantially one hundred and eighty degrees in extent, a rotatable shaft on which said disk is fixed, contact devices bearing or adapted to bear on said sections, and means for varying the distance between said contact devices, substantially as described.

8. The combination, in a circuit changing apparatus, of a rotatable shaft, several disks secured thereto and carrying conducting-sections, and contact devices adapted to bear on said sections at each disk, the distance between the contact devices at the several disks being independently adjustable, substantially as described.

9. The combination, in a circuit-changing apparatus, of standards, a rotatable shaft supported thereby, a circuit-changer having a disk with conducting-sections on the shaft and an adjustable contact device, rods supported by said standards, a yoke on said rods, and a detent-pawl for securing the adjustable contact device in the position in which it is set, mounted in said yoke, substantially as described.

481,282. ART OF PAINTING WITH DISTEMPER AND OTHER COLORS. ALFONS PERELA, Stuttgart, Germany. Filed Nov. 14, 1891. Renewed July 5, 1892. Serial No. 439,419. (No specimens.)

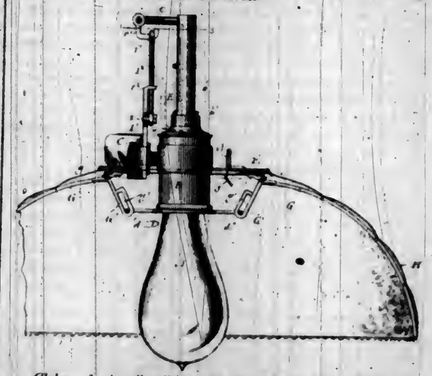
Claim.—The improvement in the art of painting in distemper and majolica colors, which consists in laying on colors ground with a mixture of glycerine, honey, and palm-oil and thinned with a solution of a gelatinous body in water and acetic acid, and finally covering the painting after the above-mentioned colors are dry with pure gum-colors dissolved in a mixture of copaiba balsam, essence of lavender, mastic, and Damarra gum, substantially as set forth.



481,283. GUIDE FOR UMBRELLA RIBS AND STRETCHERS. HERMAN G. PRAETORIUS, Dayton, Ohio. Filed Feb. 1, 1892. Serial No. 419,907. (No model.)

Claim.—1. The combination of the paragon stretcher F, the runner C, and the guide G, comprising the ears 4 and embracing parts 1 and 3 and the binding-wire 9, substantially as set forth.

2. The combination of the paragon rib D, the top notch B, and guide H, comprising the ears 7, the embracing parts 8 and 5, and binding-wire 9, substantially as set forth.

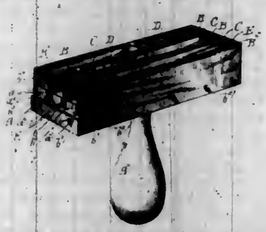


481,284. TELEPHONE. ADOLF RETTIG, Saarbrücken, Germany. Filed Feb 17, 1892. Serial No. 421,909. (No model.)

Claim.—1. The improvement in telephones and microphones, consisting in the combination, with a wooden case or head, of a plurality of diaphragms of different area, lever and spring devices connecting the said diaphragms with each other, and screw-studs and spiral springs thereon connecting the said diaphragms with each other and with the wooden case, substantially as and for the purpose herein set forth.

2. The construction of the wooden head of a telephone or microphone transmitter with the grain of the wood running across the back, substantially as and for the purpose herein specified.

481,285. SHADE FOR INCANDESCENT ELECTRIC LAMPS. CHARLES J. SALICK and EDWARD SIPP, Watertown, Wis. Filed Apr. 10, 1891. Serial No. 388,406. (No model.)



Claim.—1. A collapsible shade for incandescent electric lamps, comprising a stationary ring adapted for engagement with the lower end of the lamp-socket, a movable ring located around the outside of said lamp-socket, a yoke or frame extending upwardly from said latter ring and having a sliding engagement with a stationary bracket, a plurality of arms or bows pivotally engaged with the under side of said movable ring, extensions upon the inner ends of said arms or bows engaging the outer periphery of said stationary ring, and means for raising and lowering said movable ring, substantially as and for the purpose described.

2. A collapsible shade for incandescent electric lamps, comprising a stationary ring adapted to engage the lower end of the lamp socket, a movable ring located outside of said socket, a plurality of arms or bows pivotally engaged with the said movable ring and provided with slotted extensions upon their inner ends, said slotted inner ends having engagement with the outer periphery of said stationary ring, a movable yoke or frame for supporting said movable ring, a clip adapted to engage the lamp key or lever, and connections between said movable frame or yoke for giving a vertical movement to said frame by the rotary movement of said key, substantially as set forth.

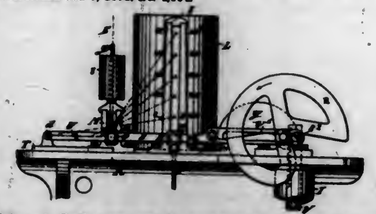
3. The herein-described improvement in shades for incandescent electric lamps, comprising a stationary ring adapted to be secured upon the lower end of the lamp-socket, a vertically-adjustable ring supported upon arms or brackets upon said lamp-socket, a plurality of arms or bows pivotally secured to the under side of said adjustable ring, slotted extensions upon the inner ends of said pivoted arms operatively engaged with the said stationary ring, and springs upon the inner periphery of said adjustable ring adapted to engage the outer margin of said stationary ring when said adjustable ring is partially lowered, substantially as and for the purposes described.

481,286. TYPE-HOLDER. LOUIS K. SCOTFORD, Chicago, Ill. Filed June 10, 1891. Serial No. 395,776. (No model.)

Claim.—1. A holder for rubber type, comprising a block or support provided with one or more type-grooves the side walls of which are composed of doubled or folded sheets of metal, said grooves being made wider at their inner than at their outer parts by the converging of said folded or doubled side walls, substantially as described.

2. A holder for rubber type, comprising a block provided with grooves and strips of metal doubled or folded and having their edges inserted and secured in said grooves in the block, substantially as described.

3. A holder for rubber type, comprising a block or support with dovetail grooves and metal strips doubled or folded and having out-



wardly flaring or flanged margins engaging said dovetail grooves, substantially as described.

4. A holder for rubber type, comprising a block or support and metal strips doubled or folded and secured to said block to form type-grooves, those strips which are adjacent to the side edges of the block being extended over said side edges and secured to the latter, substantially as described.

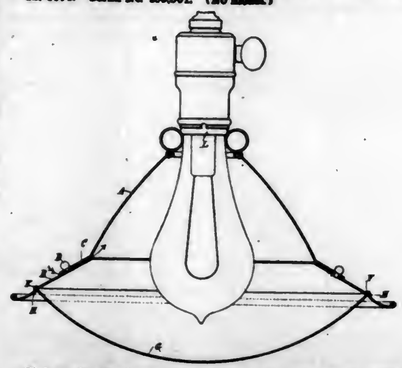
5. A holder for rubber type, comprising a block or support and doubled or folded sheet-metal strips attached to the block to form type-grooves, those strips adjacent to the side edges of the block being extended over and secured to the same and the said block being provided with grooves between its side edges into which the intermediate metal strips are inserted, substantially as described.

6. A holder for rubber type, comprising a block having intermediate and marginal grooves and sheet-metal strips doubled or folded and secured to the block to form type-grooves, the external strips adjacent to the side edges of the block being extended over and secured to the latter and having their inner edges engaged with said grooves and the intermediate strips having their free edges engaged and held within the intermediate grooves, substantially as described.

481,287. APPARATUS FOR RECORDING AND REGISTERING QUANTITIES OF STEAM, &c. FRANZ SEILER, Mannheim, Germany. Filed Mar. 30, 1892. Serial No. 427,043. (No model.) Patented in Switzerland Oct. 9, 1891. No. 4,184.

Claim.—1. In an apparatus for measuring the quantity of steam passing through a conduit in a given time, the combination, with a valve in the conduit through which the steam to be measured passes, of a swinging and lateral-movable lever connected with said valve, a marker on said lever, a movable sheet on which the lever can trace marks, a steam-pressure indicator, and means for shifting the pivotal support of the above-mentioned lever carrying the marker from said pressure-indicator, substantially as set forth.

2. In an apparatus for measuring the quantity of steam passing through a conduit in a given time, the combination, with a valve in the conduit through which the steam to be measured passes, of a reciprocating support, a lever pivoted to said reciprocating support and carrying a marker, means for raising or lowering said lever from the valve in the above-mentioned conduit, a rod connected with said reciprocating support, cams acting on said rod, and a steam-pressure indicator actuating said cams, substantially as set forth.



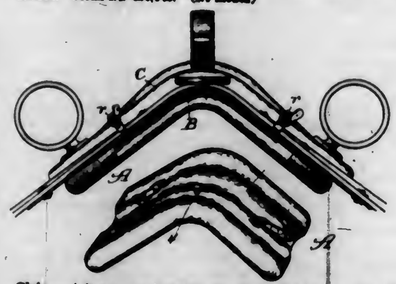
3. In an apparatus for measuring the quantity of steam passing through a conduit in a given time, the combination, with a valve in the conduit through which the steam to be measured passes, of a sliding support, a lever pivoted on said sliding support and operated from the valve, a marker on said lever, a sheet upon which the marker can trace the lines, a reciprocating rod connected with the movable support for said lever, two opposite cams acting on said rod, a pinion on the shaft of said cams, a rack engaging said pinion, and a steam-pressure indicator for actuating said rack, substantially as set forth.

4. In an apparatus for measuring the quantity of steam passing through a conduit in a given time, the combination, with a valve in the conduit through which the steam to be measured passes, a reciprocating support, a lever pivoted to said support, means for raising and lowering said lever from the above-mentioned valve, a steam-pressure indicator, and means on the same for reciprocating the support, a marker on said lever, and adding mechanism connected with and operated from said marker, substantially as set forth.

5. In an apparatus for measuring the quantity of steam passing through a conduit in a given time, the combination, with a valve in the conduit, through which the steam to be measured passes, of a swinging and sliding lever, a marker on said lever, a sliding carriage connected with said swinging and sliding lever, a counting mechanism on said carriage, a wheel for operating said counting mechanism, a disk in contact with said wheel for operating the counting mechanism, and means for rotating said disk, substantially as set forth.

6. In an apparatus for measuring the quantity of steam passing through a conduit at a given time, the combination, with a sliding support, a swinging lever pivoted on the same, which lever carries a marker, a sheet on which the marker can act, a rod connected with the sliding support, cams acting on said rod, a steam-pressure indicator for operating the cams, and means controlled by the steam to be measured for moving said swinging lever that carries the marker up or down, substantially as set forth.

481,288. REFLECTING-SHADE FOR INCANDESCENT ELECTRIC LAMPS. LOUIS T. STANLEY, Brooklyn, N. Y., assignor to the Cutter Electrical and Manufacturing Company, Philadelphia, Pa. Filed Oct 22, 1891. Serial No. 409,561. (No model.)

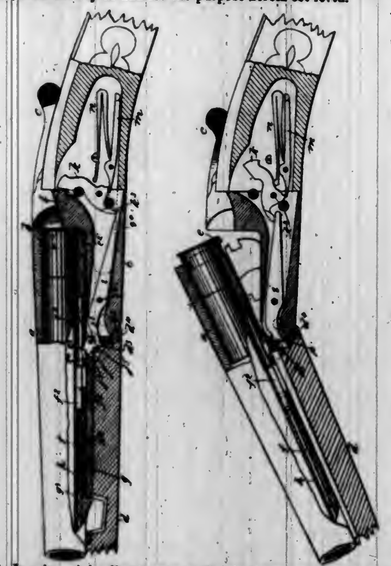


Claim.—1. A reflecting-shade for incandescent lamps, consisting in the combination of a parabolic reflecting portion provided with a contracted opening for the reception of the lamp neck or socket and of such depth as to permit the incandescent conductor or light-giving portion of a lamp when in position in the shade to extend or project out beyond the edge of the said parabolic portion, a conical or outwardly-flaring rim or portion extending from the parabolic part below the incandescent conductor, whereby both portions will receive directly the lateral rays of light, and a diffusing or translucent plate covering the open end of the shade, as set forth.

2. The combination, with a reflecting-shade for incandescent lamps having a contracted opening for the passage of the lamp neck or socket, of three spiral springs around the opening and above or outside the shade and having their ends secured or connected to the shade at points around the edge of the opening, as set forth.

3. The combination, with the parabolic reflecting-shade A, having a flange C, of an annular reflecting-apron B, secured to said flange, with an intermediate air-space, and a diffusion-glass closing the lower opening of the shade, as set forth.

481,289. HARNESS-PAD. WILLIAM D. UNDERWOOD, Chicago, Ill., assignor of two-fifths to William H. Partridge, same place. Filed Feb. 2, 1892. Serial No. 420,048. (No model.)



Claim.—A harness-pad comprising an inflated sack A of flexible material substantially impervious to air, conforming at its under surface to the shape of the animal's back and presenting an unobstructed chamber, a layer B of stiffening material on the upper inner surface of the sack, the layer and upper surface of the sack being formed with a permanent depression *s*, extending entirely across the pad to receive the superimposed harness, and means upon the pad for holding the harness in the said depressed portion comprising straps r, secured to the stiffening layer, substantially as described.

481,290. BREAKDOWN GUN. THOMAS WOODWARD, Derby, England. Filed Sept. 19, 1891. Serial No. 406,923. (No model.) Patented in England Mar. 26, 1889, No. 5,159.

Claim.—1. In a breech-loading firearm of the class mentioned, the combination, with an ejector-rod c^4, constructed with a shoulder c^5, of a sear *j*, constructed with a shoulder j^3, and a fixed removable stop *p*, arranged to withdraw shoulder j^3 of the sear from shoulder c^5 of the ejector-rod to release the latter for the sudden ejectment of the cartridge shells, and capable of detachment to permit, as an alternative, the limited extraction of said shells when desired, all substantially as and for the purpose herein set forth.

2. In a breech-loading firearm of the class mentioned, the combination, with an ejector-rod c^4, constructed with a shoulder c^5, of a sear *j*, constructed with a shoulder j^3, and a fixed stop *p*, arranged to withdraw shoulder j^3 of the sear from shoulder c^5 of the ejector, and adjustable to insure the movement of the ejector to a predetermined degree, substantially as and for the purpose herein set forth.

3. In a breech-loading firearm of the class mentioned, the combination, with an ejector-rod c^4, constructed with a shoulder c^5, of a sear *j*, constructed with a shoulder j^3, and a fixed stop *p*, constructed and arranged to be adjusted with reference to and removed from the ejector mechanism, all substantially as and for the purpose herein set forth.

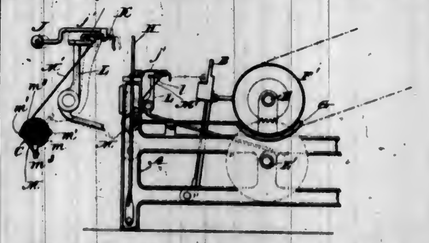
4. In a breech-loading firearm of the class mentioned, the combination, with an ejector-rod c^4, constructed with a shoulder c^5, and a sear *j*, constructed with a shoulder j^3, of an incased ejector-striker *f*, substantially as and for the purpose herein set forth.

5. In a breech-loading firearm of the class mentioned, the combination, with the hammer mechanism, of an ejector-rod c^4, constructed with shoulder c^5, of the sear *j*, constructed with the shoulder j^3, the parts being constructed and arranged to cause the shoulder j^3 to act upon the shoulder c^5 only after the hammer has been raised or raised and lowered, substantially as and for the purpose herein set forth.

6. In a breech-loading firearm of the class mentioned, the combination of a sear *j*, constructed with a horn j^2 and a shoulder j^3, a lever *i*, a hammer K, having a lip or edge K^2, an ejector-rod c^4, having a shoulder c^5, and the pivoted levers c^6, the whole constructed and arranged to enable the lever to engage with the horn j^2 to bring shoulder j^3 into position to engage shoulder c^5 when the ejector-rod is pushed rearward by the pivoted levers, all substantially as and for the purpose herein set forth.

7. In a breech-loading firearm of the class mentioned, a hammer having a lip or ledge K^2, an ejector-rod c^4, constructed with shoulder c^5, and a sear *j*, constructed with the horn j^2 and shoulder j^3, arranged to cause the shoulder j^3 to act upon the shoulder c^5 only after the hammer has been raised or raised and lowered, in combination with a lever *i* and pivoted levers c^6, arranged to enable said lever *i* to engage with the horn j^2 to bring the shoulder j^3 into position to engage shoulder c^5 when the ejector-rod is pushed rearward by the pivoted levers, all substantially as and for the purpose herein set forth.

481,291. ELECTRIC WATER-HEATER. THOMAS AHEARN, Ottawa, Canada. Filed Apr. 9, 1892. Serial No. 428,425. (No model.)



Claim.—1. In an electric water-heater, the combination of an insulated open water-tight vessel A, a coil of refractory wire or strip C, of low electric conductivity, having its terminals connected by leads passing through insulators, a containing vessel D, lined internally with a layer of non-heat-conducting material and large enough to form an annular space around said inner vessel and affording space for a thick layer of non-conducting material at the bottom, a covering G on the annular space containing insulators to pass the leads of the circuit, a removable hollow cover H, a draw-off pipe I, with faucet, and a filling of powdered whiting, fire-clay, or other refractory material in the space between the inner and outer vessel and in the cover, substantially as set forth.

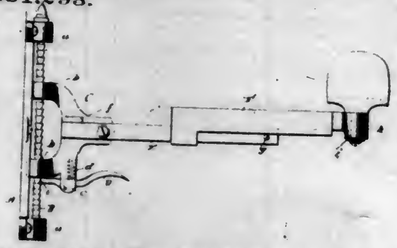
2. In an electric water-heater, the combination of an open water-tight vessel A, insulating-strips B, laid upon the exterior of said vessel, a coil C, wound upon said insulating-strips and connected with a circuit, a hollow cover H, filled with non-conductors of heat and provided with an opening *h'*, a water-tight vessel H', connected to the bottom of said cover and smaller than the vessel A, a draw-off pipe I, secured in the bottom of the vessel A and provided with faucet, a branch I' on said pipe, and a gage-glass I", secured to said branch, substantially as set forth.

481,292. STOP-MOTION FOR LOOMS. WILLIAM M. AIKLEY, Lenni Mills, Pa. Filed Oct. 15, 1891. Serial No. 408,755. (No model.)

Brief.—The weft-fork is connected to the take-up roller by a cord, so that when a certain amount of cloth has been woven—that is, sufficient to nearly exhaust the shuttle—the weft-fork is held down in the path of the vibrator-lever and the loom stopped, whereby a new shuttle can be substituted for the nearly exhausted one, to thereby overcome the defects in the fabric incident to connecting the ends of wefts in the fabric body.

Claim.—1. In a loom, the combination, with the weft-fork lever and its supporting parts, the vibrating lever and its shouldered head-piece, the shipping-lever, and the connections intermediate the same and the driving mechanism, of a revoluble shaft and a flexible connection between said shaft and the weft-fork lever, substantially as described.

2. In a loom, the combination, with the driving mechanism, weft-fork lever and its supporting parts, the vibrating lever and its shouldered head-piece, the shipping-lever, and the connections intermediate the same and the driving mechanism, of the take-up roller and its shaft, the yoke mounted thereon, the strap connecting the ends of said yoke, and the cord or flexible connection between said yoke and the weft-fork lever, substantially as described.

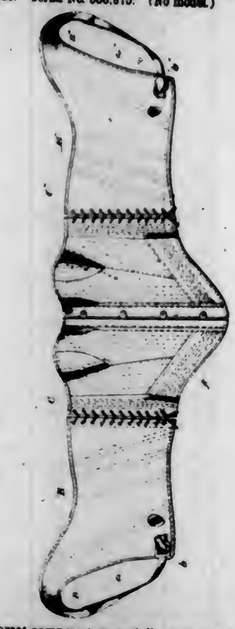


3. In a loom, the combination, with the weft-fork and its supporting and operating devices, the shipping-lever, and the connections intermediate the same and the driving mechanism, of a revoluble shaft and a flexible connection between said shaft and the weft-fork, substantially as described.

481,298. ARM-REST FOR TELEPHONES. JOSEPH R. BAILEY and LEVI C. LINCOLN, Woonsocket, R. I., assignors to the Woonsocket Edge Tool Company, same place. Filed Jan. 26, 1892. Serial No. 419,149. (No model.)

Claim.—1. In an arm-support for telephone-operators, the combination, with the shouldered rod, of a vertically-movable bracket journaled thereon and carrying a ratchet-lever adapted to engage the shoulders of the rod and a suitable rest secured to the bracket, substantially as specified.

2. In an arm-rest for telephone-operators, the combination, with a fixed rod having shoulders, each of which is of a circular form in

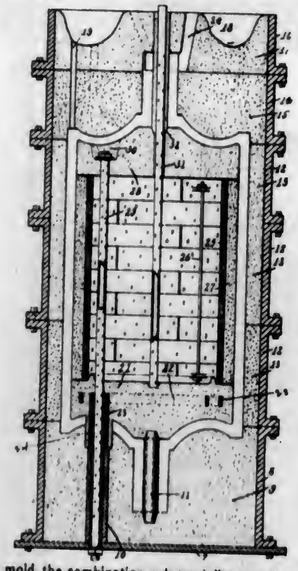


481,293.

cross-section and is tapered externally from its top down to the top of the next succeeding shoulder below, of a bracket journaled on the said rod, a spring-pressed ratchet-lever carried by the bracket and having the inner beveled end *e* adapted to engage the shoulders of the rod, and a suitable rest secured to the bracket, substantially as and for the purpose set forth.

3. The improved arm-rest for telephone-operators, consisting, essentially, of the plate having the vertically-disposed lug-eyes at opposite ends, the shouldered rod bearing in said eyes, the bracket journaled on said rod and having a stop, as described, the ratchet-lever journaled in the bracket and the spring bearing upon said lever, the bar pivoted to the bracket and adapted to engage the stop at one end, the extensible bar arranged to slide on said pivoted bar, and the arm-rest or socket journaled at the outer end of the extensible bar, substantially as specified.

481,294. CORSET. WILLIAM P. BIGELOW, Natick, Mass. Filed May 31, 1890. Serial No. 353,875. (No model.)

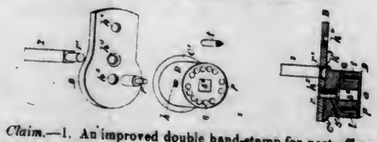


Claim.—A corset composed, essentially, of two front portions and a brace adjustably connected at its inner end to the under-arm side edge of each front portion and provided at its outer or free end with an arm-size, each brace being of sufficient length to extend from one side edge across the back from the waist to the shoulder line, in order that its attached arm size may be entered by the arm at the opposite side of the body, whereby entire freedom is given the waist, and the front portions are normally drawn up, substantially as described.

481,295. MOLD FOR CLOSED CYLINDERS. FRANK X. BLACK, Hamilton, Ohio, assignor to the Black & Clawson Company, same place. Filed Mar. 22, 1892. Serial No. 425,945. (No model.)

Claim.—1. In a mold, the combination, substantially as set forth, of a base-plate, a drag thereon containing vertical tubes standing on the base-plate, a core having core-bosses, a spider in said core, having bosses projecting through said core-bosses into contact with the upper ends of said tubes, and tube-bolts anchored in said core and passing through said spider-bosses and tubes and base-plate and clamping the core to the base-plate.

2. In a mold, the combination, substantially as set forth, of a disk-like core-base, a disk-like core-top section, an annular shell-like core-body section, and an annular series of bolts uniting the three core-sections and clamping the annular section endwise between the base and top sections.

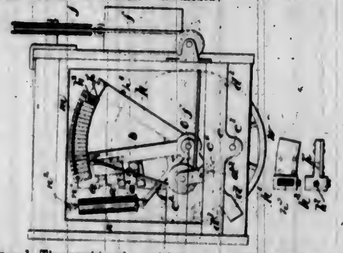


3. In a mold, the combination, substantially as set forth, of a sectional metallic core-barrel, an annular body-core thereon, a core-base, a core-top section, and bolts clamping the base and top sections endwise to the core-barrel.

4. In a mold, the combination, substantially as set forth, of a hollow cylindrical core, a perforated tube disposed centrally in said core and projecting out of the top of the mold and perforated tubes disposed eccentrically in said core and projecting out of the bottom of the mold.

5. In a mold, the combination, substantially as set forth, of a vertical series of interlocking core-barrel segments, an annular series of bolts uniting the top and bottom members of the series and clamping the intermediate members of the series between them, and a core surrounding said segments and supported by them.

6. In a mold, the combination, substantially as set forth, of a drag, a cope, an intermediate mold portion formed of a vertical series of separate sections, a core-base, a core-top section, and an intermediate body-core having a barrel formed of a vertical series of barrel-sections.



481,296. POST-OFFICE HAND-STAMP. EDWARD J. BROOKS, East Orange, N. J., assignor to the E. J. Brooks & Company, New York, N. Y. Filed July 24, 1891. Serial No. 400,614. (No model.)

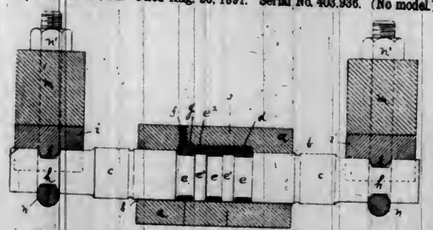
Claim.—1. An improved double hand-stamp for post-offices having a handle A, the within-described handle-tang *x*, the cross-bar B, having the countersunk holes A^2 A^3 A^4, a canceler C, attached to said cross-bar at A^4, the double-ended rivet *r*, attached to said cross-bar at A^2, and a dater D, having the countersunk neck-socket *s'* filled by the lower end of said rivet *r*, the socket s^2 for movable type, and the socket-enlargement *e*, substantially as hereinbefore specified.

2. The improved double hand-stamp for post-offices, composed of the handle A, the handle-tang *x*, the cross bar B, having the countersunk holes A^2 A^3 A^4, a canceler C, attached to said cross-bar at A^4, the double-ended rivet *r*, attached to said cross-bar at A^2, and the dater D, having the countersunk neck-socket *s'* filled by the lower end of said rivet *r*, the socket s^2 for movable type, and the socket enlargement *e*, provided with permanent type *t*, having cylindrical bodies immovably held within sockets in the dater-body perpendicular to its face, substantially as hereinbefore specified.

481,297. ELECTRIC SWITCH. JOHN H. CLARK, Boston, Mass., assignor to the Whittier Machine Company, same place. Filed Sept. 29, 1891. Serial No. 407,102. (No model.)

Claim.—1. The combination, with the movable member of a switch device, of a freely-suspended weight, a connection between it and said movable member, and a movable pulling-point intermediate said weight and movable switch member and through which said connection acts to operate, substantially as described.

2. The combination, with the movable member of a switch device, of a freely-suspended weight connected therewith by a flexible connection and a movable pulling-point intermediate said weight and movable switch member and about which said connection is passed, substantially as described.



3. The combination, with the movable member of a switch device, of a freely-suspended weight connected therewith by a flexible connection, a reversing-lever carrying thereon a pulling-point about which said connection is passed, and means to move said reversing-lever and the pulling-point thereon, the weight exerting a constant pull on said movable switch member, substantially as described.

4. The combination, with the movable member of a switch device, of a weight connected therewith by a flexible connection, a slotted reversing-lever carrying a pulling-point about which said connection is passed, and a pivoted operating-lever having a projection to enter the slot in said reversing-lever, to operate substantially as described.

5. The combination, with the shipper-wheel of an elevator mechanism, of a weight, a switch device, a connection between its movable member and said weight, and a pulling-point through which said connection acts and made movable by said shipper-wheel, substantially as described.

6. The combination, with the shipper-wheel of an elevator mechanism and a shaft therefor having an arm, of a reversing-lever moved by said arm, a switch device having its movable member journaled on said shaft, a weight, and a connection between said weight and movable member controlled by said reversing-arm, substantially as described.

481,298. BARROW-WHEEL. MCLAIN CROSSLAND and DAVID LONG, New Haven, Pa. Filed Aug. 28, 1891. Serial No. 403,936. (No model.)

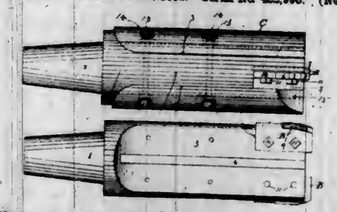
Claim.—1. In a barrow-wheel, the combination, with a spindle having grooves formed therein at or about the middle thereof and the rings formed by said grooves having flattened faces, of a hub having a seat or recess in its interior face, and Babbitt or like metal contained within said grooves and said seat or recess, substantially as and for the purposes set forth.

2. The combination, with a barrow-wheel, of a spindle secured thereto, bearing-blocks engaging the ends of said spindle, the bearing-faces of said bearing-blocks having lugs formed thereon adapted to enter annular grooves at the ends of said spindles, and means for holding said bearing-blocks in position on said spindle, substantially as and for the purposes set forth.

3. The combination, with a barrow-wheel, of a spindle secured thereto, bearing-blocks engaging the upper portions of the ends of said spindle, lugs on the bearing-faces of said bearing-blocks adapted to enter annular grooves at the ends of said spindle, recesses formed in the sides of said bearing-blocks, and bolts secured to the barrow-frame, adapted to enter said recesses and the annular grooves on the ends of said spindle, substantially as and for the purposes set forth.

4. The combination, with a barrow-wheel, of a spindle secured thereto, bearing-blocks engaging the ends of said spindle, the bearing-faces of said bearing-blocks having lugs formed thereon beyond the mid-point of said bearing-faces, said lugs being adapted to enter grooves at the ends of said spindle, and means for holding said bearing-blocks in position on said spindle, substantially as and for the purposes set forth.

5. The combination of a spindle *c*, secured to the hub *n*, the bearing-blocks *i*, bearing-faces *j*, lugs *k*, fitting in annular grooves *h* of the spindle *c*, the recesses *l* in said blocks, and the bolts *n*, secured to the shafts *m*, said bolts fitting in the recesses *l* and annular grooves *h*, substantially as and for the purposes set forth.

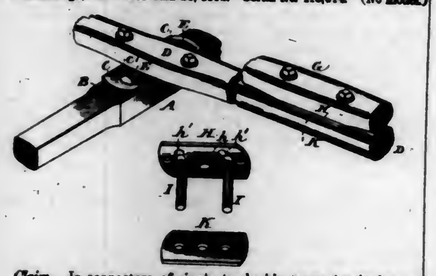


481,299. SHOE-UPPER. JOHN C. DAGGETT, Boston, Mass. Filed Apr. 14, 1892. Serial No. 429,090. (No model.)

Claim.—1. In a shoe, a seamless quarter having two slits made therein from its upper edge and a staying-tongue intermediate said slits, combined with a gusset composed of pieces *b*, having each a concaved edge and having said concaved edges stitched together to give the requisite spring to the top of the shoe, said gusset being stitched at its outer edges to the quarter, the tongue being stitched upon the central portion of the gusset to cover the seam uniting the two parts of the gusset, said tongue also constituting an outside stay, substantially as described.

2. A seamless quarter slitted from its upper toward its lower edge, a staying-tongue extended upwardly from the lower end of the slit, and a stiffening-counter for said quarter, combined with a gusset stitched to said quarter and extended down below the end of the said slit and tongue and between the quarter and the upper edge of the counter to constitute an inside stay and to protect the quarter between the top of the counter and the slitted part above, substantially as described.

481,300. TOOL FOR BORING BREECH-LOADING ORDNANCE. GREGORY GERDOM, West Troy, assignor of one-half to John H. Reynolds, Troy, N. Y. Filed Feb. 27, 1892. Serial No. 422,993. (No model.)



Claim.—1. In a tool for boring ordnance, a cutter having a cutting-edge which at its foremost end is formed at an inclination to the central axis of said tool, a succeeding cutting-edge of slighter angularity to said axis, and a final or finishing cutting-edge which is parallel to said axis, all of said cutting-edges being connected continuously, as and for the purpose herein specified.

2. In a tool for boring ordnance, a cutter having a cutting-edge which at its foremost end is formed at an inclination to the central axie of said tool, a succeeding cutting-edge of slighter angularity to said axis, and a final or finishing cutting-edge which is parallel to said axis, all of said cutting-edges being connected continuously and having the form of a sharp lip, which is produced by a groove or gutter formed in the face of the cutter, as and for the purpose herein specified.

3. In a tool for boring ordnance, the combination of a cutter-head provided with a flattened member 3, provided with a longitudinal tongue 4 on each of its plane faces and recesses 5 for receiving removable cutters, said recesses being formed in opposite faces of said

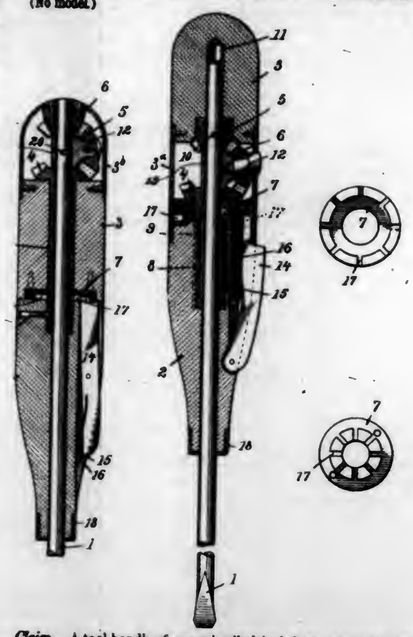
flattened member at diametrically-opposite edges of the same, removable cutters B, secured in said recesses, and segmental cheek-blocks C, secured to opposite faces of said flattened member and forming complementary additions thereto that will exactly fit into the finished bore of the cannon to retain the boring-tool in a true position in said bore, the foremost end of each cheek-block being beveled rearwardly, as at 15, for the purpose of displacing the chips of metal from the path of said boring-tool, as herein specified.

481,801. WHIFFLETREE CONNECTION. ALONSO HAGGERTY, Cambridge, Pa. Filed Jan. 21, 1892. Serial No. 418,814. (No model.)

Claim.—In connectors of single to double trees, the singletree-plate constructed with a central stud and an arc slot on each side thereof, in combination with two headed and end-threaded bolts passing through said arc slots and carrying end nuts below the doubletree, whereby the plates are held at each end to one another and not at the center, thereby dispensing with the ordinary central king-bolt and preventing the ends of singletree from rising up.

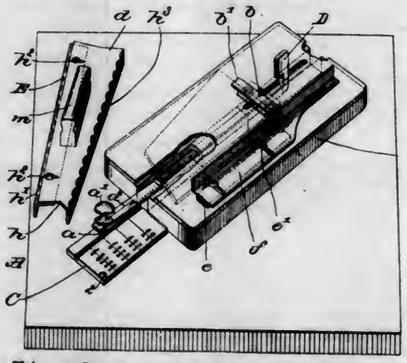
481,802. SASH-BALANCE. NOAH HAMLET, Little Rock, Ark. Filed Mar. 25, 1892. Serial No. 426,452. (No model.)

Claim.—1. The combination, with a window frame and sash, the frame H, having rear, end, and side walls, and front opening in its front, and square depressions G^3 in one of its side walls, lock L, adapted to hold the lower end of said frame, shaft D', journaled in said frame having rubber bearings D^4 D^5, rubber rollers R' R^3, and between said rollers drum D^6 and plates D^7 D^8, shaft G, also journaled in said frame, having rigidly secured to it a square G^4, adapted to fit in depression G^3, spring S', one end secured to drum D^6, and the other to said shaft G, spiral spring S^3, working around said shaft G between said spring S' and one wall of the said frame, substantially as shown and described, and for the purposes set forth.



2. The combination, with a window frame and sash, the frame H, having rear, end, and side walls, and opening in its front, and square depressions G^3 in one of its side walls, lock L, adapted to hold the lower end of said frame, shaft D', journaled in said frame, having rubber bearings D^4 D^5, rubber rollers R' R^3, and between said rollers drum D^6 and plates D^7 D^8, shaft G, also journaled in said frame, having rigidly secured to it a square G^4, adapted to fit in depression G^3, spring S', one end secured to drum D^6, and the other to said shaft G, spiral spring S^3, working around said shaft G between said spring S' and one wall of the said frame, strikers F, secured on one end of the shaft D', and bell E, secured to said frame in such a position that said strikers will strike against the same, substantially as shown and described, and for the purposes set forth.

481,803. VEHICLE-SPRING. DEWITT C. HARLIN, Great Bend, Pa. Filed Nov. 9, 1891. Serial No. 411,307. (No model.)



Claim.—In a vehicle, a spring having substantially horizontal upper arms attachable to the under side of the vehicle-body, said arms extending outwardly, in combination with coils and downwardly and upwardly extending portions adapted to pass astride the axle, said upwardly-extending portions forming a yoke pivoted on the top of the axle, in the manner and for the purpose substantially as described.

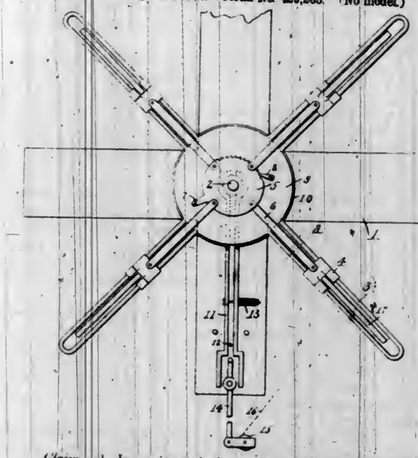
481,804. CHANGEABLE-SPEED SCREW-DRIVER. HARVEY HUSSELL, Bridgeport, Conn. Filed Apr. 3, 1891. Serial No. 388,169. (No model.)

Claim.—A tool-handle of general cylindrical shape, comprising the following elements: two parts, one part of which is stationary relative to the tool when the speed is changed and the other part rotary, a sleeve 13, through which the tool passes and which carries a bevel-gear, two other bevel-gears meshing therewith and attached one to each of the two parts of the handle, and a locking-plate and latch for holding the two parts of the handle and the tool stationary relative to each other.

481,805. GORE-MARKER. WILLIAM B. KINSLEY, Melrose, Mass. Filed Feb. 15, 1892. Serial No. 421,563. (No model.)

Claim.—1. In apparatus for marking gores, a bed-plate having a fixed gage thereon for one edge of the gore and a swiveled gage for one end of the gore, combined with a superimposed adjustable gage parallel to said fixed gage for one side of a removable marker and a sliding gage movable longitudinally with relation to the fixed gage to position the marker longitudinally with relation to the length of the gore, substantially as described.

2. In an apparatus for marking gores, a bed-plate having a sliding gage to position one end of a removable marker with relation to the length of the gore, a scale indicating sizes to co-operate with said sliding gage, and a gage for one end of the gore, combined with a removable marker, a gage on the bed-plate for one side of the gore, and a superimposed adjustable gage for one side of the marker, to operate substantially as described.



3. In an apparatus for marking gores, a swiveling gage for one end of the gore-piece, a movable rod to which it is pivoted, a scale indicating sizes to co-operate therewith, and a locking device to hold said rod in fixed position, combined with a fixed side gage for one edge of the gore-piece, substantially as described.

4. In an apparatus for marking gores, a marker having two downturned marking or impression flanges arranged at an inclination one to the other, said flanges being made adjustable one from the other, substantially as described.

5. In an apparatus for marking gores, a marker composed of flanged plates having their flanges covered each with an independent fibrous body adapted to retain chalk or equivalent and adjustable connections for said plates, substantially as described.

6. In an apparatus for marking gores, a marker composed of a flanged body cut away at intervals or provided with holes, combined with a fibrous covering applied to the flanged and perforated portion of the marker and connected through the said perforations, substantially as described.

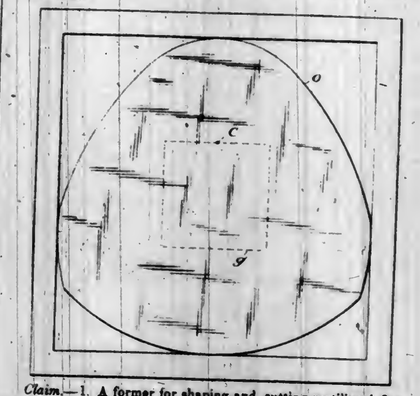
481,806. WIRE-REEL. RILEY E. MILLER and JAMES D. BOWMAN, College Corner, Ohio; said Bowman assignor to Morton A. Miller, same place. Filed Apr. 15, 1892. Serial No. 429,263. (No model.)

Claim.—1. In a wire-reel, the combination, substantially as set forth, of a base-piece, a reel journaled thereon, a brake-wheel attached to the reel, a brake mounted on the base-piece and adapted to engage the brake-wheel, a spring arranged to draw the brake forcibly into engagement with the brake-wheel, a lever pivoted to the base-piece and connected with the brake, and an eye in the outer end of said lever for the passage of the wire and so located that the strain of wire passing from the reel through the eye will move said lever against the strain of said spring and hold the brake away from the brake-wheel.

2. In a wire-reel, the combination, substantially as set forth, of a base-piece, a reel journaled thereon, a brake-wheel on the reel, a brake mounted on the base-piece and arranged for engagement with the brake-wheel, a spring urging said brake forcibly into engagement with the brake-wheel, a lever pivoted upon said base-piece and provided with an eye for the passage of wire on its way from the reel, and a pair of levers forming connections between said first-mentioned lever and said brake and serving, as said first-mentioned lever is brought in either direction from the neutral point, to release the brake from the brake-wheel.

3. In a wire reel, the combination, substantially as set forth, of a base-piece, a reel journaled thereto, a brake-wheel on the reel, a brake arranged to engage with the brake-wheel, a pair of levers arranged for opening and closing motion to release and apply the brake, a spring to hold the levers closed, a third lever pivoted to the base-piece and provided with an eye for the passage of wire leaving the reel, and projections on said third lever adapted, as the [illegible] moves in either direction from the neutral point, to open said first-mentioned levers and release the brake.

4. In a wire-reel, the combination, substantially as set forth, of a swiveled spider for the support of a coil of wire, studs projecting from the base thereof, and double-armed keepers pivoted to said studs and presenting arms within and over a coil of wire on the reel.



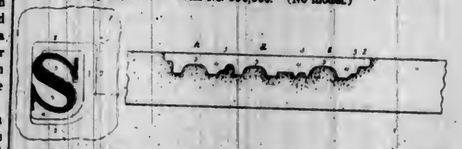
5. In a wire-reel, the combination, substantially as set forth, of a swiveled spider for the support of a coil of wire, studs projecting from the face thereof at some distance inwardly from the ends of the spider-arms and radially adjustable upon the spider, and mechanism, substantially as described, for simultaneously adjusting all of the studs.

6. In a wire-reel, the combination, substantially as set forth, of a swiveled spider, studs projecting from the face thereof and adjustable radially upon the spider, and double-armed keepers pivoted to the studs and adapted to present arms within and over a coil of wire upon the reel.

7. In a wire-reel, the combination, substantially as set forth, of a spider, an annular series of studs projecting from the face of the spider and radially adjustable thereon, a multiple of cranks mounted at the center of the spider, links connecting the crank-pins of said crank with said studs, and means, substantially as set forth, for moving and securing said multiple crank

---

481,807. BORING AND SHAPING MECHANISM. AUGUSTUS K. PHILLIPS, St. Louis, Mo. Filed Oct. 27, 1891. Serial No. 410,008. (No model.)



Claim.—1. A former for shaping and cutting rectilineal figures, consisting of a block or cam constructed, as herein described, to revolve in a guide having the same number of sides as the figure to be cut and provided with means for supporting a tool at a point that travels in a path coinciding at all parts with the outline of the rectilineal figure to be shaped or cut, substantially as set forth.

2. The combination of a guide having the same number of sides as a rectilineal figure to be cut or shaped, and a former constructed, as herein described, to revolve without lost motion in said guide and provided with a tool arranged at a point traveling in a path corresponding at all parts with the rectilineal figure to be cut, substantially as set forth.

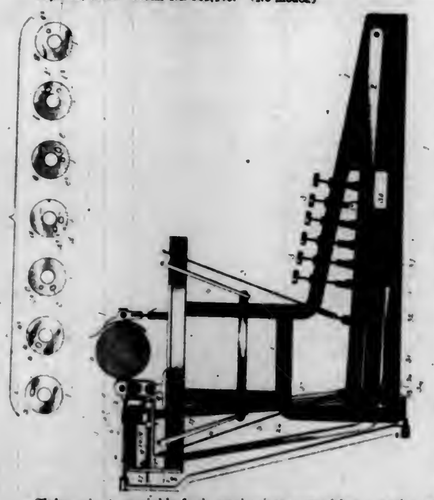
3. The combination of the guide, former constructed as herein set forth, and tool connected with the former at a point of the latter that travels in a rectilineal path, the end face of said tool inclined toward a point lower than the remaining parts of the face, substantially as described.

481,808. METHOD OF FORMING MATRICES. CASPER L. REDFIELD, Chicago, Ill., assignor to the Chicago Matrix Machine Company. Filed July 14, 1890. Serial No. 358,668. (No model.)

Claim.—1. The method of forming stereotype-matrices, which consists in making the impressions successively, forming offsets in the walls of the impressions, and rounding the edges of the offsets, substantially as set forth.

2. The method of forming matrices for stereotyping, which consists in producing type-face impressions by successively-impressed dies and forming retreating offsets in the walls around the portions of the character-faces that are not adjacent to preceding impressions, substantially as set forth.

3. The method for forming matrices for stereotype-plates, which consists in forming the impressions by type-dies impressed in sequence



(0) (.—7)

and compressing the adjacent material and forming an offset partially surrounding each character and an intermediate offset surrounding a less portion of the character, substantially as set forth.

4. The method of forming matrices for stereotyping, which consists in impressing dies successively in a matrix-body, forming small offsets close to the portions of the character-faces requiring most protection and larger offsets embracing the smaller and farther removed from the face and extending around those portions requiring least protection, substantially as set forth.

5. The method of forming stereotype-matrices, which consists in making the impression successively, forming offsets in portions of the walls thereof, and rounding the edges of the offsets and also the material intervening the separate stems of each character, substantially as set forth.

481,309. TYPE-WRITING MACHINE. CASPER L. REDFIELD, Chicago, Ill., assignor to the Chicago Matrix Machine Company. Filed Sept. 16, 1890. Serial No. 365,175. (No model.)

Claim.—1. A variable-feed mechanism comprising a series of ratchet-wheels on a common axis, each wheel being capable of limited rotation independent of the others, a spring holding them in frictional contact and tending to rotate them, a gear connected to the last wheel of the series, and a rack engaged thereby.

2. In a variable-feed mechanism, a rack and gear under tension, a fixed shaft and a sleeve thereon to which the gear is fast, a series of ratchet-wheels carried by the sleeve and connected to the gear and to one another by devices permitting each wheel partial rotation independent of the others, a motor-spring on the sleeve tending to hold the wheels in frictional contact and to rotate them in the same direction as the rack-tension, a pawl engaging the wheels, and means for shifting it from one wheel to another to vary the feed, substantially as set forth.

3. An escapement mechanism comprising a rack under tension, a gear meshing therewith, a series of ratchet-wheels loosely held on the shaft of the gear and having slots and pins, permitting partial rotation of each wheel relative to the next, a spring on the same shaft tending to hold the wheels in contact and to rotate them in the same direction as the rack-tension, a dog for holding the wheels, and means for shifting it from one wheel to another.

4. In a variable-feed mechanism, a rack under tension, a gear in mesh therewith, a series of ratchet-wheels loosely held on the axis of the gear, one of them being fast to the axis, means for permitting the partial rotation of each of the wheels independently of the others, a motor-spring tending to hold the wheels of the series in frictional contact and to turn them in the same direction as the rack-tension, and a shifting detent for engaging the wheels, substantially as set forth.

5. A variable-feed escapement comprising a rack and gear under tension, a series of ratchet-wheels having coinciding teeth, one of said wheels being fast to the axis of the gear and the others loose thereon, a spring having a tension to move the loose wheels toward the fast one and to turn them in the same direction as the gear-tension, and a movable detent for successively engaging different wheels of the series, substantially as set forth.

6. In a typographic machine having the faces of its type multiples of a selected space-unit, a feed mechanism for producing feed movements proportioned to the requirements of such type and comprising a series of ratchet-wheels, one of which is attached to an axis and the others loose on the same axis and having suitable slots and pins for connecting them to permit partial independent rotations, a motor for turning the axis, a motor-spring of less force tending to turn the wheels in the same direction and to hold them in frictional contact, and means for stopping any wheel of the series to permit partial rotation of other wheels between it and said motor-spring, whereby variable-feed movements are caused to follow the release of the engaged wheel.

7. A variable-feed mechanism comprising a series of ratchet-wheels, one of which is attached to an axis and the others loose on the same axis and having suitable slots and pins for connecting them to permit partial independent rotations, a motor for turning the axis, a motor-spring of less force tending to turn the wheels in the same direction and to hold them in frictional contact, and means for stopping any wheel of the series to permit partial rotation of other wheels between it and said motor-spring, whereby variable-feed movements are caused to follow the release of the engaged wheel.

8. A variable-feed mechanism comprising a series of toothed wheels and a gear on a common axis, a motor tending to turn the gear and its axis, a spring holding the wheels in frictional contact and tending to turn them in the direction of the gear movement, connections between the wheels permitting them to rotate with respect to one another limited distances, a movable pawl, and means for shifting it to engagement with any one of the series of wheels to vary the feed movements.

9. In a variable-feed mechanism, a rack and pinion under tension, a series of co-operating ratchet-wheels, all but one of which are loose on the axis of the pinion and under tension of a spring to hold them in frictional contact and to turn them in the same direction as the pinion movement, connections between them for limiting the extent of rotation, and a shifting device for engaging the teeth of a selected wheel to determine the aggregate rotations and resultant feed movements.

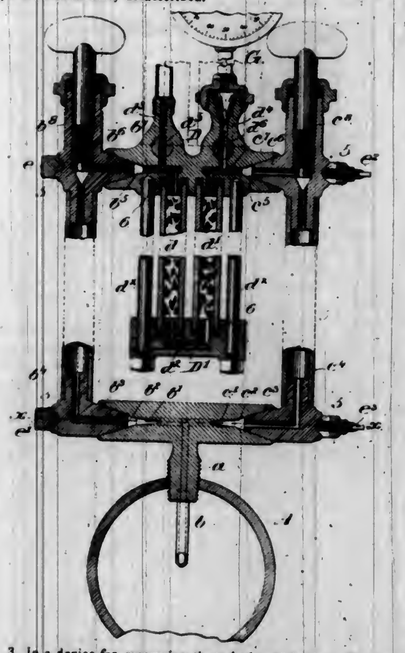
10. In a variable-feed mechanism, a series of co-operating ratchet-wheels, an axis on which one of them is fast and on which all others are loose, a spring holding them in frictional contact and tending to rotate them, connections between them for limiting their independent rotations, and a shifting pawl for selecting and holding any wheel of the series to permit others to rotate to determine the aggregate advance movement.

11. In a variable-feed mechanism, a rack, a gear, a ratchet-wheel movable with the gear, a series of other ratchet-wheels loose on the gear-axis, a spring on said axis holding the wheels in frictional contact with one another and tending to turn them independently of the gear-tension, but in the same direction, and a shifting device for holding any selected wheel of the series to permit others to rotate, substantially as set forth.

12. The combination, with a rack and gear under tension for forward movement, of a series of co-operating ratchet-wheels, one of which is fast to and the others loose on the gear-axis, a spring holding the wheels in frictional contact and tending to turn them, a pawl adapted to engage the wheels successively, a guided sliding carrier for the pawl, means for sliding the carrier, a series of stops, and means for projecting them separately into the path of the carrier to limit its movement and determine the resultant feed movement, substantially as set forth.

13. In a variable-feed mechanism, a rack, a gear, a series of ratchet-wheels on the gear-axis, the wheel next the gear being fast and the other loose on the axis, a motor for moving the rack and gear, and an independent spring for holding the wheels in frictional contact and turning them in the same direction, slots and pins in the wheels for limiting rotations with respect to one another, a pawl co-operating with the wheels, a lever for moving it from wheel to wheel, stops for limiting its travel, and key-levers and connections for controlling said pawl-operating lever and said stops, for the purpose set forth.

14. The combination, with a rack and gear under tension for forward movement, of a series of co-operating ratchet-wheels, one of which is fast to and the others loose on the gear-axis, a spring holding the wheels in frictional contact and tending to turn them, a pawl adapted to engage the wheels successively, a guided sliding carrier for the pawl, a lever for operating it, a series of bails carrying rods and adapted to tilt independently to project their respective rods into the path of the pawl-carrier to stop it, and key-levers arranged to operate said lever for actuating the pawl-carrier and to tilt said bails, substantially as set forth



---

481,310. GAGE FOR MEASURING THE VELOCITY OF FLUIDS. STILLMAN W. ROBINSON, Columbus, Ohio. Filed Sept. 15, 1891. Serial No. 405,762. (No model.)

Claim.—1. In a device for measuring the velocity of fluids, the combination of a Pitot tube presenting an open mouth to the current, a static tube having a closed end and diametrically-opposite openings

in its parallel sides, and an indicating device connected upon said tubes, substantially as described.

2. In a device for measuring the velocity of fluids, the combination, with a Pitot tube presenting an open mouth to the current, a static tube having a closed end and provided with a lateral opening extending through its parallel sides, and an indicating device connected with said tubes, of a pressure-gage in connection with one of said tubes, to operate substantially as described.

3. In a device for measuring the velocity of fluids, a Pitot tube presenting an open mouth to the current, and a static tube having a closed end and its parallel sides provided with a transverse opening extending through the tube combined with an indicating device connected with said tubes and made movable with relation thereto to permit the device to be used in connection with conduits standing in different angle and also to measure gases and liquids, all substantially as described.

4. In a device for measuring the velocity of fluids, a Pitot tube presenting an open mouth to the current, and a static tube having a closed end and provided with a transverse opening extending completely through the parallel sides of the tube, combined with two indicating-tubes in communication with each other at one of their ends and having their opposite ends connected, respectively, with said Pitot and static tubes, to operate substantially as described.

5. In a device for measuring the velocity of fluids, the combination, with a plug adapted to be screwed into a conduit, of a Pitot tube and a static tube carried by said plug, the static tube having a closed end and a transverse opening extending through its parallel sides, and an indicating device connected with said tubes and carried by said plug, substantially as described.

6. In a device for measuring the velocity of fluids, the combination, with a T-shaped threaded plug adapted to be screwed into a conduit and carrying Pitot and static tubes, of two tubes joined to the opposite ends of the T-head of said plug, said tubes having their free ends in communication with each other, to operate substantially as described.

7. In a device for measuring the velocity of fluids, a T-shaped threaded plug adapted to be screwed into a conduit, and Pitot and static tubes carried by said plug, combined with two supporting-tubes joined to the opposite ends of the T-head of said plug and two indicating-tubes joined to said supporting-tubes, whereby the said supporting and indicating tubes may be rotated with relation to the plug and to each other, to operate substantially as described.

8. The plug *a* and the tubes *b* and *c*, combined with the supporting-tubes b^4 c^4, jointed to said plug, and the head D, pivotally held between said supporting-tubes b^4 c^4, to operate substantially as described.

9. The plug *a*, having the flaring mouths b^3 c^3 and the tubes *b* *c*, connected therewith, combined with the supporting-tubes b^4 c^4, their conical-shaped fittings, the head D, indicating-tubes *d* *d'*, and end piece D', all to operate substantially as described.

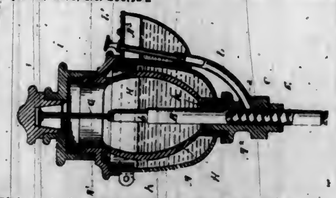
10. The combination, with a conduit and a plug having a T-shaped head and carrying two tubes, one of which has its mouth turned toward the current in the conduit, of two supporting-tubes jointed to the opposite ends of said T-shaped heads and two indicating-tubes jointed to said supporting-tubes, and the straps *e* *e'*, to operate substantially as described.

11. The combination, with a conduit and a threaded plug having a T-shaped head and carrying two tubes, one of which has its mouth turned toward the current in the conduit, of two supporting-tubes jointed to the opposite ends of said T-shaped head, valves therefor, and two indicating-tubes carried by said supporting-tubes, substantially as described.

12. The plug *a* and tubes *b* and *c*, combined with the supporting-tubes b^4 c^4, jointed to said plug, valves therefor, the head D, indicating-tubes *d* *d'*, the nozzles d^3 d^3, and valves therefor, to operate substantially as described.

13. The plug *a* and tubes *b* and *c*, combined with the supporting-tubes b^4 c^4, jointed to said plug, valves therefor, the head D, indicating-tubes *d* *d'*, the nozzles d^3 d^3, valves therefor, and a pressure-gage connected with one of said nozzles, substantially as described.

14. In a device for measuring the velocity of fluids, the combination, with a Pitot tube and a static tube, the latter having a closed end and a transverse opening through its parallel sides, of indicating-tubes connected with said Pitot and static tubes and a graduated indicating-plate adjacent to said indicating-tubes, substantially as described.



15. The combination, with a conduit containing moving fluid, of two tubes inserted therein, one of which has its mouth turned toward the current, indicating-tubes connected with said tubes, the plate *s*, binding-screws *s'*, and plate s^3, substantially as described.

481,311. FRUIT-TREE PROTECTOR. ABIA B. SMITH, Pittsburg, Pa. Filed Jan. 7, 1891. Serial No. 377,081. (No model.)

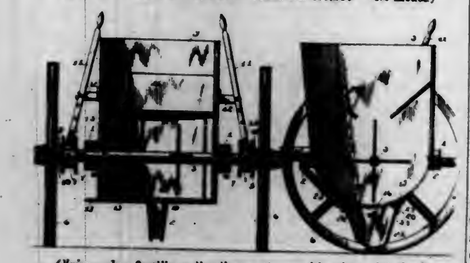
Claim.—The herein-described tree-protector, comprising the sections *a*, each consisting of the inner vertical piece *a'*, extending from top to bottom of the device, the outwardly and upwardly extending pieces a^3, the inner edge of the horizontal portion of which is secured to the lower edge of said part *a'*, thereby forming an outwardly-extending trough surrounding the lower end of said part *a'*, a horizontal water-shed *c*, extending from the top of said part *a'* over the trough *b* and terminating above said trough, and the vertical pieces *f*, secured to each end of each section and extending vertically above and horizontally beyond the same, the horizontally-projecting portions on one section being of greater length than those on the other and bent to inclose the ends of the same, all substantially as described, and for the purposes set forth.

481,312. OIL-CUP. JOHN T. SMITH, San Francisco, Cal. Filed Sept. 30, 1891. Serial No. 407,306. (No model.) Patented in France Sept. 15, 1891, No. 216,154.

Claim.—1. In an oiler, the combination of an oil-vessel, a siphon within said oil-vessel and passing through the lower end of the same, a metallic core within said siphon, a permeable packing twisted around or intertwined with said core, running the length of the siphon and contacting with the part to be lubricated, a wire wound about the surface of said packing, and an outer closely-coiled wire around the lower end of said first-named wire, substantially as set forth.

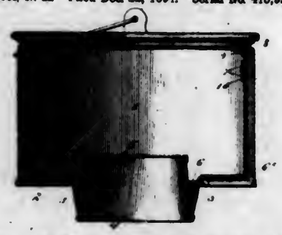
2. In an oiler, the combination of a glass oil-vessel A, upper and lower castings A' A^2 at each end of said oil-vessel, a yoke or link H connecting the same, a nut I, adapted, in connection with said yoke, to bind the said vessel and castings together, a siphon within the oil-vessel and passing through the lower casting, and an oil-conductor in said siphon, running the length thereof and contacting with the part to be lubricated, substantially as set forth.

481,313. PROCESS OF MAKING MALLEABLE-IRON CASTINGS. BENJAMIN TALBOT, Chattanooga, Tenn., assignor of one-fourth to James Meehan, Covington, Ky. Filed Feb. 12, 1892. Serial No. 421,327. (No specimens.)



Claim.—That improvement in the art of making iron for malleable-iron castings which consists in melting metal deficient in carbon, together with added ferro-silicon, in the presence of and by means of solid carbonaceous fuel, and subsequently sufficiently oxidizing the silicon to properly change the graphitic carbon to combined carbon.

481,314. LOG-CARRIER. ROBERT E. TERRY, Mobile, Ala., assignor of one-half to Thomas H. Jordan, same place. Filed Jan. 26, 1892. Serial No. 419,349. (No model.)

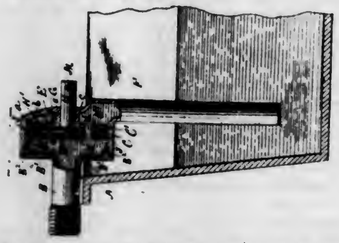


Claim.—The combination of an axle, a frame mounted on the axle, the pivoted block mounted on the frame and having a rearwardly-projecting extension and a forwardly-projecting socket, a lever stepped in the socket, a stop-block mounted on the frame and arranged in advance of the pivoted block, a pawl adapted to engage the block and pivotally connected to the lever, a tongue secured to the frame and having on its lower face a sliding section provided at the inner end with a bail encircling the tongue, said tongue having a series of perforations and the section having a perforation, a pin adapted to enter the perforation and securing the tongue in its adjustment, and chains for securing a log to the block and for connecting the lever with said bail, substantially as described.

481,315. FERTILIZER-DISTRIBUTER. ROBERT B. THOMAS, Blackburn, La. Filed Mar. 16, 1892. Serial No. 425,206. (No model.)

Claim.—In a fertilizer-distributer, the combination, with the framework, the hopper having the curved bottom provided with a discharge-opening, a downwardly-tapered drill hinged at its rear edge to the hopper-bottom in rear of the opening, having a lower rounded end, and a spring connecting the front end of the drill with the fixed part of the frame, of an axle having rounded bearing portions located in openings formed in the opposite sides of the hopper and at its opposite ends provided with reduced bearings and between the reduced bearings and rounded portions squared, the ground-wheels mounted on the reduced bearings and having their hubs notched or toothed at their inner sides, the toothed clutch-sleeves adapted to engage therewith and mounted on the squared portions of the axle, brackets extending from the opposite walls of the hopper, and hand-levers fulcrumed on the bracket, which at their lower ends terminate in lugs loosely embracing the sleeves.

481,316. CULINARY VESSEL. HARRISON F. THURSTON, Centre Bartlett, N. H. Filed Dec. 22, 1891. Serial No. 415,923. (No model.)



Claim.—The combination of a vessel provided in its bottom with a central opening and having a flange depending therefrom, a hot-air chamber secured to the flange and extending upward within the vessel, and an L-shaped tube extending along the bottom and one side of the vessel and provided at its upper end with a discharge-opening, substantially as described.

2. The combination of a vessel provided in its bottom with a circular opening and having a circular flange depending therefrom and tapering toward the lower end, an approximately cylindrical chamber having an open bottom and closed top and tapering sides and secured to the lower edge of the flange and forming a narrow annular V-shaped groove, and an L-shaped tube extending from the V-shaped groove along the bottom and side of the vessel to the top of the same and provided at its upper end with a discharge-opening, substantially as described.

3. The combination of a vessel provided in its bottom with a circular opening and having a circular flange depending therefrom and tapering toward the lower end and an approximately cylindrical chamber having an open bottom and closed top and tapering sides and secured to the lower edge of the flange and forming a narrow annular V-shaped groove, substantially as described.

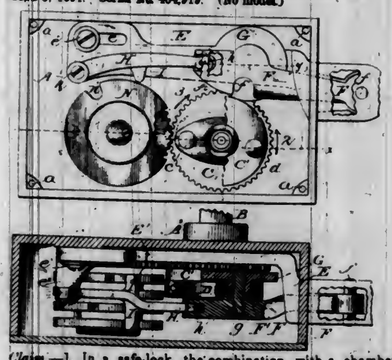
4. The combination of a vessel provided in its bottom with an annular groove, an L-shaped tube arranged inside the vessel and extending vertically along one side of the same and across the bottom from that side to the annular groove, a cap closing the upper end of the tube, and a button pivoted intermediate its ends to the tube, the latter being provided with discharge openings arranged to be closed by the button, substantially as described.

481,317. BALL-COCK VALVE. WILLIAM A. TURNER, Worcester, Mass., assignor to Edmund Converse, same place. Filed Dec. 28, 1889. Serial No. 335,278. (No model.)

Claim.—1. The combination, with a supply-pipe having a transverse partition closing the passage-way and provided with an opening through said partition, of a spindle journaled in said partition, a disk attached to said spindle and provided with an opening which is brought coincident with the opening in said partition by the rotation of said spindle, an annular ring inclosing said rotating disk, and a metallic disk covering said annular ring, said ring and said metallic disk being attached to said transverse partition and forming a chamber for said rotating disk, substantially as described.

2. The combination of the water-supply pipe B, having a radial flange B' and a concentric screw-threaded flange B², a cylinder C, held upon said screw-threaded flange and provided with a transverse partition dividing said cylinder into the chambers D and E, delivery-pipe F, annular ring J, and metallic disk L, forming a chamber for a rotating disk, rotating disk H', inclosed in said chamber, and attached spindle H, journaled concentrically with said transverse partition, said transverse partition and said rotating disk being provided with openings which are brought coincident by the rotation of said disk, substantially as described.

3. In a ball-cock valve, the combination, with the water-supply pipe provided with a partition having one or more holes, forming water-ways, of a semi-elastic washer resting against the side of said partition, an annular metallic ring inclosing a chamber for a rotating disk, a rotating disk provided with one or more holes corresponding with said water-ways and operatively connected with a float which is raised by the water in the tank, a semi-elastic washer resting against said disk, and a metallic disk covering said elastic washer, said metallic disk and said interposed elastic washers being attached to said partition, substantially as described.



481,318. CUTTER-BAR. GEORGE A. VANDAMENT, Ruark, assignor of one-third to P. O. French, S. W. Morgan, and J. M. Freese, Sumner, Ill. Filed Feb. 20, 1892. Serial No. 422,289. (No model.)

Claim.—1. The herein-described cutter-bar, the same having recesses in its upper face, provided with lugs rising from center of the bottom thereof, knives having reduced shanks fitting in said recesses and removable vertically therefrom and having holes therein for fitting over and through which said lugs pass and are flush with the upper surfaces of the said knives, the shoulders at the front ends of said shanks resting against the front edge of the body of the bar, and a fastening-slide passing over said shanks and detachably connected with the bar, as set forth.

2. The herein-described cutter-bar, the same having recesses in its upper face, provided with lugs rising from the bottom thereof, knives having reduced shanks fitting in said recesses and removable vertically therefrom and also provided with holes to engage said lugs, the shoulders at the front ends of said shanks resting against the front edge of the body of the bar, the upper side of the bar having a longitudinal groove open at its outer ends and with undercut edges, a slide having beveled edges removably inserted in said groove, the outer end of said slide being turned down, and a thumb-screw passing through said turned-down end into the end of the cutter-bar, as hereinbefore set forth.

481,319. SAFE-LOCK. JAMES WHITE, Cleveland, Ohio. Filed Sept. 5, 1891. Serial No. 404,919. (No model.)

Claim.—1. In a safe-lock, the combination, with a chambered bolt, of a drag-bar having its outer end connected to the bolt within the chamber and means for moving the drag bar and bolt endwise, substantially as set forth.

2. In a safe-lock, the combination, with the bolt, of a drag-bar connected at its front end with the bolt, means for moving the drag-bar and bolt endwise, and a fence-lever connected at its front end to the rear end of the drag-bar and having its rear end pivoted to the bolt, substantially as set forth.

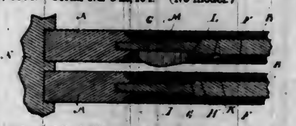
3. In a safe-lock, the combination, with the spindle, of a toothed wheel, a cam, a drag-bar engaging with the cam, a connecting-wheel mounted loosely on the spindle, and means for alternately engaging the drag-bar with the connecting-wheel and detaching the drag-bar from the connecting-wheel, substantially as set forth.

4. In a safe-lock, the combination, with the spindle, of a toothed wheel, a series of tumblers, and a toothed wheel mounted by the side of the toothed wheel of the spindle, a fence engaging with the tumblers, a drag-bar pivoted to the bolt of the lock, and a cam mounted on and operated by the spindle to lift the drag-bar, substantially as set forth.

5. In a safe-lock, the combination, with the spindle, of the bolt, a drag-bar pivoted to the bolt, a cam on the spindle, a connecting-wheel mounted on the spindle, and having a circular track open toward the cam, and a pin carried by the spindle and traversing the track, substantially as set forth.

6. In a safe-lock, a bolt having that portion which projects through the wall of the lock lying in a plane parallel with the plane of another portion which lies in close proximity to the front of the lock and having at its rear end a bracket-like projection, a fence-lever supported at one end on the bracket, and a drag-bar connected at its front end to that part of the bolt which projects through the casing, in combination with an antifriction-wheel mounted on the drag-bar between the drag-bar and the bolt and a cam adapted to engage with the antifriction-wheel for lifting the inner end of the drag-bar and fence, substantially as set forth.

7. In a safe-lock, a bolt having that portion which projects through the wall of the lock lying in a plane parallel with the plane of another portion which lies in close proximity to the front of the lock and having at its rear end a bracket-like projection, in combination with a drag-bar connected at its front end to that part of the bolt which projects through the casing, a spindle, a gear-wheel on the spindle below the bolt, a cam on the spindle inside of the gear-wheel, an antifriction-wheel mounted on the drag-bar between the drag-bar and the bolt to engage with the cam for lifting the inner end of the drag bar, and a fence-lever connected at one end to the drag-bar and at its opposite end to the bracket-like projection of the bolt, substantially as set forth.



8. In a safe-lock, the combination of a spindle, a gear-wheel mounted on the spindle in close proximity to the front wall of the lock, a pin mounted upon and driven by the spindle for moving the bolt, an other gear mounted upon a pivot other than the spindle and meshing with the first-named gear-wheel, and a series of tumblers mounted upon and rotating about the pivot inside of the gear-wheel and separable therefrom, substantially as set forth.

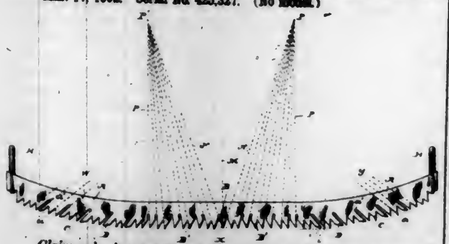
9. In a safe-lock, the combination of a spindle, a gear-wheel mounted on the spindle in close proximity to the front wall of the lock, a pin mounted upon and driven by the spindle for moving the bolt, another gear mounted upon a pivot other than the spindle and meshing with the first-named gear wheel, a series of tumblers surrounding the pivot, and the rosette between the pivot and the tumblers to facilitate the removal of the tumblers without disturbing the gear-wheel, substantially as set forth.

10. In a safe-lock, the combination of a spindle which rotates, a non-rotating pivot parallel with the spindle, a gear-wheel mounted upon the spindle and fixed thereto, a gear-wheel mounted on the pivot and meshing with the gear-wheel of the spindle, a series of tumblers mounted on and rotating about the pivot, and a clamp interposed between the tumblers and the gear-wheel on the pivot to retain the gear-wheels in mesh when the tumblers are removed, substantially as set forth.

11. In a safe-lock, a non-rotating pivot, in combination with a series of tumblers, a rosette interposed between the tumblers and the pivot, and fastening devices carried by the rosette and the pivot for securing those parts to each other, substantially as set forth.

481,320. SASH-LIFT. HENRY R. WILLER, Milwaukee, Wis. Filed Mar. 3, 1890. Serial No. 342,404. (No model.)

Claim.—1. A blind-lift constructed of metal having a plate H, provided with a flat inner surface and with apertures K K, and an arm I, integral with the plate H, having a shoulder L and an inner edge M, inclined to the flat inner surface of the plate H, substantially as described.



2. The combination, with a sliding blind having a frame containing a panel provided with a centrally-raised part, as F, and a beveled margin, as G, of a metal lift having a plate H, provided with a flat inner surface fitted and secured to the surface of the raised central part of the panel and having a shoulder L fitted to the edge of

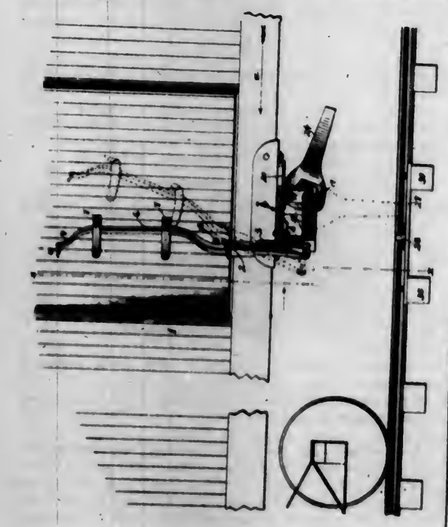
the centrally-raised part of the panel, and an inclined edge M fitted to the surface of the beveled margin G of the panel and extending from the centrally-raised part of the panel to the edge of the stile, substantially as described.

3. In a blind constructed for vertical movement, the combination, with a frame and a panel fixed in the frame, of a metal blind-lift one part of which has a flat inner surface placed against the surface of the panel and secured thereto by screws or equivalent device and another part of which projects laterally along the panel from the flat-surfaced part, the projecting part being of sufficient width outwardly from the panel to form a catch or handle to be caught by the fingers of a person, substantially as described

---

481,321. CROSSCUT-SAW. ISAAC S. WILSON, Cedar Gap, Mo. Filed Mar. 17, 1892. Serial No. 425,327. (No model.)

Claim.—1. A crosscut-saw having a central straight portion and curved end portions, substantially as described.



2. A crosscut-saw having a central straight portion with teeth projecting inward toward a central straight tooth and curved end portions with outwardly-projecting teeth, substantially as described.

3. A crosscut-saw having the teeth of the central part thereof projecting inward in reverse directions to a central tooth, substantially as described.

4. In a crosscut-saw, a middle portion with sets of cross-cut or scoring teeth arranged in even number, in combination with a clearing-tooth having a throat on either side thereof, said cross-cut or scoring teeth gradually assuming an erect position as they approach a central pyramidal tooth, substantially as described.

5. In a crosscut-saw, a central pyramidal tooth having cross-cut and clearing teeth projecting obliquely in reverse directions and outer cross-cut and clearing teeth projecting in reverse directions and obliquely to the said central cross-cut and clearing teeth, the central portion of said saw being straight and the end portions thereof curved, substantially as described.

481,322. MAIL-BAG THROWER. CLINTON B. WILSON and GEORGE W. CUMMINGS, Jamestown, N. Y. Filed Oct. 2, 1891. Serial No. 407,526. (No model.)

Claim.—1. A mail-bag deliverer comprising a pivoted support on the car, a receptacle for the bag at the upper end of the said support, and means on the car connected with the lower end of the support for operating the thrower to deliver the bag.

2. A mail-bag deliverer comprising a pivoted support on the car, a receptacle for the bag at the upper end of the said support, and a spring-actuated rod connected with the lower end of the said support.

3. A mail-bag deliverer comprising a pivoted support on the car, a receptacle for the bag at the upper end of the said support, and means on the car connected with the lower end of the support, said means including a trip-arm adapted to contact with the stop located alongside a track-rail.

4. A mail-bag thrower pivotally mounted on the car and comprising a box-like frame on the under side of the car, a spring-actuated rod connected to the lower end of the support and passing through said frame, and a trip-arm connected with the inner end of said rod, adapted to contact with the trip on the track.

5. A mail-bag thrower pivotally mounted on the car and comprising a box-like frame, a way on the under side of the car upon which said box-frame is adapted to move, and means connected with the lower end of the pivot-support for operating the thrower.

6. A mail-bag deliverer comprising a pivoted support having a receptacle for the bag at its upper end and means whereby said thrower may be reversed in position, substantially as set forth.

7. A mail-bag deliverer comprising a pivoted support having a receptacle for the bag at its upper end and means whereby said thrower may be reversed in position, said means including a curved way, a pivoted box-frame, and a stop for securing the latter in adjusted position.

8. A mail-bag deliverer comprising a pivoted support for the bag, an operating-rod connected to the lower end of said pivoted support, and a shell-headed trip-arm adapted to be engaged by said rod.

9. A mail-bag deliverer comprising a pivoted support for the bag, an operating-rod connected to the lower end of said pivoted support, and a slotted dish-headed trip-arm adapted to be engaged by said rod.

10. A mail-bag thrower provided with a trip-arm having a slotted dish-shaped head.

11. A mail-bag thrower provided with a trip-arm having a slotted dish-shaped head and a yoke extending from the rear of said head.

12. A mail-bag thrower provided with a receptacle and pivoted on the car, a rod connected to the lower end of said receptacle-support, and a coiled spring and buffer on said rod.

13. A mail-bag thrower pivoted on a car, a frame on the under side of the car adapted to oscillate, a rod connected to the support of the receptacle, passing through said frame, and a slotted dish-headed trip-arm.

14. A mail-bag deliverer comprising a socketed support and a separable bag-receptacle, whose lower end is adapted to fit in the socket of said support, and means whereby said receptacle may be instantly locked in position or released.

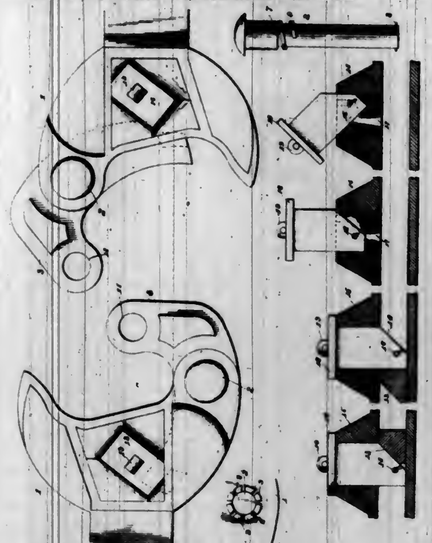
15. A mail-bag deliverer comprising a socketed support and a separable bag-receptacle, whose lower end is adapted to fit in the socket of said support, and means whereby said receptacle may be instantly locked in position or released, said means including a shoulder in the socket and a spring-catch adapted to engage said shoulder.

16. A mail-bag deliverer comprising a socketed support and a separable bag-receptacle, the latter provided with skeleton spring-arms adapted to receive the bag.

481,323. PNEUMATIC TIRE. ADOLPHUS F. WYMAN, New Bedford, Mass. Filed June 3, 1892. Serial No. 435,378. (No model.)

Claim.—A pneumatic tire having its interior provided with a number of thin pieces of rubber adapted to have free movement within said interior as the wheel revolves, as and for the purpose shown and described.

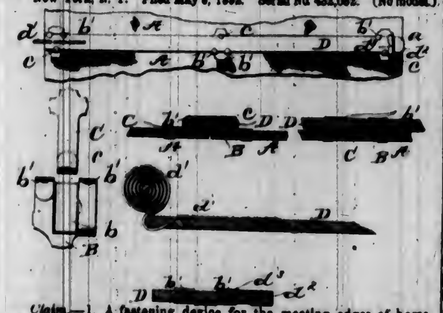
481,324. HEEL-PLATE. EDWARD F. AYERS and TIMOTHY H. FOSTER, Danbury, Conn. Filed Nov. 5, 1891. Serial No. 410,975. (No model.)



Claim.—In a heel-protector adapted to be contained within the heel of a rubber boot or shoe, comprising an approximately-V-shaped plate, such as 1, provided with perforations and depending studs or wearing-points 5 and having the ends connected by a bar 3, provided with dovetailed grooves 4, adapted to act in the capacity of retaining-

481,324.

points, and a spider or Y-bridge formed of ribs 6, which rise from approximately equidistant points on the upper surface of said plate and unite at the center, substantially as and for the purpose described.



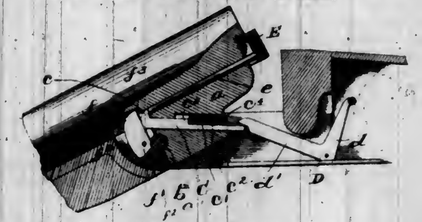
481,325. CAR-COUPLING. WALTER B. CLARK, Woodlawn Park Ill. Filed Apr. 7, 1892. Serial No. 428,145. (No model.)

Claim.—1. The combination of a draw-head provided on its lower face with a series of projections, a knuckle arranged in the draw-head and provided in the walls of its knuckle-pin perforation with a spiral groove, a knuckle-pin having a spiral flange arranged to engage the groove, and a key passing through the lower end of the knuckle-pin and arranged between said projections, substantially as described.

2. The combination of a draw-head, a knuckle arranged therein and having its inner end beveled, an enlargement mounted in the draw-head and provided in opposite walls with bayonet-grooves and a beveled gravity-catch provided on opposite sides with lugs arranged in the bayonet-grooves, substantially as described.

481,326. HORSE-BLANKET FASTENER. CHARLES A. HARVEY, New York, N. Y. Filed May 6, 1892. Serial No. 432,092. (No model.)

Claim.—1. A fastening device for the meeting edges of horse-blankets, consisting of two or more series of securing devices located at intervals along the edges, each series comprising two hooks secured to one edge and a single hook secured to the opposite edge intermediate the hooks of the first-named edge and adapted to pass between and beyond said first-named hooks to leave a space between them, and a movable tongue for passing through the said space and engaging all the hooks of the said securing devices, said tongue being capable of yielding in a direction transversely of said hooks but incapable of yielding laterally in the plane of said hooks, substantially as described.



2. A fastening device for the meeting edges of a horse-blanket, consisting of a series of securing devices located at intervals along said edges, consisting each of a plate secured to one edge and provided with a pair of hooks and an arm secured to the other edge, having a hook alternating with the hooks of the other edge, said plate being recessed to receive said arm, and the tongue for engaging the hooks of all said devices, said tongue being incapable of yielding laterally in the plane of said hooks, substantially as described.

3. In a fastening device for the meeting edges of horse-blankets, the combination, with the securing-tongue provided with a stop, of a series of securing devices located at intervals along said edges, consisting each of the recessed plate provided with a pair of tongue-engaging hooks and an arm provided with a hook adapted to engage the recess of said plate, one of the hooks of the plate adjacent to one end of said edges being continued to the opposite side of said plate to form a cross-plate adapted to be engaged by the stop on said tongue, substantially as described.

4. In a fastening device for horse-blankets, the combination, with hooks secured to opposing edges of said blanket, of the securing-tongue for engaging said hooks, provided with a stiffening-strip attached to the upper end of the said tongue, a part of said strip forming a hand piece for moving said tongue, substantially as described.

5. In a fastening device for the meeting edges of a horse-blanket, the combination, with the tongue provided at one end with a stiffening-strip, a portion of said strip forming a hand-piece, and a stop-plate provided with a projecting stop secured to the other end of a series of plates located at intervals along said edges and provided with tongue-engaging hooks, and a series of arms provided with hooks adapted to engage said plates, one of said plates being provided with a cross-plate adapted to be engaged by said stop and having a notch or recess adapted to be engaged by said hand-piece, substantially as described.

481,327. BREAKDOWN GUN. FRANK A. HOLLENBECK, Batavia, N. Y., assignor to the Baker Gun and Forging Company, same place. Filed Feb. 16, 1892. Serial No. 421,716. (No model.)

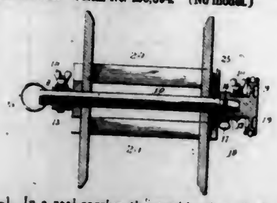
Claim.—1. In a firearm, the combination, with the cocking-lever and the shell-extractor, of a cocking-bolt operatively connected with the said cocking-lever and extractor, substantially as described.

2. In a firearm, the combination, with the cocking-lever and the extractor, of the longitudinally-movable cocking-bolt engaging said extractor and the ejector engaging the said cocking-bolt, substantially as described.

3. In a firearm, the combination, with the extractor and cocking-lever, of the longitudinally-movable cocking-bolt engaging the said extractor, the spring engaging and moving the cocking-bolt in one direction, and the ejector engaging and moving the said cocking-bolt in the opposite direction, substantially as described.

4. In a firearm, the combination, with the cocking-lever pivotally secured to the stock portion of the arm, of the cocking-bolt movably mounted in the barrel portion of the arm, a spring for moving said bolt out of engagement with said lever, and the fore-end provided with means for retaining the cocking-bolt in constant engagement with the cocking-lever when said fore-end is placed in proper position upon the barrel portion of the firearm, substantially as described.

5. In a firearm, the combination, with the cocking-lever, of the longitudinally-movable cocking-bolt secured to and moving with the barrels, a spring engaging said cocking-bolt and adapted to move it in a direction to disengage it from the cocking-lever, and the fore-end provided with a construction to engage said bolt when the fore-end is attached to the gun and hold the cocking-bolt in constant engagement with the cocking-lever against the force of said spring, substantially as described.

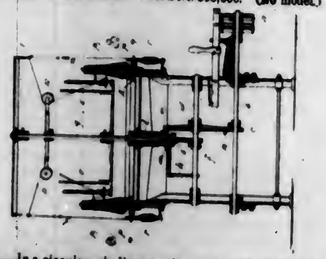


6. In a firearm, the combination, with the cocking-lever and extractor, of the longitudinally-movable cocking-bolt secured to and moving with the barrels, having a portion operatively engaging the cocking-lever and a portion operatively engaging a part connected with the

extractor, and means for positively moving said cocking-bolt longitudinally, substantially as described.

7. In a firearm, the combination, with the cocking-lever and the extractor, of the longitudinally-movable cocking-bolt secured to and adapted to move with the barrels, having a part operatively engaging the cocking-lever and a portion operatively engaging a part connected with the extractor, and the ejector for moving said cocking-bolt longitudinally when the gun is broken to effect the operation of the extractor, substantially as described.

8. In a firearm, the combination, with the cocking-lever pivoted in the stock and the extractor, of the cocking-bolt adapted to engage said cocking-lever and extractor, the spring operatively engaging the said cocking-bolt, the fore-end, the ejector pivoted to the fore-end and having a part adapted to engage a rigid portion connected with the stock, substantially as described.

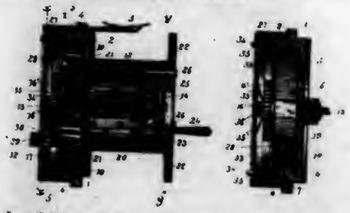


481,328. REEL-CARRIER. EVEN E. KITTLESON, Albany, Wis. Filed Feb. 9, 1892. Serial No. 420,894. (No model.)

Claim.—1. In a reel-carrier, the combination of a frame mounted on wheels and provided at its front end with the bearing-plates 8 and 9, a sleeve journaled in the bearing-plate 9 and provided with a socket and having a set-screw 17, and a removable shaft 10, adapted to carry the spool and provided at one end with a handle and having its other end arranged in the socket of the sleeve and provided with a groove to receive a set-screw 17, whereby the shaft is made rigid with the sleeve, substantially as described.

2. In a reel-carrier, the combination of a frame mounted on wheels, a spool-shaft journaled on the frame, a spool arranged on the shaft, and a guide comprising the side bars secured to the frame and having their front ends curved inward, a horizontal roller connecting the front ends of the side bars and journaled therein, a cross-bar elevated above the side bars and provided with depending L-shaped portions forming brackets and secured to the side bars, and the vertical rollers arranged within the side bars and journaled on the cross-bar, substantially as described.

481,329. DRIVING MECHANISM FOR THE SPINDLES OF CIRCULAR WINDING-MACHINES. FRIEDRICH A. LUDWIG, Chemnitz, Germany. Filed June 10, 1891. Serial No. 396,800. (No model.)



Claim.—In a circular winding-machine, the combination of a horizontal driving-cog K and sleeve *l*, carrying the same, with the bobbin-supporters *g'*, arranged around said cog, bevel-gears *p*, engaging in the same and disengaging switches *g*, a vertically-movable bar *g*, whirls *u*, thread-cleaner *v*, and adjustable guide-hooks *w*, all mounted on said bar *g*, as specified, and a guide-fork *h*, having a horizontal arm keyed to said bar *g*, said fork embracing the shaft *d*, and the shaft *d*, operated from a driving-shaft by means of intermediate gearing *m e n c*, arranged substantially as and for the purpose set forth.

481,330. FISHING-REEL. GRANVILLE E. MEDLEY, Hopkinsville, Ky. Filed May 3, 1892. Serial No. 431,685. (No model.)

Claim.—1. In a fishing-reel, the combination of a spool on which the line is wound, a body having a tubular spindle on which said spool is rotatably mounted, said body and spool being independent, a spring secured within said body, a drum or casing surrounding said spring and body, and a shaft carrying an eccentric or clutch in said spool adapted to bear against one of the connecting-screws of the parts and control the movements of the said spool, said eccentric or clutch consisting of a crescent-shaped plate pivoted at one point only and extended from said shaft, substantially as described.

2. In a fishing-reel, the combination of a spool, a body having a tubular spindle extending therefrom, a spring having its outer end connected with said body, a winding-drum having the inner end of the spring secured thereto, a shaft fitted in said tubular spindle, an eccentric or clutch secured on one end of said shaft and engaging one of the connecting-screws of the said spool, an oblong nut secured to said shaft and to which said eccentric or clutch is pivotally connected and extends therefrom, and a spring connected to and extending transversely across the opposite end of said shaft and adapted to hold the eccentric in position, substantially as described.

3. In a fishing-reel, the combination of a spool, a body having a tubular spindle extending therefrom and on which said spool has rotatable bearing and also provided with an outer covering-plate, a spring in connection with the said body, the said body having a series of holes therein, and pins or posts on the free ends of a transversely-arranged spring movably connected to the inner surface of the said outer plate and adapted to engage the said holes of the body, a shaft extending through said spindle into said spool, and an eccentric or clutch pivotally supported by said shaft in said spool, the said clutch or eccentric being free to move and connected at its inner end portion only, substantially as described.

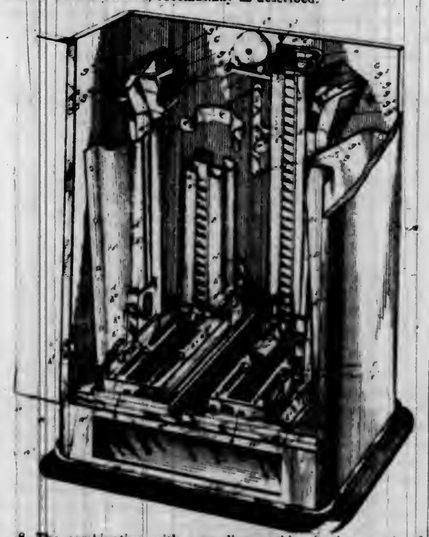
4. In a fishing-reel, the combination of a spool, a body having a hollow spindle projecting therefrom and provided with a series of holes, as set forth, a spring connected to said body and located in a counter-sink therein, a winding-drum secured to said spring, a shaft extending through said tubular spindle and having an eccentric or clutch on one end thereof in the said spool and adapted to bear against one of the connecting-screws of said parts, a pinion on the opposite end of the same, a spring extending transversely through the end of the shaft, an idler-wheel, and an outer plate fitted over the drum, having a spring secured thereto carrying pins or posts at the ends thereof to engage the holes in said body and lock the drum against movement, and said eccentric or clutch being freely movable and pivoted at one point only, substantially as and for the purpose set forth.

481,331. COIN-CONTROLLED VENDING-MACHINE. EDWARD L. PICKARD, Chelsea, assignor, by mesne assignments, to the United States Postage Stamp Delivery Company, Boston, Mass. Filed May 10, 1892. Serial No. 432,537. (No model.)

Claim.—1. In a vending-machine, the combination, with a coin tube or chute, of a laterally-movable section of coin-chute at the upper end thereof and having an opening in one side adapted to eject a small-sized disk, and a stop for holding a coin in said section until the latter is moved, substantially as described.

2. In a vending-machine, the combination, with a front plate having a coin-slot, of a bodily-movable section of coin-chute having an opening in one side adapted to eject a small-sized disk, said section being located behind and registering with said coin-slot when in one position and registering with a stationary coin-chute and out of register with the coin-slot when in the other position, and means for moving said section, substantially as described.

3. In a vending-machine, the combination, with a movable section of coin-chute for interrupting the passage of a coin, of a bell, a bell-hammer, connections between said bell-hammer and movable section, a single spring for holding them in one position, and means within reach of the operator for moving said section and hammer.



4. In a vending-machine, the combination, with a plurality of movable sections of coin-chutes for interrupting the passage of coins, of a pivoted arm, an alarm or signal device, flexible connections between said arm and signal and between said arm and movable sections, and a single spring for operating the signal and exerting tension on said pivoted arm, substantially as described.

5. In a vending-machine, the combination, with the frame or casing, of a removable magazine having a slide for temporarily closing one end thereof, said slide being fitted to guides secured to the end of

the magazine, whereby said slide may be operated to close the magazine at any time when the latter is to be removed, substantially as described.

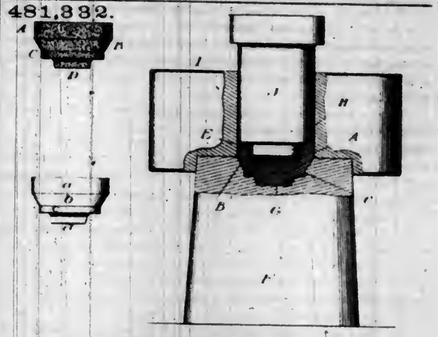
6. A magazine for vending-machines, consisting of a plurality of pockets for the articles to be sold, said pockets communicating with each other at their lower ends, and means carried by the lower end of the magazine for temporarily closing the outlet for said articles.

7. A magazine for vending-machines, consisting of a pair of pockets divided by a vertically-slotted partition and having also vertical openings at the front and back, the said partition being cut away at its lower end to an extent somewhat greater than the diameter of one of the articles to be sold, substantially as described.

8. The combination, with a vending-machine having a pair of pockets divided by a vertically-slotted partition, of a weight having two parts adapted to fit said pockets and a connecting-web passing through the slot of the partition, substantially as described.

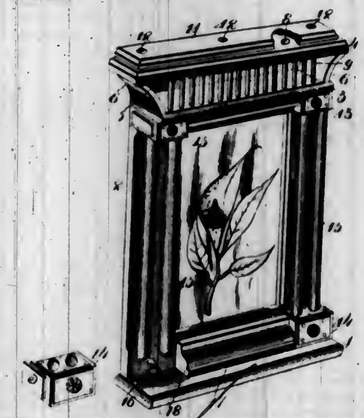
9. In a vending-machine, the combination, with a delivery-slide and a stationary lug on each side thereof, of a magazine having a pair of trunnion-pins adapted to rest on said lugs and a slide for closing the lower end of the magazine, said closing-slide having a downwardly-inclined end under the magazine, substantially as described.

10. In a vending-machine, the combination, with a delivery-slide, of a pair of fixed teeth on one side thereof, a fixed coin-chute, a trip-lever pivoted to one side of the slide and having a hook to engage the teeth and a heel portion extending into the path of a coin in the coin-chute, and a fixed guard adapted to prevent the lever from releasing the coin until the hook has passed both teeth, substantially as described.



11. In a vending-machine, the combination, with a delivery-slide, of a pair of fixed teeth on one side thereof, a fixed coin-chute, a trip-lever pivoted to one side of the slide and having a hook to engage the teeth and a heel portion extending into the path of a coin in the coin-chute, and a fixed guard located over the hook portion of the lever and consisting of two parts at different elevations connected by an inclined surface, substantially as and for the purpose set forth.

12. In a vending-machine, the combination, with a delivery-slide, of a pair of fixed teeth on one side thereof, a fixed coin-chute, and a trip-lever pivoted to one side of the slide and having a hook to engage the teeth and a heel portion extending into the path of a coin in the coin-chute, said trip-lever having a cam-surface adapted to strike the front surface of the first tooth and carry the hook down behind the second tooth, substantially as described.



481,332. PROCESS OF HARDENING SEATS AND VALVES. JAMES POWELL, Cincinnati, Ohio. Filed Oct. 13, 1888. Serial No. 288,041. (No model.)

Claim.—The process, substantially as described, of imparting a smooth, hardened, and condensed surface to cast blanks for valves and valve-seats, which process consists in confining said blanks within suitable dies and then subjecting the blanks to the percussive action of punches or their equivalents, whereby said castings are hardened, condensed, and finished without further manipulation, as set forth.

481,332.

481,333. FRAME FOR PICTURES AND SIMILAR PURPOSES. MAYER REINFELD, St. Louis, Mo. Filed June 2, 1892. Serial No. 435,260. (No model.)

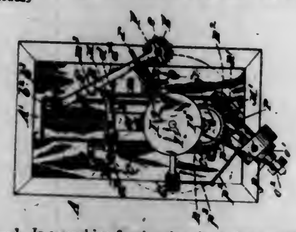
Claim.—1. A frame having stationary sockets fixed rigidly to the same near the top thereof, poles 15, the upper ends of which are adapted to be received by said sockets, and sockets 14, adapted to be removably secured to the frame at the opposite lower end of the frame for receiving the lower ends of said poles for locking the same in place, substantially as described.

2. A frame consisting of a base and back, transverse pieces 3 and 4, forming a stationary part of said frame and providing a space 7, openings 8, formed in the said transverse pieces registering with one another, short rods or poles 9, inserted within said openings, and a removable strip 11, adapted to be secured to the upper transverse piece 4 and cover the openings formed in said strip for preventing the said rods from passing out of said openings formed for their reception, substantially as described.

3. A frame having stationary sockets fixed rigidly to the top thereof, poles 15, removable sockets 14 to receive the lower ends of said poles and locking the same, transverse pieces 3 and 4, forming the stationary part of said frame and separated by the space 7 and having openings 8 therein registering with one another, short removable rods inserted in said openings, and a removable strip 11, secured to the upper transverse piece 4 and cover the openings formed in said strip and retaining said rods 9 in place, substantially as described.

481,334. EXHAUST-NOZZLE. PAUL SWENSON, Minneapolis, Minn. Filed Feb. 13, 1892. Serial No. 421,448. (No model.)

Claim.—1. In an exhaust-nozzle constructed with a primary and a supplemental discharge-orifice, the supplemental discharge-orifice



having an annular form and surrounding the primary discharge-orifice, and a valve located in said nozzle normally closing the said supplemental discharge-orifice to the said nozzle and adapted to be actuated to open the said supplemental discharge-orifice to the said nozzle under the action of an excessive pressure in the said nozzle, substantially as described.

2. An exhaust-nozzle constructed with a primary and a supplemental discharge-orifice, the supplemental discharge-orifice having an annular form and surrounding the primary discharge-orifice, and a valve located in one side of the nozzle for opening and closing the supplemental discharge-orifice to the said nozzle, the said supplemental discharge-orifice being widest at a point diametrically opposite the valve, substantially as and for the purpose set forth.

3. The combination, with the nozzle E, having the primary and supplemental discharge-orifices F and G, respectively, of the valve I, fulcrumed at its lower edge and moving at its upper edge with steam-tight engagement against the abutment K and provided near its fulcrumed edge with the slot-and-pin engagement K', substantially as and for the purpose set forth.

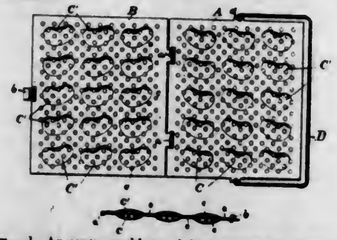
4. The combination, with the nozzle E, having the primary and supplemental discharge-passages F and G, respectively, of the valve I, located in one side thereof, and a valve-controlling device connecting the valve with the exterior of the stack comprising the telescoping sections L L', the hand-nut M, the spring N, and the telescoping portions *g*, the sections L L' being provided with the perforation P, through which a pin may be inserted to secure the said sections together, substantially as described, and for the purpose set forth.

481,385. MACHINE FOR BEVELING BARREL-HEADS. HENRY THEIS, Lawrenceburg, Ind. Filed Sept. 26, 1891. Serial No. 406,912. (No model.)

Claim.—1. In a machine for dressing the peripheral edges of barrel-headings, a blank-holding clamp composed of the lower live-disk H', upper vertically-movable disk H, arbor A, at the lower end of which said upper disk is mounted, block or head *i*, having laterally-projecting lugs *l l'* and receiving the said arbor A, compressible retractile spring J, depressing hand-lever K *k'*, pivoted to the outer end of the pillar-arm *a* on the main frame, and split foot or cam L, hinged to said pillar-arm and engaging said lugs *l l'* on the head-block *i*, said depressing-lever K engaging said foot or cam L for the downward or closing movement of the upper disk H and when raised allowing spring J to retract or withdraw said upper disk from the blank, and thereby automatically open the clamp for the release of said blank, substantially as herein set forth.

2. In a machine for dressing the peripheral edges of barrel-headings, the combination, with the head-blank clamp, of the upright standards M M', mounted on a horizontal rod or shaft *m*, the latter being suitably mounted in a bracket-bearing *m'*, projecting from the pillar-arm *a'* of the main frame, a pendent arm m^2, projecting from standard M, said standards M and M' forming gages or stops whereby the said head-blank is readily and properly centered in said clamp, and suitable stop arms or brackets m^3 and N on the swinging arm B and pillar-arm *a'*, respectively, whereby said standards are held in proper relation to the head-blank both for setting and revolving it, substantially as herein set forth.

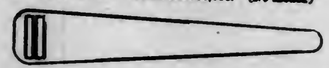
3. In a machine for dressing the peripheral edges of barrel-headings, the combination, with a frame the standard of which is provided with two shafts, one of which is movable longitudinally relatively to the other one and each of which is provided upon its inner end with a clamping-disk, of two lugs upon the frame, each provided with an adjusting-screw the axis of which is parallel with the axis of said shafts, an arm adjustably secured to the frame by means of said screws, and a revolving cutter in the outer end of said arm, the axis of which is also parallel with the shafts and the periphery of which is provided with a V-shaped groove, substantially as set forth.



4. In a machine for dressing the peripheral edges of barrel-headings, the combination, in a revolving cutter-head F, having a V-concave face and one or more cutters or blades *f f'*, mounted therein, of a cutting tool or tools G G, mounted in one half of the hub of said cutter-head and adjustably held in place, with their inner ends or cutting-edges g^6 entering or occupying a recess or chamber g^5 in the other half of the hub at the angle of said V-concave, whereby both the beading or dressing and beveling on the edge of the blank are performed, substantially as herein set forth.

481,386. TOE-CALK FOR HORSESHOES. THEODORE S. VERY, Boston, Mass. Filed May 8, 1891. Serial No. 392,016. (No model.)

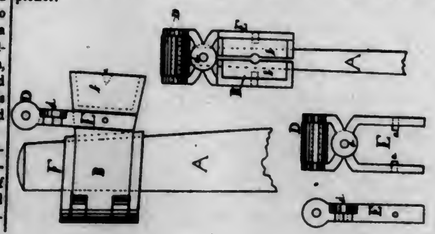
Claim.—The improved calk for horseshoes, having a hole formed part way therein and a spur made in a separate piece from said calk and having one end permanently and rigidly secured in said hole, as set forth.



481,387. APPARATUS FOR MAKING FRIED OYSTERS. FRANKLIN F. WARTHEN, Baltimore, Md. Filed Dec. 17, 1891. Serial No. 415,346. (No model.)

Claim.—1. An oyster padder and frier consisting of two sheet-metal pieces hinged together at one side and having a connecting-fastener at the opposite side, one of said pieces being formed with perforated molds for receiving the oyster and the material for padding it and the other formed with perforated covers for said molds, the portions of the two sheets between the molds fitting close against each other, as described.

2. An apparatus for frying oysters, comprising a perforated mold made up of two sections hinged together at one side and having a connecting-fastener at the opposite side and provided with ears at two opposite sides, a swinging bail pivoted in said ears, a receptacle for containing the frying substance, in which the perforated mold is placed, and an overhanging hook fastened to the said receptacle and arranged to receive the bail of the mold and hold the latter suspended while it is turned over in the bail, in the manner described.

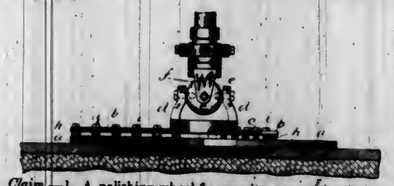


481,388. RIBBON-NEEDLE. GUSTAVUS G. WEIGAND, Des Moines, Iowa. Filed Feb. 9, 1891. Serial No. 380,683. (No model.)

Claim.—As a new article of manufacture, a ribbon-needle consisting of a flat plate that is wider at one end than the other and has straight smooth edges and two parallel slots extending transversely to the longitudinal axis of the needle at its wide end adapted to admit a ribbon in the manner set forth, for the purposes stated.

481,389. LOOM-PICKER. RICHARD WHARTON, Philadelphia, Pa., assignor of two-thirds to George F. Patterson and James B. Patterson, same place. Filed Dec. 19, 1891. Serial No. 415,690. (No model.)

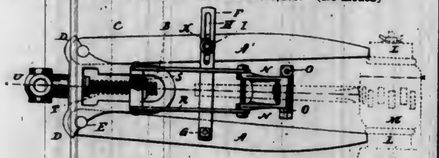
Brief.—The picker is hinged in the back, and the two parts being held together by the spring-clamp allows the parts to slightly separate when the point of the shuttle strikes the recess in the end of the picker.



Claim.—A loom-picker in two parts hinged together at the back, said parts projecting to the front, and a spring-clamp embracing said parts and holding them together, substantially as described.

481,840. RIM AND TIRE FOR WHEELS. CHARLES R. W. WOODWARD, Chicopee, Mass., assignor to the Overman Wheel Company, same place. Filed Feb. 16, 1891. Serial No. 381,701. (No model.)

Claim.—The combination, with an arch-shaped rubber wheel-tire having the edges of its side walls made flat in cross-section and beveled or inclined toward each other at an angle of about forty-five degrees, of a wheel-rim having its bed constructed with two annular seats made flat in cross-section and inclined toward each other in conformity with the inclination of the edges of the tire, substantially as described.



481,841. DEVICE FOR POLISHING GRANITE, &c. GEORGE L. BADGER, West Quincy, Mass. Filed Dec. 21, 1891. Serial No. 415,889. (No model.)

Claim.—1. A polishing-wheel for granite, comprising in its construction a plurality of rings, tie-bars connecting the rings, and springs interposed between the rings and tie-bars, as set forth.

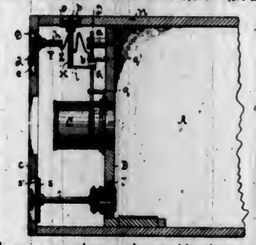
2. A polishing-wheel for granite, consisting of a plurality of rings, a hub *c*, tie-bars connected with said hub and radiating therefrom, springs interposed between the rings and tie-bars, and bolts for connecting the tie-bars to the rings, as set forth.

481,842. SPOKE-EXTRACTOR. WALLACE F. BOWE, Meriden, Conn. Filed July 23, 1891. Serial No. 400,470. (No model.)

Claim.—1. In a spoke-extractor, the combination, with a frame consisting of a head and two legs, one of which is adjustable toward and from the other, of pulling mechanism mounted in the said frame between the legs thereof and means for positively varying the separation between the ends of the said legs, substantially as described.

2. In a spoke-extractor, the combination, with a frame consisting of a head and two legs pivoted to the said head which extends between them, of pulling mechanism mounted in the said frame between the legs thereof and means for positively varying the separation of the free ends of the legs, substantially as described.

3. In a spoke-extractor, the combination, with a frame consisting of a head and two legs connected therewith and one being movable toward and away from the other, of pulling mechanism located between the said legs and including two jaws pivotally connected at their forward ends, a screw mounted in the said head, and connections between the rear ends of the jaws and the screw, substantially as described.



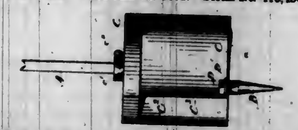
4. In a spoke-extractor, the combination, with a frame consisting of a head having a longitudinal opening and two parallel legs connected therewith, one being movable toward and away from the other, of pulling mechanism including two jaws pivotally connected at their forward ends, a screw mounted in the outer end of the said head, a nut mounted in the opening of the head, and connections between the inner ends of the jaws and the nut, substantially as described.

5. In a spoke-extractor, the combination, with a frame consisting of a head and two parallel legs connected therewith, one being movable toward and away from the other, of a pulling mechanism consisting of two jaws pivotally connected at their forward ends, which are separated, a screw mounted in the outer end of the head, a nut located in the opening of the head, and two pairs of bars respectively connecting the inner ends of the jaws with the projecting opposite ends of the nut, substantially as described.

6. In a spoke-extractor, the combination, with a frame consisting of a head having a longitudinal opening and enlarged at its outer end to form two sockets and of two parallel legs respectively pivoted in the said sockets, of a pulling mechanism consisting of two jaws pivotally connected at their forward ends, which are separated, a screw mounted in the outer end of the head, a nut located in the opening of the head, and connections between the rear ends of the jaws and the said nut, substantially as described.

7. In a spoke-extractor, the combination, with a frame consisting of a head and two parallel legs, one of which is movable toward and away from the other, of a pulling mechanism consisting of two jaws pivotally and adjustably connected together at their forward ends, a screw mounted in the head, and connections between the rear ends of the jaws and the said screw, substantially as described.

481,848. CAMERA-SHUTTER. WILLIAM H. BRISTOL, Hoboken, N. J. Filed Mar. 2, 1892. Serial No. 423,473. (No model.)



Claim.—In a camera-shutter, the combination of a pivoted shutter, a movable support therefor, a spring made fast at one end to the shutter, an energizing-key arranged in line with the spring and having the end opposite the spring slotted to receive the free end of the spring, and a detent and releasing device, substantially as described.

481,844. NUT-LOCK. JOSEPH BROADLEY, Elkhorn, Canada. Filed June 10, 1892. Serial No. 436,184. (No model.)

Claim.—The combination, with a screw threaded bolt A, having a reduced cam-surface *a*, of the nut B, having one or more grooves *b*, and the locking-strip or key C, composed of relatively-soft metal, insertible into the keyway formed by said cam-surface *a* and one of said grooves *b* when in registration, whereby on turning the nut in the tightening action the said strip will be carried laterally over the said cam-surface on the bolt and be thereby compressed between threads of the bolt, becoming a positive friction-lock to the nut, substantially as described.

481,845. EARTH-AUGER. FREDRICK W. BROCKNEPER, New Haven, Conn. Filed Jan. 18, 1892. Serial No. 418,490. (No model.)

Claim.—1. In an earth-auger, the combination, with the shank thereof, of a substantially cylindrical earth-chamber having a discharge-opening in its side and having its upper end, to which its shank is attached, closed and its lower end constructed with a downwardly-projecting lip, and an adjustable centering-point mounted in the said lower end of the chamber, substantially as described.

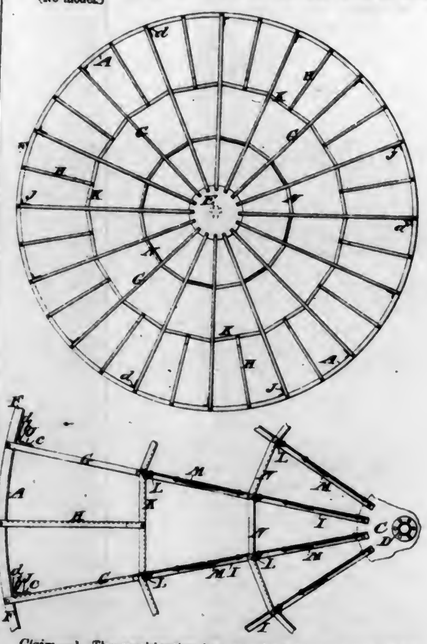
2. In an earth-auger, the combination, with the shank thereof, of a substantially cylindrical earth-chamber having its lower end broken away on one edge, a portion of which is bent downward to

form a lip and having its shell made with a discharge-opening, the rear edge of the said shell with reference to the rotation of the device in use being bent inwardly to form a packing-abutment, and a centering-point mounted in the lower end of the earth-chamber, substantially as described.

481,346. **STORE-SERVICE APPARATUS.** JOHN J. CRIST, Wichita, Kans. Filed Oct. 19, 1891. Serial No. 409,146. (No model.)

Claim.—1. In the cash and parcel carrier apparatus described, the combination of the depending bars, the horizontally-extending and vertically-adjustable arms supported by said bars at opposite stations, the weighted track supporting and tilting arms pivotally connected with said former arms, the track-wire pivotally connected to and supported by said pivoted arms, and the cords and pulley mechanism for operating said pivoted track-supporting arms simultaneously for inclining the track in either direction, substantially as set forth.

2. In the carrier apparatus described, the combination, with the depending bars fixed to the wall or other support and the adjustable braces thereof, of the horizontally-extending arms respectively provided with upright portions having boxes sleeved upon the bars and adjustably held thereon by means of set-screws, the weighted track supporting and tilting arms respectively pivoted to said horizontal arms, the track-wire provided at its terminals with jointed sections pivotally connected to the swinging end of said pivoted arms, the cord-pulleys provided with supporting-frames adjustably attached to said bars above said arms, the cords attached to said track-joint sections, arranged about said pulleys, and depending therefrom for operating said pivoted arms to incline the track at each station, and the cords connecting said pivoted arms, passing about pulleys, and extending to the opposite station from such connection for reversing the inclination of the track by means of reversing the position of said pivoted arms, substantially as and for the purpose set forth.



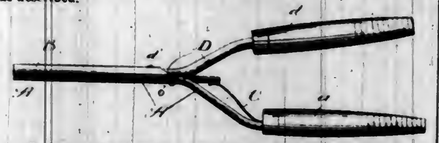
3. In store-service apparatus, the combination of depending hangers or supports at the stations, oppositely-arranged bell-crank levers pivotally connected to said supports, said levers being provided with laterally-projecting studs or pins on their forwardly-extending arms, stop-lugs adjacent to their pivots adapted to engage stops on the supports and weights on their rearward arms, jointed arms pivoted on the laterally-extending pins, a track-wire attached to the jointed arms, cords connected to the levers to reversely incline the track-wire, and pulleys over which the operating-cords are passed, all substantially as described.

4. In the carrier-apparatus system described, the combination, with the cord for operating the pivoted track supporting and tilting arms and for lowering and raising a carriage, of the cord-winding apparatus consisting of a frame, a pair of winding-drums geared together, a crank for rotating the drums, whereby a cord connected therewith is adapted to be wound upon one of said drums when raising a carriage, and a counter-weight connected by means of a winding-cord with the fellow drum, said weight-cord being arranged to wind on its drum reversely from the former cord, substantially as and for the purpose set forth.

5. In store-service apparatus, the combination of the oppositely-arranged bell-crank levers pivoted to suitable supports, jointed arms *a* and *a'*, pivoted to said bell-crank levers and provided with longitudinally-extending bores, a track-wire secured in the bores to the arms *a*, and the operating-cords similarly secured in the bores to the arms *a'*, all substantially as described.

6. In the carrier apparatus described, the carriage thereof provided with two upright side portions respectively having vertical slots, in combination with a secondary frame arranged between said upright parts, provided with side studs extending, respectively, into said slots, a downwardly-extending shank projecting into a hole in the carriage-frame, a wheel or roller, and a coiled spring surrounding said shank for yieldingly supporting said secondary frame within the carriage-frame, substantially as and for the purpose set forth.

481,347. **CIRCULAR-ROOFED STRUCTURE.** CHRISTOPHER CUNNINGHAM, Jr., Brooklyn, N. Y. Filed Mar. 30, 1892. Serial No. 427,029. (No model.)



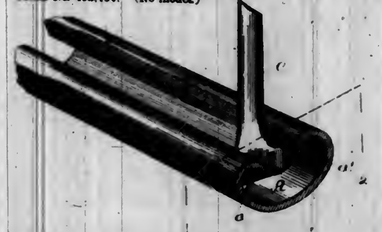
Claim.—1. The combination, in a circular tank or roofed structure, of a central roof-supporting post B, a central king-post D, erected above said post B, a crown-plate E, concentric with said posts, supported on said king-post, a concentric tie-beam plate C between said central supporting-post, a flanged wall-plate F, surrounding the side walls of the structure, inclined radial rafters G G, supported by said crown-plate and wall-plate, and radial tie-beams I, connecting the walls of the structure with said concentric tie-beam plate C, substantially as herein set forth.

2. The combination of the central post B, the side walls A, the central king-post D, the concentric crown-plate E, and tie-beam plate C, the flanged wall-plate F, the radial inclined main rafters G, connected with the concentric crown-plate E, the radial tie-beams connected with the concentric plate C, the flanged gusset-plates J, connecting both the rafters G and the tie beams C with the side walls A, the purlins K, connecting the main rafters G, and the intermediate or radial rafters H, connecting the purlins K with the flanged wall-plate, all substantially as herein set forth.

481,348. **CURLING-IRON.** FREDERICK H DEKNATEL, Evanston, Ill. Filed Aug. 24, 1891. Serial No. 403,524. (No model.)

Claim.—1. In a curling-iron, the combination of a clamping-jaw and a sleeve pivoted thereto, the pivot passing through the sleeve and jaw in a plane substantially parallel to that of the handles, a removable core adapted to be inserted into such sleeve at the end thereof adjacent to and forward of the handles, and handles for the clamping-jaw and core, substantially as described.

2. In a curling-iron, the combination of a clamping-jaw and a sleeve pivotally secured thereto by a pivot passing through the sleeve and jaw in a plane substantially parallel to that of the handles, such sleeve and jaw normally contacting throughout substantially their entire length, a separate core adapted to be inserted into the sleeve through the end thereof adjacent to the handles and forward of such handles, such core and jaw being provided with suitable handles, substantially as described.



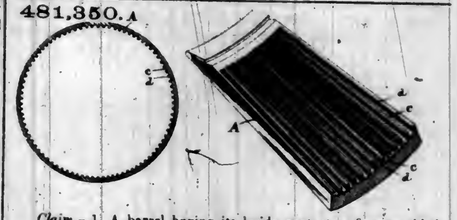
3. In a curling-iron, the combination of a sleeve, a core separate from such sleeve and adapted to be inserted into the same through the end thereof adjacent to the handles and forward of such handles, and means for securing the core in place, the iron being provided with suitable handles, substantially as described.

4. In a curling-iron, the combination of a clamping-jaw, a sleeve pivoted thereto, said sleeve being formed by rolling a piece of sheet metal upon a substantially cylindrical mandrel and leaving the adjacent edges thereto unattached to each other, forming an opening adjacent to the jaw, and a core adapted to be inserted into such sleeve, substantially as described.

5. In a curling-iron, the combination of a clamping-jaw, a sleeve pivotally secured thereto and provided with a slot, and a core separate from such sleeve adapted to be inserted into the end of the stem adjacent to the handles and forward of such handles and provided with a lug adapted to engage with the slot in the sleeve to hold the core in place, substantially as described.

6. In a curling-iron, the combination of a clamping jaw, a sleeve, a spring normally holding the jaw and spring in contact, a core separate from such sleeve and adapted to be inserted into the same through the end thereof adjacent to the handles and forward of such handles, and handles for the jaw and core, substantially as described.

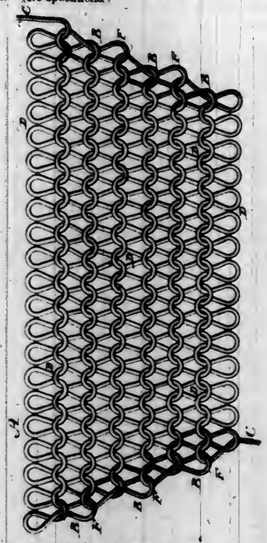
481,349. **HAY-CARRIER TRACK.** HENRY L. FERRIS, Harvard, Ill., assignor to Hunt, Helm & Ferris, same place. Filed May 12, 1892. Serial No. 432,759. (No model.)



Claim.—1. A track having two parallel convex portions separated by a practically-continuous slot and a depending portion uniting the outer edges of the convex portions, in combination with the hanger having a shank adapted to slide back and forth in the slot, and a head sliding loosely within the track and adapted for engagement therewith, substantially as described.

2. A track having two convex parallel treads separated by a slot and a depending portion uniting the outer edges of the treads, in combination with a hanger having a shank adapted to slide back and forth in the slot, and an anchor shaped head adapted to engage with the concave under surfaces of the treads, substantially as described.

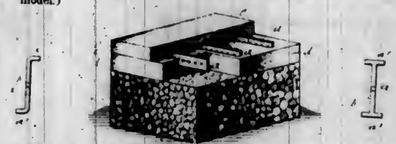
3. A track formed of a thin piece of metal in the shape of the letter U, with the edges curved inward and downward to form two convex treads, in combination with hangers having anchor-shaped heads, and a carrier having wheels with concave peripheries, whereby the wheels, the track, and the hangers are all locked together against independent lateral movement, substantially as described.



481,350. **BARREL.** GEORGE H. FORSTER, Baltimore, Md. Filed Nov. 16, 1891. Serial No. 412,024. (No model.)

Claim.—1. A barrel having its inside contact-surface provided with indentations so formed as to leave between them thin projecting wood parts, for the purpose described.

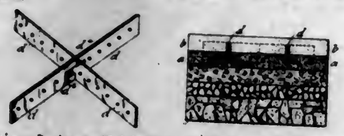
2. A barrel having its inner surface provided with alternating tongues and grooves, for the purpose set forth.



481,351. **KNIT FABRIC.** JOSEPH F. GEE, Philadelphia, Pa., assignor to Edward H. Godshalk, same place. Filed Oct. 3, 1891. Serial No. 407,597. (No specimens.)

Claim.—1. A widened knitted fabric having a selvage formed of twisted loops, substantially as described.

2. A widened knitted fabric having a selvage formed of its body-thread twisted so as to consist of tight loops, substantially as described.

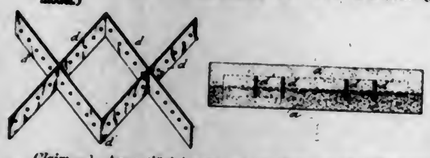


481,352. **ARTIFICIAL-STONE PAVING-BLOCK.** FRANKLIN HAINES, Yonkers, N. Y. Filed Aug. 3, 1891. Serial No. 401,559. (No model.)

Claim.—1. An artificial-stone paving-block formed of two layers or courses and having embedded therein metallic binder bars or plates which are set on edge and provided with bent-over flanges at the upper and lower edges, said plates being completely embedded and inclosed in said block, one flange in one layer thereof and the other flange in the other layer thereof, substantially as described.

2. An artificial-stone paving-block formed of two layers or courses having embedded therein metallic binder bars or plates set on edge and provided with openings in the body along the middle thereof, the material of the adjacent layers uniting at the openings and flowing therethrough, and with flanges at the upper and lower edges, said binder-bars extending from the base-layer into the top layer or course of the block, substantially as described.

481,353. ARTIFICIAL-STONE PAVING-BLOCK. FRANKLIN HAINES, Yonkers, N. Y. Filed Aug. 3, 1891. Serial No. 401,560. (No model.)

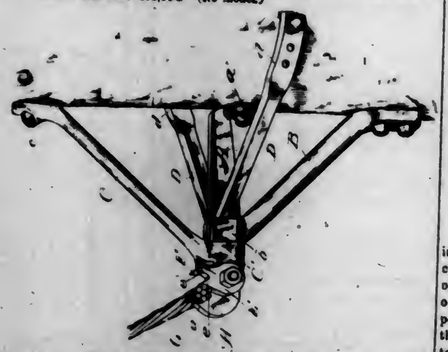


Claim.—1. An artificial-stone paving-block having embedded therein two intersecting flat metallic binder bars or plates set on edge, both of said plates being provided at or near their centers with interlocking slots, substantially as described.

2. An artificial-stone paving-block having embedded therein two perforated intersecting flat metallic binding bars or plates set on edge, both of said plates being provided at or near their centers with interlocking slots.

3. An artificial-stone paving-block formed of two layers or courses, having embedded therein metallic binder bars or plates set on edge and provided with interlocking slots at or near the center of said bars and with openings along the middle thereof, the material forming the pavement uniting at said openings and flowing therethrough.

4. An artificial-stone paving-block having embedded therein interlocking metallic binding bars or plates set on edge, one of said bars being provided with a longitudinal closed central slot and the other with lateral open slots, whereby the interlocking of the bars is effected.



481,354. ARTIFICIAL-STONE PAVING-BLOCK. FRANKLIN HAINES, New York, N. Y. Filed June 22, 1892. Serial No. 437,630. (No model.)

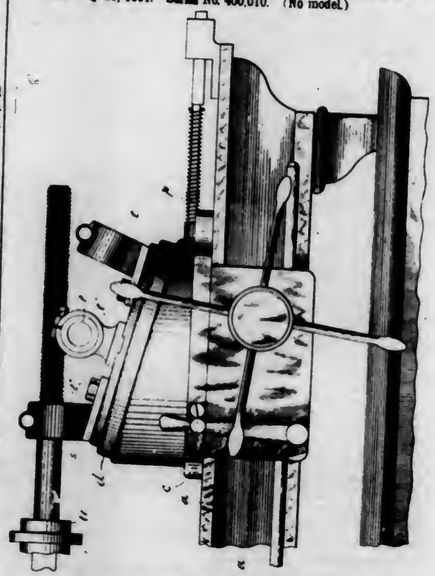
Claim.—1. An artificial-stone paving-block having embedded therein metallic V-shaped binder bars or plates set on edge and provided with interlocking recesses at or near their end centers, said V-shaped bars being disposed in opposite direction, substantially as described.

2. An artificial-stone paving-block having embedded therein metallic V-shaped binder bars or plates set on edge and provided with interlocking recesses at or near their end centers, said V-shaped bars being disposed in opposite direction and provided with openings along the center thereof, so that the material forming the block flows through said openings and unites on both sides of the binder-bars, substantially as set forth.

481,355. HANGER FOR LUMBER-CARRIERS. JAMES E. HARDER, Chicago, Ill., assignor to George W. Cole, same place. Filed Aug. 11, 1891. Serial No. 402,364. (No model.)

Claim.—1. A rail-support comprising a central bar provided with a fixed jaw, a movable jaw connected to such bar, and means whereby the movable jaw is advanced toward the fixed jaw to engage the track, substantially as described.

2. The combination of a center bar provided with a stationary jaw, a brace connected with such bar, a movable jaw attached to such bar, and a set-screw passing through the brace and engaging with the movable jaw, substantially as described.



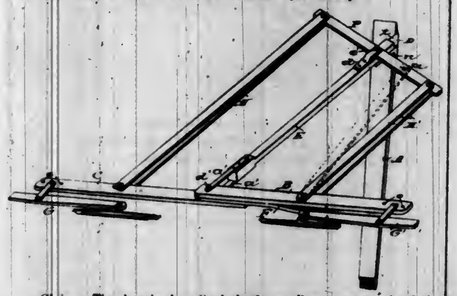
3. In a hanger, the combination of a center bar for supporting the track and side braces, such braces being independent of the center bar, abutting at one end against the same and having at the other end means for fastening the same to a tree, whereby the braces may be adjusted to permit the hanger to be attached to trees of varying sizes, substantially as described.

4. The combination of a center bar provided with a fixed jaw, a movable jaw secured thereto, means for operating the movable jaw, braces for preventing the vertical movement of the center bar, such bar and braces lying in substantially the same plane, and adjustable side braces secured to the tree and engaging with the center bar or vertical braces, substantially as described.

5. A hanger comprising a center bar having a stationary and a movable jaw, means for operating such movable jaw, braces for preventing any movement of the bar in a vertical plane, and side braces abutting at one end against the center bar or vertical braces and secured at the other end to the tree, such side braces being separate from the center bar, with their outer ends free to move, as desired, and provided with means for fastening, whereby they may be adjusted to permit the hanger to be attached to trees of varying diameters, substantially as described.

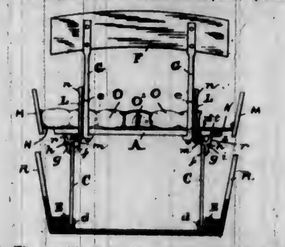
6. The combination of a center bar to support the track, a brace placed beneath such bar and provided with forks to receive and hold the same, a brace placed above the bar and provided with a slot to receive and hold the same, and side braces separate from the bar abutting at one end against the bar or other braces, provided at their outer ends with means for fastening and free to move at their outer ends, whereby the center bar is held from moving in all directions, while the braces may be so adjusted as to allow the hanger to be attached to trees of varying sizes, substantially as described.

481,356. TURRET-LATHE. JAMES HARTNESS, Springfield, Vt. Filed July 20, 1891. Serial No. 400,010. (No model.)



Claim.—1. In a turret-lathe or screw-machine of the class hereinbefore described, the combination, with the bed, the work-holding chuck, and other essential parts, of an inclined turret having a series of operating-tools projecting above its upper surface, the inclination of the turret being such as to elevate the tool which is in operative position or nearest the chuck and depress the opposite tool, whereby the work is enabled to project across the turret from the operating-tool without contact with the opposite tool, as set forth.

2. The combination, with the bed, the work-holding chuck and other essential parts, of a carrier having an inclined seat and an inclined bearing at its central portion, the highest part of said seat being nearest said chuck, and a turret formed to rest in an inclined position on said seat and having a shaft journaled in said bearing, said turret having operating-tools projecting above its upper surface, as set forth.



3. A lathe provided with a work-holding chuck and a tool-carrying turret inclined downward from the said chuck and provided with a series of operating-tools, the highest part of the turret being nearest the chuck, so that the operating-tool at the front of the turret is raised above the opposite tool, as set forth.

481,357. DRAFT-EQUALIZER. ALSON HUNT, Atlantic, Iowa. Filed Sept. 25, 1891. Serial No. 406,849. (No model.)

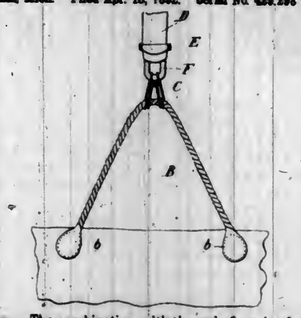
Claim.—The herein-described draft-equalizer, composed of the tongue A, the bar E, secured to the tongue, the spring-support F, secured to the tongue, the levers B and C, pivoted at their inner ends to the outer ends of the bar E and support F by a common pivot, the lever P, pivoted to the bar E, the parallel bars H, pivoted at their forward ends to the lever C and at their rear ends to the lever P, and the parallel bars A', pivoted at their forward ends to the lever B and at their rear ends to the lever P, all combined substantially as described.

481,358. JUMP-SEAT FOR VEHICLES. GEORGE H. HUTTON, Baltimore, Md. Filed Apr. 23, 1892. Serial No. 430,327. (No model.)

Claim.—1. The combination of the seat, movable sides therefor supported by sliding arms N, which rest on the seat, pivoted legs supporting the seat, swinging irons I under the seat for locking the said pivoted legs and located on the outer sides of the latter, said irons provided with prongs r, projecting upward beyond the pivots of said swinging irons and loosely engaging the slide-arms which support the seat sides, and also having lateral arms m, a seat-back, jointed irons connecting said back with the seat, and rods connecting said jointed irons and the lateral arms of the swinging leg-locking irons.

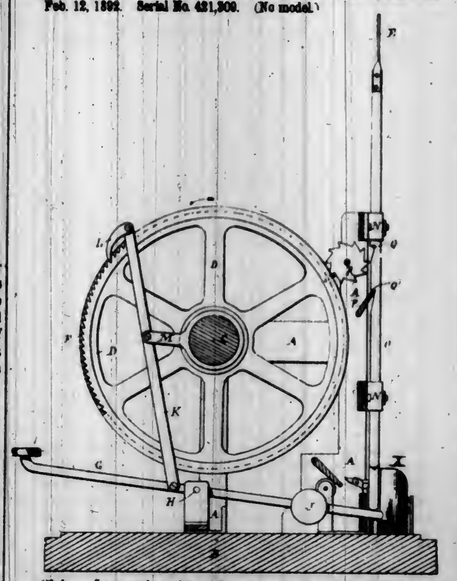
2. A jump-seat for vehicles having extensible sides and extensible cushions connected to said sides.

3. The combination of the seat, extensible sides therefor supported by slide-arms resting on the seat, and an extensible cushion connected to said slide-arms.



4. The combination of the seat, extensible sides therefor having slide-arms connected to them and resting on the upper side of the seat, said arms having hooks formed at the ends, and cushion-pieces joined by a flexible web and engaged by said hooks, substantially in the manner and for the purpose described.

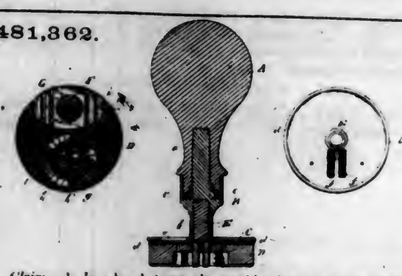
481,359. MASSAGE APPARATUS. ARTHUR KARN, New York, N. Y. Filed Dec. 28, 1891. Serial No. 416,340. (No model.)



Claim.—A massage apparatus consisting of a reservoir the head of which is perforated and is provided with a number of warts, substantially as specified.

481,360. SUSPENDER-END ATTACHMENT. JOHN LEES, Jr., Adrian, Mich. Filed Apr. 15, 1892. Serial No. 429,296. (No model.)

Claim.—The combination, with the end of a pair of suspenders, of loops formed of curved braided strips having flat securing portions at their lower ends to be permanently secured to trousers, a spring-hook formed of a single piece of wire bent at its middle to form a hook c, the shanks of which are bent, respectively, into coils constituting registering eyes through which the strip passes, the ends of the wire terminating in spring-arms and carried up and engaging below the hook portion, and an eye F on the end of the suspenders with which the hook engages, substantially as described.

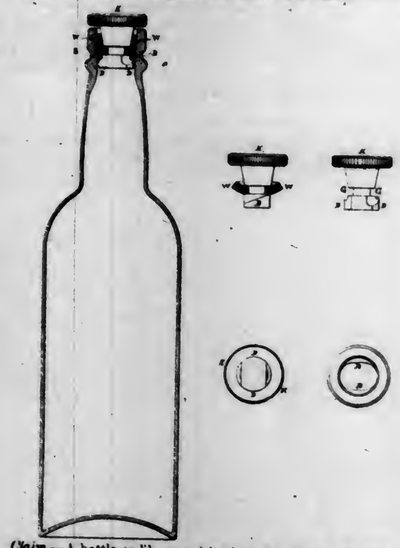


481,361. CASH-REGISTER. CHARLES LENZ, Acton, England. Filed Feb. 12, 1892. Serial No. 421,309. (No model.)

Claim.—In a cash-register, the combination, with a plurality of independent drums or wheels, a shaft on which said drums or wheels are revolubly, a portion of the peripheries of said drums having teeth, bars K, having pawls L secured at their upper ends, said bars being secured to levers G, loose collars mounted on said shaft, each carrying a projecting arm M, pivoted at its outer end to bar K, weights J, attached to levers G, and vertically-movable disk-rods resting upon the inner ends of said levers G, substantially as set forth.

481,362. HAND-STAMP. FREDERICK C. LIDER, New York, N. Y. Filed May 15, 1889. Renewed Oct. 6, 1891. Serial No. 407,908. (No model.)

481,362.

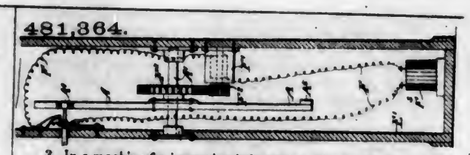


Claim.—1. In a hand-stamp, the combination, with a stock provided with a socket and a circumferential groove surrounding the same, of types provided with projections and an expansion-ring, as set forth.

2. In a hand-stamp, the combination, with a stock provided with a socket, of a series of sets of type and expansion-rings, as set forth.

3. In a hand-stamp, a stock provided with a socket, in combination with removable type located in said socket and a spring-ring pressing against the type and holding them in place.

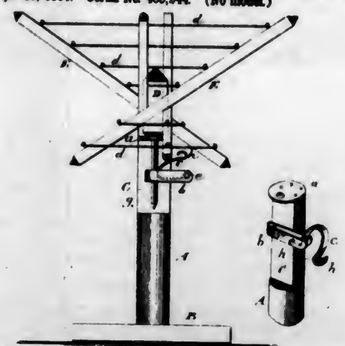
481,363. BOTTLE-STOPPERING DEVICE. MATTHEW L. MACAULEY, Glasgow, Scotland. Filed Mar. 16, 1891. Serial No. 385,463. (No model.) Patented in England Sept. 24, 1887, No. 12,938.



Claim.—A bottle or like vessel having ribs within the neck on opposite sides in a plane at right angles to the passage in the neck, in combination with a stopper provided at its inner end with projections having inclined or screw-like upper surfaces and adapted to pass down between the bottle-neck ribs and turn under them when the stopper is fully in and also provided with a groove immediately above the projections, and an elastic washer held in said groove and adapted to bear upon the internal ribs when the stopper is in place, all substantially as described.

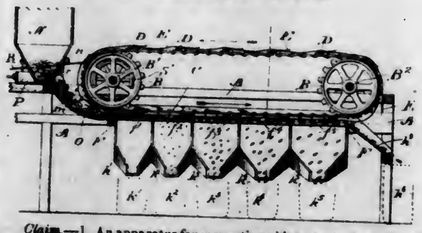
481,364. TRAIN-INDICATOR. HERBERT L. MANTON, Melbourne, Victoria. Filed Dec. 1, 1891. Serial No. 413,752. (No model.)

Claim.—1. In a machine for imparting information, the combination, with a casing having a reading-opening, of a dial carrying a series of tabulated statements and having a corresponding number of holes at different distances from its axis, a series of press-button plugs mounted in bearings in the casing and corresponding in number with the holes in dial, and means for rotating the dial, for the purpose set forth.



2. In a machine for imparting information, the combination, with a dial having a series of holes at different distances from its axis, of a series of spring-retracted press-button plugs having reduced ends, forming shoulders to limit the entry of the plugs into the said holes, substantially as described.

481,364.



3. In a machine for imparting information, the combination, with a casing having a suitable reading-opening, of a dial carrying a series of tabulated statements and having a corresponding number of holes at different distances from its axis, a series of press-button plugs mounted in a row of bearings formed in the casing and having springs to normally keep them out of engagement with the holes in the dial, and means for rotating the dial, substantially as described.

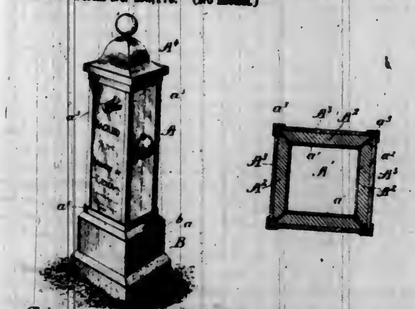
481,365. CLOTHES-DRIER. JOHN L. MATHER, Lanark, Ill. Filed Sept. 10, 1891. Serial No. 405,244. (No model.)

Claim.—The stock A, having at the upper end a rabbet with the perforated plate *a* above it, and below said plate the band *b*, attached to the flat face C, said plate carrying a pivoted spring-latch *c*, in combination with the reel-head D, having a bottom bolt *g*, whereby the reel may be conveniently held in the positions specified.

481,366. GRAIN-SEPARATOR. JOSEPH MENGE, New Orleans, La. Filed Apr. 8, 1892. Serial No. 428,390. (No model.)

Claim.—1. An apparatus for separating oblong grains from shorter grains or smaller particles of foreign matter, comprising a fixed screen having holes of less diameter than the length of the oblong grains and moving flaps adapted to lie upon and drag the mixed grain over said screen, substantially as described.

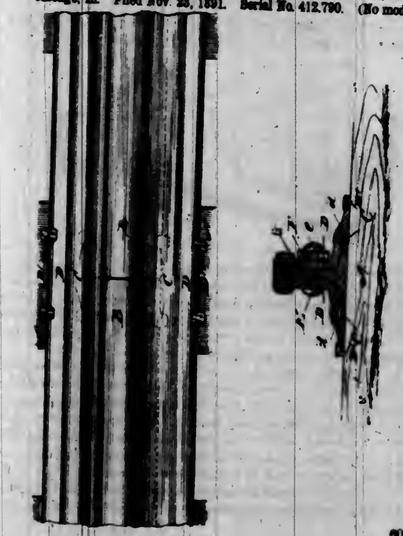
2. An apparatus for separating oblong grains from shorter grains or small particles of foreign matter, comprising a graded fixed screen having a number of small holes at one end and a number of holes increasing in diameter toward the other end, with suitable receptacles under said holes, and moving flaps adapted to lie upon said grain and to drag it along over said screen, substantially as and for the purposes described.



3. An apparatus for separating oblong grains from shorter grains or small particles of foreign matter, comprising a fixed screen having holes of less diameter than the length of the oblong grains, and an endless drag of the character described, with flaps adapted to lie upon the mixed grain and to drag it over said screen, substantially as described.

4. In an apparatus of the character described, the combination, with two pairs of sprocket-wheels and means for driving the same, of endless chains meshing in said sprocket-wheels, slats spanning said chains and secured thereto, and pads attached at one end to said slats and free at the other, a screen beneath said pads and adapted to be swept thereby, and means for feeding the grain onto said screen, substantially as described.

5. In an apparatus of the character described, the combination, with two pairs of sprocket-wheels and means for driving the same, of endless chains meshing in said sprocket-wheels, slats spanning said chains and secured thereto, and pads attached at one end to said slats and free at the other, a screen with holes less in diameter than the length of a whole grain beneath said pads and adapted to be swept thereby, and means for feeding the grain onto said screen, substantially as described.



6. In an apparatus of the character described, the combination, with two pairs of sprocket-wheels and means for driving the same, of endless chains meshing in said sprocket-wheels, slats spanning said chains and secured thereto, and pads attached at one end to said slats and free at the other, a graduated screen having fine holes toward one end thereof and coarser holes toward the other end thereof, the said holes being all less in diameter than the length of the longest grains to be separated, the said screen being placed beneath the said pads and being swept by them, and means for feeding the grain onto said screen, substantially as described.

481,367. MEMORIAL MONUMENT. JOSEPH MITCHELL, Cayuga, Ind., assignor of one-fourth to Milton James, same place. Filed May 7, 1892. Serial No. 432,176. (No model.)

Claim.—A monument consisting of a base-piece of stone or other suitable material, a polygonal hollow metallic frame mounted upon said base-piece with radial ribs terminated by arrow-head angle-flanges at the edges of said polygon, panels of plaster-of-paris or stone placed between said radial ribs, and glass plates covering said panels, the edges of said glass plates and panels being covered by the said arrow-head angle-posts, substantially as described.

481,368. RAILWAY CONSTRUCTION. WILLIAM J. MORDEN, Chicago, Ill. Filed Nov. 23, 1891. Serial No. 412,790. (No model.)

Claim.—1. In means for securing track-rails, the combination, with the rail, of continuous brace-bars having one member thereof secured with the web of the track-rail and the other member thereof provided with seats to receive the heads of the track-rail spikes, substantially as described.

2. In means for securing railway-rails, the combination, with said rails, of continuous bars joined end to end and having members fitted beneath the head of the track-rail, against the web, and upon the foot thereof, grooves in the lower members of said bars to receive the heads of the track-spikes, and bolts or rivets for securing the bars and rails together, substantially as described.

3. In means for securing railway-rails, the combination, with rails having perforations through their webs, of angle-bars joined end to end and having elongated apertures registering with the said perforations, and horizontal members overlapping the track-rail spikes and secured to the ties, and bolts or rivets passed through said apertures and perforations to secure the bars and rails together, substantially as described.

4. In means for securing railway-rails, the combination, with said rails having perforations therein, of angle-bars having in their upright members elongated apertures registering with said perforations, the horizontal members of the bars provided with seats for and overlapping the rail-spikes, rivets having their shanks passed through said perforations and apertures, washers applied to the ends of said rivets, and the rivets headed over said washers, substantially as described.

5. The combination, with railway-rails, of continuous angle-bars secured therewith, substantially as described, whereby said bars serve as fish-bars to maintain the rails in alignment, and said bars having their lower members overlapping the rail-spikes, substantially as described.

6. In combination with railway-rails, continuous angle-bars secured therewith, substantially as described, such bars having upright members provided with grooves on their inner faces and metallic conductors inserted in said grooves, and means for securing the bars to the rails, whereby to clamp and protect the conductors, substantially as described.

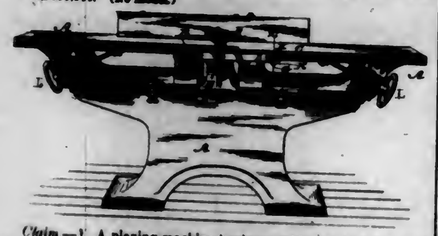
481,369. CONDUCTOR'S TRIP-SLIP. EDWIN H. MURDOCK, Cincinnati, Ohio. Filed Dec. 26, 1891. Serial No. 416,135. (No model.)

Claim.—1. The within-described method of protecting railway-tickets, &c., from being used a second time, which method comprises a conductor's trip-slip having the names of the various stations arranged on it in regular order and numbered consecutively, and a cancelling device wherewith is applied to said slip opposite a passenger's destination two numbers that indicate the station where he got on, said device being then used to mutilate the slip by cutting therefrom a piece containing a number for each of said stations, which severed piece is retained within said cancelling device, substantially as herein described.

2. A conductor's trip-slip consisting of the head A and foot C of the same color or design and inscribed with the names of the stations, their numbers and spaces *a c*, the body B, inscribed with the names of the stations, and the columns D E, of different colors or designs, ar-

ranged on opposite sides of said body inscribed with the numbers of said stations and having spaces *d e*, for the purpose stated.

3. A conductor's trip-slip consisting of the head A *a*, body B, foot C *c*, and columns D *d* E *e*, arranged and inscribed as herein set forth, said head and foot being of the same colors or designs, the columns being of different colors or designs and said colored or designed portions being duplicated on the back of said slip, as at A', C', D', and E', as described.

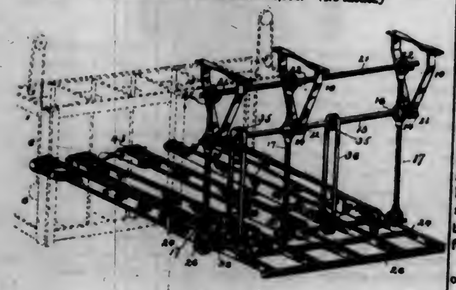


4. A conductor's trip-slip, including the head A, body B, foot C, and columns D E, of different colors or designs, inscribed and numbered, as herein set forth, and for the purpose stated.

481,370. BURIAL-CASKET. JOHN N. PRUSER, Union Hill, N. J. Filed Feb. 15, 1892. Serial No. 421,578. (No model.)

Claim.—A burial-casket of earthy material constructed of the body A, having a continuous metallic rim embedded around its upper edge flush with the outer surface thereof, the edges of said frame being bent or turned inwardly to enter the material, nuts also embedded in the material beneath the frame, and the lid having a similar rim around its edge and provided with fastening-screws for entering the nuts of the body, substantially as described and shown.

481,371. PLANING-MACHINE. LOUIS T. PYOTT, Philadelphia, Pa., assignor to L. Power & Co., same place. Filed June 13, 1890. Serial No. 355,311. (No model.)



Claim.—1. A planing-machine having a table capable of vertical adjustment and an extension or rest detachably connected to the edge of one part thereof, substantially as described.

2. A planing-machine having a table capable of vertical adjustment and an extension or rest adjustable to and from one edge of said table, substantially as described.

3. A planing-machine having a table capable of vertical adjustment with a slot in the edge thereof and an extension or rest having a headed bolt to adjustably engage said slot of the table, substantially as described.

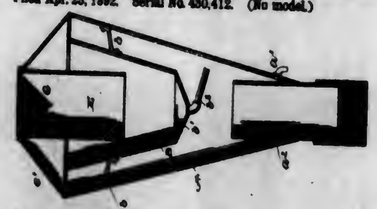
4. A planing-machine having a table capable of vertical adjustment, an extension or rest with a flange attachable to said table, and means for connecting said parts, substantially as described.

481,372. CARVING-MACHINE. JOHN K. REBEL, Hughesville, Pa. Filed Nov. 11, 1891. Serial No. 411,556. (No model.)

Claim.—1. The combination of a series of horizontally-disposed carving-arms adapted to oscillate in vertical planes, a counterbalancing-rod connecting said arms, a counter-shaft, means for suspending the carving-arms beneath the counter-shaft, a cutting or operating tool on the extremity of each carving-arm, and means for operating the counter-shaft and transferring its motion to the cutting-tools.

2. The combination of a counter-shaft, supporting-arms mounted thereon and adapted to oscillate thereon both from side to side and forward and backward, carving-arms carried by said supporting-arms, cutters on the ends of the carving-arms, and means for operating the counter-shaft and the cutters.

3. The combination of carving-arms, a counter-balance therefor, a shaft connecting said arms, supporting-arms having an eye or loop through which the counter-shaft passes and another loop or eye at their lower extremities wherein the shaft connecting the carving-arms is supported, cutters on the ends of the carving-arms, and means for operating the counter-shaft and the cutters.



4. The combination of counterbalanced carving-arms having their inner ends provided with cutters, a shaft connecting the carving-arms, arms for suspending the carving arms, provided at their ends and intermediate said ends with eyes or loops, a counterbalance-rod secured in the upper eyes by set-screws, sleeves secured centrally in the intermediate eyes or loops and supporting the arms, sleeves secured centrally in the lower eyes or loops and in which lateral extensions from the carving-arms are journaled, and means for operating the cutters.

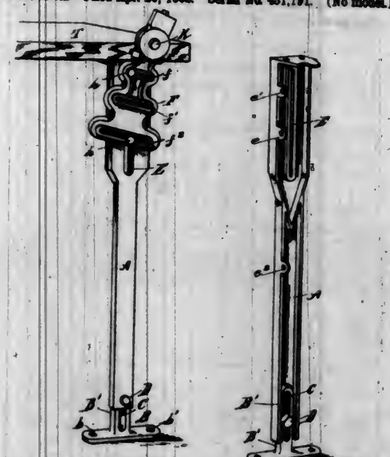
5. The combination of a shaft or shafts, means for rotating the same, carving-arms provided with fixed bearings for the journals of the shafts so as to have a pivotal movement independent thereof, sleeves loosely mounted on said bearings, and supporting-arms having eyes or loops in which said sleeves are pivotally secured.

6. In a carving-machine, the combination of carving-arms and an intermediate guiding-arm, socketed bearings passing through the carving-arms, said bearings upon the two outer arms and one of the intermediate arms being extended laterally, shafts having their ends journaled in said bearings and passing through the guiding-arm, sleeves loosely mounted upon the extended bearings, a counter-shaft above the carving-arms, supporting-arms provided with eyes or loops to receive the loose sleeves, and means for transferring the rotary movement of the counter-shaft to the shafts of the carving-arms and from the latter to the cutting-tools, substantially as set forth.

7. In a carving-machine, the combination of brackets provided at their lower ends with square or rectangular frames, journal-boxes having square or rectangular portions registering therewith, a counter-shaft provided with pulleys and having its ends bearing in the journal-boxes, sleeves loosely mounted upon the cylindrical portions of the journal-boxes, counterbalanced supporting-arms provided with eyes or loops, one set of eyes or loops being secured to the loose sleeves by set-screws, sleeves fitting and secured within the lower eyes of the series, carving-arms provided with lateral extensions turning in the sleeves, a shaft or shafts journaled in said carving-arms and carrying pulleys to receive one belt from the pulley of the counter-shaft, and also a belt connecting with the pulley of the cutting-tool, substantially as set forth.

481,373. EXHAUST-HEAD. JAMES L. ROBERTSON, New York, N. Y. Filed Apr. 23, 1892. Serial No. 430,412. (No model.)

Claim.—1. The herein-described improved exhaust-head, comprising the outer casing having the lower inlet and upper outlet pipes, the inner casing located within and secured to said outer casing, forming a passage-way between itself and said outer casing, and the foraminous plate or screen located in said passage-way at right angles to the line of passage of the steam, substantially as set forth.

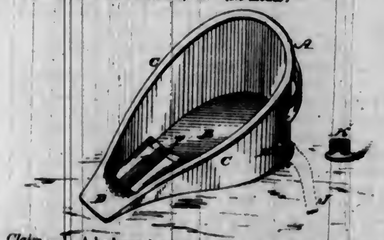


2. The herein-described improved exhaust-head, comprising the outer casing having the lower inlet-pipe, the inner casing located within and secured to said outer casing, the foraminous plate or screen located in the passage-way between said outer and inner casings and at right angles to the passage of the steam, and the outlet-pipe depending from the top of said outer casing down into said inner casing and having a foraminous plate or screen located therein, substantially as set forth.

3. The herein-described improved exhaust-head, comprising the outer casing, the inner casing located within said outer casing, the

arms supporting the same, the foraminous plate or screen secured to the upper end of said inner casing and also to said outer casing, the outlet-pipe depending from the top of said outer casing down into said inner casing, and the cone-shaped foraminous plate or screen secured to the upper end of said outlet-pipe, substantially as set forth.

4. An exhaust-head having its outer casing provided with a beveled or inclined inner flange or lower thickened end and the outlet-tube extending from said casing at the lowest point of said flange or thickened end, in combination with the inner casing and the inlet and outlet pipes, substantially as set forth.



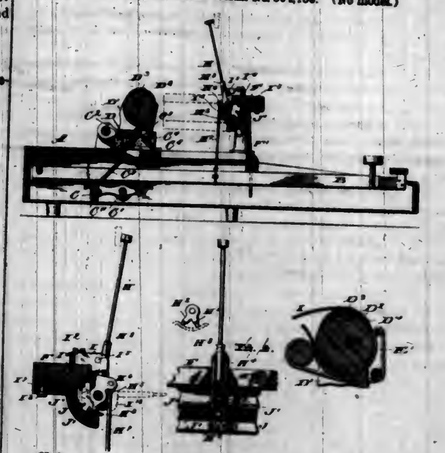
481,374. PEGGING-JACK SUPPORT. WILLIAM M. SAWYER, Detroit, Mich. Filed Apr. 20, 1892. Serial No. 431,191. (No model.)

Claim.—1. In a pegging-jack, an adjustable support consisting of a standard provided with a vertical slot at its upper end, combined with a swinging last-support provided with two or more horizontal slots of different lengths and bolts adapted to secure the parts adjustably together, substantially as and for the purposes described.

2. In a pegging-jack, the combination of a foot-piece, a standard secured thereto and vertically adjustable thereon, a swinging last-support provided with horizontal adjusting-slots, and holding-bolts passing through the horizontal slots and through a vertical slot in the standard and securing the standard and last-support together, substantially as and for the purposes described.

481,375. BED-PAN. SARAH A. SMITH, Philadelphia, Pa. Filed Aug. 13, 1891. Serial No. 402,501. (No model.)

Claim.—1. A bed-pan having a body with a chamber in the front part thereof, an inclined gutter in the rear of said chamber, and a discharge-nozzle on said body, said parts being combined substantially as described.



2. A bed-pan having a gutter E in the body thereof at or near the front thereof, said gutter being raised above the bottom, bearing the shoulder F, substantially as described.

3. A bed-pan having a body with sides ascending from front to rear, a raised gutter on the bottom of said body, and a discharge-nozzle, substantially as described.

4. A bed-pan having a body with a front portion D, a guard G in said portion, and a gutter E at the rear of said portion, said gutter being raised, forming the shoulder F, substantially as described.

5. A bed pan having an advanced portion with an under-cut at its inner end, forming a guard, and a gutter inclined from front to rear and raised above the bottom of the pan, terminating in a shoulder, said guard rising above said gutter, said parts being combined substantially as described.

481,376. TYPE-WRITING MACHINE. CHARLES SPIRO, New York, N. Y. Filed May 26, 1891. Serial No. 394,159. (No model.)

Claim.—1. A crescent-shaped grooved impression-bar and a rubber or other material arranged in the groove of the bar, in combination with and placed over a cylindrical rotary platen, substantially as specified.

2. The combination of the rotary platen E, bar D^3, bands E', and impression-strip D^2, placed over the platen and terminating at one side near the feed-bands, substantially as specified.

3. The combination, with the platen E and risers D', of the crescent-shaped bar D^3, strip D^2, and pins D^4, substantially as specified.

4. A spring-drum having a removable cap, a centrally screw-threaded spindle, and an interiorly-threaded collar having a lug, substantially as specified.

5. In a spring-drum of the character described, a spindle having an enlarged body portion, a reduced adjacent screw-threaded portion, and an interiorly-threaded collar having a lug, substantially as specified.

6. The combination, with a spring-drum, of a spindle having a disk at its lower end, a stationary pin, a base supporting the pin and spindle, an interposed spring, and a movable device for insertion beneath the drum, substantially as specified.

7. The combination, with the rack-bar of a platen-carriage, of two pawls arranged in a common vertical plane, one longer than the other and each connected at different points with relation to their pivots with a universal ball, substantially as specified.

8. An escapement for a carriage-feed, comprising a pawl fixedly connected with the universal ball and a companion pawl movably connected with said ball by a single link, substantially as specified.

9. The combination, with a ball, of two pawls, one connected with the ball at a point beyond its pivot and the other connected with the ball at a point between its pivot and its free end, substantially as specified.

10. The combination of two pawls and a ball to which both are directly connected at points at opposite sides of their pivots, and a spring interposed between the pawls, substantially as specified.

11. The combination, with two pawls operating with a common rack-bar, of two links, the one fixedly connecting one of the pawls with the ball and the other adjustably connecting the other pawl with the ball, substantially as specified.

12. The combination, with the carriage feed-rack of a type-writing machine, of a pawl pivotally mounted on a fixed part of the machine, a link extending from the point on the pawl beyond its pivot to a ball, and means for fixedly connecting said link to the ball, substantially as specified.

13. The combination, with the carriage feed-rack of a type-writing machine, of a pawl pivotally mounted on a fixed part of the machine, a link pivotally connected with the pawl between its pivot and the free end and extending to a ball, and means for connecting the pawl to the ball, to permit of a slight relative independent movement of the link on the ball, substantially as specified.

14. The combination, with the universal ball of a type-writing machine, of two links and two pawls, the links extending directly from

the ball to the pawls, one of said links being fixedly connected with the ball and the other movably connected with the bail, substantially as specified.

15. A key-lever having a V-shaped bifurcated end, in combination with a key resting on the ends of the bifurcations, substantially as specified.

16. A key-lever having resilient bifurcations at its ends, substantially as specified.

17. The combination, with a bifurcated key-lever, of a key having a recess adapted to receive the ends of the bifurcations, substantially as specified.

18. A type-bar provided with a pinion at one end, in combination with relatively-fixed means in the path of the bar for rotating or partially rotating said bar, substantially as specified.

19. A type-bar having a pinion at its end, in combination with relatively-fixed means in the path of the bar for rotating or partially rotating the pinion and bar in opposite directions, substantially as specified.

20. A type-bar having a pinion at its end and relatively-fixed means in the path of the bar for rotating or partially rotating the said pinion in either direction, substantially as specified.

21. A type-bar having a pinion at its end and means for rotating the pinion, located on opposite sides of the pinion and capable of moving into and out of mesh therewith.

22. A type-bar having a pinion at one end, a printing character at the other end, and an intermediate pivot, whereby a pivotal movement of the type-bar moves the pinion bodily and renders it capable of rotation by contact with a fixed pinion-rotating mechanism arranged in the path of said bar, substantially as specified.

23. A type-bar carrying a printing character at one end, a rotating mechanism at the other and intermediately pivoted, in combination with a relatively-fixed pinion-rotating mechanism arranged in the path of the bar, whereby the printing character at one end of the bar is bodily rotated to be presented at one end of the movement of the bar to an inking-pad and at the opposite end to a printing-point, substantially as specified.

24. The combination, with a rotatable type-bar and means for partly rotating the same, of a movable pinion-rotating mechanism arranged in the path of said bar and on opposite sides of its pinion, substantially as specified.

25. The combination, with a rotatable type-bar and with movable mechanism arranged in the path of said bar and on opposite sides of its pinion for rotating the same, of locking devices for maintaining the movable rotating mechanism in a shifted position, substantially as specified.

26. The combination, with a rotatable type-bar and its rotating mechanism arranged in the path of said bar and on opposite sides of its pinion, of a locking mechanism for preventing the rotation of the type-bar at the end of its movement, substantially as specified.

27. The combination, with a rotatable type-bar and its pinion and with the pinion-rotating mechanism arranged in the path of said bar and on opposite sides of its pinion, of locking mechanism for preventing the rotation of the bar as and after it leaves its rotating mechanism, substantially as specified.

28. A type-bar bracket consisting of a bent plate riveted together at its ends, having an adjusting-screw connecting the sides, and intermediate type-bar bearings, substantially as specified.

29. A type-bar bracket connected at its ends by a rivet provided with type-bar bearings and with an adjusting-screw, said bearings being between the rivet and the adjusting-screw, substantially as specified.

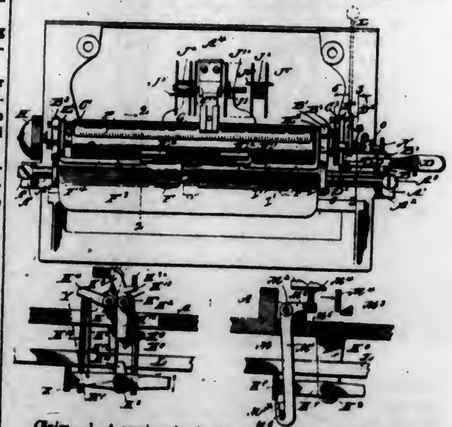
30. The combination, with a rotatable type-bar and with the mechanism arranged in the path of said bar, comprising a pinion and pins arranged at opposite sides thereof for causing its rotation, of a lever connected with the rotating mechanism and a locking device for securing the lever in a desired position, substantially as specified.

31. The combination, with a key-lever and the type-bar rotating mechanism, which is movable, of a lever actuated by the movement of said mechanism for the purpose of producing a locking of said mechanism against return movement, substantially as specified.

32. The combination, with a rotatable type-bar, of mechanism for rotating the same in opposite directions and a lever for locking the rotating mechanism, substantially as specified.

33. The combination, with a rotatable type-bar, movable rotating mechanism arranged to be projected into the path of the bar at either side thereof, and mechanism for locking the rotating mechanism operatively connected with the key-levers of the machine, substantially as specified.

34. The combination, with a rotary type-bar and with means arranged in the path of said bar for rotating the same, of locking mechanism controlled by a key-lever, substantially as specified.



35. The combination, with a rotary type-bar and with the mechanism for rotating the same, of locking devices operatively connected with the universal bail of the machine, substantially as specified.

36. The combination, with a bar-rotating mechanism, of a lever mounted on an adjacent fixed part of the machine and adapted to lock said movable mechanism against movement, substantially as specified.

37. The combination, with the movable character-selecting and bar-rotating mechanism, of a lever pivoted to an adjacent fixed part of the machine, the key-bars, and intermediate connecting devices, which, through the operation of the key-bars, serve to lock movable mechanism against movement, substantially as specified.

38. The combination, with a rotatable type-bar having a pinion, positively-arranged pinion-operating devices mounted on a movable part, of an adjacent fixed part having a toothed locking-lever carried by the movable part and provided with a pawl, a universal bail, and a device connecting the bail with the pawl, substantially as specified.

481,877. TYPE-WRITING MACHINE. CHARLES SPIRO, New York, N. Y. Filed Jan. 5, 1892. Serial No. 417,100. (No model.)

Claim.—1. A carriage having forwardly-inclined open bearings in its risers and having upon each riser a pivoted hook, the free end of which is extended to form a rearwardly-inclined edge, in combination with a platen the journals of which are extended beyond said bearings and adapted to force said hooks away from said open bearings, and springs for forcing said hooks over said journals, substantially as specified.

2. The combination, with a platen, line-spacing gears, and pawl, of a pawl-arm having steps and a lever mounted for projection into the path of the different steps of the pawl-lever, substantially as specified.

3. The combination, with the line-spacing gear of a platen and its pawl, of a pawl-arm and a detent mounted to operate in a plane parallel with the gear on a common pivot independently of each other, and a spring for operating the detent, arranged independent of the pawl-arm, substantially as specified.

4. The combination, with a line-spacing gear and its pawl-arm, of a detent mounted for independent movement on the pawl-arm pivot and carrying a pawl-arm-obstructing device, substantially as specified.

5. The combination of a line-spacing pawl, its lever and its arm, a detent mounted on the pivot of the pawl-arm, and a pawl-arm-limiting device pivoted on the detent and capable of springing into and out of contact with the pawl-arm, substantially as specified.

6. The combination, with a line-spacing pawl, its arm, and a detent, and with the line-spacing gear, of a lever pivoted on the detent, a secondary detent for said lever fixed to the primary detent, and means for oscillating the secondary lever on its pivot, substantially as specified.

7. The combination, with the carriage and its platen, of a bell-crank lever pivoted to the carriage, an interposed spring for raising one arm of the lever, a pawl-arm and pawl operatively connected with the lever, and a detent carrying a pawl-arm-limiting device, substantially as specified.

8. The combination, with a platen, of a pressure-roller carried by a support mounted on a pivot located at a point between the ends of the roller, substantially as specified.

9. The combination, with a platen, of a pressure-roller carried by a pivoted spring-pressed yoke, the pivot of which is located at a point between the ends of the roller, substantially as specified.

10. The combination, with a platen, of a bail carrying a pressure-roller in a yoke pivoted to the bail, the pivot of which is located at a point between the ends of the roller, substantially as specified.

11. The combination, with a platen, of a shelf or plate pivotally mounted on the carriage and extended along the platen and a roller carried by the shelf or plate and mounted on a pivot located between the ends of the roller for alignment with the platen, substantially as specified.

12. The combination, with a platen, of two or more rollers arranged adjacent to and to bear upon the platen and each mounted on a pivot located between the ends of the roller, whereby said rollers are free to align themselves with and to the surface of the platen, substantially as specified.

13. The combination, with a platen, of two bails mounted for movement in opposite directions away from the platen and each carrying pivoted yokes and pressure-rollers mounted therein and a pivoted guard-plate, said plate being provided with an eye for connection with a hook upon the carriage, substantially as specified.

14. The combination, with the spring-drum and its spindle having portions thereof removed, of a sleeve adapted for connection with the spring and with the spindle, substantially as specified.

15. The combination, with a spring-drum of a type-writing machine and the tape thereof, of a stud or projection fixed upon the machine adjacent to the drum and a plate secured to the tape and projecting from the surface thereof, said plate being provided with an eye for connection with a hook upon the carriage, substantially as specified.

16. The combination, with the spring-drum, of its spindle passing through the base of the machine, a gear of the character described secured to the spindle at the lower side of the base, and a gear-operating disk arranged to mesh with the gear and mounted upon an adjacent spindle passing up through the base of the machine and having a slotted head, substantially as specified.

17. A ribbon-spool having oppositely-projecting circumferentially-grooved pins, in combination with a spool-gear having a circumferentially-grooved hub and a pin-retaining spring, substantially as specified.

18. The combination, with a hub and a ribbon-spool adapted to be connected therewith, of a spring ring lying in the plane of an aperture in the hub, substantially as specified.

19. A spool-gear having a circumferentially-grooved and perforated hub, a ribbon-spool adapted to be connected therewith, and a ring arranged within the groove and having its ends bent, substantially as specified.

20. The combination, with a carriage and its rack, of independently-pivoted spring-pressed pawls and means for alternately storing tension in said springs, which springs are put under tension to throw the pawls into mesh with the rack, substantially as specified.

21. The combination, with the feed-rack, of independently-pivoted pawls, a universal bail, springs extending from each pawl to the bail, and means mounted on the bail for operating the pawls, substantially as specified.

22. The combination of a feed-rack, independently-pivoted pawls, a universal bail, and a yielding and rigid device connecting the bail with each of the pawls, substantially as specified.

23. The combination of a feed-rack, two pawls, and yielding and rigid devices for operating each pawl, said devices being arranged at different points on the universal bail, substantially as specified.

24. The combination, with a feed-rack, of two pawls, a universal bail, springs extending from each pawl to the bail, and rigid devices for operating the pawls, projecting from the bail and from points on opposite sides of its shaft, substantially as specified.

25. The combination, with a bail, of a movable yielding abutment and means mounted upon the carriage for rendering said abutment operative, as set forth.

26. The combination, with the carriage, of a fixed rack-bar, a rotatable shaft, and a movable section of a rack-bar mounted on said shaft, substantially as specified.

27. The combination, with a carriage, a fixed rack-bar, and a movable section of a rack-bar, of a shaft for carrying the section, mounted for rotation to disconnect the section from the rack-bar, substantially as specified.

28. The combination, with a fixed rack-bar and a movable section of a rack-bar, of a shaft, and a sliding member carrying the section, and means for rotating the shaft, substantially as specified.

29. The combination of a carriage having a projection which is beveled, a fixed rack-bar, and a section of a rack-bar which is movable and provided with a bevel, and a rotatable shaft for carrying the movable section of a rack-bar, substantially as specified.

30. The combination, with the universal bail and the carriage of a type-writing machine, of interposed yielding bail-locking mechanism, substantially as specified.

31. The combination, with the universal bail and the carriage of a type-writing machine, of a bail-locking device and a yielding obstruction or abutment, substantially as specified.

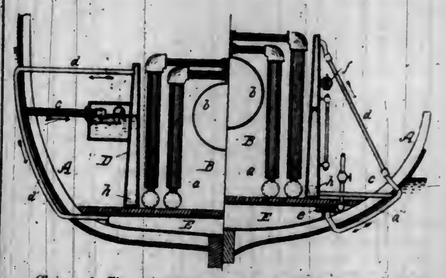
32. The combination, with a bail, of a movable rod, a spring interposed between the rod and bail, and a spring for moving the rod in one direction, and devices operatively connected with the carriage for moving the rod in the opposite direction, substantially as specified.

33. The combination, with a carriage having a bell-trip mounted thereon, of a bell-trip pin, a block adjustable with relation to the bell-trip pin on a sliding rod, a bail, and means for yieldingly connecting the rod with the bail, substantially as specified.

34. The combination, with a margin-gage, of a key-lever and an interposed disconnected pin, substantially as specified.

35. The combination, with the margin-gage comprising a fixed and an adjustable rack, of a rotatable bar carrying the adjustable rack, a key-lever, and connections between the lever and the rotatable bar, substantially as specified.

36. The combination, with a carriage and its spring-drum and feeding-tape, of a gear secured to the spring-drum spindle and a gear rotating and locking disk secured to a spindle arranged adjacent to the spring-drum and accessible for purposes of adjustment from adjacent to or at the upper surface of the base of the machine, substantially as specified.



481,878. REFLECTING-SHADE FOR INCANDESCENT LAMPS. LOCRUS T. STANLEY, Brooklyn, N. Y., assignor to the Cutter Electrical and Manufacturing Company, Philadelphia, Pa. Filed Feb. 29, 1892. Serial No. 423,236. (No model.)

Claim.—1. In a reflecting-shade, the combination, with the metallic or reflecting portion inclosing the lamp, of spiral springs, one end of each being secured to the inner surface of the reflector and provided at their ends with catches, and a glass plate over the opening of the reflector and held in position by engagement therewith of the springs, as set forth.

2. The combination, with the reflecting-shade having an upper portion parabolic and a lower portion conical in cross-section, of spiral springs secured at one end to the inner surface of the reflector and having their free ends bent to form lugs or engaging catches, and a glass plate held up against the inner surface of the conical part by engagement therewith of the springs and so that an annular space will be left between the edge of the glass plate and the inner surface of the reflector, as set forth.

481,879. WATER-JACKET AND CONDENSING APPARATUS FOR MARINE BOILERS. THOMAS L. STURTEVANT and THOMAS J. STURTEVANT, Framingham, Mass. Filed Aug. 21, 1891. Serial No. 403,309. (No model.)

Claim.—1. The combination, with a marine boiler, of a water-jacket placed closely adjacent thereto and between said boiler and the shell of the vessel, said water jacket being provided with a feed pipe passing from said jacket all the way to and through the shell of the vessel below the load water-line for the free passage of water in and out and with a suitable steam-discharge.

2. The combination, with a marine-boiler, of a water jacket placed closely adjacent thereto and between said boiler and the shell of the vessel, said water-jacket being provided with a feed-pipe passing from said jacket all the way to and through the shell of the vessel below the load water-line for the free passage of water in and out, a water-storage reservoir, and a steam pipe and condenser forming a communication between said jacket and said reservoir.

3. The combination, with a marine boiler, of a water-jacket placed closely adjacent thereto and between said boiler and the shell of the vessel, said water-jacket being provided with a feed-pipe passing from said jacket all the way to and through the shell of the vessel below the load water-line for the free passage of water in and out, a water-storage reservoir, and a steam pipe and condenser forming a communication between said water-jacket and said reservoir, said condenser being arranged exteriorly of the shell of the vessel.

4. The combination, with a marine boiler, of a water-jacket placed closely adjacent thereto and between the said boiler and the shell of the vessel, said water-jacket being provided with a feed-pipe opening through the shell of the vessel, a water-storage reservoir, a vacuum-forming apparatus, a steam pipe and condenser forming a communication between said water-jacket and said reservoir, and a relief-valve to regulate the passage of steam through said steam-pipe.

5. The combination, with a marine boiler, of a water-jacket placed closely adjacent thereto and between said boiler and the shell of the vessel and provided with a feed-pipe opening through the shell of the vessel, a water-storage reservoir, a steam pipe and condenser forming a communication between said water-jacket and said reservoir, and an injector for producing a partial vacuum in said water-jacket.

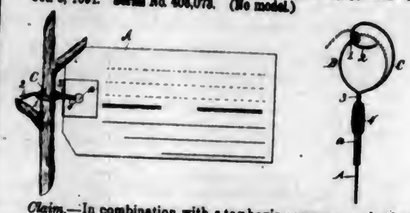
481,380. GRINDING-MACHINE. OAKLEY S. WALKER, Worcester, Mass. Filed June 4, 1891. Serial No. 395,063. (No model.)

Claim.—1. In a grinding-machine, a suitable grinding-wheel arbor, a supporting column, a tool-holding support arranged to swing about said column and to be vertically adjusted thereon and clamped at any point of its adjustment, combined with a clamping-collar mounted on the said column adjacent to the tool-holding support, and an angular nut fitted to recesses in both tool-holding support and clamping-collar to prevent a swinging movement of either except in unison with the other, but allowing a separate vertical adjustment of the tool-holding support, substantially as shown and described.

2. In a grinding-machine, the combination of interchangeable grinding-wheel collets and a grinding-wheel arbor suitably arranged and mounted in journal-boxes, with a vertically-swinging tool-holding support swinging around and upon one of the journal-boxes and arranged to be fixedly clamped at any point, for the purpose set forth.

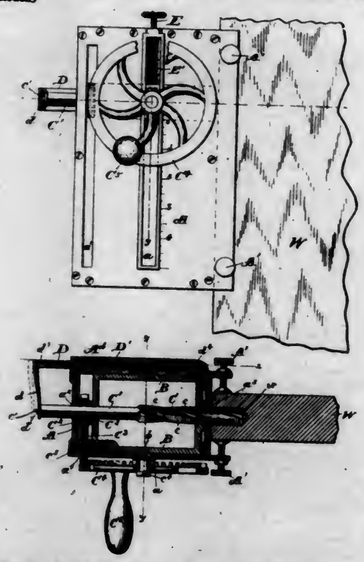
3. The combination of a suitable supporting-column and a grinding-wheel arbor mounted thereon, with interchangeable grinding-wheel collets provided with internally-tapered recesses at one end and internally-threaded recesses at the other end for the reception of a central fastening-screw, as fully set forth.

481,381. MAST-ARM. AUGUSTUS WRIGHT, Providence, R. I., assignor to the Hope Electric Appliance Company, same place. Filed Oct. 14, 1891. Serial No. 408,668. (No model.)



Claim.—1. In a mast-arm, the combination, with a tubular frame formed by the fitting 9 and the side stays 6 and 7 and a cross-arm 8, secured to the butt-ends of said stays, of an upper stay 11, secured to the outer end of said frame and supporting the same, a tension-trolley stay 12 for depressing the outer end of the mast-arm, adapted to support a lamp-carriage, and means for operating said carriage, as described.

2. In a mast-arm, the combination, with a tubular frame formed by the fitting 9 and the side stays 6 and 7, a cross-arm 8, secured to the butt-ends of said stays, an upper stay 11, secured to the outer end of said frame and supporting the same, and a trolley-stay 12, carrying the lamp support or carriage 22, and means for operating said carriage, of a switch secured to the outer end of said tubular frame, adapted to be operated by said carriage to cut the lamp into and out of circuit, as described.



3. In a mast-arm, the combination, with a tubular frame formed by the tubular stays 6 and 7 and the fitting 9, suitably supported and containing electric conductors, the insulating-blocks 25 and 26, secured to said stays and provided with spring contact-plates connected with said conductors, and a spring-operated circuit-closing device also connected with said conductors, of a lamp-carriage 22, moving on a trolley-stay 12 and provided with the contact-plates 24 24, connected with opposite poles of the lamp, and a forwardly-extending bent arm 23, adapted to operate said circuit-closing device, as described.

481,382. TAG-FASTENER. ORRA R. ABBEY, Dalley, Mich. Filed Oct. 8, 1891. Serial No. 408,073. (No model.)

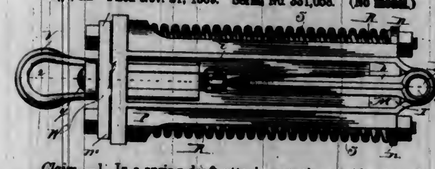
Claim.—In combination with a tag having an eye *a*, a wire fastening device made up of a single piece, which is bent upon itself to form a closed eye 1, the members 3, which extend from the eye 1, being passed through the eye of the tag so as to form a double loop, which engages with the members beyond the edge of the tag, the terminal members 2 being adapted to be passed through the eye 1 and bent to be held in engagement therewith to secure the tag to an object, substantially as shown.

481,383. BORING AND MORTISING MACHINE. GEORGE A. ADAMS, Santa Clara, Cal. Filed Nov. 2, 1891. Serial No. 410,572. (No model.)

Claim.—1. In a combined boring and mortising machine, the combination, with a bit and means for revolving the same, of a spring adapted to press said bit in the direction of its length and a spring adapted to press said bit transversely, substantially as described.

2. In a combined boring and mortising machine, the combination, with a revoluble bit moving in suitable guides, and means for revolving said bit, of a detachable spring adapted to press said bit in the direction of its length and an adjustable spring adapted to press said bit transversely, substantially as described.

3. In a combined boring and mortising machine, the combination, with a guide-frame and means of attaching said frame to the wooden piece to be cut, of an inner frame sliding in said guide-frame, a bit mounted transversely in said inner frame and means for revolving the said bit also mounted on the said inner frame and adapted to slide with the said bit and said inner frame along said outer guide-frame, a detachable spring adapted to press said bit in the line of its axis, and



a spring adapted to press said bit transversely to its axis, with means of withholding said latter spring, substantially as described.

4. In a combined boring and mortising machine, the combination, with a guide-frame and means of attaching said frame to the wooden piece to be cut, of an inner frame sliding in said guide-frame, a bit mounted transversely in said inner frame and means for revolving the said bit also mounted on the said inner frame and adapted to slide with the said bit and said inner frame along said outer guide-frame, a detachable spring-operated frame attached to said guide-frame and adapted to press said bit in the line of its axis, and a spring adapted to press said bit transversely to its axis, with means of withholding said spring, substantially as described.

5. In a combined boring and mortising machine, the combination, with a guide-frame and means for attaching said frame to the wooden piece to be cut, of an inner frame sliding in said guide-frame, a bit mounted transversely in said inner frame and means for revolving the said bit also mounted on the said inner frame and adapted to slide with the said bit and said inner frame along said outer guide-frame, a detachable spring-operated frame attached to said guide-frame and adapted to press said bit in the line of its axis and a spring normally compressed between said guide-frame and said inner frame adapted to press said bit transversely to its axis, and a screw adapted to clamp said inner frame in said guide-frame, substantially as described.

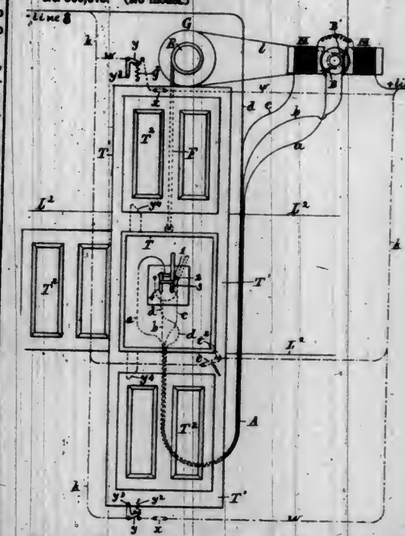
6. In a combined boring and mortising machine, the combination, with a slotted guide-frame and means for attaching the said guide-frame to the article to be cut, of an inner frame traveling in said guide-frame and carrying a bit free to revolve and to move transversely to the line of its axis, with means attached to said inner frame for revolving said bit, a spring set between said inner and outer frames, and a clamp-screw for clamping said inner frame in said outer frame against the normal pressure of said spring, substantially as described.

481,384. SPRING DRAFT ATTACHMENT. HIRAM BARBER, Chicago, Ill. Filed Nov. 21, 1889. Serial No. 331,058. (No model.)

Claim.—1. In a spring draft attachment, the combination of the draw-plate P, the draw-bar B, the rods R R, the coil-springs S S, the swivel V, attached to the cross-piece W, the bolt T, and hammer-strap A, hinged to the outer surface of the plate P, all constructed and arranged substantially as and for the purposes herein described.

2. In a spring draft attachment, the combination of the slotted draw-plate P, the draw-bar B, the rods R R, the coil-springs S S, the swivel V, attached to the cross-piece W, the bolt T, the hammer-strap A, hinged to the plate P, the evener E, and the bolt K, all arranged and constructed substantially as and for the purposes herein described.

481,385. COMBINED FOLDING BED, BILLIARD-TABLE, &c. ROBERT H. BARBER, Hopedale, Ill. Filed Mar. 30, 1892. Serial No. 427,095. (No model.)

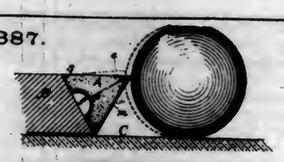


Claim.—1. A combination article of furniture comprising in its organization a main frame or supports intersected by longitudinal strips constructed to hold billiard balls or cues and formed with notches *b b* therein, the bed pivoted to and folding within or between said supports, a table having pendent portions embracing the outer sides of said supports and movably connected thereto by the same pivot which holds the bed, and the settee hinged to the under side of the bed and constructed with the central rest and the two end rests, each of the said end rests being provided with hinged arms, which may be turned upwardly or downwardly, substantially as shown and described, and for the purpose set forth.

2. A combination article of furniture comprising the main frame having the notches or recesses therein, the bed folding within the main frame, and the settee hinged or pivoted to the under side of the bed, the said settee being constituted of the central rest and the two end rests, each of the latter being provided with hinged arms which fold downwardly and fit within the notches of the main frame, substantially as described.

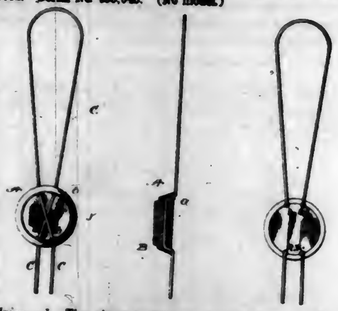
3. A combination article of furniture comprising the main frame, the table, the bed, and the settee, the latter having the hinged arms for resting upon the floor when either the table or bed is lowered into position for use, substantially as described.

481,386. ELECTRIC ELEVATOR. WILLIAM BAXTER, Jr., Baltimore County, Md. Filed July 19, 1888. Renewed Oct. 31, 1890. Serial No. 369,873. (No model.)



Claim.—1. In an electric-elevator system adapted to a current of constant strength, the combination, with the moving car, of an electric motor wound in series, four insulated electric conductors inclosed in a flexible cable, having one end attached to the car, a switch upon the car, having contacts connected, respectively, with the commutator-brushes of the motor, one of the terminals of the field-coils, and one pole of the generator, and a movable connector in the said switch adapted to vary the course of the current through the motor and to thereby vary the movements of the hoisting mechanism, as and for the purpose set forth.

2. In an electric-elevator system in which a car or platform hoisting device is operated by a stationary electric motor, the combination, with the electric motor and the car or platform moved thereby, of an operative electric circuit adapted for a current of constant strength, a switch in said circuit adapted to vary the course of the current in the motor to vary the movement of the hoisting mechanism, one or more shunt-circuits around the motor, normally-open switches placed in such shunt-circuits, suitable mechanism actuated by the car at the end of its travel to move such switches and thereby short-circuit the motor, and hand-switches adapted to reopen such shunt circuit or circuits to restore the current to the operative circuits, substantially as herein set forth.



481,387. BILLIARD-CUSHION. MOSES BENSINGER, Chicago, Ill., assignor to the Brunswick-Balke-Collender Company, same place. Filed Apr. 27, 1892. Serial No. 430,868. (No model.)

Claim.—A billiard cushion strip composed of the usual rubber compound, provided with a suitable face-hardening device and formed with a comparatively large recess *f*, located about centrally of the back side of the strip, the flat and recessed portions of said back side of the strip being backed with canvas or its equivalent, all substantially as and for the purposes set forth.

481,887.

481,888. CAR-SEAL. FRANKLIN W. BROOKS, New York, N. Y., assignor of one-half to William C. Rogers, same place. Filed May 11, 1892. Serial No. 433,645. (No model.)

Claim.—1. The sheet metal cup A, with converging wall and threading-holes *b*, located in the bottom at the point of juncture between said bottom and the converging wall, in combination with the bail-wire C, threaded as described, and the soft-metal plug B, compressed and expanded within the wall of the cup, substantially as and for the purpose hereinbefore set forth.

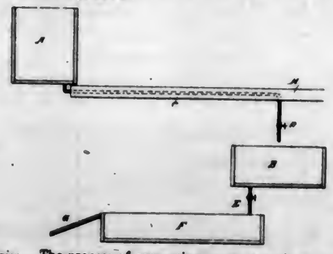
2. The sheet-metal cup A, with converging wall and formed with the exterior depression or shoulder *a* and threading-holes *b*, located in the angle formed between the shoulder *a* and the bottom of the cup, in combination with the bail-wire C and soft-metal plug B, substantially as and for the purpose set forth.

481,889. WRENCH. EDWARD A. COCHRAN, Oak Park, Ill. Filed Nov. 5, 1891. Serial No. 410,709. (No model.)

Claim.—The combination, in a wrench, of a fixed jaw, a rack-bar permanently fastened to the fixed jaw and a handle at the end thereof, a moving jaw sliding upon the rack-bar and having teeth that engage the teeth of the rack-bar and a strap 3 passing around the rack-bar, and a spring fastened at one end to the strap and pressing at the other end against the back edge of the rack-bar, the strap having a bearing at 6 against the back of the rack-bar and in line, or nearly so, with the face of the moving jaw and the mortise of the strap diverging from the bearing to allow the jaw to be rocked on the bearing 6 to disconnect the teeth, substantially as set forth.

481,890. BICYCLE-LOCK. FREDERICK EGGE, Bridgeport, Conn., assignor of two-thirds to Charles R. Smith and Oliver C. Smith, same place. Filed June 18, 1892. Serial No. 437,184. (No model.)

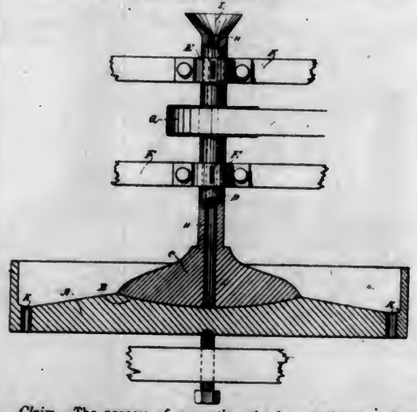
Claim.—1. In a lock for bicycles, the combination of the casing having a block extending laterally therefrom, the clamps secured thereto, the hub within said casing and adapted to turn freely therein, the turn-button rigid with said hub, and locking-pins within said hub and casing, which pins operate to establish a rigidity between the hub and casing when the button is turned to a horisontal position, substantially as set forth.



2. The combination of the casing, the rotary hub therein, the button rigid on the end of said hub, sectional screw-operated clamping devices attached to said casing, whereby the latter may be secured to the fork of a bicycle, and means for locking said hub when the button is in a horizontal position, substantially as shown and set forth.

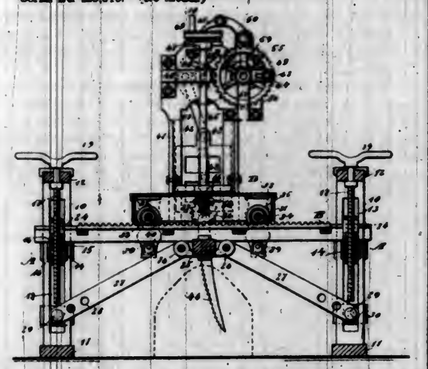
3. The combination of the casing having perforations, the rotary hub therein provided with a key-slot and perforations leading within said slot and having a shoulder and recess, as described, the turn-button secured to said hub, spring-actuated pins within the perforations in the casing, and pins within the perforations in the hub, both series of perforations being adapted to register in alignment when said button is turned to a horizontal position, substantially as and for the purposes hereinbefore set forth.

4. The combination of the hub provided with a key-slot and the casing surrounding the hub and having a slot which registers laterally with the key-slot when the hub is in normal position, substantially as set forth.



5. The combination of the casing having the block extending laterally therefrom, the clamps guided on said block, the screw extending through said clamps and block, the rotary hub within the casing, and the turn-button secured to said hub without the casing and having a heel which overhangs the head of said screw when the button is in its horizontal or locked position, substantially as shown and set forth.

481,891. RECOVERING WASTE PRODUCTS OF PETROLEUM. JACOB P. ENGLE, San Francisco, Cal. Filed Dec. 11, 1891. Serial No. 414,740. (No specimens.)

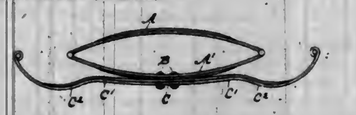


Claim.—The process of separating waste petroleum products in which the water globules are covered with petroleum-oil, consisting in mixing and agitating with such combined products a dry material which breaks up the globules by absorbing the lighter oil and spirit, then discharging the heavy oil or residue and water into a tank to enable the said heavy oil or residue to settle, and finally separating the water from the heavy oil or residue, substantially as herein described.

481,892. SEPARATION OF WASTE PRODUCTS OF PETROLEUM DISTILLATION. JACOB P. ENGLE, San Francisco, Cal. Filed Dec. 11, 1891. Serial No. 414,741. (No specimens.)

Claim.—The process of separating the heavy oil arising from petroleum distillation from the water with which it is mixed, consisting, essentially, in imparting to the material a rubbing action to break up the globules and separate the water from the oil, substantially as herein described.

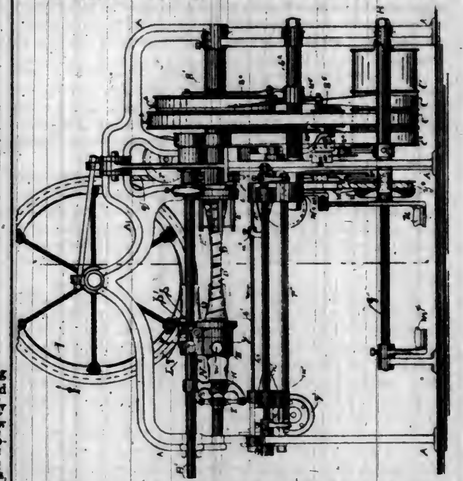
481,893. MACHINE FOR CUTTING HAY-STACKS. JOHN T. EVANS and JOSEPH H. DOUGLASS, Adamsville, Utah. Filed Mar. 19, 1892. Serial No. 425,513. (No model.)



Claim.—1. A machine for cutting hay from stacks, comprising trestles, a bed vertically adjustable on the trestles, a carriage mounted to travel on the bed, a vertically-reciprocating cross-head carried by the carriage, a knife secured to the cross-head and projecting below the bed, and means for simultaneously moving the carriage and reciprocating the cross-head, substantially as described.

2. In a machine for cutting hay from stacks and for like purposes, the combination, with trestles and a bed adjustably carried by the trestles, the said bed being provided with a rack and tracks, of a carriage held to travel upon the bed and provided with wheels engaging with the track and a shaft carrying a pinion engaging with the rack, a standard projected from the carriage, a cross-head having movement in the standard and adapted to receive a knife, a driving mechanism journaled upon the standard of the carriage, and a driving connection between the pinion-shaft of the carriage and the driving mechanism, substantially as and for the purpose set forth.

3. In a machine for cutting hay from stacks and for like uses, the combination, with trestles and a bed carried by the trestles and provided with tracks and a rack, of a carriage provided with wheels engaging with the track, a shaft journaled in the carriage and carrying a pinion engaging with the rack of the bed, a standard projected upward from the carriage, a cross-head held to slide in said standard, a drive-shaft, a driven shaft located adjacent to the drive shaft and driven therefrom, a disk secured to the driven shaft and provided with an adjustable wrist-pin, a pitman connection between the cross-head and the wrist-pin, and a driving connection between the drive-shaft and the pinion-shaft of the carriage, as and for the purpose specified.



4. In a machine for cutting hay from stacks and for like uses, the combination, with trestles and a bed adjustably supported by the trestles, the said bed being provided with tracks and a rack between the tracks, of a carriage held to travel upon the bed and provided with wheels engaging with the tracks above and below, and a shaft carrying a pinion engaging with the rack of the bed, a standard projected upward from one portion of the carriage, a cross-head having movement in the standard and adapted to carry a knife or like cutting implement, a drive-shaft carried by the carriage-standard, a parallel shaft driven from the drive-shaft, a disk secured to the driven shaft and provided with an adjustable wrist-pin, which is connected by a pitman with the cross-head, a vertical shaft having a driving connection with the pinion-shaft of the carriage, and a pawl-and-ratchet mechanism imparting movement to the vertical shaft from the drive-shaft, substantially as and for the purpose specified.

481,894. VEHICLE-SPRING. GEORGE W. FARRELL, Au Sable Forks, assignor to Ignatius Wiley, Albany, N. Y. Filed Nov. 9, 1891. Serial No. 411,253. (No model.)

Claim.—As an improved article of manufacture, a vehicle-spring comprising an elliptic spring adapted to be secured to the vehicle body by its upper half and a triple sweep-spring secured at its middle part to the lower half of the elliptic spring and adapted to be secured at its ends to the side bars of the vehicle, substantially as described.

481,895. MACHINE FOR MAKING SPIRAL SPRINGS. PETER FRASER, Plymouth, Mass., assignor to the Atlas Tack Corporation, of Massachusetts. Filed Aug. 7, 1891. Serial No. 402,053. (No model.)

Claim.—1. In a machine for forming spiral springs, the combination, with the rotary longitudinally-movable forming-head held advanced by yielding pressure, of the power-shaft and gearing connecting said head and power-shaft to retract the head and a shifting connection in said gearing under the control of the operator, whereby the head may be moved back at the will of the operator, substantially as described.

2. In a machine for forming spiral springs, the combination, with the rotary longitudinally-movable spring-pressed forming-head, of the power-shaft, gearing connecting the head and power-shaft, and a clutch under the control of the operator interposed in said gearing, whereby the head may be moved back against the tension of its spring, substantially as described.

3. In a machine for forming spiral springs, the combination, with the rotary longitudinally-movable spring-pressed forming-head, of a drum and flexible connection for moving the head against the tension of its spring, a power-shaft, and a clutch under the control of the operator interposed between the power-shaft and drum, whereby it may be rotated and the head moved, substantially as described.

4. In a machine for forming spiral springs, the combination, with the rotary longitudinally-movable spring-pressed forming-head and the pulley having a lever-arm connected with said head, of the flexible connection passing around said pulley, the drum to which said flexible connection is secured, a power-shaft, and a clutch interposed between said power-shaft and drum, whereby the head may be moved against the tension of its spring, substantially as described.

5. In a machine for forming spiral springs, the combination, with the rotary longitudinally-movable forming-head and the pulley having the lever-arm connected with said head, of the flexible connection passing around said pulley, the spring-drum, to which one end of said connection is secured, the loose drum, to which the opposite end of said connection is secured, a power-shaft, and a clutch under control of the operator interposed between said last-mentioned drum and power-shaft, substantially as described.

6. In a machine for forming spiral springs, the combination, with the hanger or head, of the rotary forming-cone carried thereby and having a limited longitudinal movement and wire-gripping jaws at the base of said cone adapted to be opened by the longitudinal movement of the cone, substantially as described.

7. In a machine for forming spiral springs, the combination, with the hanger or head and the rotary forming-cone carried thereby and having a limited independent longitudinal movement, of a wire-gripping jaw at the base of said cone movable independently of the cone and adapted to co-operate with a jaw on the base of the cone, substantially as described.

8. In a machine for forming spiral springs, the combination with the hanger or head and the rotary forming-cone carried thereby and having a limited independent longitudinal movement, of a wire-gripping jaw mounted in the hanger or head, movable independently of the cone and co-operating with a jaw on the base of the cone, and a spring for holding said movable jaw projected, substantially as described.

9. In a machine for forming spiral springs, the combination, with the hanger or head, the rotary forming-cone carried thereby and having a limited longitudinal movement, and the spring for holding said cone outward, of a movable wire-gripping jaw mounted in the hanger or head, movable independently of the cone, a spring for advancing said jaw, and a hand-lever for retracting the same, substantially as described.

10. In a machine for forming spiral springs, the combination, with the longitudinally-movable hanger or head, the rotary forming-cone carried thereby, the gripping-jaw rotating with said cone, and the shaft lying parallel with said head, of the collar mounted on said shaft for operating the gripping-jaw, whereby the gripping-jaw may be operated, substantially as described.

11. In a machine for forming spiral springs, the combination, with the longitudinally-movable hanger or head, the rotary forming-cone carried thereby, the gripping-jaw rotating with said cone, and the shaft lying parallel with said head, of the longitudinally-movable collar mounted on said shaft for operating the gripping-jaw and the hand-lever for moving said collar into operative position, substantially as described.

12. In a machine for forming spiral springs, the combination, with the oppositely-arranged rotary heads having a relative longitudinal movement and the wire gripping-jaws carried by one head, of the co-operating cutting-jaws mounted directly on and rotating with the opposite head, and the movable force-bar mounted in stationary bearings co-operating with the cutting-jaws to close the same and sever the wire, and mechanism under control of the operator for moving said bar, substantially as described.

13. In a machine for forming spiral springs, the combination, with the rotary forming-head having the pair of co-operating cutting-jaws mounted on and rotating with the said head, of the movable force-bar mounted in stationary bearings co-operating with the jaws to close the jaws, the bar g, and the crank-shaft and crank controlled by the operator for operating said bar g, substantially as described.

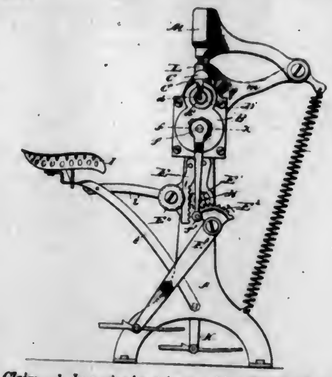
14. In a machine for forming spiral springs, the combination, with the longitudinally-movable hanger or head, the rotary-forming-cone carried thereby, and the wire-gripping jaw at the base of the cone, of the rod n, connected with the jaw, the lever T, co-operating with the rod, the bar s, engaging the lever, the collar q^x, having the incline engaging the bar, and the rotary shaft B^3, carrying the collar, substantially as described.

15. In a machine for forming spiral springs, the combination, with the longitudinally-movable head carrying the forming-cone with the gear-wheel for rotating the cone journaled in the head, of the counter-shaft and the gear rotating with but longitudinally movable on said shaft and in mesh with the cone-driving gear, substantially as described.

16. In a machine for forming wire springs, the combination, with the counter shaft and forming-cones, of the gears for driving the cones from the counter-shaft cored out on one side, the friction-cone keyed to the shaft and fitting in said gear, and the collar fitting on the opposite side of the gear, substantially as described.

17. In a machine for forming wire springs, the combination, with the forming-cones and driving mechanism, of a controlling mechanism consisting of the clutch-surfaces and the longitudinally-movable collar for moving said clutch-surfaces, a rotary collar having cam-surfaces co-operating with the surfaces of the longitudinally-movable collar, and an operating-handle for moving said rotary collar, substantially as described.

18. In a spring-machine, the combination, with the forming-cones and drive-shaft, of a reversing-gear interposed between the cones and drive-shaft, consisting of the fast and loose pulleys, the belts passing from the drive-shaft around said pulleys, one being crossed to drive its pulley in the opposite direction, a clutch-operating mechanism for moving said fast and loose pulleys into engagement, and a belt-tightener normally co-operating with the belt of the fast pulley and moving in unison with the clutch-operating mechanism, whereby the tension on said belt is released and the pulleys thrown into engagement simultaneously, substantially as described.



19. In a machine for making spiral springs, the combination, with the compressor-cradle formed by the three shafts and the compressor-head movable longitudinally on said shafts, of a drive-shaft gearing between said head and shaft and a clutch interposed in said gearing and under the control of the operator, substantially as described.

20. In a machine for forming spiral springs, the combination, with the cradle and movable compressor head, of the spring for retracting said head, the drive-shaft, a drum having a clutch connection with said shaft, and a flexible connection between the drum and compressor-head, substantially as described.

21. In a machine for forming spiral springs, the combination, with the cradle having the laterally-movable gate, with its operating-arm and the longitudinally-movable compressor-head, of the longitudinally-movable shaft having the incline controlling the operating-arm of the gate and having the projections thereon in the path of the movable head, whereby the movement of said head opens or closes the gate, substantially as described.

481,396. MACHINE FOR KNOTTING THE ENDS OF SPIRAL SPRINGS. PETER FRASER, Trenton, N. J., assignor to the Atlas Tack Corporation, of Massachusetts. Filed Jan. 19, 1892. Serial No. 418,553. (No model.)

Brief.—The rotary twister-head is movable up and down or transversely to the plane of the coils, while the two clamping-jaws both move simultaneously toward or from each other, both twister and clamp being reciprocated independently by treadles, and the twister being rotated by a hand-crank. The twister contains a removable steel wearing-face, and the knotted spring is set by a blow from the hammer.

Claim.—1. In a wire-knotting machine, the combination, with the clamp for holding the sections of wire to be united, of the rotary twister-head movable bodily with relation to the clamp, substantially as described.

2. In a wire-knotting machine, the combination, with the clamp for holding the sections of wire, of the twister-head mounted in a carriage movable toward and from the clamps and means for rotating said head, substantially as described.

3. In a wire-knotting machine, the combination, with the clamp for holding the sections of wire, of the twister-head, the carriage in which the twister-head is journaled movable toward and from the clamps, and the gear-wheel carried by the carriage for rotating said head, substantially as described.

4. In a wire-knotting machine, the combination, with the frame having the guideway thereon and the clamp for holding the sections of wire, of the carriage held by the guideway on the frame and movable toward and from the clamp and the rotary twister-head mounted in the carriage, substantially as described.

5. In a wire-knotting machine, the combination, with the frame having the guideway thereon and the clamp for holding the sections of wire, of the carriage held by the guideway on the frame and movable toward and from the clamp, the rotary twister-head journaled in the carriage and having the gear-wheel thereon, the gear-wheel meshing with the gear-wheel on the twister-head, and the crank-handle for rotating the same, substantially as described.

6. In a wire-knotting machine, the combination, with the frame having the guideway thereon and the clamp for holding the sections of wire, of the carriage held by the guideway on the frame and movable toward and from the clamp, the rotary twister-head journaled in the carriage and having the gear-wheel thereon, the gear-wheel of greater diameter also journaled in the carriage and meshing with the first-mentioned gear-wheel, and the crank-handle connected therewith for rotating the gears and twister-head, substantially as described.

7. In a wire-knotting machine, the combination, with the transversely-movable rotary twister-head having the central opening and a groove in its face leading into said central opening, of the relatively stationary clamp lying in proximity to the twister-head, whereby as the twister-head is moved one strand of the wire is bent at an angle in the groove and when rotated it is wrapped around the other strand of the wire, substantially as described.

8. In a wire-knotting machine, the combination, with the transversely movable rotary twister-head having the central opening, a slot from said opening to the exterior, and the groove in the face of the head merging into the central opening, of the relatively stationary clamp against which said twister-head works, whereby as the twister-head is moved one section of wire passes into the central opening through the slot and the other section of wire is bent at right angles and wrapped around the first-named section as the head rotates, substantially as described.

9. In a wire-knotting machine, the combination, with the transversely-movable rotary twister-head having the flat face, the central opening, a slot from said opening to the exterior, and the groove in the flat face separated from the slot at the periphery of the head and merging into the same at the central opening, of the clamping-jaws having the flat face against which the flat face of the twister-head works, substantially as described.

10. In a wire-knotting-machine, the combination, with the transversely-movable rotary twister-head, of the clamp in proximity to said head having the two movable jaws, with mechanism for opening and closing said jaws simultaneously, substantially as described.

11. In a wire-knotting machine, the combination, with the frame and the twister-head mounted thereon, of the clamp having the jaws formed on bars sliding in a recess in the frame adjacent to the twister-head, with means for moving said jaws simultaneously in opposite directions, substantially as described.

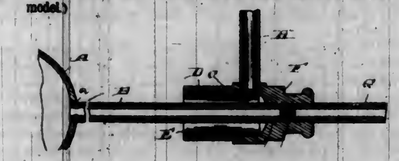
12. In a wire-knotting machine, the combination, with the twister-head, of the co-operating clamping-jaws, the bar carrying one of said jaws, the operating-shaft and treadle therefor, the crank-pin moved by the shaft, and the yoke connecting said pin with the bar carrying the clamping-jaw, substantially as described.

13. In a wire-knotting machine, the combination, with the twister-head, of the oppositely-arranged clamping-jaws and bars carrying the same, the operating-shaft therefor carrying the cam, and connections between the respective bars and cam on opposite sides of the shaft, whereby the jaws are moved in opposite directions as the shaft is rotated, substantially as described.

14. In a wire-knotting machine, the combination, with the twister-head, of the oppositely-arranged clamping-jaws and bars on which they are mounted, the operating-shaft therefor, the cam secured rigidly on said shaft, the yokes connected to one of said bars and to the cam at one side of the shaft, and the toggle-link connecting the other bar and the opposite side of the cam, substantially as described.

15. In a wire-knotting machine, the combination, with the twister-head, of the oppositely-arranged clamping-jaws and bars on which they are mounted, the operating-shaft therefor, the cam secured rigidly on said shaft, the toggle-link uniting the cam and one bar at one side of the shaft, and the yokes arranged on each side of the cam and toggle-link and connecting the other bar with the cam on the opposite side of the shaft, substantially as described.

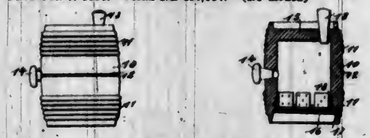
16. In a wire-knotting machine, the combination, with the clamp and the twister-head journaled in a movable carriage, of the link connected to the carriage, the idler-wheel engaging said link, and the foot-treadle co-operating with the wheel to rotate the same, and move the carriage, substantially as described.



17. In a wire-knotting machine, the combination, with the clamp, the twister-head, and the movable carriage in which the twister-head is journaled, of the link connected to the carriage and having its lower portion formed into a rack-bar, the idler-wheel meshing with said rack-bar, the foot-lever having the segmental rack meshing with the idler, and the guide-roller for holding the link in gear, substantially as described.

18. In a wire-twisting machine, the combination, with the clamp, the rotary twister-head, and the movable carriage in which the twister-head is journaled, of the gage for determining the length of wire to be inserted, mounted on the movable carriage, substantially as described.

19. In a wire-twisting machine, the combination, with the clamp having the flat face, of the rotary twister-head movable transversely with relation to the clamp, having the groove in its face, journaled with said face in proximity to the flat face of the clamp, whereby by the transverse movement the wire held by the clamp may be bent at an angle in the groove, substantially as described.



20. In a wire-twisting machine, the combination, with the clamp having the flat face, of the rotary twister head movable transversely with relation to the clamp, having the central opening and slot, and the groove in its face, said head being journaled with its face in proximity to the flat face of the clamp, whereby by the transverse movement the wire held by the clamp may be bent at an angle in the groove, substantially as described.

481,397. SAFETY-COUPLING FOR GAS-MAINS. AMOS GARRETSON, Fall Creek, Ind. Filed Mar. 31, 1892. Serial No. 427,211. (No model.)

Claim.—The combination, with a gas-main and a service-pipe leading therefrom, of a safety-coupling connected to said service-pipe, said coupling having in one end portion a chamber E, opening toward said main, said chamber surrounding a portion of said pipe, an escape-pipe communicating with the inner end of said chamber through the wall thereof, and the passage in said coupling in which the ends of the service-pipe sections are threaded, substantially as specified.

481,398. PUZZLE DICE-BOX. HIPPOLYTE GOUJON, Paris, France. Filed Oct. 6, 1891. Serial No. 407,837. (No model.)

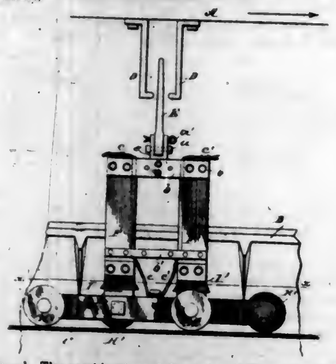
Claim.—1. As a new article of manufacture, a dice-box having a tapering open end and provided with a removable head fitting in said open end and of less thickness than the taper of the said open end, as set forth.

2. As an improved article of manufacture, a puzzle dice-box of a barrel shape, said box having a tapering open end with a terminal shoulder, a removable head fitting in the tapering end and of less length than the taper of the said open end, a removable plug and bung, and a central circumferential groove, all substantially as described.

481,399. CAR-COUPLING. WILLIAM H. HARRIS, Newberry, S. C., assignor of one-half to Augustus P. Pifer, same place. Filed July 20, 1891. Serial No. 400,165. (No model.)

Claim.—1. The combination, with the car, of the longitudinally-movable rock-shaft journaled at the end of same, the laterally-projecting pin attached to said rock-shaft, the plate secured to the car, and the angular catch attached to the said plate, adapted to receive the pin on the shaft and thereby hold said shaft in a raised position, substantially as shown and described.

2. The combination, with the draw-head having a central cavity and side recess, of the coupling-jaw having a coupling and locking arm, the faces of said locking-arm being vertical, the latch-block pivoted near its lower rear end within the central cavity, the forward end of said block being wider than the rear end, the forward face being cut away adjacent to the side recess, the rock-shaft, upon which the block is mounted, and means for operating said shaft, substantially as shown and described.

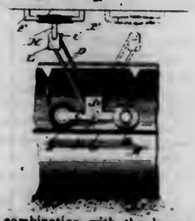


481,400. EYEGLASSES. ADOLPH H. HARTMANN, Brooklyn, N. Y. Filed Apr. 12, 1892. Serial No. 428,795. (No model.)

Claim.—In eyeglasses and spectacles, the combination, with the frame thereof, of bracket-like strips 10, detachably secured to the frame, each strip consisting of a vertical body portion 10^a and a horizontal foot-section 10^b, curved inwardly and then outwardly, said

bracket-like strips forming auxiliary clamps to engage the nose in advance of the ordinary clamps, substantially as herein shown and described.

481,401. TROLLEY FOR ELECTRIC RAILWAYS. WILTON F. JENKINS, Richmond, Va., assignor of five-sixteenths to Louis Euker and William E. Shelley, same place. Filed Sept. 5, 1891. Serial No. 404,810. (No model.)



Claim.—1. The combination of the shanks F F', the cross-bar *b b'*, connecting their upper and lower ends in the same plane, the bent or offsetting bars I I', bolted to the lower ends of the shanks and having each a fulcrumed horizontal lever G and G', provided at their opposite ends with contact-wheels for the conductors, substantially as shown and described.

2. The combination of the trolley-shanks F and F', connected as described and provided each upon its inner edge with an open-sided groove, and the circuit-wires *c c'*, laid laterally in and protected by said open groove, substantially as shown and described.

3. The combination, with the car-body having forward and rearward bearing-surfaces for the trolley connection, of the trolley-carriage running upon conductors, a subjacent conduit, and a jointed arm E, connected to the trolley-carriage and arranged to move transversely to the car into or out of the space between the bearing-surfaces, substantially as shown and described.

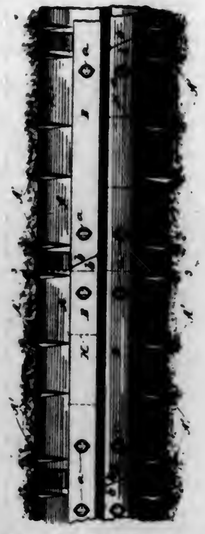
4. The combination, with the car-body having the pendent parallel plates D D', of the trolley-carriage having the bifurcated lug *e*, the arm E, pivoted in the lug upon pin *a*, and the spring locking-key *a'* for holding the arm in erect position between the said plates, substantially as shown and described.

481,402. TROLLEY FOR ELECTRIC-RAILWAY CONDUITS. WILTON F. JENKINS, Richmond, Va., assignor of five-sixteenths to Louis Euker and William E. Shelley, same place. Filed Sept. 5, 1891. Serial No. 404,811. (No model.)

Claim.—1. The combination, with the lower portion of a car having the transverse parallel guide-rails F F, of the bail H, having grooved pulleys arranged horizontally between and supported by said guide-rails, and a trolley hung upon said bail, substantially as shown and described.

2. The slotted and reversible drag link or bar, combined with and hung to a trailing trolley, subjacent conductors supporting the trolley, and a transverse bail or axial connection passing through the opening of the drag-link and free to move vertically therein and connected to the car, substantially as shown and described.

3. The trolley-carriage having parallel insulated plates J^a J^a, combined with the drag-link D, hung upon a horizontal axis between said plates, substantially as shown and described.



4. The combination, with the trolley and the lower part of a car having bearing-surfaces for the trolley and the bail H on the trolley, of the slotted drag link D and the adjustable plates L L, connected to the bail upon opposite sides of the drag link, substantially as and for the purpose described.

5. The combination of the lower portion of a car having parallel transverse guide-rails F F, the bail H, with horizontal grooved pulleys G G, fitting between the rails, the slotted link D, hung upon the bail, and the trolley-carriage having a pivoted or jointed connection with the link, substantially as shown and described.

6. The trolley-carriage C, having its trolley rollers or wheels arranged at opposite ends upon opposite sides and having upwardly-projecting plates J^a J^a, in combination with the drag-link jointed between said plates to the trolley-carriage, substantially as and for the purpose described.

7. The combination, with a portion of the car, a trailing trolley, and subjacent conductors supporting the trolley, of an open reversible drag-link or slotted bar connecting the car and trolley and adapted to take up vertical motion between the car and trolley and also permit of the reversal of the position of the trolley, substantially as shown and described.

481,403. CONDUIT FOR ELECTRIC RAILWAYS. WILTON F. JENKINS, Richmond, Va., assignor of five-sixteenths to Louis Euker and William E. Shelley, same place. Filed Sept. 5, 1891. Serial No. 404,812. (No model.)

Claim.—1. A tubular conduit formed with a longitudinal slot and provided along the length of each section with a series of transverse external reinforcing-ribs extending around the same, terminating on the external periphery some distance from the slot and reappearing internally and extending to a point immediately adjacent to the slot and supplementing the lack of the external ribs at this point, substantially as shown and described.

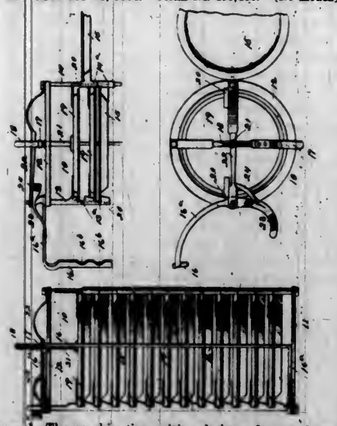
2. A tubular slotted conduit having a series of transverse reinforcing-ribs arranged internally near the slot and externally throughout the other portions of the conduit, in combination with slot-plates applied externally to the conduit upon each side of the slot, substantially as and for the purpose described.

3. The combination of a tubular and slotted conduit-section having a manhole opening into the slot and a slot-plate applied to the side of the conduit-slot and forming also the cover to the manhole, substantially as shown and described.

4. The combination, with the tubular and slotted conduit-sections, of removable slot-plates made longer than the conduit-section and overlapping the joints of the conduit-sections both at the middle of the slot-plates and at the ends of the slot-plates, substantially as shown and described.

5. The combination, with the tubular and slotted conduit-sections, of removable slot-plates applied to the edges of the slot and having their ends cut diagonally and fitting with an oblique joint across the joint of the conduit-section, substantially as shown and described.

6. The combination, with the tubular and slotted conduit-sections having external ribs near their ends, of a metallic collar applied between the ribs and overlapping the joint of the conduit-sections and a water-tight luting or packing retained between the collar and the ribs, substantially as shown and described.



7. The combination, with a conduit, of a conductor-support having a collar or shoulder and a screw nut and insulated clamping-jaws arranged between them to clutch and hold the conductor, substantially as shown and described.

8. The combination, with a conductor, of insulated clamping-jaws having teeth or opposite binding-surfaces for the conductor arranged out of coincidence with each other, substantially as and for the purpose described.

9. The combination, with the bolt C, having shoulder c^3 and nut c^3 and squared or non-circular shank between, of the insulating-blocks D, with clamping-jaws having a perforation corresponding to the shank, substantially as shown and described.

10. The combination of the bolt C, having shoulder c^3 and screw-nut c^3, the insulating-blocks D D, with recessed face and grooves *d d*, and the detachable jaws *c*, with lugs c^3 and teeth *c'*, substantially as shown and described.

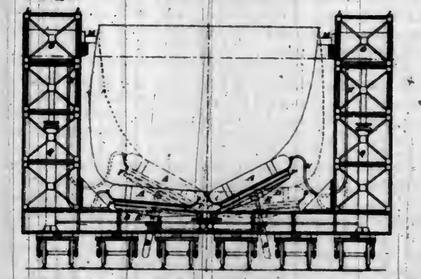
481,404. PORTABLE PASTRY-RACK. CHARLES F. JESSER, Staunton, Va. Filed Oct. 31, 1891. Serial No. 410,460. (No model.)

Claim.—1. The combination, with a skeleton frame, of a series of pans or receptacles pivoted thereto and adapted to swing horizontally into and out of said frame and a locking-arm attached also to said frame to secure the pans therein, substantially as shown and described.

2. The combination, with a frame composed of a base, a head, and vertical connections, of series of pans or receptacles hinged to one of said vertical connections and adapted to swing in and out of the frame and a locking-bar hinged to the opposite vertical connections, substantially as shown and described.

3. The combination, with the head and base portions, of the vertical connecting rod or bar, the pans or receptacles pivotally connected therewith, the notched vertical connecting rod or post, and the notched locking-bar and catch, all arranged substantially as shown and described.

4. The combination, with the head and base portions, of the rods or posts 13 and 14, the pans having collars arranged upon the rod or post 14, the notched locking-bar pivotally connected with the rod or post 13 opposite the rod or post 14, and the catch attached to the head portion and adapted to engage the locking bar, substantially as shown and described.



5. The combination, with a skeleton frame, of a series of horizontally movable pans or receptacles pivoted thereto and a series of vertically movable covers arranged within the frame, one above each pan, and the rods connecting the said covers, whereby they are held in place and adapted to be moved simultaneously, substantially as shown and described.

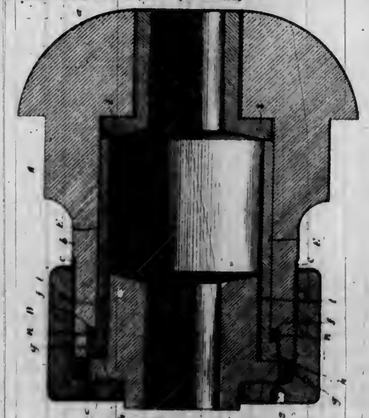
6. The combination, with a skeleton frame, of the horizontally-movable pans pivoted thereto, the locking-bar, the vertically-movable covers, and connections between the locking-bar and covers, substantially as shown and described.

7. The combination, with the skeleton frame of the horizontally-movable pans pivoted thereto, the vertically-movable covers arranged therein and connected with one another, the spring-bar to which the covers are connected, and the curved arm pivotally attached to the frame, arranged beneath the spring-bar, and adapted to raise the same, substantially as shown and described.

8. The combination, with a frame, of the horizontally-movable pans pivoted thereto, the series of vertically-movable covers arranged therein, one above each pan, the rods connecting the covers, the spring-bar attached to the frame, the connecting-post connecting the top cover and spring-bar, and the locking-bar pivoted to the frame and carrying a curved extension, which rests beneath the spring-bar, said extension being provided with an inclined wing, substantially as shown and described.

481,405. OVERLAND SHIP CONVEYANCE. WALTER R. KINIPPLE, London, England. Filed May 2, 1892. Serial No. 431,414. (No model.)

Claim.—1. In apparatus for conveying ships or large heavy bodies overland; the combination, with suitable supports, of a series of hydraulic cushions between the ship and supports, each cushion being provided with an independent pressure-regulating device, substantially as described.



2. In apparatus of the kind and for the purpose referred to, the combination, with the hydraulic cushions, of tanks or reservoirs connected, respectively, with separate cushions and adjustable to vary the pressure in said cushions, substantially as described.

3. The combination, with suitable supports, of hydraulic cushions interposed between the ship and supports, supply-tanks connected, respectively, with different cushions or groups of cushions, and means for independently raising and lowering the respective tanks, substantially as described.

4. In apparatus of the kind and for the purpose referred to, the combination, with the hydraulic cushions, of movable carriers therefor and means for independently adjusting said carriers, substantially as described.

5. In apparatus of the kind described, the combination, with the framework and trucks, of carriers hinged at one end near the middle of the framework and extending in opposite directions, means for raising and lowering the free ends of the carriers, and hydraulic cushions on the respective carriers, substantially as described.

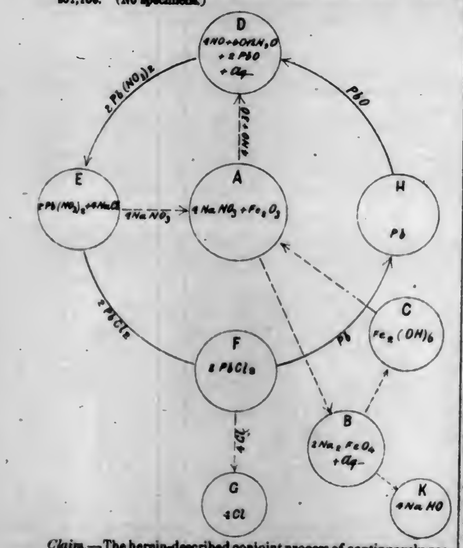
481,406. STUFFING-BOX. CHARLES E. LONGENECKER, Painted Post, N. Y., assignor to the Weston Engine Company, same place. Filed Apr. 2, 1892. Serial No. 427,509. (No model.)

Claim.—1. In a stuffing-box for piston-rods and the like, the combination of a bushing having a flanged end and an adjustable cylindrical sleeve arranged within said box and having one end bearing on

the flanged end of said bushing, whereby said bushing is rigidly held against longitudinal movement, substantially as described.

2. In a stuffing-box for piston rods and the like, the combination of a bushing arranged within and free of the walls of the opening of said box, a cylindrical sleeve for holding said bushing against longitudinal movement, a gland extending into and free of said sleeve, and means for adjusting said gland longitudinally, substantially as described.

3. In a stuffing-box for piston-rods and the like, the combination of a bushing arranged within and with its peripheral surface free of said box, a cylindrical sleeve adjustably secured within the box and having one end bearing against said bushing, a gland extending within and with its peripheral surface free of said sleeve, and an adjustable cap having a flange adapted to bear against said last-named gland, substantially as described.



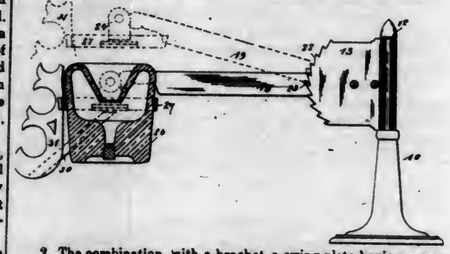
4. The combination, in a stuffing-box, of a gland and a bushing, each of which is formed with a flange, and an adjustable cylindrical sleeve arranged between and bearing against said flanges, whereby said gland and bushing are rigidly held against longitudinal movement and may be supported out of peripherical contact with said box, substantially as described.

5. The combination, in a stuffing-box for piston-rods and the like formed with an interior shoulder, and internal screw-threads adjacent said shoulder, of a cylindrical sleeve having a screw-threaded flange, pliable or flexible packing arranged between said shoulder and flange, and a bushing arranged within and peripherally free of said box and held against longitudinal movement by said sleeve, substantially as described.

6. The combination, in a stuffing-box for piston-rods and the like formed with external and internal screw-threads at one end, of a sleeve having a screw-threaded flange arranged within, a bushing supported within and peripherally free of said box by said sleeve, a gland arranged within and free of said sleeve, and an internally-screw-threaded gland for adjusting said last-named gland longitudinally, substantially as described.

481,407. PRODUCTION OF CAUSTIC ALKALIES AND CHLORINE.

FARNHAM M. LYTE, London, England. Filed July 30, 1891. Serial No. 401,139. (No specimens.)

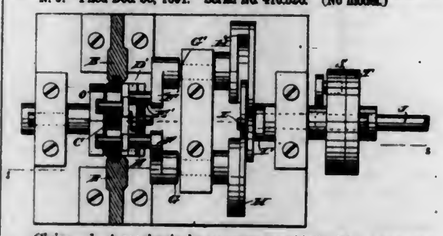


Claim.—The herein-described conjoint process of continuously producing caustic alkali and chlorine, which consists in decomposing an alkaline nitrate by heating it with ferric oxide to evolve nitrous fumes, decomposing the residue by boiling with water into caustic alkali free from iron and a precipitate of ferric hydrate, converting the nitrous fumes into aqueous nitric acid, dissolving plumbic oxide therein, precipitating plumbic chloride, fusing it, and decomposing it electrolytically into chlorine and metallic lead, and finally converting this (or any other) lead into plumbic oxide and the ferric hydrate into ferric oxide for recommencing the cycle, all as specified.

481,408. INKSTAND.

LINTON B. MANLEY, Duluth, Minn. Filed May 28, 1892. Serial No. 434,702. (No model.)

Claim.—1. The combination, with a supporting-bracket, a swing-plate held to turn upon the bracket, an arm having vertical movement in the swing plate, and a locking mechanism incident to both the swing-plate and the arm, of sockets for the reception of ink-wells pivotally connected with the arms, as and for the purpose specified.



2. The combination, with a bracket, a swing-plate having movement around the bracket, an arm pivotally connected with the swing-plate and capable of vertical movement, and a locking device incident to both the plate and the arm, of an extension projected downward from the free end of the arm, sockets for the reception of ink-wells pivotally attached to the extension, and a rack carried by the sockets, as and for the purpose specified.

3. The combination, with a bracket, a swing-plate capable of turning laterally upon the bracket, the said plate being bent around a member of the bracket to form two parallel and spaced sections, an adjusting mechanism connecting the sections, the outer edges of the sections being provided with teeth, and an arm one end of which is provided with a diagonally-located slot, a pin passed through the sections of the plate and through the slot in the arm, the arm being capable of movement upon the pin, and lugs carried by the arm and adapted for engagement with the teeth of the swing-plate, of sockets for the reception of ink-wells and adjustable upon the arm near its free end, substantially as and for the purpose specified.

481,409. MECHANICAL MOVEMENT.

FELIX MEIY, Elizabeth, N. J. Filed Dec. 30, 1891. Serial No. 416,520. (No model.)

Claim.—1. A mechanical movement provided with a reciprocating cross-head, two rock-shafts controlled from the said reciprocating cross-head, and slotted arms held on the said shafts, of which one delivers the main crank-pin to the other to carry it around one-half revolution, substantially as shown and described.

2. A mechanical movement comprising a reciprocating cross-head having pivoted wings, crank-arms engaged by the said pivoted wings, and rock-shafts carrying the said crank-arms and receiving a rocking motion on the up-and-down movement of the said cross-head, substantially as shown and described.

3. In a mechanical movement, the combination, with a reciprocating cross-head provided with wings having slots, of rock-shafts provided with crank-arms, the pins of which pass between the said wings, and slotted arms held on the said rock shafts and arranged to deliver the main crank-pin from one to the other, so that each carries the crank-pin during one-half revolution, substantially as shown and described.

4. In a mechanical movement, the combination, with a reciprocating cross-head provided with wings having slots, of rock shafts provided with crank-arms, the pins of which pass between the said wings, slotted arms held on the said rock-shafts and arranged to deliver the main crank-pin from one to the other, so that each carries the crank-pin during one-half revolution, and means, substantially as described, for locking and unlocking the said wings on the cross-head, as set forth.

5. In a mechanical movement, the combination, with a reciprocating cross-head provided with wings having slots, of rock-shafts provided with crank-arms, the pins of which pass between the said wings, slotted arms held on the said rock-shafts and arranged to deliver the main crank-pin from one to the other, so that each carries the crank-pin during one-half revolution, the blocks mounted to slide on the said cross-head and adapted to engage the said pivoted wings, and a cam-plate controlled from the main driving-shaft, mounted to swing, and formed with slots engaged by pins on the said blocks, substantially as shown and described.

6. A mechanical movement provided with slotted driving-arms, and a main crank-arm having a wrist-pin adapted to be alternately engaged by the said slotted driving-arms, substantially as shown and described.

7. A mechanical movement comprising two swinging drive-arms, each formed with a radial slot, and a main crank-arm provided with a wrist-pin engaging the said radial slots of the drive-arms, the latter being arranged to lead one another in their up-and-down movement, substantially as shown and described.

481,410. HARVESTER.

JACOB T. MIDER, Wathena, Kans. Filed Mar. 15, 1892. Serial No. 425,001. (No model.)

Claim.—1. An improved harvester comprising a main supporting-frame, a casing or box frame held thereon, thrashing devices mounted in such casing, a conveyer mounted transversely therein over the thrashing devices, projected at its discharge end through one side of the casing, its receiving end extended through the opposite side of the said casing, a comb secured to the casing under the conveyer, and means for operating the conveyer and thrashing devices, substantially as shown and described.

2. In a harvester of the class described, the combination, with the thrashing mechanism, of a comb having its rear end concaved, the rear ends of its fingers curved down and merged into such concave portion, a screw conveyer operating in such concaved portion, and a cap-plate mounted over the conveyer and extended above the front end thereof, all arranged substantially as shown and described.

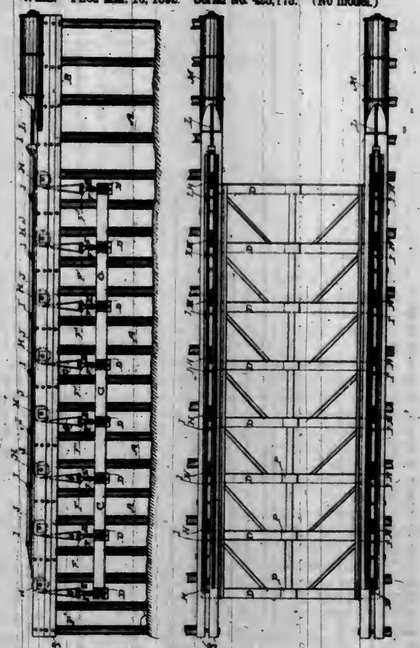
3. In a harvester of the class described, in combination, the thrashing mechanism, a comb having its rear end concaved, a screw conveyer mounted in said concaved end, its spirals projected over the inner ends of the comb-fingers, and a cap-plate secured to the rear edge of the comb-plate and projected over and beyond the front edges of the spirals of the conveyer, all substantially as and for the purpose described.

4. In a harvester of the class described, in combination with a box or casing, a separating-screen held therein, a comb, means for leading the headed grain from the comb to the screen, and a spiral beater mounted over the screen, adapted to lead the grain transversely over the screen and at the same time thrash it, as and for the purpose described.

5. In a harvester of the kind described, the combination, with the main frame, a box or casing held thereon, a separating-screen mounted longitudinally therein, a comb projected from one side, and means for leading the headed grain from the comb onto the screen in the casing, of a spiral conveyer having its peripheral edges roughened, arranged transversely over the screen, and adapted to convey the grain across the screen and thrash it as it is carried thereover, such conveyer projected over one side of the casing to discharge the husks, substantially as shown and described.

6. In a harvester of the kind described, the combination, with a casing, a separating-screen supported therein, and the combing-frame projected from one side of the casing, of a screw conveyer mounted transversely on the casing, its outer end held to rotate over the rear end of the combing-frame and adapted to lead the headed grain inward into the casing, its inner portion having the peripheral edges of its spirals widened and roughened and arranged to beat the grain against the screen, substantially as and for the purpose described.

7. In a harvester of the class described, the combination, with a thrashing-casing and a beater mounted transversely in such casing, of a screening-body mounted longitudinally in said casing under the beater, said body formed with an operating portion and a surplus or extended portion, means for shifting such body, whereby to change its rubbing or beating portion, and the comb and conveyer devices for heading and leading the grain to the screen, substantially as and for the purpose described.



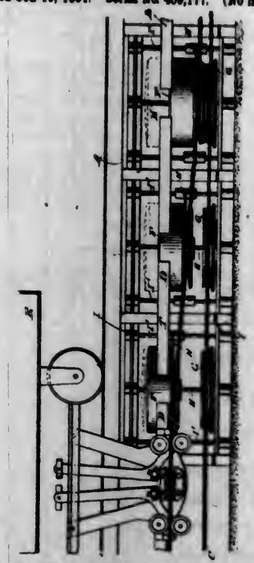
8. The combination, in a harvester of the class stated, with the casing, the comb, the conveyer, and the spiral beater, of a screen mounted longitudinally in the casing and extended under the beater and the tension devices for such screen, all arranged substantially as and for the purpose described.

9. The combination, with the thrashing-casing, the spiral beater, and the comb-frame held thereon, said frame having a portion extended into the casing and formed with prongs or fingers, of a separating-screen held for longitudinal movement in the casing under the beater, said screen arranged when adjusted to be engaged by the prongs on the comb-frame and held from movement, as and for the purpose described.

10. In a thrashing-machine essentially as described, the combination, with the main frame, the driver's seat, and the thrashing-box mounted thereon to one side of the seat, the thrashing devices carried by the box, and the elevating mechanism supported thereon and arranged to discharge the grain in advance of the driver's seat, of a rotatable storing-bin support mounted thereon having a turning shaft projected up therefrom and cut-off devices in the elevator discharge-chute, all substantially as shown and described, whereby the bin-holder can be rotated and the cut-off operated by the driver from his seat, as and for the purposes described.

481,411. HYDRAULIC LIFTING-DOCK.

ROBERT MORAN, Seattle, Wash. Filed Mar. 16, 1892. Serial No. 425,173. (No model.)



Claim.—1. In a lifting-dock, the combination of the horizontal cylinders having pistons reciprocating therein and mounted upon the

sides and at one end of the dock, the link-rods extending along the sides of the dock, the movable dock-platform adapted to be raised and depressed between the sides of the dock, the pins I of the link-rods, the equalizing-bars, the suspending ropes or chains connected in pairs with said pins and connected with opposite ends of the equalizing-bars, guide-pulleys over which the ropes or chains pass, and the turnbuckles connecting the equalizing-bars with the girders, substantially as herein described.

2. In a dock, the stationary sides, the movable platform adapted to be raised and depressed between the sides having transverse girders at equal intervals from one end to the other, suspending-rods connected with the opposite ends of each of the girders and turnbuckles by which the length is adjusted, horizontal equalizing-bars pivoted to the upper ends of said rods, suspending-ropes in pairs connected with the opposite ends of the equalizing-bars, guide-pulleys over which the ropes pass and by which their direction is changed from vertical to horizontal, link-bars each having a length equal to the distance between two adjacent girders of the platform, connected together in continuous line and adapted to travel upon the cap-timbers of the sides of the dock, and horizontal hydraulic cylinders fixed at one end having pistons and piston-rods connected with the link-bars, whereby motion is transmitted to lift all parts of the platform simultaneously, substantially as herein described.

481,412. CABLE-RAILWAY CURVE. GEORGE MULLER, Hoboken, N. J. Filed Oct. 19, 1891. Serial No. 409,177. (No model.)

Claim.—1. A cable-traction system provided with two sets of cable-supporting devices D and D', arranged on opposite sides of the cables, and each device of each set comprising a pulley and a retaining device located above the said pulley, substantially as shown and described.

2. In a cable-traction system, the combination, with two cables, of the two sets of cable-supporting devices D and D', located at opposite sides of the said cables, each device of the two sets being provided with a retaining device and a pulley located below the retaining device, the cables at the adjacent devices of the two sets of supporting devices passing and crossing from the retaining device of the one supporting device to the pulley of the other adjacent supporting device located at the opposite side of the cables, substantially as shown and described.

3. In a cable-traction system, a cable-supporting device comprising a pulley for one cable and a retaining and protecting device for the other cable, substantially as described.

4. A cable traction system provided with a retaining and protecting device to support the uppermost cable while the other cable is in use, substantially as shown and described.

5. A cable-traction system provided with a pulley for the lowermost cable and a retaining device arranged above the said pulley and adapted to support the uppermost cable to permit the lowermost cable to pass from its pulley up onto the said retaining device without striking the uppermost cable on the latter, substantially as shown and described.

6. A cable-traction system provided with a retaining device comprising a revoluble disk, a ball held on top of the said disk, and a bar formed with a recess containing the said ball, the latter permitting the cable to pass upon the said disk below the said bar, substantially as shown and described.

7. A cable-traction system provided with a retaining device comprising a revoluble disk, a ball held on top of the said disk, a bar formed with a recess containing the said ball, the latter permitting the cable to pass upon the said disk below the said bar, a lock for the said ball and also held in the said recess, and a pulley held on top of the said disk and on which butts the cable, substantially as described.

8. A cable traction system provided with a retaining device comprising a revoluble disk, a recessed bar arranged above the said disk, a ball held on top of the said disk in the said recess, and a pulley held above the said bar in axial line with the said disk, said pulley being formed with a flange extending over the ends of the said bar, substantially as shown and described.

9. A cable-traction system provided with a retaining device comprising a revoluble disk, a recessed bar arranged above the said disk, a ball held on top of the said disk in the said recess, a pulley held above the said bar in axial line with the said disk, said pulley being formed with a flange extending over the ends of the said bar, and locking-balls held in the said recess in the rear of the first-named ball, substantially as shown and described.

10. In a cable-traction system, the combination, with a grooved pulley for the lowermost cable, of a retaining device for the uppermost cable and arranged above and in line with the said pulley, substantially as shown and described.

11. In a cable-traction system, the combination, with a grooved pulley for the lowermost cable, of a retaining device for the uppermost cable and arranged above and in line with the said pulley, the said retaining device being mounted to slide vertically, substantially as shown and described.

12. In a cable-traction system, the combination, with a grooved pulley for the lowermost cable, of a retaining device for the uppermost cable and arranged above and in line with the said pulley, the said retaining device comprising a revoluble disk, a recessed bar fitted to slide vertically and adapted to carry along the said disk, and a ball held in the recess of the said bar and mounted on top of the said disk, and a lock, as described, for the said ball and arranged in the said recess, substantially as shown and described.

13. In a cable-traction system, the combination, with a grooved pulley for the lowermost cable, of a retaining device for the uppermost cable and arranged above and in line with the said pulley, the said retaining device comprising a revoluble disk, a recessed bar fitted to slide vertically and adapted to carry along the said disk, a ball held in the recess of the said bar and mounted on top of the said disk, and two smaller balls arranged in the said recess in the rear of the first-named larger ball, substantially as shown and described.

14. In a cable-traction system, the combination, with a grooved pulley for the lowermost cable, of a retaining device for the uppermost cable and arranged above and in line with the said pulley, the said retaining device comprising a revoluble disk, a recessed bar fitted to slide vertically and adapted to carry along the said disk, a ball held in the recess of the said bar and mounted on top of the said disk, two smaller balls arranged in the said recess in the rear of the first-named larger ball, and a second disk held on top of the first-named disk to form an abutment for the uppermost cable, substantially as shown and described.

15. In a cable-traction sytem, the combination, with a grooved pulley for the lowermost cable, of a retaining device for the uppermost cable and arranged above and in line with the said pulley, the said retaining device comprising a revoluble disk, a recessed bar fitted to slide vertically and adapted to carry along the said disk, a ball held in the recess of the said bar and mounted on top of the said disk, and a pulley mounted to turn loosely on top of the said bar and formed with a downwardly-extending flange passing over the ends of the said bar, and a lock, as described, for the said ball and arranged in the said recess, substantially as shown and described.

16. In a cable-traction system, the combination, with a grooved pulley for the lowermost cable, of a retaining device for the uppermost cable and arranged above and in line with the said pulley, the said retaining device comprising a revoluble disk, a recessed bar fitted to slide vertically and adapted to carry along said disk, a ball held in the recess of the said bar and mounted on top of the said disk, two smaller balls arranged in the said recess in the rear of the first-named larger ball, a second disk held on top of the said first-named disk to form an abutment for the uppermost cable, and a counterbalancing device for the said balls, substantially as shown and described.

481,418. CABLE-TRACTION SYSTEM. GEORGE MULLER, Hoboken, N. J. Filed Mar. 26, 1892. Serial No. 426,926. (No model.)

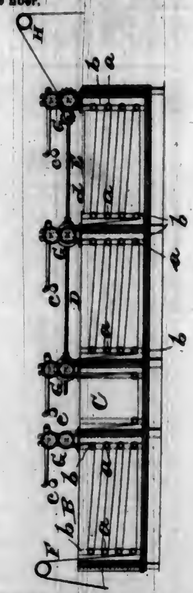
Claim.—1. A cable-traction system provided with two sets of pulleys D and D', arranged on opposite sides of the cables, each set comprising two pulleys, one for each cable, the cables crossing each other between the sets of pulleys D and D', so that the cable which was uppermost in one set of pulleys becomes lowermost on the other set of pulleys, and a yoke carrying the said pulleys and adapted to be tilted, substantially as shown and described.

2. In a cable-traction system, a cable-supporting device for two cables and comprising two pulleys located one above the other, a yoke carrying the said pulleys and mounted to swing upward by the action of the lowermost cable on the lowermost pulley, and an advance pulley journaled on the said yoke and engaged by the said lowermost cable to return the yoke to its normal position, substantially as shown and described.

3. In a cable-traction system, the combination, with a yoke mounted to tilt, of two pulleys journaled in the said yoke and one located above the other and an advance pulley supported on the said yoke and located in advance of the two other pulleys, substantially as shown and described.

4. In a cable-traction system, the combination, with a tilting yoke and two pulleys journaled therein, of an advance pulley supported by the said yoke and mounted to turn and to slide up and down, substantially as shown and described.

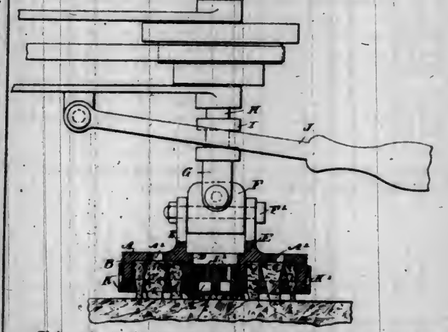
5. In a cable-traction system, the combination, with a tilting yoke and two pulleys journaled therein, of an advance pulley supported by the said yoke and mounted to turn and to slide up and down, the said advance pulley being also adapted to move forwardly while sliding upward, substantially as shown and described.



6. In a cable-traction system, an advance pulley provided with a spherical base, an inclined part extending from the said base, and a flange on top of the inclined part, substantially as shown and described.

7. In a cable-traction system, the combination, with a counterbalanced yoke mounted to tilt, of two pulleys journaled in the said yoke, one above the other and one in front of the other, an advance pulley mounted to turn adapted to slide up and down and to shift transversely, and means, substantially as described, for imparting the said movement to the advance pulley, as set forth.

8. In a cable-traction system, the combination, with a counterbalanced yoke mounted to tilt, of two pulleys mounted in the said yoke, one above the other and one in front of the other, an advance pulley mounted to turn, adapted to slide up and down and to shift transversely, a shaft secured in a frame and on which the said advance pulley is mounted to turn, an arm held on the said tilting yoke and pivotally connected with a link supporting the said advance pulley, and a fixed plate on which a bar of the said advance-pulley frame is mounted to slide, substantially as shown and described.



481,414. PROCESS OF BLEACHING. JOSEPH A. MYRICK, Salisbury, N. C. Filed Apr. 1, 1892. Serial No. 427,364. (No specimens.)

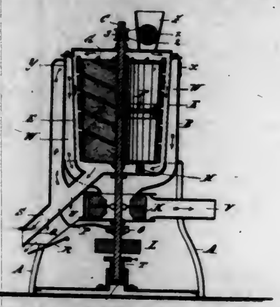
Claim.—1. The process of bleaching cotton-chain warp or analogous fiber, which consists in subjecting the fiber to a solution of chloride of lime, then to hot water, then to a solution of sulphurous acid, and finally rinsing the fiber.

2. The process of bleaching cotton-chain warp or analogous fiber, which consists in subjecting the fiber to a solution of chloride of lime, expressing the liquid from the fiber and exposing it to the atmosphere, then subjecting the fiber to hot water and expressing the water, then subjecting the fiber to a weak solution of sulphurous acid, expressing said acid and again subjecting the fiber to the atmosphere, and finally rinsing the fiber.

481,415. POLISHING-WHEEL. JOHN MCCLELLAN, Greenbush, N. Y. Filed Sept. 19, 1891. Serial No. 406,304. (No model.)

Claim.—1. A polishing-wheel comprising an inverted cup adapted to contain the polishing material held therein by a binding substance and an adjustable ring on the cup and adapted to engage the binding substance, substantially as and for the purpose set forth.

2. A polishing-wheel comprising an inverted revoluble cup adapted to support the polishing material, and a ring made adjustable on the said cup to hold the polishing material in place and to prevent the cup from striking the marble under treatment, and a plug held adjustably on the hub of the said cup and formed with apertures for the passage of water, substantially as shown and described.



3. A polishing-wheel comprising an inverted cup having a threaded rim and a hub with an interior thread, a ring screwing on the threaded rim of the said hub, and an apertured plug screwing in the said hub, substantially as shown and described.

4. In a polishing-wheel, the combination, with an inverted cup

formed with a threaded rim, ribs, and a central threaded hub, of a ring screwing on the said rim, substantially as shown and described.

5. In a polishing-wheel, the combination, with an inverted cup formed with a threaded rim, ribs, and a central threaded hub, of a ring screwing on the said rim and an apertured plug screwing in the said hub, substantially as shown and described.

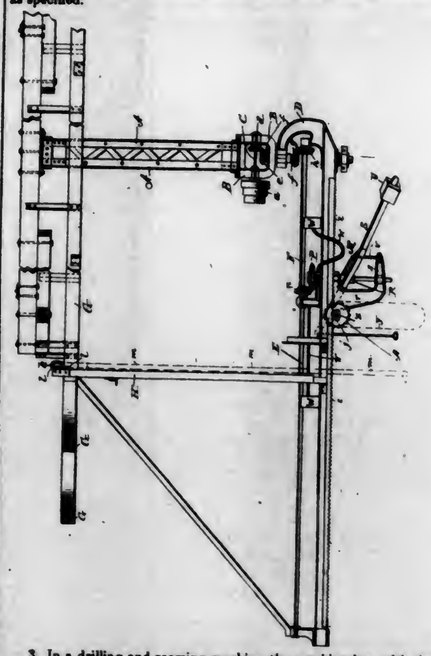
481,416. COTTON-SEED-DELINTING MACHINE. JOHN H. MCCONNICK, New Orleans, La. Filed Oct. 16, 1891. Serial No. 408,948. (No model.)

Claim.—1. In a cotton-seed delinter, the combination, with the frame B, of the indented and perforated casing arranged thereon and forming a lint-chamber, the brush-cylinder arranged within the indented casing, the vertically-adjustable shaft secured to said brush-cylinder, the fan-casing below the brush-cylinder, the fan arranged therein and secured to said shaft, the chute leading from the interior of the perforated casing and having a perforated shaker in its bottom, the dust-receiving chute below said shaker, the cam on the shaft, and an agitator for engaging the cam on the shaft for operating the shaker, substantially as specified.

2. In a cotton-seed delinter, the combination of the casing, the vertical shaft therein, the vertically-adjustable bearing for said shaft, the brush-cylinder secured to the shaft and provided with a spiral brush on the periphery, a brush on the bottom of the cylinder, the casing having a return-inlet for lint and a discharge-outlet for seed, a sieve arranged in the seed discharge or outlet, and an agitator for said sieve connected with the shaft, substantially as specified.

3. A cotton-seed delinter having the following instrumentalities in combination: a lint-chamber arranged upon a suitable frame, a fan-casing arranged below the lint-chamber and in communication therewith, a lint-discharge leading from said casing, a perforated casing arranged in the lint-chamber, a vertically-adjustable shaft passing through the respective chambers, the brush-cylinder secured to the shaft, a brush secured to the under side of the brush-cylinder, a fan also secured to said shaft, a grooved cam secured to the shaft below the fan-casing, a sieve arranged on the seed-discharge, a dust-chamber beneath the sieve, and an agitator connecting the sieve with the cam on the vertical shaft, all adapted to operate substantially as specified.

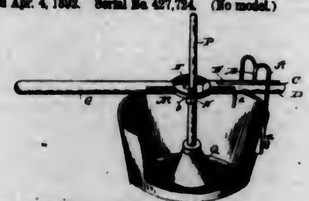
481,417. NUT-LOCK. JAMES C. MCGUILKIN, Industry, Pa. Filed Mar. 31, 1892. Serial No. 427,235. (No model.)



Claim.—In a nut-lock, the combination, with a washer having a central aperture, a diagonal recess, and a diagonal slot, of a key adapted to fit in said recess, having a projection at its outer end, adapted to fit in said slot, said projection having a wedge-shaped projection projecting beyond the face of the projection at the outer end and adapted to engage with a nut, substantially as described.

481,418. REAMING AND DRILLING MACHINE. OLE C. OPSHOL and JESSE V. HOOPER, Pittsburg, Pa. Filed Nov. 13, 1891. Serial No. 411,858. (No model.)

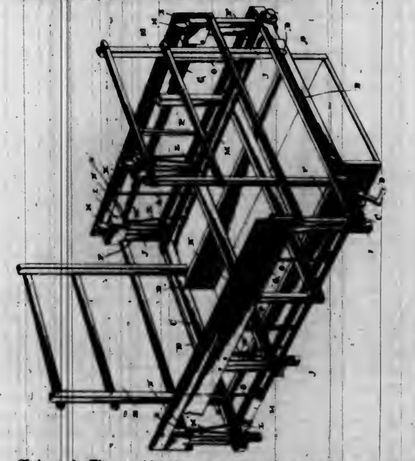
Claim.—1. In a drilling and reaming machine, the combination, with a pivot-hanger, the sweep pivotally connected thereto, and the carriage adjustably mounted on said sweep, of a series of approximate semicircular hanger-tracks arranged at various distances from the pivot-hanger and a hanger carrying a traveling wheel at its upper end, adapted to engage the hanger-tracks and adjustably connected at its lower end to the sweep, substantially as and for the purpose set forth.



2. In a drilling and reaming machine, the combination, with a pivot-hanger, the sweep pivotally connected thereto, the carriage adjustably mounted on said sweep, and the series of approximate semicircular hanger-tracks arranged at various distances from the pivot-hanger, of a hanger adjustably connected to the sweep and carrying a traveling wheel adapted to engage the hanger-tracks, a sprocket-wheel connected with said traveling wheel, and an endless chain taking around said sprocket-wheel and depending therefrom, substantially as specified.

3. In a drilling and reaming machine, the combination, with the sweep, the longitudinal feathered shaft mounted thereon, and the bevel gear keyed on said shaft, of the drill-carriage loosely mounted on the shaft and loosely connected to the gear thereon, the tubular shaft journaled in the carriage-body and carrying a beveled gear at its upper end, meshing with the gear on the shaft, the spindle keyed or feathered in the tubular shaft and having a key-seat at its lower end, a suitable means for normally holding the spindle up out of an operative position, and a suitable means for throwing said spindle down into an operative position, substantially as specified.

4. In a drilling and reaming machine, the combination, with the sweep, the longitudinal shaft mounted thereon, and the movable drill-carriage loosely mounted on said longitudinal shaft, of the movable bearings mounted on the sweep and supporting the longitudinal shaft and ropes or chains connecting said bearings with the drill-carriage, substantially as specified.



481,419. WASHING-MACHINE. IRA R. OWEN, Glen Elder, Kans. Filed Apr. 4, 1892. Serial No. 427,734. (No model.)

Claim.—1. In a washing-machine substantially as described, the combination, with a supporting-frame having a vertically-disposed shaft and a friction and fulcrum ball journaled on said shaft, of a reciprocatory lever embodying a tubular portion having a longitudinal slot in its upper side and adapted to receive the friction and fulcrum ball and a suitable means for connecting a rubber to said lever, substantially as and for the purpose specified.

2. In a washing-machine substantially as described, the combination, with a supporting-frame having a vertically-disposed shaft and a friction and fulcrum ball journaled on said shaft, of a reciprocatory lever comprising the tubular section having a longitudinal slot in its upper side and adapted to receive the friction and fulcrum ball, the handle-section, the curvilinear or bowed straps, and the set-screws taking through the bowed straps and adapted to engage the handle of a rubber, substantially as and for the purpose set forth.

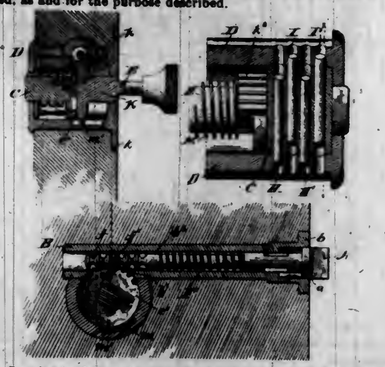
481,420. HAY-RACK. SEVER H. FLOBERG, Leland, Iowa. Filed May 14, 1892. Serial No. 433,419. (No model.)

Claim.—1. The combination, with the sides of a hay-rack having vertical ways formed thereon, of vertically-adjustable racks having depending standards which move in said ways and a means for elevating the said adjustable racks, substantially as shown and described.

2. The combination, with the sides of a hay-rack having vertical ways formed thereon and side racks adapted to move in said ways, of a drum secured across the projecting portion of the side of the rack and ropes so connected to the drum and the adjustable racks that when the former is revolved the racks will be elevated, substantially as shown and described.

3. In a hay-body, the combination of a stationary vertical rack, a vertically-adjustable rack adapted to move thereon, ropes for elevating and separate ropes for lowering the rack, and a drum upon which the said ropes are adapted to be wound in opposite directions, substantially as shown and described.

4. The combination, with a hay-body having cross-pieces C, of sides projecting vertically from said cross-pieces having ways thereon, vertically-adjustable racks, standards depending therefrom which move in the ways of the said sides, a drum journaled to the under sides of the cross pieces C, and ropes secured to the said drum and lower ends of the said standards at their respective ends, the said ropes between their ends passing up over pulleys depending from the stationary vertical sides, substantially as shown and described.



481,421. CYLINDER-LOCK. JOHN B. PRICE, Wolleston, Mass. Filed Mar. 30, 1892. Serial No. 427,106. (No model.)

Claim.—1. The combination, with a latch-bolt, of the key-actuated plug or barrel seated in a suitable fixed shell at right angles to said latch-bolt and an operating-spindle in line with the plug or barrel and connected to the latch-bolt, the adjacent ends of the plug and spindle being connected to permit said spindle to have a limited axial movement irrespective of the plug to retract or project the latch-bolt, as and for the purpose described.

2. In a latch, the combination of the spring-actuated bolt, an independent key-actuated turning plug or barrel at right angles to the bolt, and an endwise-adjustable spindle normally geared to the bolt and connected to the plug or barrel, said spindle adapted to be disconnected from the plug or barrel while still engaged with the bolt, as and for the purpose described.

3. In a latch, the combination, with a bolt and an axially-turning key-actuated plug or barrel, of an endwise-movable spindle arranged in axial alignment with said plug or barrel and connected normally to said plug and the bolt, said spindle being capable of endwise movement to disconnect the same from either the plug or the bolt, as and for the purpose described.

4. In a latch, the combination, with a bolt and a key-actuated plug or barrel, of the spindle geared to the bolt and having means to connect the same to the barrel or plug to turn axially therewith, said spindle adapted to be withdrawn from engagement with the plug or barrel while still connected to the bolt, and means for holding the connected bolt and spindle against movement when the bolt is retracted, as and for the purpose described.

5. In a latch, the combination, with a key-actuated plug or barrel, of an endwise-movable bolt and a spindle arranged in axial alignment with the plug or barrel and connected therewith, said bolt and spindle being coupled to permit of reversal of the bolt without disconnecting the parts, as and for the purpose described.

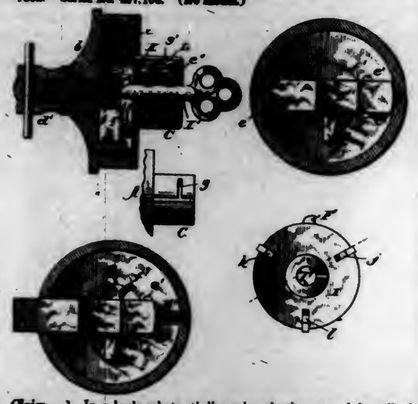
6. In a latch, the combination of an endwise-movable bolt having a rack at its inner end, a key-actuated plug or barrel, and a spindle in axial alignment with and connected to the barrel and having a gear which meshes with the rack of the bolt, as and for the purpose set forth.

7. In a latch, the combination of an endwise-movable bolt provided with a rack, the spindle geared to said rack and provided with the shoulders *e e* at its inner end, and the plug or barrel having the stud *e'* adapted to impinge against the shoulders *e* of said spindle, as and for the purpose described.

8. In a latch, the combination, with the fixed cylinder and the jacket arranged at right angles to each other, of the reciprocating bolt in the jacket, a key-actuated plug fitted in one end of the cylinder and having the tumbler-controlled plungers and the stud *e'*, and the spindle fitted in the opposite end of the cylinder in line with the plug and having shoulders in the path of the stud *e'* of said plug, said spindle and bolt being connected by means which retracts the bolt when the spindle is turned on its axis, as and for the purpose described.

9. In a latch, the combination, with a cylinder, of a key-actuated plug or barrel fitted in one end thereof, a reciprocating bolt at right angles to the cylinder and disconnected from the barrel or plug, and an endwise-adjustable and turning spindle geared to the bolt and normally connected to the plug or barrel to turn axially therewith, said spindle connecting the bolt and plug for simultaneous operation and adapted to be withdrawn from engagement with either or both of said parts, as and for the purpose described.

10. In a latch, the cylinder having the longitudinal and circumferential grooves *m n* connected together, combined with a spindle having the guide-pin fitted in the grooves and provided with the gear-pinion, the reciprocating bolt having the teeth meshing with the gear-pinion on the spindle, and the key-actuated plug or barrel in axial alignment with the spindle and connected thereto, substantially as described.



11. In a latch, the combination, with a cylinder, of the spring-impelled bolt provided with the concentric annular shoulders forming the rack, the spindle operating in one end of the cylinder and having the gear-pinion meshing with the rack and the shoulders *e e* on its inner end, and the plug or barrel having the stud fitted between the shoulders and the tumbler-controlled plungers, which engage with the cylinder, as set forth.

12. In a latch, the axially-turning plug or barrel having the slots and passages, the two sets of plungers fitted in passages and arranged so that adjacent plungers project beyond the plug in opposite directions, the tumblers pivoted in the slots and connected to the plungers, and the springs, substantially as described

13. In a latch, the combination, with a cylinder, of a plug or barrel having its V-shaped key passage or way and transverse passages

connected by the radial slots, the tumblers pivoted in said slots, the plungers in the passages connected to the tumblers, and the springs bearing on the tumblers, substantially as described.

481,422. LOCK. JOHN B. PRIME, Wellesley, Mass. Filed Mar. 30, 1892. Serial No. 427,108. (No model.)

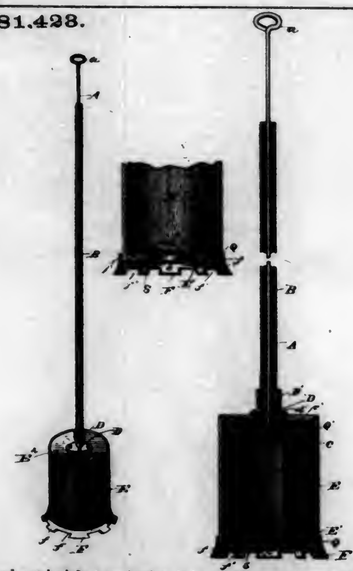
Claim.—1. In a lock substantially as herein shown and described, the sectional casing comprising the two annular members A C, of which the smaller member C is arranged in axial alignment with the larger member and provided at its inner end with a radial flange or plate c, secured directly to said larger member, combined with a bolt guided in the member A and a key-actuated plug seated in the smaller member and having an arm F, which operates between suitable stops on the bolt, as and for the purpose described.

2. In a lock substantially as herein shown and described, the combination of an annular sectional casing having its aligned members connected rigidly and directly together and one member provided with a spindle-bearing, the latch-bolt F, guided in one member of the casing and recessed on both sides thereof to provide the two sets of shoulders f' f', an axially-turning plug seated in the other member of the casing and provided at its inner end with a radial arm F, which operates between the shoulders f' of the bolt, and a spindle journaled in the bearing of one member of the casing and also provided with a radial arm that fits between the shoulders f of the bolt, as and for the purpose described.

3. In a lock substantially as herein shown and described, the sectional annular casing adapted to be fitted in a door-stile by having two holes therein of different diameters, comprising an annular divided casing A C, in which the members are united rigidly and directly together at their inner meeting ends, combined with a latch-bolt guided in the member A, a spindle, and a turning plug seated in the member C and connected directly to the latch-bolt, as and for the purpose described.

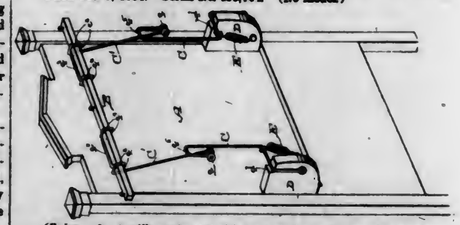
4. The combination, with a fixed slotted casing, of the axially-turning plug or barrel seated therein and having the radial tumbler-recesses, the tumblers pivoted eccentrically in said recesses and normally projected by springs beyond the surface of the plug or barrel, and the plungers or pins bearing against the tumblers and normally forced thereby into a longitudinal key-passage in the center of the barrel or plug, substantially as described.

5. The combination, with a slotted casing, of the recessed axially-turning plug, the series of tumblers, each pivoted independently in the plug or barrel and projected at one end beyond the surface thereof by a separate pressure-spring, and a separate pin or plunger bearing against the heel of each tumbler and forced thereby into a key-opening in the barrel, substantially as described.



6. The combination, with a radially-slotted casing, of an axially-turning plug having the radial recesses in its surface and a central key-passage, the series of tumblers, each eccentrically pivoted in one of the recesses and having a heel, a spring for each tumbler, seated in a socket in the plug or barrel and bearing against the free end of the tumbler, and a radial pin or plunger operating in a seated radial opening in the plug and bearing against the heel of the tumbler, as and for the purpose described.

481,428. CISTERN-CLEANER. EVAN B. RAVENSCROFT, North Baltimore, Ohio, assignor of one-half to Thomas H. Carter, same place. Filed Feb. 13, 1892. Serial No. 421,368. (No model.)



Claim.—1. A cistern-cleaner comprising a cylinder having a flaring and notched foot projecting below its lower end, a reciprocating piston in the cylinder, an apertured head in the lower end of the cylinder, an inwardly-opening flap-valve secured to said head and adapted to close the aperture therein, and a screw taking through this head from the exterior and adapted to sustain the free edge of said valve, as and for the purpose set forth.

2. A cistern-cleaner comprising a cylinder having a handle, a piston within said cylinder, means for operating the piston, an apertured head in the lower end of the cylinder, an inwardly-opening flap-valve secured to said head and adapted to close the aperture therein, and an adjustable support on this head adapted to sustain the free edge of said valve, as and for the purpose set forth.

481,428.

481,424. PILLOW-SHAM HOLDER. ALEXANDER J. ROBERSON, Napa, Cal., assignor of one-half to Joseph W. Hostetler, same place. Filed Oct. 8, 1891. Serial No. 408,164. (No model.)

Claim.—1. A pillow-sham holder consisting of a bar for supporting the shams and the supporting-arms each made in two sections pivoted together at their adjoining ends, the upper section forming a support for the bar, while the lower section is pivotally secured to a fixed part of the bed-frame, said sections having their points of pivotal movement in the plane of the width of the bed and one of the sections of each arm crossing the other section at one side of the pivotal center to form a limiting-stop, substantially as herein described.

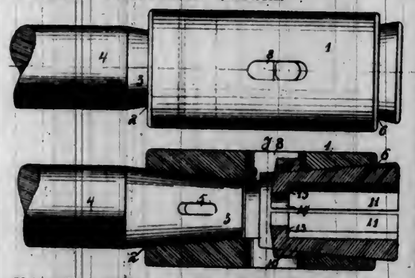
2. A pillow-sham holder consisting of upper and lower arms pivotally secured to each other at the inner ends and with the lower portions of the lower arms pivotally secured to a fixed portion of the bed-frame, one of said arms being bent at right angles and across the other arm to form a limiting-stop, and a bar supported upon the upper ends of the upper arms.

3. A pillow-sham holder consisting of a bar for supporting the shams, jointed sectional arms carrying the supporting-bar at their upper ends, and brackets secured to the head-board and to which said arms are pivoted at their lower ends, said brackets having top shoulders forming stops and rests for the arms and bar, substantially as herein described.

4. A pillow-sham holder consisting of the bar for supporting the shams, the jointed sectional arms carrying said bar, the brackets fixed to the head-board and to which the lower ends of the arms are pivoted, said brackets having top shoulders or rests for said arms and for the bar when lowered, and the springs secured to said brackets and arms, substantially as herein described.

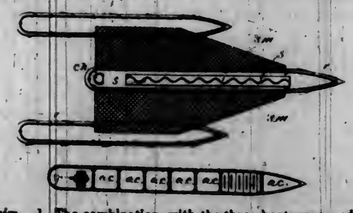
5. A pillow-sham holder consisting of the bar for supporting the shams and the pivoted arms carrying said bar, said arms being sectional with adjacent ends pivoted, the lower sections of the arms being bent at right angles across the lower ends of the upper arms to form stops c^3 for controlling the position of the upper sections and adjusting the supporting-bar to the moldings of the head-board, substantially as herein described.

6. A pillow-sham holder consisting of the bar for supporting the shams the fixed brackets on the head-board, the upper sections C' of the supporting-arms, secured to and carrying the bar, and the lower sections C of said arms pivoted to the brackets at their lower ends and pivoted at their upper ends to the lower ends of the upper sections, said lower sections being formed with the bendable stops c^3 in front of the upper sections for adjusting the position of said upper sections and of the supporting-bar, substantially as herein described.



481,425. SHIRT-COLLAR HOLDER. FRANK L. ROBINSON, Hartland, Me. Filed Apr. 7, 1892. Serial No. 428,185. (No model.)

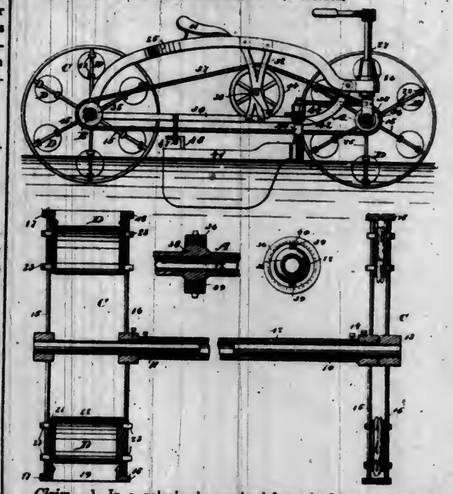
Claim.—1. A shirt-collar holder comprising a doubled tape having a clasp secured to each of its free ends and a clasp secured to its doubled portion and a device connecting the parts of the tape between its doubled portion and its free ends, substantially as described.



2. A shirt-collar stay comprising a doubled tape having a clasp adjustably secured to each of its ends and a clasp secured to the doubled portion of the tape and a sliding loop connecting the parts of the tape between its doubled portion and free ends, substantially as described.

481,426. CHUCK. WILLIAM F. SCHMIDT, St. Louis, Mo. Filed Jan. 25, 1892. Serial No. 419,181. (No model.)

Claim.—The combination, with a chuck provided with an inwardly-tapering conical socket, and with a transverse slot intersecting the latter, of two inwardly-tapering semi-conical jaws provided with opposing angular grooves and with lugs 10, normally seated in said transverse slot, the rear ends of the jaws being reversely beveled in line with the lugs, substantially as and for the purpose set forth.



481,427. LIFE-SAVING AND PLEASURE CRAFT. ARTHUR B. SERARER, Reno, Nev. Filed Mar. 29, 1892. Serial No. 426,969. (No model.)

Claim.—1. The combination, with the three boats arranged parallel, but separated and rigidly connected, as specified, of batteries and motors arranged in pairs in each boat, a propeller connected with each boat and motor, a switchboard located in the central boat, and a series of conductors which connect each battery with the nearest motor and also with said switchboard, as shown and described.

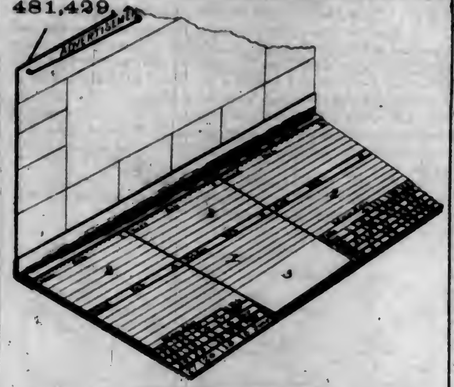
2. The combination, with the three boats arranged parallel, but separated and rigidly connected, as specified, of batteries and motors arranged in pairs in each boat, a propeller connected with each boat and motor, a switchboard located in the central boat, and a series of conductors which connect each battery with the nearest motor and also with said switchboard, a cable-reel located in the central boat and adapted to revolve, a cable wound thereon and connected with the adjacent switchboard and with a shore-switchboard, as shown and described.

481,428. VELOCIPEDE. ABRAM C. SHELLEY, Rythebourne, N. Y. Filed Nov. 6, 1891. Serial No. 411,042. (No model.)

Claim.—1. In a velocipede, a wheel formed of two sections adjustable toward and from each other and a series of floats and paddles between the said sections, substantially as and for the purpose set forth.

2. In a velocipede, a wheel formed of two sections adjustable toward and from each other, floats secured between the sections of the wheel, and paddles detachably secured to and between the said sections, substantially as described.

3. In a velocipede, wheels constructed in two sections, one adjustable toward the other, detachable floats connecting the two wheel-sections, said floats comprising stiff heads and flexible bodies, and paddles intervening the sections of the wheels, said paddles being also removable, as and for the purpose specified.



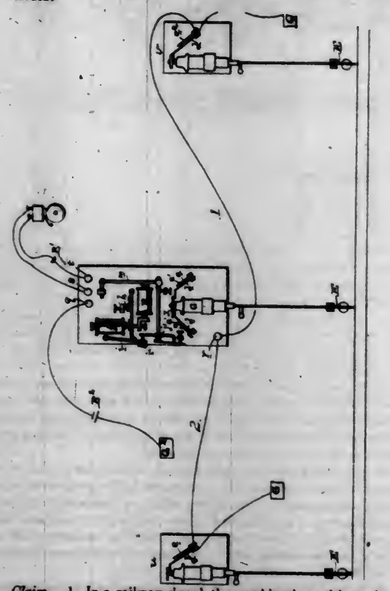
4. In a velocipede, the combination, with the axles and wheels mounted to turn therewith, the said wheels being constructed in two sections, one adjustable toward the other, and provided with floats and paddles removably attached to the sections and intervening them, of a pedal-shaft, a driving mechanism connecting the pedal-shaft and the axles, and a steering device connected with the forward axle, as and for the purpose set forth.

5. In a velocipede of the character described, the combination, with the axles and wheels secured to said axles, the said wheels being constructed in two adjustable sections and provided with removable floats and paddles intervening the sections, of a pedal-shaft, a driving mechanism connecting the pedal-shaft and the axles, a steering apparatus connected with the forward axle, a rudder suspended between the axles, and a connection between said rudder and the steering apparatus, as and for the purpose specified.

481,429. MEMORANDUM-TABLET. GEORGE H. SEYMOUR, Stanton, Tex., assignor of one-half to William H. Fusch, same place. Filed Mar. 18, 1892. Serial No. 425,468. (No model.)

Claim.—A memorandum-tablet or tickler consisting of fifty-two connected leaves, each divided into six spaces marked with the six business days of the week and the corresponding month and day thereof, and the index at the bottom having the name of the month and the date of the first business day of the week corresponding to the leaf printed thereon and said leaves cut away, so that all the names and numerals thereon will be visible, substantially as and for the purpose set forth.

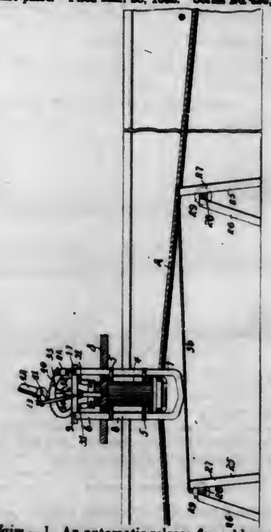
481,429.



8. A pneumatic track-instrument actuated by passing trains, a chamber with a piston and rod, a pipe connecting the track-instrument with the chamber, whereby the vibration of a column of air is communicated from the track-instrument to the chamber to move the piston therein, and the locking and unlocking mechanism of an interlocking relay, mechanically actuated by the movement of the piston, substantially as herein described.

4. In a railway-signal, a track-instrument consisting of a vertical cylinder with piston, piston-rod, actuating-lever, and returning-spring, a pipe connecting the cylinder with a second cylinder upon a relay or contact instrument adjacent to the track-instrument, a piston moving loosely in the second cylinder so as to allow the air to gradually escape past it, while itself falls by gravitation when the air-supply ceases, elastic contact-arms situated above the cylinder, an attachment upon the upper end of the piston-rod to engage one of the arms and hold them out of contact when the piston is at the bottom of the cylinder and to allow contact to be made when the piston rises, an electro-magnet and mechanism whereby a local circuit is completed when these contacts are made and a signal or alarm is actuated, and a mechanism by which the local circuit is maintained and the signal continued during a period after the actuating force has ceased, substantially as herein described.

5. In a railway-signal, an apparatus consisting of the two connected air-cylinders, contact-arms, and mechanism whereby contact between said arms is produced, as shown, a local circuit and signal, with a mechanism by which the latter is actuated when the contact is made and the circuit is maintained and the signal continued after the actuating force has ceased, and a mechanism by which the circuit is automatically cut off at the end of the time and the parts returned to their normal position, substantially as herein described.

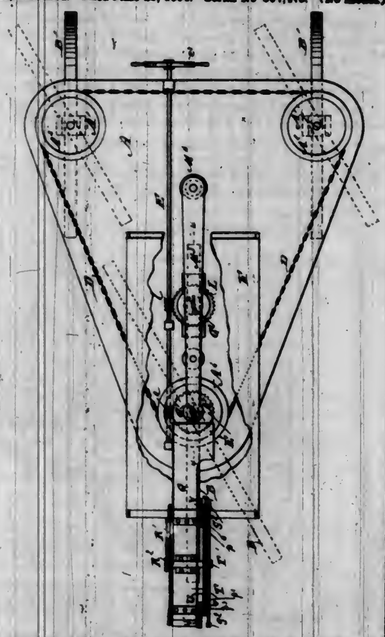


481,430. PNEUMATIC ELECTRIC-CIRCUIT-CONTROLLING AND INTERLOCKING APPARATUS. WILLIAM W. SLATER and HARRY C. BARNES, Oakland, Cal. Filed Oct. 24, 1891. Serial No. 409,742. (No model.)

Claim.—1. In a railway-signal, the combination, with an electro-pneumatic contact-instrument and actuating mechanism, as shown, of a track-instrument consisting of a vertical cylinder, a piston moving therein, a spring by which the piston is held normally in the upper part of the cylinder, a piston-rod extending through the top of the cylinder, a lever fulcrumed by the side of the track, resting upon the top of the piston-rod, with its movable end so disposed that it is depressed by the successive wheels of a passing train, and an inwardly-opening valve by which air is admitted into the pipe connecting with the lower part of the cylinder when the piston rises, said pipe leading from this track-cylinder to the cylinder of the electro-pneumatic contact-instrument, substantially as herein described.

2. In a railway-signal, the track-instrument consisting of a vertical cylinder with piston, piston-rod, actuating-lever, and returning-spring, a pipe connecting the cylinder with a second cylinder upon a relay or contact-instrument adjacent to the track-instrument, a piston moving in the second cylinder, the piston-rod of which extends through the top of the cylinder, elastic contact-arms *d* and *e*, which are normally separated by the position of the piston at the bottom of the cylinder and the contacts are made when the piston is raised, and an electro-magnet *f* and mechanism whereby a local circuit is completed and a bell or signal actuated, substantially as herein described.

481,431. AUTOMATIC RELEASE FOR CABLE-GRIPPERS. ANDREW J. SMITH, St. Louis, Mo., assignor of one-half to Charles Kroemke, same place. Filed Mar. 25, 1892. Serial No. 426,409. (No model.)



Claim.—1. An automatic release for cables, consisting of a movable frame, the lower end of which is forked and the same adapted to be attached to the grip, a loop attached to said frame and adapted to surround the upper portion of the grip, inclined tracks located within the subway upon which the forked ends of the said frame are adapted to come in contact, a connecting-rod carried by the said frame and in movable connection with the pawl carried by the grip-lever, and an alarm adapted to be sounded when the said frame is elevated and previous to disengaging the pawl, substantially as described.

2. An automatic release for cables, consisting of a movable frame, straps attached to the grip, forming loops through which the said frame is adapted to pass, a connecting-bar attached to the said frame, a slot formed in the upper end of the said bar through which a screw or other device is adapted to be passed for attaching the said bar to the pawl carried by the grip-lever, inclined tracks located within the subway and mounted upon suitable supports for elevating the said frame, and an electric bell fixed to the upper portion of the grip-frame and adapted to be sounded when the said frame is partially elevated, substantially as described.

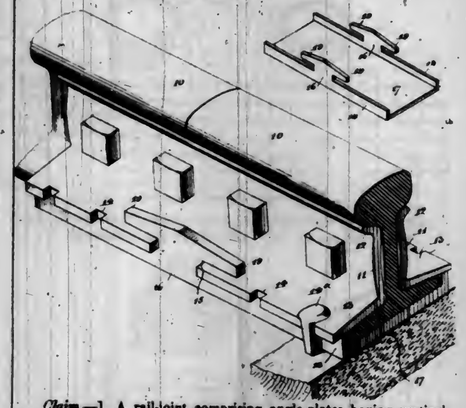
3. An automatic release for cables, consisting of a movable frame 6, having a forked extension 7, a loop 9, forming the upper portion of the said frame, a connecting-rod 14, movably attached to the said loop, a slot 15, formed in the upper end of the said rod, a screw or other like device 16, passed through said slot and into the pawl 11 of the grip-lever, loops attached to the grip-frame for holding the said frame 6 to the said grip, a spring 23, attached to the said grip-lever, the free end of which is adapted to bear against a projection 32, fixed to the upper portion of the said grip-frame, an electric alarm or bell 22, fixed to the upper portion of the grip-frame, a yielding rod 19, carried by the upper portion of the frame 6 and adapted to sound an alarm when the same is elevated, supports located within the subway, and plates, such as 30, fixed to the upper end of the said supports and arranged at an incline, whereby the frame 6 is elevated when the same comes in contact with the said plate 30, first producing an alarm and afterward releasing the grip-lever, allowing the cable 2 to fall and assume its normal position, substantially as described.

481,432. SELF-RECORDING PLANOGRAPH. JUSTO SOLER, Yauco, Porto Rico, West Indies; Perry B. Turpin administrator of said Justo Soler, deceased. Filed June 26, 1891. Serial No. 397,473. (No model.)

Claim.—In a planograph, the combination, with the platform or frame having front and rear wheels geared together and tracking in unison and a steering-shaft forming part of said gearing, of the feed-wheels for the paper continuously rotated from the main axle and the pencil or marker supported in the path of the paper, substantially as set forth.

2. The standards A' A' and frame A^3, having wheels B B' journaled therein, in combination with the platform A, pulleys A^2 A^4, endless chain D, worm-wheel E', attached to the frame A^3, and the steering-shaft E, having worm *e* to engage with the worm-wheel E', substantially as described.

3. The combination, with the steering-shaft E and the standards for the wheels, the pulleys A^2 A^4, endless chain D, gear E', and worm *e*, of the worm-gear L, shafts H' J', feed-wheels G' G^4, and the gearing and shafts for revolving the said feed-wheels from the main axle B^3, substantially as described.

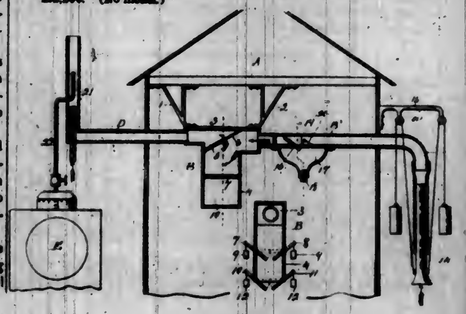


4. The combination, with the platform or frame having front and rear wheels and a steering-shaft geared to the said wheels and tracking them in unison, of the paper-feed wheels rotated from the main axle and having horizontally-turning bearings geared together and to said steering-shaft to track the feed-wheels in unison with platform-supporting wheels, substantially as set forth.

5. The combination, with the wheeled platform or frame and the paper-table, of feed-wheels driven from the main axle and projecting at their upper sides flush with the upper surface of the table, a pencil and a presser-foot or rod over the respective feed-wheels, and a spring pressing the pencil and presser-foot down to hold the paper to the feed-wheels, substantially as set forth.

6. The combination, with the wheeled platform or frame, the longitudinally-aligned feed-wheels rotated from the main shaft, and the vertical spring-pressed pencil and presser-foot or rod to hold the paper down upon the respective feed-wheels, of a transverse screw-shaft supported adjacent to the pencil and a nut traveling on said screw-shaft and also carrying a pencil and a pendulum mechanism and gearing for traversing said nut, substantially as set forth.

7. The combination, with the wheeled frame, the paper-feeding mechanism, and stationary pencil, of the transverse screw-shaft having a pencil-carrying nut, a shaft provided with a ratchet-wheel and geared to the screw-shaft, a horizontal bar T, pivoted between its ends on the ratchet-wheel shaft, pawls pivoted to the said bar at opposite sides of the ratchet-wheel and provided with oppositely-extending arms p^3 p^3, a spring throwing the pawls out of engagement with the ratchet-wheel, wheels V V' above said pawls and having projections *o o'* to engage the respective arms p^3 p^3 when the bar T is rocked, a lower bar S, pivoted between its ends, links S^2, pivotally connecting the ends of the bars S T, a pendulum S^3 for rocking the bar S, and gearing connecting the wheels V V' with the main axle, substantially as set forth.



481,433. RAIL-JOINT. GEORGE G. STAGY, New York, N. Y. Filed Dec. 31, 1891. Serial No. 416,635. (No model.)

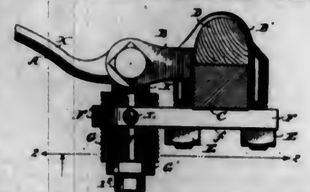
Claim.—1. A rail-joint comprising angle-plates having vertical portions to fit the rail-webs and outwardly-extending base-flanges with notches therein and a base-plate adapted to receive the rails, said plate having uprights on opposite sides to fit the notches in the angle-plate flanges, the uprights terminating at their upper ends in laterally-extending arms to overlap the flanges of the angle-plates, substantially as described.

2. The combination, with the base-plate adapted to receive the rails and having side flanges with vertical uprights terminating in laterally-extending arms, of the angle-plates adapted to be secured to the rails, said plates having outwardly-extending base-flanges with notches therein to receive the uprights, substantially as shown and described.

481,434. PNEUMATIC CONVEYER FOR UNLOADING COTTON. GEORGE A. STAFFORD, Montague, Tex. Filed Feb. 20, 1892. Serial No. 422,296. (No model.)

Claim.—1. In a pneumatic conveyer for unloading cotton, the combination, with the main feed pipe, of upwardly-inclined beaters fulcrumed in the pipe and a spring to hold the beaters, whereby they are given a yielding function, substantially as described.

2. In a pneumatic conveyer for unloading cotton, the combination of the main feed-pipe formed with a grating in the bottom, a dust-receptacle under and inclosing the grating, and beaters yieldingly fulcrumed in the bottom of the pipe and over the grating and dust-receptacle, substantially as described.



3. The herein-described pneumatic apparatus for handling cotton, comprising a feed-pipe B, having a grating in the bottom thereof, beaters yieldingly fulcrumed over the grating, and a dust-receptacle under the grating, a cotton box provided with a deflecting board and screen and formed with an extending lower portion 4, automatically-operating doors 7 8 midway in said portion 4, automatically-operating doors 10 11 to close the bottom of said portion 4, an exhaust-pipe D, leading from the cotton-box, and an exhaust mechanism, all combined substantially as and for the purpose specified.

481,435. TIRE FOR CYCLES. THOMAS H. STONE and HARVINGTON CORBER, Birmingham, England. Filed Feb. 2, 1892. Serial No. 420,119. (No model.) Patented in France Jan. 15, 1892, No. 218,743; in Germany Jan. 15, 1892, No. 67,720, and in Belgium Jan. 18, 1892, No. 97,966.

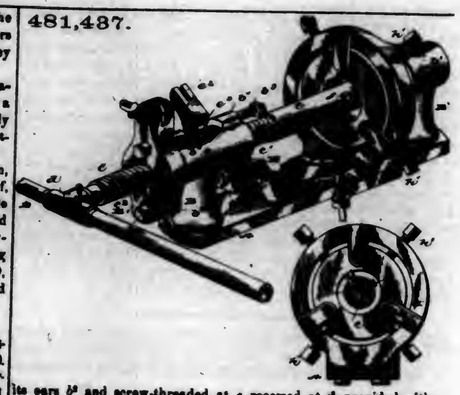
Claim.—The combination, with a felly *c*, having inwardly-turned edges, of an elastic tire formed with shoulders *e*, comprising a thickened solid portion *a* and the tubular portion *b*, said solid and tubular portions formed integral with each other, said tubular portion adapted to seat within the felly *c*, the inwardly turned edges of which engage the shoulders *e* of the tire, substantially as described.

481,436. THILL-COUPLING. ALGERNON L. STRAW, Marlborough, Mass. Filed Apr. 13, 1892. Serial No. 429,061. (No model.)

Claim.—1. In a thill-coupling, the combination, with the thill and coupling-pieces, of the elongated tie-piece, a hollow screw mounted therein, and an elastic block fitting the hollow screw and bearing against the thill, substantially as described.

2. In a thill-coupling, the combination, with the thill and lugs supporting the thill, of the elongated tie, a hollow screw mounted in the tie, an elastic block mounted in the hollow screw, and an adjusting-block also mounted in the hollow screw and arranged to regulate the pressure of the block on the thill, substantially as described.

3. In a thill-coupling, the combination, with the thill and lugs supporting the thill, of an elongated tie, a hollow screw having a slot in its outer surface and a set-screw for fitting the same, an elastic block mounted in the upper portion of said hollow screw, a block sliding in said hollow screw beneath the elastic block, and a screw for adjusting said block, the threads of which are in the opposite direction from the threads of the hollow screw, substantially as described.

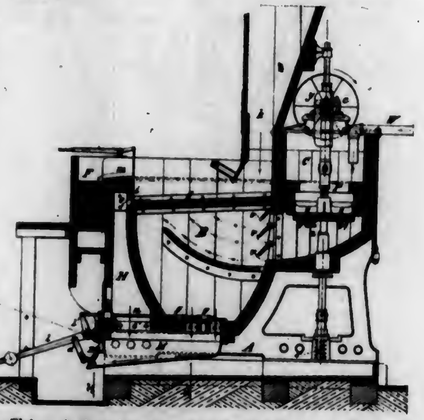


481,437. DEVICE FOR THREADING NUT-BLANKS. JOHN C. STOUMS, Indiana, Pa. Filed Nov. 13, 1891. Serial No. 411,761. (Model.)

Claim.—1. In a nut-threading device, a rod provided with a right and left hand screw and cutting-bit and combined with right and left hand screw-threaded split nuts and with a chuck for holding the nut, in the manner and for the purposes set forth.

2. In combination with the base A, having posts B B' at its respective ends, each provided with a sleeve at its upper end, the split nuts E E', pivoted on the former sleeve, screw-threaded, as set forth with the rod C, screw-threaded and otherwise, as described, and the chuck H.

3. In a machine or tool as set forth and in combination with the sleeve B, the split nuts E and E', respectively pivoted to the sleeve on



481,437.

its ears b^3 and screw-threaded at *c*, recessed at c^2, provided with a locking-latch *c'*, and adapted to be fixed firm in position by bolt b^3, all substantially as and for the purposes set forth.

4. The rod C, having smooth portions and screw-threaded portions, as set forth, and a cutting-bit F near its middle part, combined with the sleeves *b b'*, and means for causing it to cut a right or left hand screw-thread, and a centering-chuck, all as described.

481,438. COAL OR ORE JIGGER AND WASHER. SEBASTIAN STOUT, Pittsburg, Pa. Filed Mar. 29, 1892. Serial No. 426,911. (No model.)

Claim.—1. A coal or ore washer comprising a separating-chamber, a sieve or screen fitted into the chamber, a piston or plunger chamber adjacent to the separating-chamber, a piston or plunger adapted to reciprocate vertically in said chamber, a slate-chamber adjacent to the separating-chamber, and an auxiliary receiver arranged below the bottom of the washer and communicating with both the separating-chamber and the slate-chamber, substantially as described.

2. A coal or ore washer comprising a separating-chamber, a sieve or screen fitted into said chamber, a piston or plunger chamber adjacent to the separating-chamber, a piston or plunger adapted to reciprocate vertically in said chamber, a slate-chamber adjacent to the separating-chamber, an auxiliary receiver arranged below the bottom of the washer and communicating with both the separating-chamber and the slate-chamber, and mechanism for opening and closing the communication between the separating-chamber and the receiver, substantially as described.

3. A coal or ore washer comprising a separating-chamber, a plunger-chamber and a slate-chamber adjacent to and communicating with the separating-chamber, and an auxiliary receiver arranged beneath and communicating with the separating-chamber, substantially as described.

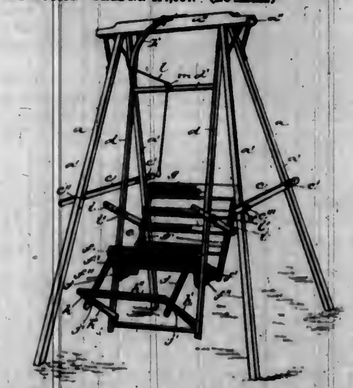
4. A coal or ore washer comprising a separating-chamber, a sieve or screen fitted therein, a piston or plunger chamber adjacent to the separating-chamber, a piston or plunger having a valve-controlled opening therein adapted to reciprocate vertically in said chamber, and

an auxiliary receiver arranged beneath the separating-chamber and communicating therewith, substantially as described.

5. A coal or ore washer comprising a separating-chamber, a sieve or screen fitted therein, a piston or plunger chamber adjacent to the separating-chamber, a piston or plunger having a valve-controlled opening therein adapted to reciprocate vertically in said chamber, a slate-chamber adjacent to the separating-chamber and communicating therewith, and an auxiliary receiver arranged beneath the separating-chamber and communicating therewith and with the slate-chamber, substantially as described.

6. A coal or ore washer comprising a separating-chamber, a piston or plunger chamber communicating therewith by means of an opening, valves for controlling said opening, a piston or plunger adapted to reciprocate vertically in the plunger-chamber having openings in the bottom thereof governed by a floating valve or valves, and an inflow-pipe arranged above the piston or plunger, substantially as described.

7. A coal or ore washer comprising a separating-chamber, a piston or plunger chamber adjacent thereto and communicating therewith by means of an opening, valves for controlling said opening, and an auxiliary receiver arranged beneath the separating-chamber and communicating therewith, substantially as described.



8. A coal or ore washer comprising a separating-chamber, a piston or plunger chamber adjacent thereto, an auxiliary receiver arranged beneath the separating-chamber and communicating therewith by means of openings, valves for controlling said openings, a slate-chamber adjacent to the separating-chamber and communicating therewith through an opening, and a gate for governing said opening, substantially as described.

9. A coal or ore washer comprising a separating-chamber, a piston or plunger chamber adjacent to the separating-chamber, and a piston or plunger adapted to reciprocate vertically in the chamber having openings in the bottom thereof, the floating valve or valves for governing said openings, the vertical guides for supporting said valves, and the inflow pipe arranged above the piston or plunger, substantially as described.

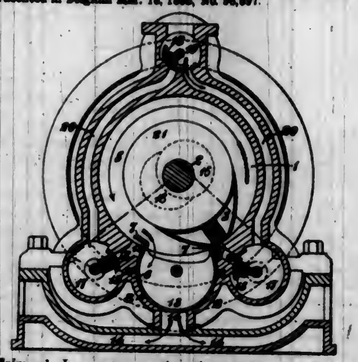
10. A coal or ore washer, in combination with a piston or plunger having openings in the bottom thereof, the floating valve or valves for governing said openings, the vertical guides for supporting said valves, and the inflow-pipe arranged above the piston or plunger, substantially as described.

11. A coal or ore washer comprising a separating-chamber, a sieve or screen fitted therein, a piston or plunger chamber adjacent thereto and communicating therewith, a piston or plunger adapted to reciprocate vertically in said chamber, a slate-chamber adjacent to the separating-chamber, an auxiliary receiver arranged beneath the separating-chamber and communicating therewith, and mechanism for governing the communication between the separating-chamber and plunger-chamber, the separating-chamber and auxiliary receiver, and separating-chamber and slate-chamber, substantially as described.

481,439. SWING. JEROME B. SWEETLAND, Pontiac, Mich. Filed Jan. 12, 1892. Serial No. 417,967. (No model.)

Claim.—1. The combination of a pair of foldable supports, a pair of swinging bars *d d*, pivotally depending therefrom and connected together, seat side bars *f f*, each provided with a closed vertical slot f^5 midway its ends, and an open notch or slot f^6 in its lower edge, bolts f^4 and f^5, passing through said slots and entering the bars *d*, thereby rendering the side bars vertically movable and capable of folding, seat-slats connecting these side bars, a pivoted back detachably and adjustably connected to the swinging bars *d* by arms *i*, a forwardly-projecting foot-rest, and bars *j*, depending from the seat side bars and detachably connected to the foot-rest, substantially as described.

2. The combination of a pair of supports hinged together and adapted to fold, a swing depending therefrom and adapted to fold, a bar projecting forwardly from the upper end of the support, this bar being pivotally connected to the support, so as to fold laterally, and an operating-cord connected to the end of this bar and carried down to within reach of the occupant, substantially as described.

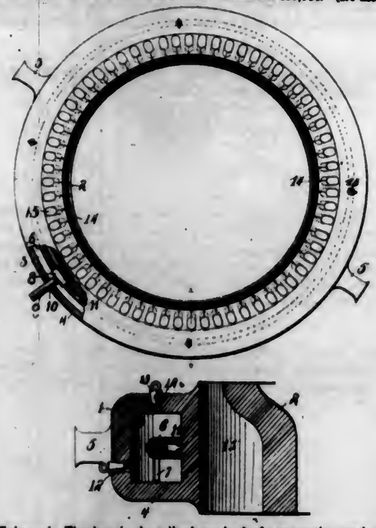


3. In a swing, the combination of an adjustable and folding supporting-frame constructed of two sections hinged together at their upper ends and held apart, as described, a swing supported in the upper end of one of said sections, an angle plate secured to the upper end of the rear section of the supporting-frame extending forwardly over the top of the sections and bearing on their upper edges, a spring-bar secured to the forward end of this plate, as described, and a cord attached to the free end of this bar and extending to the swing-seat in a position to be grasped by the occupant, substantially as described.

481,440. SASH-FASTENER. DAVID H. TAYLOR, Cincinnati, Ohio. Filed Apr. 18, 1892. Serial No. 429,650. (No model.)

Claim.—In a window sash fastener or lock, the combination of the rocking cam lever or dogs pivoted in a suitable casing and the main lever having the oppositely-curved semicircular slots respectively engaged by studs on the inner ends of said cam levers or dogs, the inner ends of said slots standing upon opposite sides of the main lever-pivot, substantially as set forth.

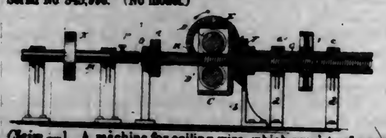
481,441. ROTARY FLUID-PRESSURE ENGINE. EDWARD TOWLSON, Norwich, England, assignor to the Rotary Engine Syndicate, Limited, same place. Filed Apr. 16, 1892. Serial No. 429,476. (No model.) Patented in Belgium Mar. 18, 1892, No. 96,897.



Claim.—1. In a rotary engine, the combination of a cylinder, bosses fixed centrally therein, a driving-shaft provided with a collar, extending between said bosses, a piston arranged to partly surround said bosses and carried by said collar, a hollow oscillating abutment formed with an exhaust-opening, cut off valves located in chambers, one at each side of said abutment, a hand-operated valve serving as a starting, stopping, and reversing valve, and fluid-supply passages for connecting the steam-chamber containing said starting, stopping, and reversing valve with each of the chambers containing said cut-off valves, substantially as described.

2. In a rotary engine, the combination of a cylinder, bosses fixed centrally therein, a driving-shaft provided with a collar, extending between said bosses, a piston arranged to partly surround said bosses and carried by said collar, a hollow oscillating cylindrical abutment formed with an exhaust-opening and with lips or projections, supply-passages having their inner ends each formed to receive one of said lips or projections, oscillating cut-off valves arranged one at each side of said abutment and adapted to control one of said supply-passages, eccentrics on said driving-shaft for actuating said cut-off valves, a hand-operated oscillating valve, and steam-supply passages formed in the wall of said cylinder and connecting the chamber containing the hand operated valve with each of the chambers containing said cut-off valves, substantially as described.

3. In a rotary motor, the combination of a cylinder, bosses fixed centrally therein, a piston 3, carried by a collar 21, arranged between said bosses and fixed to a driving-shaft extending through said bosses, a hollow cylindrical abutment 6, mounted to rock in a bearing 8, provided with lips or projections 7 and having an exhaust-opening 13, inlet-passages 12, oscillating cut-off valves 15, each mounted within a chamber 17 and arranged one at each side of said abutment, eccentrics fixed to said driving-shaft for operating said cut-off valves, an oscillating valve 18, mounted in a chamber 19, passages 20, connecting said chamber 19 with each of said chambers 17, and an exhaust-passage in communication with the interior of said abutment, substantially as herein described.

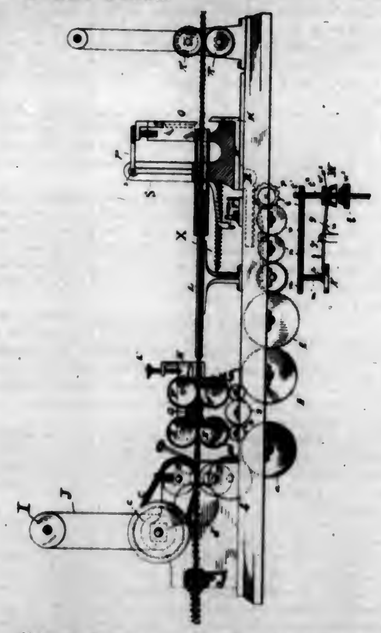


481,442. CHILL FOR CASTING CAR-WHEELS. CORNELIUS A. TREAT, Hannibal, Mo., assignor to the C. A. Treat Manufacturing Company, same place. Filed Feb. 1, 1892. Serial No. 419,911. (No model.)

Claim.—1. The herein-described method of contracting and ventilating chills, consisting in passing compressed air to the interior of the chill and allowing the same to escape through suitable openings formed in the pipe for conveying the same.

2. A contracting and ventilating chill consisting of an annular space 3, a pipe 11, located within the same and held by means of supports 7, a coupling 8 for uniting the ends of the said pipe, a pipe 9, leading from a suitable source of air-supply and also attached to the said coupling, conical-shaped openings 12, formed in the walls 4 of the chill for allowing the air to escape from the same, and plugs 13 for closing said opening for either holding the air within said space 3 or preventing dirt or other accumulation from gaining access to the said space, substantially as described.

481,443. SPIRAL-SPRING-COILING MACHINE. JOHN VERMEULEN, New York, N. Y., assignor, by mesne assignments, to the Oliver & Roberts Wire Company, Limited, Pittsburg, Pa. Filed Mar. 31, 1890. Serial No. 345,998. (No model.)



Claim.—1. A machine for coiling wire, which consists of a revolving mandrel for coiling a strand of wire and a pair of rollers which revolve at or about the same speed as the coiling-mandrel, said rollers feeding the coil onward from the mandrel, and means for imparting a positive motion of rotation to said rollers, substantially as described.

2. A machine for coiling wire, which consists of a coiling mandrel, forming-die, and a rotating head, rotating rollers for said head, means for rotating the head, and means for rotating the rollers upon their axes, substantially as set forth.

3. In a machine for coiling wire, the combination of a coiling-mandrel, a forming-die through which said mandrel passes, rollers geared together and having their axes transverse to the coiling-mandrel and arranged on opposite sides thereof, a bevel-wheel mounted upon one of the rollers, a revoluble head within which the rollers are mounted, a shaft for revolving said head, and a stationary gear-wheel, meshing with the bevel-wheel, substantially as described.

481,444. WIRE-BOX-STRAP MACHINE. JOHN VERMEULEN, New York, N. Y., assignor, by mesne assignments, to the Oliver & Roberts Wire Company, Limited, of Pittsburg, Pa. Filed Mar. 31, 1890. Serial No. 345,997. (No model.)

Claim.—1. In a wire-working machine, the combination, with the tension-drum, flattening-disks, measuring-rolls, and means for operating the same, of a cutting-off mechanism for cutting the wires in any desired length, all arranged for successive action, substantially as described.

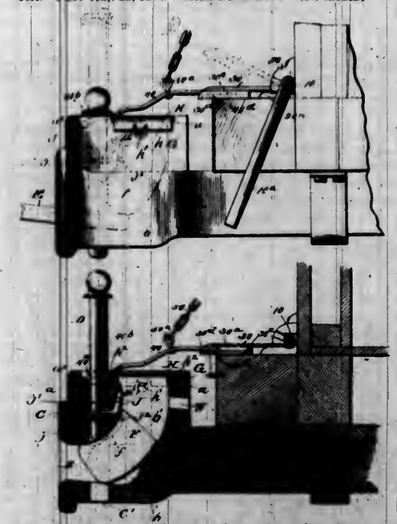
2. In a wire-working machine, the combination, with the forming-die, tension-drum, flattening-disks, measuring-rolls, and means for operating the same, of a cutting-off mechanism for cutting the wires in any desired lengths, all arranged for successive action, substantially as described.

3. In a wire-working machine, the combination, with the forming-die, tension-drum, flattening-disks, measuring rolls, adjustable straightening device, and means for operating the same, of a cutting-off mechanism for cutting the wires in any desired lengths, all arranged for successive action substantially as described.

4. In a wire-working machine, the combination, with the forming-die, tension-drum, adjustable flattening-disks, measuring-rolls, guide, rolls, adjustable straightening device, and means for operating the same, of a cutting-off mechanism, which consists of a lever, rack, and knives, adapted to be thrown into operation by a traveling part of the machine, so as to cut off the wires in uniform lengths, all arranged for successive action, substantially as described.

5. In a wire-working machine, the combination, with the forming-die, tension-drum, adjustable flattening-disks, measuring-rolls, guide, rolls, adjustable straightening device, and means for operating the same, of a cutting-off mechanism, which consists of the lever, rack, and knives, adapted to be thrown into operation by a traveling part of the machine actuated by means of the disk and the lug thereon, divided check, and the lever, all constructed and arranged for successive action, substantially as described.

6. In a wire-working machine, the combination, with the forming-die A, tension-drum C, adjustable flattening-disks B B, measuring-rolls E E, guide G, rolls F F, adjustable straightening device H, tube L, and means for operating the same, of a cutting-off mechanism that is adapted to be thrown into operation by a traveling part of the machine, which consists of the lever P, standard S knives Q M, rack



R, spring X, trip *g*, disk K and lug *r* thereon, lever *y*, spring *w*, and divided chuck W, all constructed and arranged for successive action, substantially as and for the purpose set forth.

481,445. SCREW. LEAVEN J. H. VINSON, Titusville, Fla. Filed Feb. 23, 1892. Serial No. 422,590. (No model.)

Claim.—A screw having a shank with continuous threads thereon, including the head, and oblique openings in opposite sides of the head, opening at their upper ends in the slot of the head, in combination with a locking-pin with limbs adapted to enter said opening and extend beyond the sides of the head, the bend of the locking-pin resting in the slot of the head, substantially as and for the purposes specified.

481,446. CAR-COUPLING. WILLIAM H. VIOLETT, Grand Junction, Colo. Filed Mar. 22, 1892. Serial No. 426,084. (No model.)

Claim.—1. An improved car-coupler having a draw-head, a coupling-pin, a main pin-support operating in the link-mortise, a gravity-pin holder operating in the upper pin-aperture, adapted to swing under the pin when elevated and arranged to be swung out of such position by the main support as it drops under such pin-aperture, substantially as and for the purpose described.

2. The combination of the draw-head, a gravity-pin support operating in the link-mortise, formed with a cam-groove, a pin-holder operating in the upper pin-aperture, having a projection fitting the groove in the main pin-support, the said holder adapted to swing under the pin when elevated, its projection adapted to be engaged by the main support when the said support drops to its lowermost position to support the pin, substantially as and for the purpose described.

3. In a car-coupling, the combination of the draw-head formed with the usual pin-apertures and with an upwardly-projecting portion forming an abutment, the link-mortise having an upwardly and rearwardly inclined portion opening through the top of the projecting portion of the draw-head, said portion having depressions in its sides, and a cover plate formed with lateral flanges having finger portions adapted to be bent into engagement with the said depressions, all arranged as shown, and for the purpose described.

4. The improved car-coupling herein described, comprising the draw-head, the coupling-pin, a main gravity-pin support, a supplemental gravity-pin holder arranged to drop by gravity in one direction and to be swung back by the main support as it drops by gravity, all substantially as and for the purpose described.

5. The improved car-coupling herein described, comprising a draw-head having the usual pin-apertures, the coupling-pin, and formed with a link-mortise having an upwardly and rearwardly extending portion, the main pin-support arranged to operate by gravity in said mortise and formed with a cam-groove, a swinging pin-holder having a body portion operating in said mortise transversely to the main pin-support, said holder having an arm projecting in the upper pin-aperture when down in its operative position, and with a projecting lug arranged for engagement with the cam-groove in the main support, substantially as and for the purpose described.

6. The combination of the draw-head, the coupling pin, and the pin-lifting mechanism, including a lifting-arm expansible longitudinally and movable laterally and vertically, substantially as shown and described.

7. In a car-coupling substantially as described, a pin-lifting arm expansible longitudinally, substantially as shown and described.

8. The combination, in a car-coupling, with the car-body, the draw-head movable longitudinally, and the coupling-pin, of a lifting-arm hinged to the car-body, its front end connected with the pin, said arm formed of a rigid rear member, and a front member movable longitudinally in the rear member, substantially as and for the purpose described.

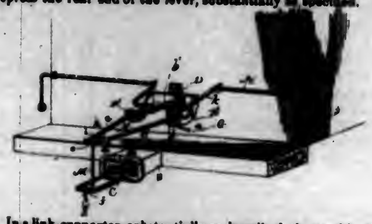
9. The combination, with the car-body, the draw-head, and the coupling-pin, of a rock-shaft journaled on the car-body, a pin-lifting arm secured to such shaft, an abutment for limiting the upward movement of the lifting-arm, said arm having its front portion formed extensible and adapted to be moved laterally, substantially as and for the purpose described.

10. In a car-coupling substantially as described, the combination, with the car-body, the movable draw-head, and the coupling-pin, of a rock-shaft journaled on the car-body and movable sidewise in its bearings, one of such bearings formed with an abutment and an upwardly-inclined recess, said shaft having an outwardly-extending rigid arm formed with a socket portion at its end, a pin-lifting arm connected with the pin at its front end, its rear end fitting the socket of the rigid arm and having a pivotal bearing longitudinally movable in such socket, and means for rocking the shaft to lift the pin-arm, all arranged substantially as shown and described.

481,447. AUTOMATIC RAILWAY STOCK AND CATTLE GUARD. JAMES WALTON, La Plata, Mo., assignor of two-thirds to John F. Mitchell, same place, and George D. Hutchison, Fort Madison, Iowa. Filed Apr. 14, 1892. Serial No. 429,213. (No model.)

Claim.—1. In an automatic cattle-guard, side bars pivoted at one end, a rock-shaft having loose connection with the other end, plates on the bars near their pivot end, rods or pickets carried by the rock-shaft, and double-inclined blocks on the ties parallel therewith between the rails, as set forth.

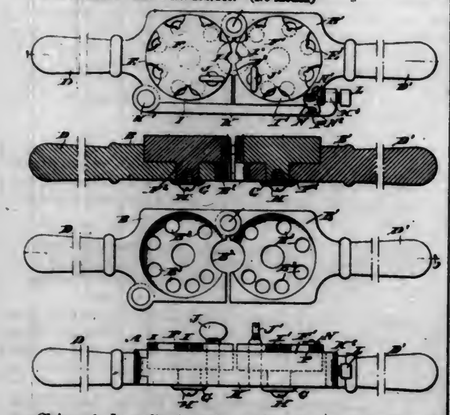
2. The combination, with the pivoted side bars and the plates thereon and the gate actuated through connection with the side bars, of double-inclined blocks on the ties upon opposite sides of said plates parallel therewith between the rails and inclined upon the end and sides, as and for the purpose specified.



481,448. IDENTIFICATION DEVICE. BEN H. WEEKS, Chicago, Ill. Filed June 8, 1890. Serial No. 354,512. (No model.)

Claim.—The combination, with a hollow cylinder A, having screw-threads *a*, of a cap B, having screw-threads *b* and furnished with a pointed blade-shaped spindle C and scroll D, attached thereto, an eye-piece *a'* at the end of said tube A, and a similar eye-piece at the end of said cap B, substantially as specified.

481,449. CAR-COUPLING. EVERETT C. WELCH, Friedens, Pa. Filed Apr. 23, 1892. Serial No. 430,397. (No model.)

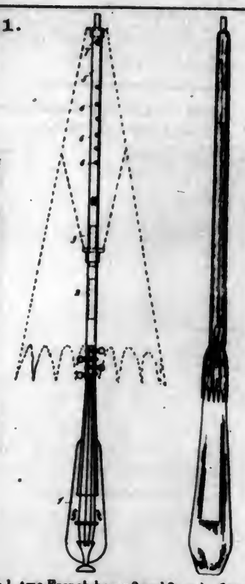


Claim.—1. In a link-supporter, substantially as described, the combination, with the lever fulcrumed at an intermediate point in its length, the hook pivotally connected to the forward end of said lever and adapted to engage a link, and the weight connected to the rear end of the lever, of the rock-shaft having angular branches at its ends and having a ball at an intermediate point in its length, adapted to engage and depress the rear end of the lever, substantially as specified.

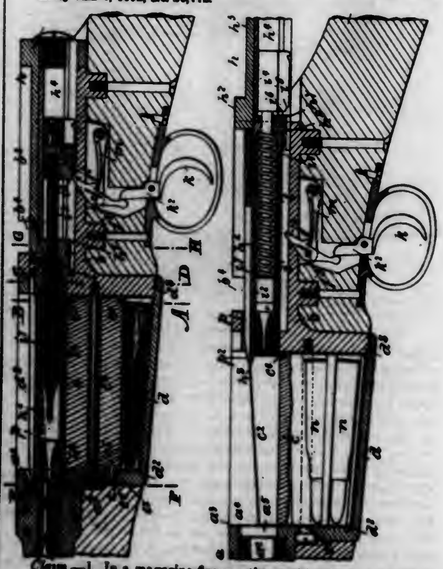
2. In a link-supporter, substantially as described, the combination, with the lever, of the hook pivotally connected to said lever and bent adjacent to its free end to form the link-seat *f* and the depending branch *g*, substantially as and for the purpose specified.

3. In a link-supporter, substantially as described, the combination, with the lever comprising the arms having transverse apertures and the bridge-bar connecting said arms adjacent to the apertures therein, of the link-engaging hook having lateral trunnions adjacent to one end and having its portion above said trunnions bent at an angle to the main portion and adapted to engage the bridge-bar of the lever-arms, substantially as specified.

481,450. DIE-PLATE. LEWIS C. WESTEL, Scottdale, Pa. Filed Feb. 23, 1892. Serial No. 422,449. (No model.)



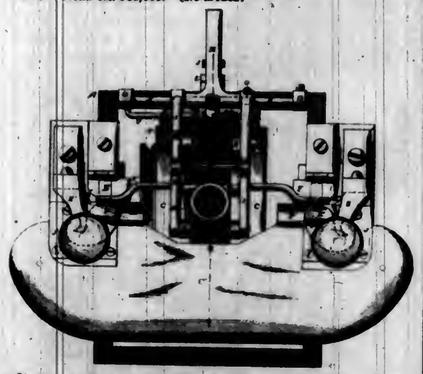
Claim.—1. In a die-plate, the combination, with the stock A, formed of two sections B B', hinged together at one side and provided with the circular recesses E E', handles D D', and opening B^3 in the adjacent edges of the sections, of the dies F F', fitting in the recesses E E' and provided with shafts F^2, mounted in bearings in the said sections, and with the threaded recesses I I' means for locking the dies in position in said recesses, and the bar K, hinged to one section and having its free end detachably secured to the other section, substantially as described.



2. In a die-plate, the combination, with the stock A, formed of two sections B B', hinged together at one side and provided with the circular recesses E E', apertures B^3, handles D D', and opening B^3 in the adjacent edges of the sections, of the dies F F', fitting the recesses E E' and provided with shafts F^2, fitting in bearings in the said sections, and with the threaded recesses I I' in their peripheries, the pins J J', extending through the dies and engaging the apertures B^3 of the sections, the bar K, hinged to one section and provided with an inwardly-projecting lug, and a set-screw and catch for locking the free end of the bar to the other section, substantially as herein shown and described.

481,451. MULTIPLEX MUSICAL INSTRUMENT. JOHN H. WERNER, Saugatuck, Mich. Filed Apr. 16, 1892. Serial No. 429,058. (No model.)

Claim.—The herein-described multiplex musical instrument comprising the violin 1, two French harps 2 and 3, and a flute or flageolet 5, serially arranged, as shown, in combination with an umbrella and smoking-cap, substantially as and for the purposes herein set forth.



481,452. REVOLVING MAGAZINE-GUN. THOMAS WILSON, Birmingham, England. Filed Jan. 18, 1892. Serial No. 418,469. (No model.) Patented in England Dec. 30, 1890, No. 21,171; in France Oct. 27, 1891, No. 217,036; in Belgium Nov. 3, 1891, No. 97,042, and in Germany Jan. 7, 1892, No. 66,772.

Claim.—1. In a magazine-firearm, the combination, with the barrel and breech shoe, of a pivotally-mounted cartridge-cylinder having open-ended and open-sided cartridge-chambers and a casing or jacket inclosing said cylinder and provided with a side passage for the entrance and exit of cartridges and cartridge-shells and with a side opening for the working of said cylinder by hand, substantially as described.

2. In a magazine-firearm, the combination, with the cartridge-cylinder C, having open-sided chambers c^2 c^2, of the charging-bolt, the ejector-rod *p*, carried by said charging-bolt, and the tilting-pins c^4 c^4, arranged at the rear ends and bottoms of said chambers, substantially as described.

481,453. CIGAR-ROLLING MACHINE. JASPER S. WILDEY, Columbus, Ohio, assignor to Myron H. Scoville, same place. Filed Feb. 15, 1891. Serial No. 381,863. (No model.)

Claim.—1. In a cigar-bunch-rolling machine, a rotating drum, a laterally-adjustable frame having a bunching-roller in its free end, an endless apron which passes around the drum and the said roller, and a shaping-thimble at one end of the drum, all combined substantially as specified.

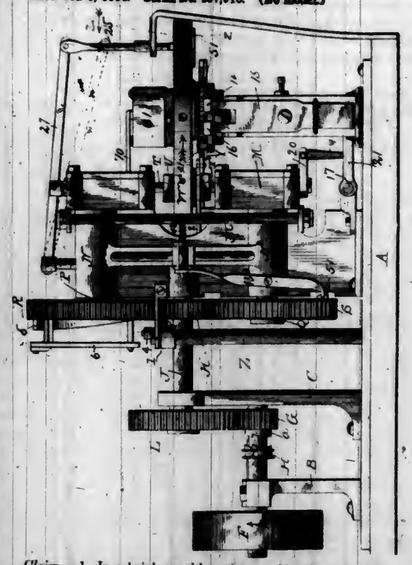
2. In a cigar-bunch-rolling machine, a rotating drum, a pivoted frame provided with a bunching-roller, an endless apron which passes around the drum and the said roller, and a supporting-frame carrying the said pivoted frame, which engages the said supporting-frame for adjusting the distance that the pivoted frame shall move forward, all combined substantially as described.

3. In a cigar-bunch-rolling machine, a main frame, a large rotating drum journaled therein, a pivoted supporting-frame mounted upon the main frame, and a regulating device which engages the main frame and the said pivoted supporting-frame and regulates the distance that the latter shall move forward, combined with the pivoted spring-actuated roller-frame which extends over the drum, a bunching-roller in the free ends of the roller-frame, which latter is supported by the said pivoted supporting-frame, and an endless apron which passes around the bunching-roller and the drum, substantially as shown and described.

4. In a cigar-bunch rolling machine, a main frame provided with a lug or projection, a rotating drum, a pivoted supporting-frame mounted upon the rear side of the main frame and provided with a plate M, and a regulating device which passes through the said lug or projection upon the frame and engages the said pivoted supporting-frame for regulating the movement thereof, combined with a pivoted and spring-actuated roller frame mounted upon the said pivoted supporting-frame, a regulating device located upon the roller-frame and engaging the plate M, a bunching-roller mounted in the free end of the roller-frame over the drum, and an endless apron which passes around the drum and roller, and a tension device, substantially as described.

5. In a cigar-bunch-rolling machine comprising a rotating drum, a laterally-adjustable frame carrying a bunching-roller, and a shaping-thimble at each side of the said drum a greater distance apart than the width of the said frame, whereby either right or left hand cigars can be made by moving the frame laterally, substantially as set forth.

6. In a cigar-bunch-rolling machine, a rotating drum, a frame carrying a bunching-roller, an apron which passes around the said drum and bunching-roller, and a horizontal spring-actuated rod adjustably connected with the said frame, one end of the said rod adapted to bear against the end of the cigar, and a thimble, the parts being combined and arranged to operate substantially as described.



7. In a cigar bunch-rolling machine, a frame, a bunch-rolling mechanism, a thimble for shaping the end of the cigar, having a shoulder at its tapered end, combined with a vertically-moving die placed to one side of the tapered end of the said thimble, an opening in the frame below the die, and a spring-actuated plate in the said opening, the shape of the opening die and plate being the same, substantially as specified.

8. In a cigar-bunch-rolling machine comprising a rolling mechanism, a thimble at each side of the said mechanism for shaping the ends of cigars, and a right and left hand die, one at each side of the mechanism and placed adjacent to the tapered end of the said thimbles, whereby the machine is adapted to be used for forming right and left hand cigars, substantially as set forth.

9. In a cigar-bunch rolling machine, a rotating drum, a spring-actuated pivoted frame having a bunching-roller over the said drum, an endless apron passing around the said drum and roller, a stationary thimble having a hinged cover, and an arm or projection upon the said pivoted frame, which engages the hinged cover of the said thimble, substantially as described.

10. In a cigar-bunch-rolling machine, a rolling mechanism, a pivoted frame forming a part thereof, a stationary thimble, a hinged cover therefor, a spring for normally holding the cover open, and an extension upon the said pivoted frame, which engages the cover and forces it down when the frame is lowered, the parts combined substantially as specified.

481,454. BRICK MACHINE. THOMAS T. WOOD, St. Joseph, Mich. Filed Oct. 6, 1891. Serial No. 407,910. (No model.)

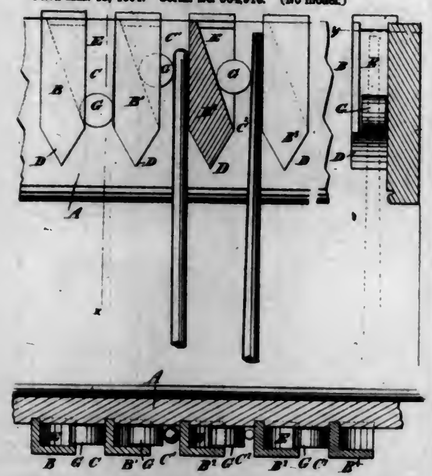
Claim.—1. In a brick-machine, the combination, with the revoluble table, of a wheel having an inclined plane and a curvilinear arm, a suitable means for revolving said wheel, and suitable mechanism intermediate the revolving wheel and the table adapted to revolve said table, substantially as specified.

2. In a brick-machine, the combination, with the revoluble table and a horizontal gear-wheel connected thereto, of the longitudinally-movable rack-bar engaging the teeth of said gear, the vertical rock-shaft, the lateral branch fixedly connected to said shaft and carrying a friction-roller, a link connecting the lateral branch of the rock-shaft and the rack-bar, and a suitable means for automatically engaging the friction-wheel and moving the lateral branch of the rock-shaft, substantially as and for the purpose set forth.

3. In a brick-machine, the combination, with the revoluble table, a horizontal cog-gear connected thereto, a movable rack-bar engaging said cog-gear, a laterally-swinging branch carrying a friction-wheel, and mechanism intermediate the said branch and the rack-bar, of a wheel having an inclined plane and a curvilinear arm adapted to engage the friction-wheel on the swinging branch, substantially as specified.

4. In a brick-machine, the combination, with the revoluble table, of the vertically-reciprocating pressure-plungers above and below the same, the vertically-reciprocating removing-plunger below the table, the transverse rock-shaft having an angular branch 18 and an angular branch 21, a link connecting the branch 18 and the lower pressure-plunger, a link connecting the branch 21 and the removing-plunger, and a suitable means for reciprocating the pressure-plungers, substantially as specified.

5. In a brick-machine, the combination, with the revoluble table, the molds carried thereby, the movable dies seated in said molds, the vertically-reciprocating pressure-plungers above and below the table, and the vertically-reciprocating removing-plunger below the table connected with and adapted to be operated simultaneously with the lower pressure plunger, of the beam pivotally connected at its rear end to



the guide-casting and at an intermediate point in its length to the upper plunger, and the plunger pivotally connected to the forward end of said beam and adapted to return the dies to their normal position, substantially as and for the purpose set forth.

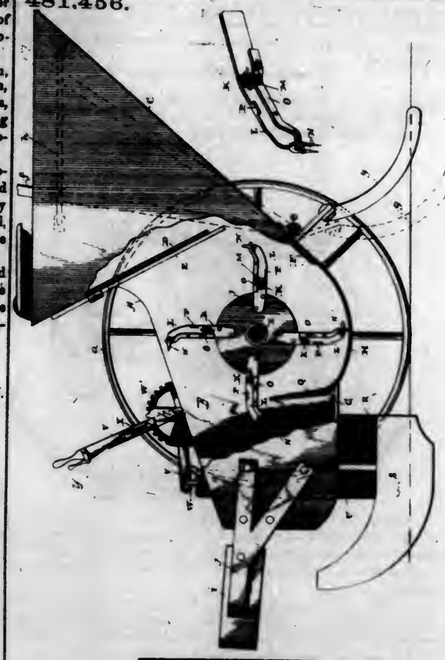
6. In a brick-machine substantially as described, the combination, with the revolvable table, the vertically-disposed molds formed therein, and the supporting-ledges 10^a, arranged at the lower edges of the molds, of the movable dies normally resting on the ledges 10^a, and comprising a bottom section and an end section flexibly connected together, substantially as and for the purpose set forth.

7. In a brick-machine, the combination, with a feed box or hopper, of the lever having a depending branch at its forward end adapted to strike the walls of the box or hopper, a friction-wheel carried by the rear end of the lever, a gear-wheel engaging said friction-wheel, and a spring for holding the friction-wheel in engagement with the gear-wheel, substantially as specified.

8. In a brick-machine, the revolvable table having mold-boxes and movable die-plates seated in said mold-boxes, in combination with the feed box or hopper, the vertically-reciprocating pressor-plungers, the vertically-reciprocating removing-plunger, and the vertically-reciprocating die-returning plungers, substantially as specified.

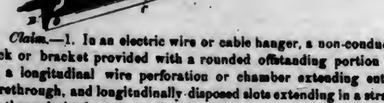
481,455. HOLDER OR RACK. CHARLES WORDEN, Rye, N. Y. Filed Mar. 13, 1891. Serial No. 384,916. (No model.)

Claim.—In a holder or rack, the combination, with a wall-board, of a series of vertically arranged and spaced ribs or lugs secured to the wall-board, having pointed ends and provided in one side with recesses having inclined bottoms, and a roller in each recess, substantially as described, whereby a handle when inserted in the space between two ribs will be pressed by the roller against the side of the adjacent rib or lug and held thereby, substantially as herein shown and described.



481,456. POTATO-PLANTER. CHESTER WRIGHT, Fairfield, Nebr. Filed Jan. 5, 1892. Serial No. 417,068. (No model.)

Claim.—1. In a potato-planter, a hopper, a shaft extending through it, a disk upon the shaft, picker-plates secured to and extending from the disk, having their outer portions alternately turned to one side, teeth at the outer ends of said plates, stripping-levers pivoted between their ends upon the plates, the outer ends of the levers projecting between the teeth, and trippers in the hopper which engage the inner ends of the stripping-levers, the parts being combined substantially as shown and described.



2. An automatic picker for a planter of the character described, comprising a plate having its outer end provided with laterally-extending prongs, a stripping-lever pivoted near one edge of the plate, which has its outer end between the said prongs, a tripper, and a stop at the opposite side of the plate, which engages the inner end of the said lever, substantially as described.

3. In a planter, a frame, a supporting-shaft, an opener at the front end of the frame, a shaft journaled at the rear end of the frame carrying coverers, a lever for operating the shaft for raising or lowering the coverers, and a means connected with the shaft for feeding potatoes, substantially as set forth.

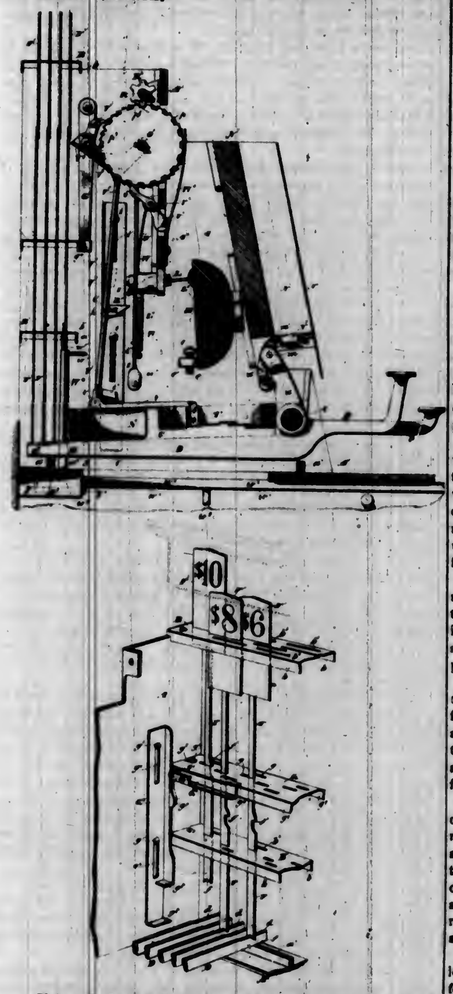
481,456.

481,457. INSULATOR. ARTHUR J. WYLIE, Rome, N. Y. Filed Jan. 18, 1892. Serial No. 418,501. (No model.)

Claim.—1. In an electric wire or cable hanger, a non-conducting block or bracket provided with a rounded offstanding portion having a longitudinal wire perforation or chamber extending entirely therethrough, and longitudinally-disposed slots extending in a straight line through the front face thereof and opening into said wire chamber, substantially as set forth.

2. In an electric wire or cable hanger, a non-conducting block or bracket provided with a rounded offstanding portion, a longitudinal wire perforation or chamber extending through said offstanding portion, longitudinally-disposed slots extending in a straight line through the front face of said block or bracket and opening into said wire-chamber, and a tubular partition extension forming a continuation of the wire perforation or chamber, substantially as set forth.

481,458. PADLOCK. NICHOLAS J. ZELL, Reading, Pa. Filed Apr. 27, 1892. Serial No. 430,855. (No model.)



Claim.—1. The combination, with the barrel and the partially rotatable portion within the same, of the spring carried by the inner part and partially surrounding the same and designed to engage a shoulder on the barrel to prevent withdrawal of the parts, and means for preventing rotation of said parts, as set forth.

2. The combination, with the barrel having interior longitudinal and horizontal grooves and recess with shoulder, of the inner partially-rotatable part with cap-piece and ribs, and the spring partially surrounding the same and having a portion protruding to engage said shoulder, as and for the purpose specified.

3. The combination, with the barrel having grooves and recess with shoulder, of the inner, partially-rotatable part having ribs and a ferrule with horizontal slot, and a spring having a bend protruding through the slot to engage said shoulder and one end extended within the bore of the inner part, as set forth.

481,459. CASH REGISTER AND INDICATOR AND CHECK-MACHINE. WALES ALDRICH, Dayton, Ohio. Filed July 5, 1883. Serial No. 278,966. (No model.)

Claim.—1. In an indicator, in combination with the series of indicator-rods provided with projections having abrupt locking-shoulders and inclines on the lower and upper ends, respectively, the sliding locking-bar for engaging the shoulders on the rods as the latter are moved into indicating position, a spring tending to keep the bar in position to engage the shoulder on any moved rod, the series of keys for moving the rods, the swinging frame extending across the series of keys, and a tripping device actuated by such frame to trip and release the locking-bar as a rod is being moved by its key and before the projection on such rod reaches the bar, substantially as and for the purpose specified.

2. In combination with the series of indicator-rods provided with locking-shoulders, the rod-locking bar provided with portions to engage the shoulders on any indicator-rod moved into indicating position, the spring for moving and holding the bar in locking position the series of rod-moving levers, the swinging frame engaged by the levers, and the sliding piece engaged and moved by the frame, a cam on such piece, and the swinging pawl-piece on the locking-bar engaged by the cam, substantially as and for the purpose described.

3. In combination with the indicator-rods provided with projections having the abrupt shoulders and inclines, the reciprocating locking-bar provided with slots through which the indicator-rods pass, a spring holding such bar normally in locking position, the keys for moving the indicator-rods, the swinging frame engaged by the keys, and tripping mechanism actuated by the frame to move the locking-bar out of locking position and then let it fly into such position again as the frame is moved by a key bringing an indicator-rod into indicating position before the projection on the rod passes the bar, substantially as and for the purpose shown.

4. In an indicator, in combination with the reciprocating locking-bar for locking the indicator-rods, the spring for holding the bar in locking position, the pivoted piece on the bar, a stop for limiting the upward swing of the outer end of such piece, while allowing it to swing downward, and the sliding bar provided with the cam made inclined on its upper side and abrupt below, substantially as and for the purpose specified.

5. In combination with the reciprocating locking-bar, the spring forcing it in one direction, the pivoted piece on the bar having on one arm a lug to limit its swing and on the other arm a roller, and the movable bar or piece having a cam for engaging the roller, made inclined on one side and abrupt on the other, substantially as and for the purpose set forth.

6. In combination with the series of indicator-rods provided with locking-shoulders, the reciprocating locking-bar for engaging such shoulders, the spring engaging such bar, the pivoted piece on the bar having a stop on one arm to engage the bar and a roller on the other arm, the indicator-rod moving keys, the movable frame engaging such keys, and the sliding bar or plate connected with the frame so as to be moved thereby and provided with a cam-lug to engage the roller of the pivoted piece on the locking-bar, substantially as and for the purpose described.

7. In combination with registering mechanism and a series of devices for actuating such mechanism, each connected therewith so as to cause it to register different amounts, a series of check-feeding devices connected with the register-actuating devices, and a series of check-holders, each containing checks marked to indicate the amount registered by the movement of the register-actuating device connected with the respective feeder for such check-holder, substantially as and for the purpose specified.

8. In combination with a series of register-actuating devices and registering mechanism to register different amounts, connected with the several actuating devices, a check-holder for each register-actuating device, and a check-feeding mechanism connected with each of such devices, so as to be actuated thereby, substantially as and for the purpose shown.

9. In combination with a series of check holders, each containing checks marked or adapted to indicate a certain amount, a series of feed devices to feed out separately the checks in the different holders, a registering mechanism, and connections between such mechanism and the series of feed devices whereby the registering mechanism is operated to register the amount of each check fed out, substantially as and for the purpose set forth.

10. In combination with a series of check-holders for containing checks, the checks in the holders adapted to indicate certain amounts, registering mechanism, a series of devices for actuating it to register amounts corresponding with the marks or indications of the check in the different holders, and a series of devices, each connected with one of the different register-actuating devices and each adapted to engage and feed from its holder a check to indicate the amount caused to be registered by the respective register-actuating device, substantially as and for the purpose described.

11. In combination with the registering mechanism, the series of levers and connections between the levers, and registering mechanism for causing the latter to register different amounts, a series of check-holders, each containing checks marked to indicate the amount caused to be registered by the movement of one lever, and the series of feed devices, each connected with one of the levers and operating in connection with the respective check-holder of that lever, substantially as and for the purpose specified.

12. In combination with a check-holder containing checks, each marked with or adapted to indicate a certain amount, a key-lever, the check-feeding device operated thereby, and registering mechanism for registering the amounts indicated by the checks connected with the lever, so that each time the latter is moved to issue a check the amount indicated by that check will be added up by the register, substantially as and for the purpose shown.

13. In combination with a series of keys, registering mechanism connected with the several keys, so as to register different amounts as

the different keys are operated, a series of check-holders for containing checks adapted to indicate amounts corresponding with the different amounts registered, and the series of feed devices, each connected with a key, so as to be caused thereby to engage a check in the holder corresponding with that key, substantially as and for the purpose set forth.

14. In an indicating apparatus provided with a series of movable indicators, in combination with each indicating device, a check-holder, and a check issuing or feeding device connected with the indicating device, so as to be operated therewith, substantially as and for the purpose described.

15. In an indicating apparatus, in combination with the indicating mechanism for indicating different amounts, a series of check-holders containing checks marked with the different amounts to be indicated and means for feeding from such holders as different indications are made the checks corresponding with such indications, substantially as and for the purpose specified.

16. In an indicating apparatus, in combination with a series of check-holders and feed devices for issuing checks therefrom, the series of movable indicating devices and connections between the check feeding and indicating devices, adapted to cause a check-feeder to be operated each time that an indication is made, substantially as and for the purpose shown.

17. In an indicating apparatus, in combination with the series of movable indicating devices for indicating different amounts, suitable holders containing checks marked with the amount to be indicated and means adapted to be operated by the movement of any indicating device to feed from its holder a check marked with the amount indicated by such device, substantially as and for the purpose set forth.

18. In an apparatus for indicating, in combination with the series of movable devices for indicating various amounts, a series of check-holders, each containing checks marked to correspond with one of the possible indications of the apparatus, check feeding or delivering devices, one for each holder, each connected with and operated by the movement of the indicating mechanism, which causes the indication of the amount marked on the checks in the respective holder, substantially as and for the purpose described.

19. In combination with the series of indicator-rods provided with display plates or tablets marked with certain amounts, the series of keys for moving such rods, the series of check-holders, each containing checks marked with the same amount as one of the indicator-plates, the series of check feeding or issuing devices for the holders, each connected with and operated by the key which moves the indicator-rod marked to correspond with the checks in the respective holder, substantially as and for the purpose specified.

20. In an indicating apparatus, in combination with the series of indicating display devices, the series of key-levers for operating the display devices, a series of check-holders, arms on the key-levers, and check-feeding pawls on such arms, substantially as and for the purpose set forth.

21. In an indicating apparatus, in combination with the series of indicating display devices, a key-lever for operating a display device, a check-holder above the lever, provided with a suitable check-issue slot, an arm on the lever, and a pawl on such arm provided with a check-engaging shoulder, substantially as and for the purpose described.

22. In an indicating apparatus, in combination with the series of indicating display devices, the series of key-levers for operating the display devices, the series of check-holders, each provided with a check-issue slot and with an opening in its bottom to admit a check-feeding device, the arms on the levers, and the check-feeding pawls on such arms, substantially as and for the purpose specified.

23. In a cash registering and indicating apparatus, in combination with the series of indicating devices for indicating various amounts and the registering devices for registering the amounts indicated, a series of check-holders adapted to receive checks marked to correspond with the indications of the apparatus, and check-feeding devices connected with the indicating and registering devices, so as to be operated therewith, substantially as and for the purpose shown.

24. In a cash registering and indicating apparatus, in combination with the series of indicating devices for indicating different amounts and registering mechanism for registering the amounts indicated, the series of check-holders, one for each indicating device, and a check feeding or issuing mechanism for each holder, connected with the respective indicating device, so as to be operated therewith, substantially as and for the purpose set set forth.

25. In a cash register and indicator, in combination with the series of key-levers, the swinging frame having the cross-bar extending over the rear portions of the key-levers, a movable plate adapted to be engaged by the frame, a trip carried by the plate, a pivoted lever adapted to be engaged by the trip on the plate, a bell-striker operated by the lever, and a bell, substantially as and for the purpose shown.

26. In a cash register and indicator, in combination with the series of keys, the swinging frame extending across such keys, the sliding piece adapted to be moved by such frame, the swinging pawl on such piece, and the spring-actuating alarm-striking lever in position to be engaged and moved by the pawl as the sliding piece is raised by the swinging frame, substantially as and for the purpose shown.

27. In a registering apparatus, in combination with a series of keys of different denominations and the registering mechanism to be actuated therefrom, a swinging frame having a bar extending diagonally across the keys, so as to approach nearer and nearer to the pivotal points of the keys as it passes over the keys of lower denomination and having key-engaging surfaces arranged so that an equal movement of different keys will move the frame different distances, and connections between the frame and the registering mechanism, substantially as and for the purpose specified.

28. In a registering apparatus, in combination with a series of keys for causing registration of different amounts, a swinging frame having a bar extending diagonally across the keys, provided with bearing-surfaces for the different keys, arranged at different heights above such keys, and registering mechanism connected with and actuated by the movement of the frame, substantially as and for the purpose described.

29. In a registering apparatus, in combination with a series of key-levers having equal amounts of movement, a swinging frame having a bar extending diagonally across the key-levers and provided with bearing-surfaces to be engaged by such levers, each successive bearing-surface as the bar approaches nearer the pivotal point of the levers being placed a greater portion of the possible swing of the surface-engaging part of the respective key-lever away from such lever, substantially as and for the purpose specified.

30. In a registering apparatus, in combination with the series of key-levers having equal movements, a movable frame having a bar extending from a point over the outer end of the lever at one end of the series diagonally inward across the series of levers and provided with bearing-surfaces for the respective levers, set above the levers successively a greater portion of the possible movement of the engaging point on the respective lever, substantially as and for the purpose shown.

31. In a registering apparatus, in combination with the series of levers pivoted on a suitable shaft, a swinging frame having a bar extending diagonally across the lever series, provided with bearing-surfaces to be engaged by the respective levers, such bearing-surfaces being placed above the levers different fractions of the amounts of possible travel of the surface-engaging points on the lever, substantially as and for the purpose set forth.

32. In a registering apparatus, in combination with the series of levers, the swinging frame having the bar extending diagonally across the lever series, provided with a series of bearing-surfaces to be engaged by the levers so situated with reference to the levers that each successive surface will normally be above its respective lever a distance equal to a greater number of fractions of the possible movement of the engaging point on the lever, substantially as and for the purpose described.

33. In a registering apparatus, in combination with a series of key-levers and a swinging frame having the bar extending diagonally across the lever series so as to pass over points on the levers successively nearer and nearer to the lever-pivots and provided with bearing-surfaces for the levers, of which the outer one bears on the lever at that end of the series, the next stands above its respective lever a distance equal to a certain fraction of the possible movement of the surface-engaging point on the lever, and the succeeding surfaces are farther and farther above their levers by a greater and greater number of similar fractions of the possible travel of the respective lever-engaging points, substantially as specified.

34. In a registering apparatus, in combination with the series of key-levers, the swinging frame having the bar extending diagonally across the series of levers and having the bearing-points to be engaged by the levers, situated on a curved line at different heights along the bar, substantially as and for the purpose shown.

35. In combination with the series of key-levers and the swinging frame, the adjustable bar or bearing piece thereon extending diagonally across the series of levers and provided with bearing-surfaces at different heights from the respective levers to engage such surfaces, substantially as and for the purpose set forth.

36. In an indicating and registering machine, a series of keys, a movable frame to be moved by any key operated, the adjustable piece consisting of a plate having surfaces to be engaged by the keys pivoted to the frame, so that it can be swung up or down on the latter to adjust its angle with reference to the plane of the keys, and means for fixing it at any desired point of adjustment on the frame, substantially as and for the purpose specified.

37. In combination with a series of key-levers and a register-wheel, suitable connecting mechanism for turning the wheel as any key-lever is moved, a swinging frame resting on the key-levers, and brake mechanism for the register-wheel, actuated by the frame only after the latter has been moved a certain distance by the movement of a key, substantially as and for the purpose specified.

38. In combination with the series of key-levers and a register-wheel turned therefrom through any suitable connection, a brake-lever adapted to engage a brake-surface on the register-wheel, a swinging frame engaging the key-levers, and an arm on the frame adapted to engage the brake-lever only after the frame has moved some distance and then to move it to apply the brake-lever to the brake-surface as the limit of throw of a key is reached.

39. In combination with a series of key-levers, a register-wheel, and suitable connecting mechanism for turning the wheel as any key-lever is operated, ratchet-teeth on the wheel, the brake-lever adapted to engage such teeth, the frame engaged by the key-levers, and an arm on the frame adapted to engage and operate the lever only during the latter part of travel of the frame, substantially as and for the purpose set forth.

40. In combination with a wheel of the registering mechanism and the series of key-levers, the swinging frame provided with the cam-arm, and the brake-lever provided with the adjustable bearing to be engaged by the frame-arm, substantially as and for the purpose described.

41. In combination with the wheel of the registering mechanism provided with the ratchet-teeth, the brake-lever for engaging such teeth, the series of key-levers, and the frame with the brake-lever engaging and actuating arm adapted to engage and operate the brake-lever only as the frame approaches the limit of its travel, substantially as and for the purpose specified.

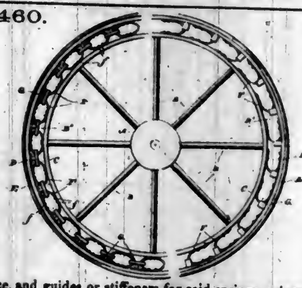
42. The combination of the registering-ratchet, a movable piece carrying a pawl to engage said ratchet, numbered key-levers arranged below said piece, adapted when moved to actuate the piece to rotate the registering-ratchet a distance corresponding with the number of said key, a stop-ratchet secured to said registering-ratchet concentrically therewith, a stop-lever, and means whereby the actuation of any key-lever causes such stop-lever to engage the stop ratchet to prevent over rotation of the registering apparatus, substantially as and for the purpose shown.

43. In a cash register and indicator, in combination with a registering-wheel provided with teeth, a series of keys for actuating such wheel, pivoted upon a shaft, a swinging frame pivoted upon the key-supporting shaft and actuated by the operation of any key, a swinging brake-arm having a portion to engage the teeth of the register-wheel to lock it from movement, and connecting mechanism between the swinging brake arm and the frame, whereby upon the operation of any key the arm is swung to cause it to engage the teeth of the register-wheel, substantially as and for the purpose shown.

44. In a cash register and indicator, in combination with a register-wheel provided with teeth; a series of keys for actuating the wheel through suitable connecting mechanism, a series of indicator-tablet-carrying rods actuated by the keys, a swinging frame actuated by any one of the keys, a brake for engaging the teeth of the wheel to stop the wheel from rotating, and means carried by the frame, adapted to actuate the brake device after the frame has traveled over part of its throw and cause it to engage the teeth of the wheel as the frame reaches the limit of its movement by any key, substantially as and for the purpose shown.

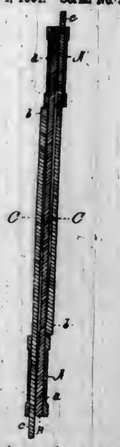
45. In a cash register and indicator, in combination with the series of key-levers and the swinging frame engaging the same, alarm mechanism actuated to sound an alarm as the frame nears the limit of its swing, the movable till lid or cover, and one or more latches for locking the same shut, adapted to be tripped by the frame after the latter has caused the alarm to be sounded, substantially as and for the purpose described.

46. In a cash register and indicator, the combination, with a series of key-levers, of a swinging frame pivoted on the same axis therewith, having a cross-bar to be engaged by the key-levers, and a till-locking latch provided with a portion extending over above a portion of the frame, so as to be moved by the frame, substantially as and for the purpose described.



47. In combination with a series of keys pivoted on a shaft at the front of the machine, a series of tablet-carrying rods operated by the keys, a swinging frame pivoted on the same axis with the levers, having the bar extending across the tops of the keys to the rear of their pivotal support, and the till-locking and alarm-striking mechanisms operated by the swinging frame, so that the locking mechanism is tripped and the alarm mechanism is operated to sound an alarm as the frame is raised by the movement of any keys, substantially as and for the purpose described.

481,460. BICYCLE-WHEEL. FREDERICK ASHLEY, Brooklyn, N. Y. Filed Oct. 30, 1891. Serial No. 410,347. (No model.)



Claim.—1. A wheel having an inner and an outer felly separated from each other by an annular chamber or space, said outer felly being compressible under the tire, a series of springs located in said chamber or space, and guides or stiffeners for said springs, substantially as specified.

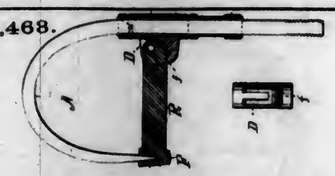
2. A wheel having a series of springs between the ends of its spokes and the felly, said springs being held between guides secured to the felly and limiting and stiffening their action, substantially as specified.

481,460.

481,461. BOW OR HOOP FOR NETS. ALFRED G. BENSON, Camden, N. J. Filed June 1, 1891. Serial No. 394,620. (Model.)

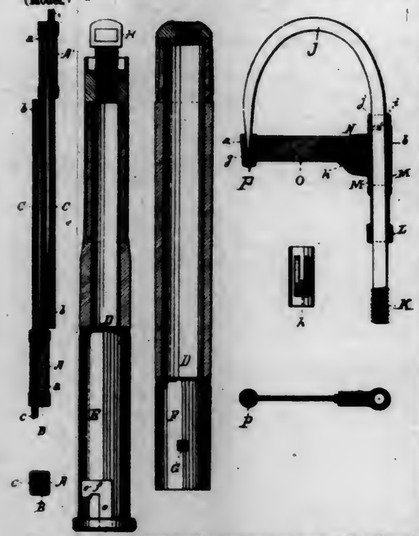
Claim.—A telescoping bow or hoop consisting of sections composed of bars or rods having ferrules thereon, said ferrules having longitudinal wedge-shaped slots therein, and said sections having their extremities reversely wedge-shaped for locking engagement with the interior of the ferrules when the sections are extended, as set forth.

481,462. LOCKING-FERRULE. ALFRED G. BENSON, Camden, N. J. Filed June 1, 1891. Serial No. 394,621. (Model.)



Claim.—A locking ferrule consisting of a male ferrule having a locking stud or boss thereon, and a female ferrule having an L-shaped slot therein for engagement with said stud, the terminal recess of the slot serving to engage the stud and thereby lock the female ferrule against tensional or torsional movement, as set forth.

481,463. GAFF-HOOK. ALBERT G. BENSON, Camden, N. J. Filed June 1, 1891. Serial No. 394,622. (Model.)



Claim.—The combination of a gaff-hook and its shank with a sliding and locking sleeve and suitable jaws, a vibrating arm pivoted therein and provided with a socket end for the reception of the end or point of the gaff-hook, for the purpose shown and described.

481,463.

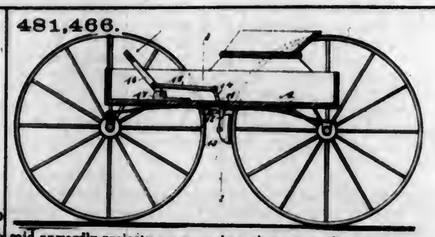
481,464. COMBINED GAFF-HOOK AND LANDING-NET. ALFRED O. REMSON, Camden, N. J. Filed June 1, 1891. Serial No. 394,622. (Model.)

Claim.—1. A combined landing-net bow or hoop and gaff-hook, consisting of a rod having a bow or hoop on one end and a gaff-hook on the other end.

2. In combination, a protected gaff-hook, suitable couplings for securing the joints of the sectional rod, and attachment for the reception of the bow or hoop at one end of the rod and the gaff-hook at the other end, as set forth.

3. A combined sectional landing net bow or hoop, gaff-hook, and rod, the rod having attachments for the reception of the bow or hoop at one of its ends and the gaff hook at the other end, and suitable couplings for uniting two or more sections of the rod, if desired, as set forth.

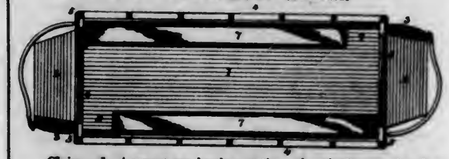
481,465. INCLOSURE FOR PACKING AND CARRYING PRINTERS' ROLLERS. HERBERT M. DUNHAM, Avondale, N. J., and GUSTAVE RUNGE, Cleveland, Ohio. Filed Nov. 25, 1891. Serial No. 413,027. (No model.)



Claim.—The carrying-case for printers' rollers herein described, consisting of a cylindrical paper tube of greater diameter and length than the roller to be carried, wooden disks detachably fitted in the ends of the tube and formed with central apertures to take the journals of a roller and fastening-nails to hold the disks in the tube, as specified.

481,466. VEHICLE-BRAKE. REUBEN W. BROADHEAD, Dolores, Colo. Filed Mar. 28, 1892. Serial No. 426,676. (No model.)

Claim.—1. In a vehicle, the combination of a shaft having crank-arms at its ends carrying brake-shoes and provided with an upwardly-extending arm, a foot-lever, a link connecting the foot-lever with the



481,466.

said upwardly-projecting arm, and a spring surrounding the shaft and having one end secured to the bearing of the shaft and its other end secured to an adjustable collar on the said shaft, substantially as described.

2. In a vehicle-brake, the combination, with a shaft adapted to be journaled beneath a vehicle-body and provided with downwardly-extending crank-arms at its ends having brake-shoes applied thereto, the shaft being constructed in sections and connected by a coupling, and an arm extending upward from the shaft, of a foot-lever, a link connection between the foot-lever and the upwardly-extending arm of the shaft, and a spring encircling the shaft, having one end attached to the shaft-bearing and the other end secured to a collar adjustably fixed upon the shaft, whereby the tension of the spring may be increased or decreased, the said spring being adapted to normally maintain the brake-shoes out of engagement with the wheels, as and for the purpose set forth.

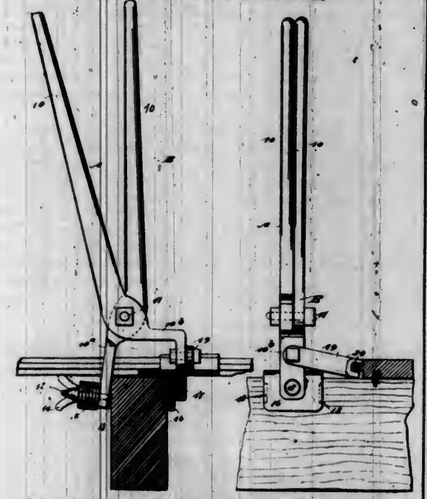
481,467. STREET-CAR. FREDERICK B. BROWNELL, St. Louis, Mo. Filed Nov. 30, 1891. Serial No. 413,503. (No model.)

Claim.—1. A street-car having at the end a platform and a door moving from one side of the car toward a fixed partition, pocket, or casing located at the other side, the said fixed partition, pocket or casing occupying substantially one-half of the full width of the car, the construction being such that when the door is opened ready ingress and egress are provided across that corner of the platform adjacent to the side of the car from which the door is moved, substantially as set forth.

2. A street-car having at the end a platform and a door moving from one side of the car toward a fixed partition, pocket, or casing and adapted when opened to provide means of ingress and egress across that corner of the platform adjacent to the side of the car from which it is moved, combined with seats constructed and arranged as described, whereby spaces are left between the seats adjacent to the door-opening and said opening, substantially as set forth.

481,468. STREET-CAR. FREDERICK B. BROWNELL, St. Louis, Mo. Filed Nov. 30, 1891. Serial No. 413,503. (No model.)

Claim.—A street-car having at its end a doorway situated at one side of the longitudinal center of the car, a door adapted to open and close said doorway, and a shortened seat adjacent thereto, combined with a seat-section for continuing or extending said shortened seat, thus making up for the deficiency in seating capacity consequent upon such shortening of the seat at or near the doorway not in use as an entrance, substantially as set forth.



481,469. SPOKE-TENON CUTTER. ABSALOM BRUNER, Artoe, Mo. Filed Oct. 7, 1891. Serial No. 408,009. (No model.)

481,469.

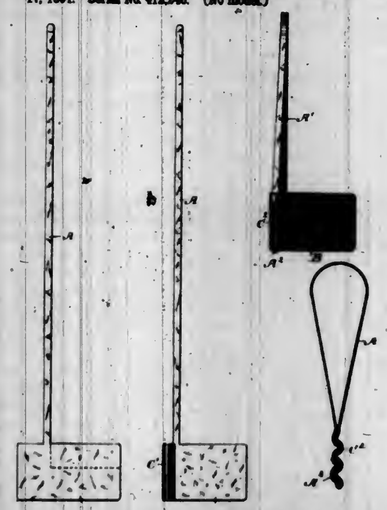
Claim.—The combination of a longitudinally-slotted support, a projecting bearing formed by turning the rear end of the support outward, a clamp-section formed by turning the inner end of the support in the reverse direction, a movable post having a head which projects through the slot of the support, a shaft carrying a cutter head journaled in the said post and outturned bearing, being adapted to move with the former, a lever secured between its ends to the projecting head of the post, a link secured at one end to the outer end of the lever and its opposite end to the slotted support, a spoke-grasping member, and a projection thereon which is adapted to be secured to the said clamp-section on the slotted support, substantially as shown and described.

481,470. FLOOR-JACK. EDWARD A. BULLOCK, Bellefonte, Pa. Filed Mar. 18, 1892. Serial No. 425,574. (No model.)

Claim.—1. A floor-jack consisting of two sections pivotally connected, said sections comprising handles and jaws, the jaw of one section being practically straight and the jaw of the other section angular, an adjusting-pin carried by one of the jaws, a clamping-plate having a swivel connection with the opposite jaw, and a shoe pivotally connected with one of the jaws and adapted for engagement with the board to be operated upon, as and for the purpose set forth.

2. In a floor-jack, the combination, with a body comprising two pivotally-connected sections, each section consisting of a handle and an attached jaw, one jaw being practically straight and the other angular, whereby an essentially-rectangular opening is formed between them, of an adjusting-screw having a pointed inner end passed through the straight jaw and provided with a series of spacing-washers, an angled clamping-plate having a swivel connection with the angular jaw, and a shoe pivotally connected with the said angular jaw, the shoe being adapted to receive the board to be operated upon, as and for the purpose specified.

3. In a floor-jack, the combination, with two sections pivotally connected, each of said sections comprising a handle and a jaw, the jaw of one section being practically straight and that of the other section angular, of an adjusting-screw passed through the straight jaw, the inner end of which screw is formed as a head and is pointed, spacing-washers carried by the adjusting-screw, an angled plate having a swivel connection with the inner face of the angular jaw, said plate being provided with teeth, and a shoe comprising a shank and a head, the shank being pivotally connected with the angular jaw and the head being provided with a groove to receive the tongue of the board, substantially as and for the purpose specified.

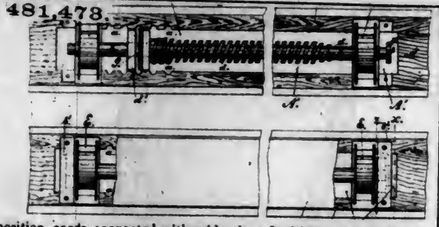


481,471. HARNESS-TUG. SAMUEL P. CHANDLER, Lake City, S. C. Filed Nov. 25, 1891. Serial No. 413,082. (No model.)

Claim.—1. A thill-tug, substantially as herein described, comprising a yielding loop portion C, having rigid end sections A and B, the section A, having apertured ears a^2 a^2, the buckle F, having a pivot-bar *f* journaled in such ears, and the section B, having a hook member *b'* arranged to lock over the pivot-bar *f*, such hook member adapted to extend under the bar *f* when the loop is distended and adapted to be detached when the members A and B are closed in, substantially as and for the purpose described.

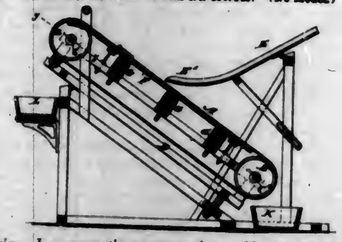
2. In a thill-tug, the combination of the loop C, having a member A formed with apertured ears a^2 a^2, the buckle F, having a pivot-bar *f* held in said ears, and the rigid member B, having a hook member *b'* adapted to engage the bar *f* between the ears a^2 a^2 and be held in a locked engagement therewith and provided with a finger or lifting portion G, all arranged substantially as and for the purpose described.

481,472. SEAL. SAMUEL R. CHESSEMAN, Millsdale, Ky. Filed Nov. 17, 1891. Serial No. 412,246. (No model.)



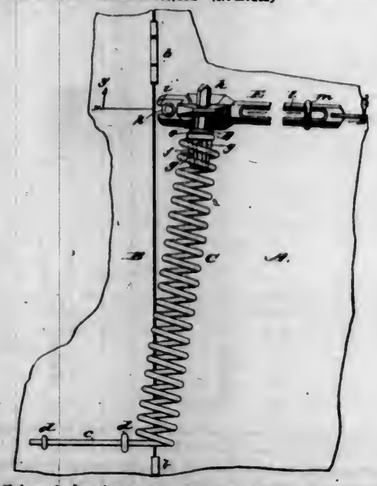
Claim.—A seal consisting of a sheet-metal blank, having a shackle integral therewith, a portion of said blank on one side of said shackle being formed into a hollow cylinder in which the free end of said shackle is adapted to be secured, the other side of said blank forming a tag, substantially as described and shown.

481,473. VENETIAN BLIND. CARL G. CHRISTENSEN, Christiania, Norway. Filed Nov. 9, 1891. Serial No. 411,271. (No model.)



Claim.—In a Venetian blind, the combination, with the slats, the slat-supporting tapes, and a recessed top piece pivoted to oscillate in the frame to which the blind is applied, of an axle journaled in said top piece, a fastening-piece adjustable on said axle, a spring, one end of which is secured to said axle and the other end of which is secured to the fastening-piece, means for securing said fastening-piece in its adjusted

481,478.



position, cords connected with said axis and with the slats, and cords connected with the recessed top plate for adjusting the position of the slats, substantially as described.

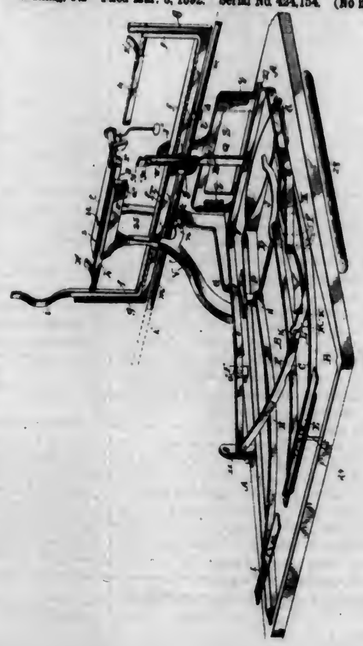
481,474. MAGNETIC SEPARATOR. GURDON CORNELIUS, Glens Falls, N. Y. Filed July 23, 1891. Serial No. 400,445. (No model.)

Claim.—In a magnetic separator, the combination of an inclined frame having two opposite drums, one of which is made in three sections b b' b^2, the endless belt passing around said drums, and the magnets supported by the frame within the belt and provided with recesses f to receive the rims of the sections b b' b^2 of the upper drum, substantially as described.

481,475. DOOR-SPRING. JOHN A COOPER, Nashville, Tenn. Filed Dec. 29, 1891. Serial No. 416,444. (No model.)

Claim.—1. In a door or gate spring attachment, the combination, with the spring proper having a terminal portion or limb at its fast end adapted to engage in a removable manner with fixed holders or staples, of a socket or shank piece adapted to enter within and engage with the opposite or free end of a spring and a removable wrench adapted to engage with said socket or shank piece and forming a part of the spring fixture, substantially as specified.

2. In combination with the coiled spring and socket or shank piece fitted within and engaging with the free end of said spring, the removable sliding wrench attachment constructed to engage with said shank-piece and provided with an open-ended slot at its inner end adapted to engage with a fixed pin or screw and a turn-button or device for holding said wrench in place and for releasing it when required, essentially as set forth.



481,476. BICYCLE. WILLIAM S. CRANMER, Sonoma, Cal. Filed Feb. 12, 1892. Serial No. 421,304. (No model.)

Claim.—1. In a bicycle of the Safety type, the combination of a front steering-wheel, a rear driving wheel of larger diameter, a frame closely connecting the two wheels and consisting of the backbone A and bottom bar C, both forked over the rear driving-wheel, separate crank-axles journaled in the bottom bar C on each side of the driving-wheel back of its front, independent chain-gearing on each side of the driving-wheel for transmitting the motion of the cranks thereto, a seat carried by the backbone of the frame in the vertical plane of the crank-axles, and the vertical brace-bars F on each side of the driving-wheel in the perpendicular plane of the crank axles and seat and connecting the bottom bar and backbone of the frame, substantially as herein described.

2. In a bicycle of the Safety type, the combination of a front steering-wheel, a rear driving-wheel of larger diameter, a frame closely connecting the two wheels and consisting of backbone A and bottom bar C, the vertical brace-bars F on each side of the driving-wheel and connecting the backbone and bottom bar, the inner straps c' and f of the bottom bar and brace-bars, respectively, the independent crank-axles mounted in bearings formed by said bar and brace-bars with their straps, the independent chain-gearing from said crank-axles to the rear driving-wheel, and the seat supported by the backbone and lying in the perpendicular plane of the crank-axles and vertical brace-bars, substantially as herein described.

481,477. TYPE-WRITING MACHINE. JAMES D. DAUGHERTY, Kittanning, Pa. Filed Mar. 8, 1892. Serial No. 424,154. (No model.)

Claim.—1. A type-writer comprising a base, a printing mechanism, carriage-supporting standards having a vertical longitudinal slot, a carriage-track within the slot below its upper end, a carriage having a vertical portion moving in the said slot, and yokes secured to the carriage, which engage the said track, for holding the said vertical portion in position, substantially as specified.

2. A type-writer comprising a base, a printing mechanism, carriage-supporting standards having a vertical longitudinal slot, a track within the slot below its upper end, screws supported by the said standards, which secure the said track, a carriage having a vertical portion which moves in the said slot, and yokes upon the said vertical portion of the carriage, which have a slot or opening to allow them to pass the said track-securing screws, substantially as shown.

3. A type-writer comprising a base, a printing mechanism, carriage-supporting standards having a vertical longitudinal slot, a track within the said slot and below its upper end, a carriage substantially U-shaped, a platen supported between its upper end, yokes at the lower end of the carriage, which slide upon the said track, and a longitudinal bar connecting the vertical portions of the carriage below the said platen, which bar slides in the said vertical slot of the standards for supporting the carriage in an upright position, substantially as described.

4. A type-writer comprising a base, a printing mechanism, carriage-supporting standards having a vertical longitudinal slot, a track in the said slot below its upper end for supporting the lower end of a carriage, a carriage substantially U-shaped carrying a platen in its upper ends, a bar connecting the vertical portions of the carriage below the platen, a U-shaped rack having its ends pivoted upon the said rod, one end of the rack being extended to form a handle, substantially as specified.

5. A type-writer comprising a base, a printing mechanism, carriage-supporting standards having a vertical longitudinal slot, a carriage having a vertical portion, which slides in the said slot, and a laterally-adjustable plate at the upper end of the slot, for the purpose set forth.

6. An interchangeable-carriage type-writer comprising a base, a printing mechanism, and a track having screw-threaded openings in its ends and screw-threaded extensions to be screwed therein, whereby a long carriage can be accommodated, substantially as specified.

7. An interchangeable-carriage type-writer comprising a base, a printing mechanism, carriage-supporting standards having a vertical longitudinal slot from end to end, a carriage having a vertical portion sliding within the slot, and a track within the slot below its upper end constructed to have its ends extended, substantially as set forth.

8. An interchangeable-carriage type-writer comprising a base, a printing mechanism, carriage-supporting standards having vertical longitudinal slot, a track within the said slot below its upper end constructed to have its ends extended, and a carriage having a vertical portion sliding in the said slot and its lower end sliding upon the extensible track, substantially as described.

9. A type-writer carriage comprising a frame, a platen journaled therein, a rod extending longitudinally of the said frame below the said platen, a paper-guide in rear of the said platen, curved levers pivoted between their ends upon the said rod near the ends of the platen, a roller journaled between the said levers in front of the said platen, springs upon the paper-guide, which engage the opposite ends of the said levers for holding the roller in contact with the platen, and a bar which connects the said spring-pressed ends of the levers, whereby they can be operated to release the tension of the roller upon the platen.

10. A type-writer carriage comprising a frame, a platen journaled therein, a paper-guide curved and having at each end vertical lips or extensions at its lower edge and inwardly-projecting extensions at its upper portion, both of which are secured to the said frame, substantially as described.

11. A type-writer carriage comprising a vertical U-shaped frame, a platen journaled in its upper end, a curved paper guide provided with extensions or lips, which are secured to the vertical portions of the said U-shaped frame, substantially as set forth.

12. A type-writer carriage comprising a frame, a platen journaled therein, a paper guide secured to the said frame, a platen-operating lever, which has its inner end pivoted to the said paper-guide, and a pawl for operating the said platen, substantially as specified.

13. A type-writer carriage comprising a frame, a platen journaled therein, a paper-guide secured to the frame, having an opening with lips extending laterally therefrom, a platen-operating lever having its inner end passing through the opening and pivoted between the lips, a dog passing through said opening and pivoted between the said lips, and a spring upon the paper-guide, which engages the said dog for holding it in engagement with the platen, substantially as described.

14. A type-writer carriage comprising a vertical frame having slots in its upper end, a soft material placed in the said slots to deaden the sound, a boxing in the said material, a means for detachably securing the said material in the said slots, whereby the platen is made detachable, substantially as set forth.
